**AÉRONAUTICS.**—The art of sailing in or navigating the air, has occupied the ingenuity of men from the earliest ages. But it was not till the composition of the atmosphere had begun to be ascertained, and that means had been devised of filling vessels with heated air, or other air lighter than atmospheric air, and consequently capable of floating on it, that there came to be a rational prospect of succeeding in the "audacious attempt" of riding in the air.

**Balloon.**—In 1782, the brothers Montgolfier succeeded in constructing a balloon; and on the 21st of October, 1783, Pilâtre de Rozier, a young naturalist, and the Marquis d'Arlandes, ascended from Paris to an elevation of more than 3,000 feet, and alighted safely from their "aerial tour," after describing a circuit of about six miles.

The ascents performed by Gay-Lussac, who attained an elevation of  $4\frac{1}{2}$  miles, are memorable for being the first ever undertaken solely for objects of science. In 1802 Mr. Glaisher reached the estimated elevation of 37,000 feet, which was approximated by two German aeronauts at Berlin in 1901. The most daring attempt at an aerial voyage was that of the Swede, Andree, who, with two companions, in 1897 ascended from Spitzbergen in hopes of reaching the north pole, their fate remaining unknown.

The modern balloon is but a slight improvement on that invented by Montgolfier. In place of heated air or hydrogen, common coal gas is now used. This improvement was introduced by Mr. Green, the English aeronaut. As gas expands rapidly as the balloon ascends, and the pressure of the external air is diminished, the neck of the balloon is commonly left open, and the machine is also furnished with a safety valve at the top, which can be opened or shut at pleasure.

**Shape.**—The balloon is usually a large pear-shaped bag, made of pliable silk cloth, covered with a varnish of caoutchouc dissolved in oil of turpentine to render it air-tight. The ordinary size may range from 20 to 30 feet in equatorial diameter, with a proportionate height, but balloons of far greater dimensions have been constructed. A car, generally of wicker-work, supported by a network which extends over the balloon, contains the aeronaut; and a valve, usually placed near the top and to which is attached a string reaching the car, gives him the power of allowing the gas to escape, whereby the balloon is lowered at pleasure.

A quantity of sand ballast in small bags is usually taken, and when the balloon tends to descend too far sand is thrown out and it rises again. The guide-rope, a long and heavy rope trailing over the ground, is sometimes used when the country is such that no serious damage will result from its trailing. The principle of this device is that as the balloon tends to rise it must lift more of the rope off the

ground, while when the balloon sinks it is relieved of so much weight, and thus it will tend to float at one level above the ground. A parachute, a contrivance resembling a huge umbrella, is often used in ballooning, and by its means an aeronaut can leave a balloon and descend slowly to the ground.

**Steering.**—The problem of how to steer or propel a balloon in a desired horizontal direction can scarcely be said to have been satisfactorily solved, though numerous attempts at producing navigable balloons have lately been made. In a navigable balloon to be propelled through the air by some kind of motor—against the wind if necessary—the familiar balloon shape is departed from as quite unsuitable, and the airship is usually of an elongated form and more or less cylindrical or cigar-shaped. These are floated by gas, and propelled by a screw driven by a dynamo-electric machine, and steered by a large rudder.

Renard and Krebs, two other workers in this field, subsequently built an airship 165 feet long and  $12\frac{1}{4}$  feet in diameter, moved by a battery of Renard's invention, a dynamo and a screw 7 feet in diameter. This machine, in 1884, was driven at a speed of 12 to 15 miles an hour in calm weather, and had power enough to contend against a light breeze.

The names of Count Zeppelin and M. Santos-Dumont have recently become well known in connection with such balloons. From 1897 to 1910 the former constructed several huge cylindrical airships of great length, with paraboloid ends, divided into a number of separate chambers filled with hydrogen gas and these enclosed in an outer air balloon, the whole being braced and made rigid by an aluminium framework, and the means of propulsion being screws driven by Daimler petroleum motors and fixed to the longitudinal axis of the airship.

M. Santos-Dumont has constructed several navigable balloons, and one of them was so successful at Paris in 1901 as to gain a prize of 100,000 francs. On this occasion his airship made the journey from St. Cloud to the Eiffel tower and back again, a distance of about  $9\frac{1}{2}$  miles, in half an hour. In 1907, and since, the British army balloon department made remarkably successful experiments with air ships; and successes on the part of Count Zeppelin and others were also reported.

**Aviation.**—Besides balloons, which are lighter than a corresponding volume of air, and airships depending on the same principle, various apparatus have been constructed for aerial navigation that are heavier than the air. Attempts at navigation by means of such craft is termed *aviation*. Some of these machines are intended more for gliding or soaring through the air than for actual flight, having somewhat the nature of a huge bird with outstretched wings beneath which a man attaches himself and on springing from a height gradually descends to the bottom.

**Aeroplane.**—Hence the invention of the aeroplane, which shows a large flat surface con-

trived to float nearly horizontally in the air, but with the front edge very slightly raised, so that in being propelled rapidly along it receives the pressure of the air on the under side, the air thus tending to counteract the force of gravity. Sir H. S. Maxim in 1894 constructed a huge machine with main and several subsidiary aeroplanes, propelled by two large screws driven by steam engines of 300 horsepower, and able to rise with a great weight. As a model, at least, Prof. Langley's *aerodrome* had some success, flying through the air a distance of three-quarters of a mile. It had two rigid pairs of wings about 12 feet in width, with large screw-propellers between them driven by a small steam engine.

**Type of Aeroplane.**—Since the first aeroplane types of flying machines designed by Maxim and Lilienthal, the work of inventors and scientists along the line of motor-driven, heavier-than-air flying machines has shown a rapidly progressive. The general and most popular design is that of the simple aeroplane, supported by air, through which it is propelled by detached force. The aeroplane, it should be observed, however, consists of two types—the *monoplane* and the *biplane*. There have been many radical but experimental departures from the aeroplane type, none of which, however, has shown any great degree of success. Among these radical types is the helicopter, the production of Otto Luyties of Baltimore, Md. The design of the machine embraces several pairs of huge wings and two or more upright revolving propellers, the latter operated by a 100-horsepower motor for the purpose of lifting the machine. The entire weight is 1,700 pounds.

**Wright Machine.**—The first achievement, however, in the form of sustained flight, with power to rise and descend without mishap, and to guide the machine in a circular flight, is confined to the Wright brothers of Dayton, Ohio, one of whom, in 1906, remained in the air thirty-eight minutes and three seconds, making a circular flight of twenty-four and a half miles. The brothers Voisin also constructed an aeroplane on lines laid down by M. Octave Chanute, which was driven in a successful flight in November, 1907, at Paris by M. Henry Farman. The aeroplane on the first attempt rose slowly from the ground, and in one minute and fourteen seconds completed a circle.

Officials of the Aéro Club of America, at the international congress held in New York, 1907, admitted that in flights of man-carrying galeas machines the Wright brothers were far ahead of all competitors. What the Wright brothers have accomplished since 1908, in both this country and France, has marked a new era in aerial navigation; and the prolonged, flights of motor-driven aeroplanes, together with the recent work of Santos Dumont, Voisin brothers, Farman, Bleriot-Levasseur, Curtiss and other aeroplane builders and operators fills the future with great expectations.

#### NOTABLE EVENTS AND RECORDS IN AVIATION

AVIATOR	AEROPLANE	DATE	PLACE	TIME	DISTANCE	REMARKS
W. Wright	Biplane	Nov. 9, 1904	Dayton, Ohio	0:04:30	3 miles	Wright brothers made 105 flights in 1904.
W. Wright	Biplane	Oct. 5, 1905	Dayton, Ohio	0:38:00	24 miles	Wright brothers made 49 flights in 1905.
Santos-Dumont	Biplane	Nov. 13, 1906	Bagny, France	0:02:15 $\frac{1}{2}$	722 feet	His best record for 1906.
Delagrèze	Biplane	May 30, 1907	Bagatelle, France		656 feet	His best record for 1907.
Farman	Biplane	Oct. 26, 1907	Ivy, France		2,530 feet	His best record for 1907.
Bleriot	Monoplane	Dec. 6, 1907	Ivy, France		2,000 feet	His best record for 1907.
Petitefleur	Monoplane	Jan. 8, 1908	Buc, France		3,960 feet	His best record for 1908.
Farman	Biplane	Mar. 13, 1908	Ivy, France	0:01:28	4,921 feet	
Farman	Biplane	Mar. 21, 1908	Ivy, France		1,25 miles	

very gradual changes must be taking place. Apparent evidence of this is furnished by close comparative study of the planets. Proctor (1837-88), Flammarion (1842-19-), and Lowell (1855-19)—have devoted much attention to this speculative research.

We may summarize their conclusions briefly by saying that some of the bodies of the solar system (sun, Jupiter, Saturn, Uranus, Neptune) are as yet undeveloped to the life-supporting era, because of intense internal heat; others (earth, Venus, the Galilean moons of Jupiter, and possibly Mars) have a constitution and temperature hospitable to life; while still others (asteroids and lesser satellites, the moon, Mercury, and possibly Mars) have likely been habitable in the remote past, but are no longer capable of sustaining life.

The solar system is not at rest in interstellar space, but the sun with all its planetary freight is voyaging toward the northern constellation Lyra about twelve miles a second. Whether this motion is in a straight line or in a vast orbit around some stellar center is yet unknown.

**The Sun** is a dense, gaseous sphere, 866,000 miles in diameter, inconceivably hot (perhaps 10,000° F.), and 93,000,000 miles distant from the earth. The sun is exceedingly massive—330,000 planets like the earth fused in one would barely weigh as much as the sun. Gravity at the sun's surface is nearly twenty-eight times greater than here on earth—an average man would weigh a ton there. Slowly round on its axis the sun turns once in 27½ days.

**The Outer Surface of the Sun** is not solid, but atmospheric; and the phenomena of this surface confirm beyond question the existence of winds, tumultuous currents, not only eddies but up and down, in the vaporized materials composing the outer layers. Most prominent of these is the photosphere, an unbroken mass of incandescent cloud a few thousand miles in depth. Just outside the photosphere is a vapor-laden atmosphere called the reversing layer, probably less than a thousand miles deep. It causes the dark absorption lines of the solar spectrum first mapped by Fraunhofer (1787-1826), and named after him. Rising to vastly greater heights than the reversing layer is the chromosphere (color-sphere), chiefly hydrogen, calcium and helium, averaging seven or eight thousand miles in depth. Projected from the chromosphere, sometimes quiescent in form and again violently eruptive, are the scarlet prominences, or protuberances. All these interesting phenomena of the sun's surface are now photographed daily by means of the spectroheliograph of Hale (1868-19-) and Deslandres (1853-19-).

Far outside the chromosphere is a sort of quasi-atmosphere, seen only when the sun itself is totally eclipsed, and called the solar corona—an irregularly filamentous halo of pearly light, whose long streamers often stretch millions of miles into space, with the soft radiance of a comet or a distant searchlight. Its cause and significance are very obscure. In part at least, the corona seems to be an electro-magnetic phenomenon.

**Sun Spots.**—Spots on the sun are sometimes large enough to be seen without telescopic aid. They are well viewed through a small telescope by projection on a white screen. The largest spots are about 50,000 miles across, and the smallest are mere dark specks 500 miles in breadth. Spots are never permanent, though they sometimes endure for many months.

The dark center of a spot (umbra) is surrounded by a less dark, ring-shaped aureole (penumbra). After many days the umbra usually begins to break up by bridges of penumbral light forming across it, a train of small spots forms, and these gradually fuse into the general surroundings of the photosphere. Schwabe (1789-1875) first discovered that sun spot appear and disappear in a pretty regular period of 11½ years. They were very numerous in 1905 and fewest in 1900 and 1911. Spots are most frequent in solar latitudes 15 degrees north and south.

Students of the sun are not wholly agreed as to the cause and significance of sun spots. The true cause appears to lie in the sun itself; probably the spots are consequent on eruptions. Many of them are hollows, or depressions, in luminous matter ascending as well as descending. Frequently they are cyclonic, as demonstrated by recent photographs of Hale. Epochs of large or numerous spots are nearly always accompanied by displays of the aurora, magnetic disturbances and electric earth-currents, sometimes powerful enough to interfere with the working of telephones and telegraphs.

Whether sun spots, protuberances or corona have any effect upon the weather is not yet sufficiently proven. When spots have been very abundant, the weather (for the earth generally) has been sometimes less rainy, sometimes more so; sometimes warmer, sometimes colder, than the average. So that weather disturbances due to fluctuating conditions on the sun are at best very slight and undetermined. Faculae, or bright spots, are frequent near the edge, or limb, of the sun, and the spectroheliograph has proved that they exist everywhere on the sun's surface. Many of them are the tops of incandescent calcium clouds.

**Chemical Composition.**—Close study of the sun's spectrum for a half century has revealed many terrestrial elements in the sun in the vapor state—aluminum, calcium, carbon, cobalt, copper, hydrogen, iron, magnesium, nickel, oxygen, silicon, silver, sodium, titanium, zinc and many others. Iron, calcium, hydrogen, nickel and sodium are the most strongly indicated. But chlorine, gold, mercury, nitrogen, phosphorus and sulphur are not present.

**Light and Heat.**—So dazzling is the radiance of the sun that all artificial sources of light pale against it—even the arc light seems black by comparison. Even the spots emit light and are only relatively dark. The sun's total light surpasses that of the full moon 600,000 times. If the sun's heat could be fully utilized, the deck of a steamer on tropical oceans receives enough to maintain it at a ten-knot speed. The sun's light and heat are essentially constant, and their maintenance is satisfactorily explained on the theory of slow but continuous contraction upon itself by its own gravity. A practical method of converting the sun's heat into available mechanical energy will be one of the great discoveries of the future.

**The Moon,** nearest of all celestial bodies to us (239,000 miles), and brightest of all save the sun, is a solid, opaque sphere of very rough contour, traveling around the earth once in 27½ days. The moon's motion easterly from night to night is obvious, if we refer it to the stars; and it passes over its own breadth (about half a degree) every hour. Occasionally a star is hidden behind it (occulted)—a very sudden phe-

nomenon at either disappearance or re-appearance. Sometimes a planet suffers occultation; and when the moon occults the sun, a total eclipse takes place. A fortnight earlier (or later) an eclipse of the moon itself is liable; but this is due to the moon's passing through the earth's shadow, so that sunlight is for the time withdrawn from it.

**Light.**—Half of the moon's sphere is always illuminated by the sun, and it is the amount of this illuminated half turned toward us that causes the moon's phases. Much of the time between new moon and either quarter, the sallow light of the unilluminated part of the moon's disk is faintly visible, called the "old moon in the new moon's arms." It is caused by sunlight reflected from the earth. Eastward progress of the moon makes it rise on the average about three-quarters of an hour later from night to night. The full moon of autumn rises with a daily retardation of less than half this amount; so they are called (in September and October) harvest moon and hunter's moon.

The spectroscopic shows that the moon's light and sunlight are identical in composition. We often say the full moon is as bright as day, but a half million full moons would not equal the sun's radiance.

**Dimensions.**—The diameter of the moon is 2,160 miles, easily ascertained after her distance is found. The distance is not difficult to determine, once we know the size of the earth, and can tell the straight-line distance between two observatories, as Greenwich and Cape Town. This becomes a base-line from which the distance between the earth's center and the moon's can be found by a trigonometric solution. Eighty-one globes like the moon rolled into one would equal the mass, or weight of the earth, and surface gravity is a sixth what it is here on earth; an average man would weigh but 25 pounds there, and an athlete with terrestrial thighs would find a 30-foot standing jump mere exhilaration. The moon turns round on its axis very slowly—only once, in fact, while it is making one complete journey round the earth. So that the half turned toward us is always the same, and no one has ever seen the other side of the moon. Her atmosphere, if the moon has any, must be very light; and water, if at all, must exist as ice.

**Heat.**—Lacking an atmosphere to absorb and retain the solar heat, the lunar surface must always be intensely cold. Moon's perigee (least distance) and apogee (greatest distance) cause a slight disturbance of magnetic needles; but the changing phases of the moon, especially the angle of the cusps with the horizon, are not responsible for any weather changes that the critical expert has ever been able to discern.

**Surface.**—The moon's surface is highly diversified by a wealth of smooth, darkish patches, named *mares* (seas), now regarded as desert plains; a few mountain chains; hundreds of rills or valleys; numerous systems of radiating streaks; and over 30,000 ring mountains of all sizes from a mile in diameter to a breadth sixty times that. All details of the lunar surface are mapped and named. Hevelius (1611-87) of Danzig made the first map of the moon, and Schmidt (1825-84) of Athens the last. The recent photographic atlases of the Lick and the Paris observatories show the lunar surface very satisfactorily, and Ritchey (1864-19-) attained even greater success with the Yerkes telescope. Changes on the

moon, if at all, are on a very small scale, too minute for detection with present instruments.

**The Planets.** in the order of their distance from the sun, are Mercury, Venus, earth, Mars, asteroids (about 700), Jupiter, Saturn, Uranus, and Neptune. No planets have yet been discovered inside of Mercury's orbit, or outside that of Neptune. Venus is the brightest planet, and Jupiter comes next. With Mars, Saturn and Mercury, these are all that are easy to see with the naked eye.

**Inferior and Superior.**—Mercury and Venus are classified as inferior planets, because their orbits are within the earth's; all the others are superior, that is, outside the earth's. To the naked eye none of the planets have appreciable disks or phases, but with the telescope Mercury and Venus pass through all the phases of the moon. Of the superior planets Mars alone exhibits a considerable phase, being at times gibbous, or like the moon two days from full.

**Motion.**—The planets are so named because they appear to move among the stars. The general trend of their motion is eastward (direct motion) along the ecliptic, or sun's apparent path. But during a part of each year every planet also travels westward (retrograde motion). When nearest the earth a planet's motion is retrograde; when farthest, direct. The ancients explained this forth and back motion of the planets by means of the epicycle of the Ptolemaic system; whereas it is really due to composition of earth's and planet's own motions around the sun.

Venus is a bright evening star in the western sky in August 1911, March 1913, October 1914, May 1916, December 1917 and August 1919. Mercury and Venus when nearest are at inferior conjunction; superior planets when nearest are at opposition. At inferior conjunction, Mercury and Venus sometimes pass directly between earth and sun, called a transit.

Dates of transit of Mercury are May of 1878, 1891, 1924 and November of 1868, 1881, 1894, 1907, 1914. Transits of Venus are much less frequent—December of 1631, 1639, 1874, 1882 and June of 1761, 1769, 2004, 2012.

For all details of motion of the planets, their distance from earth and sun, and positions in the sky at any time, consult the *Nautical Almanac*, a mathematical work based primarily on what are termed the "elements of the orbits." These technical quantities express with accuracy the size, form and position of the planetary orbits in space.

PLANET'S NAME	DISTANCE FROM THE SUN	ECCENTRICITY OF ORBIT	INCLINATION TO PLANE AND OF ECLIPTIC	TIME OF REVOLUTION AROUND THE SUN	LENGTH OF PLANET'S DAY	DIAMETER OF PLANET IN MILES
EARTH'S EQUALS UNITY	IN MILLIONS OF MILES					
Mercury.....	0.39	36	0.206	7° 0'	88d.	3,000
Venus.....	0.72	67	0.007	3° 24'	225d.	7,700
Earth.....	1.00	93	0.017	0° 0'	365½d.	7,900
Mars.....	1.42	142	0.093	1° 51'	68½d.	4,200
Jupiter.....	5.20	483	0.048	1° 19'	12y.	87,000
Saturn.....	9.54	886	0.056	2° 30'	29½y.	73,000
Uranus.....	19.18	1780	0.046	4° 45'	84y.	36,000
Neptune.....	30.06	2790	0.009	1° 47'	165y.	30,000

**The Northern Lights** (aurora borealis of the northern hemisphere, and aurora australis of the southern) are a phenomenon of the earth's atmosphere. This composite, compressible gas is rather less than one-millionth the earth's weight, is a hundred miles or more in depth, its density increases rapidly downward, and at the

bottom of this ocean of air humanity lives and moves and has its being. The atmosphere bends downward the rays of light coming from all celestial bodies, causes the twinkling or scintillation of the stars, and the common phenomena of dawn and twilight. The aurora is another phenomenon of the atmosphere, a soft, vibrating luminosity, streaming upward into the sky sometimes to the zenith, exhibiting greenish yellow, pale blue and other tints, occasionally with pulsating streamers. The semiperiodic recurrence of the aurora connects it with sun spots and protuberances. The magnetism of the earth as influenced by the condition of the sun appears responsible for the aurora, a species of luminosity in the very rare gases of the upper atmosphere.

Comets nearly a thousand in number have been recorded within historic time. Half have had the paths of their motion in space ascertained. If the orbits of two or more are the same, it is generally true that they are not different comets, but the same body moving in an elliptical track around the sun, which is situated (as in planetary orbits) at one focus of the ellipse.

Halley (1686-1742) first made this important discovery, and the comet which in consequence bears his name returns to the sun at intervals of about seventy-six years. Before his time comets were thought to move in straight lines through space. So it seemed quite possible that a comet might collide with the earth and wreak destruction thereon. In such case, however, collision would doubtless destroy the comet.

**Description and Development.**—If we conceive of a vast congeries of separate particles, varying in size from grains of sand to that of large buildings, these masses not compacted together but loosely related or hundreds of miles apart, traveling in shoals through space, we shall have the modern notion of a comet. During most of the time comets are dark invisible bodies; but, on approaching the sun within 500 million miles, they gradually begin to glow with a self-luminosity, and are visible in the telescope as faint, round patches of cloud-like light. Their true nature is detected by apparent motion among the stars from night to night. Most telescopic comets never develop beyond this simple stage; but the larger ones, on approaching near the sun, form first a nucleus, then a corona, or head with curving envelopes, or sheaths, sometimes opening toward the sun like an unfolding fan. Later follows development of the tail, quite invariably on the side away from

the straight tails due to hydrogen, the slightly curving ones to hydrocarbons, and the stubby, sharply curved tails to vapor of iron or chlorine. The shaggy tail is formed at the expense of the head and its particles never return to the comet again. A slow disintegration thus takes place at every return. When near the sun the head of a comet shines very faintly by reflected solar rays, and the spectroscope shows that the light of comets is mainly due to hydrocarbons, cyanogen and sodium.

**The Great Comets and Their Discoverers.**—Two French astronomers, Pons (1761-1831) and Messier (1730-1817) are the most famous of all discoverers of comets. In America Swift (1820-19—), Brooks (1844-19—) and Barnard (1857-19—) have been most successful. Discoveries are now sometimes made by photography. Encke's comet moves around the sun in the shortest period (3½ years), and is noted also for freaky changes of form. The largest and brightest comet ever seen came in 1843, stretching from horizon to horizon. It approached nearest to the sun of all known comets, and was visible to the naked eye at noon. Probably the outer regions of its head brushed through the streamers of the solar corona. Its velocity at perihelion was more than one and a quarter million miles per hour, and its tail was 150 million miles long. This comet will not return for 500 years. Other very bright and striking comets appeared in 1811, 1858 (Donati's), 1861, 1874 (Coggia's), 1882, 1887, and 1910. In extreme cases comets are visible a year and a half to two years. Occasionally one is discovered during a total eclipse of the sun (as in 1882 and 1893), and never seen again.

**Meteors,** or shooting stars, are fragments of comets rendered luminous by impact and friction with our atmosphere. Comets have been caught in the act of breaking up, as Biela's in 1845-6, and Brooks' in 1893. Generally, however, disintegration takes place very slowly, and the cometary fragments are thus scattered everywhere along the paths of these bodies. Showers of such fragments come within reach of the earth's attraction every day. For the most part they are dissipated in the upper air; but occasional fragments that reach the earth's surface, called meteorites, are found by chemical analysis to have the same constitution as comets themselves. Meteorites are either stones or irons, the latter yielding a large percentage of nickel. Fine American collections of meteorites are in the museums of Chicago, New York, Washington, Cambridge, New Haven and Amherst.

**The Stars** are situated at incomprehensible distances from the depths of space. To express these enormous distances, an astronomical unit is employed called the light-year: it is nearly six trillions of miles in length, and is the distance that a light-wave (whose speed is 186,000 miles per second) travels in a whole year. So astronomers have ascertained that Alpha Centauri, the nearest known fixed star, is four light-years away, Sirius is double that, Vega thirty light-years, Polaris seventy, and Castor 120, and so on.

**Classification.**—The stars are variously classified, first by their apparent magnitudes, or order of brightness. There are about twenty stars of the first magnitude, sixty-five of the second and 200 of the third, proceeding in geometric progression; 5,000 of the sixth, 720,000 of the tenth magnitude, and so on. An average first-magnitude star gives two and a half times more light than one

the sun. Often it stretches through space many millions of miles, giving the comet a bizarre and spectacular appearance which no other heavenly body possesses.

Comets sometimes have two or more tails; one had six (in 1744). Differences in the curvature are perhaps due to the nature of the volatile gases composing them—

of the second magnitude, and so on, by a nearly constant relation. In a clear, dark sky the average sixth-magnitude star is the faintest visible to the naked eye.

But the telescope reveals stars fainter and fainter, until the seventeenth magnitude is reached, as a *minimum visibile* in a forty-inch lens. Keeping pace with their diminution in brightness, the number of the stars increases, until their total is estimated at 150 millions. Dark or non-luminous stars there are also, and some astronomers think these exceed the luminous ones in number. The total light from all the stars is rather more than a hundredth that of the full moon.

**Colors.**—Another but less marked classification of the stars is by their colors; still another by their spectra, of which there are not less than five types, by the scheme of Secchi (1818-78):

(I.) *Sirians*, stars with spectra resembling that of Sirius, with broad, dark hydrogen lines.

(II.) *Solars*, with spectra resembling the sun's, with fine, dark metallic lines. Practically all the stars are evenly divisible between types I. and II.; and stars of type II. are least remote from the sun.

(III.) *Dark*, banded spectra, with bands well-defined on the blue-ward side.

(IV.) *Spectra with dark bands, or flutings*, fading out toward the blue. Stars of this type are few, faint, blood-red in hue, and their atmospheres are charged with carbon.

(V.) *Stars with bright-line spectra*. Classification of stars by their ages, indicated by the character of their spectra, has been attempted. The spectra show that as the stars are younger, the brighter, and then faint (minimum) for a relatively brief span. Such fluctuations of brightness are due to temporary occultation by a large, dark star whose orbit lies nearly edgewise to our vision. Others are called *Umicron Ceti variables*, also after the type star, often called "Mira the Marvelous."

Variables are especially numerous in the thick fields of star clusters. New stars are a type of variable which increase vastly in brightness in a few days or weeks, and then slowly wane or disappear, as *Nova Persei* in 1901, which for a brief period outshone *Capella*, and then gradually faded into a faint, encircling nebula. Of double stars more than 10,000 are now catalogued—stars with a nearly companion usually much fainter than the bright component. Burnham is the chief American discoverer of these objects. Hundreds of doubles belong to the class of binaries, whose components revolve around their common center of gravity in an elliptic orbit, generally in a long period of years. These paths are usually very eccentric, and the masses of the stars often nearly equal.

A similar type has been discovered, called the spectroscopic binary. In such the components are so near each other that the telescope unaided is powerless to divide, or separate them; therefore their spectra overlap. *Capella*, *Castor*, *Polaris* and *Spica* are spectroscopic binaries. Of all the stars so far examined, nearly one-

tenth reveal orbital motion. Multiple stars are those with many components: *Epsilon Lyrae*, near *Vega*, is a beautiful system of this sort.

**Star Clusters** are either loose, as the *Pleades*, with a few scattering bright stars in a region where the photographic plate shows many thousands; or close, like that in *Perseus*, with thousands of stars compactly aggregated and forming a denser region of the Milky Way. The whole of this marvelous galaxy, stretching all the way around the heavens, is made up of millions of minute stars, each comparable in size and constitution with our sun, and so immensely remote that their effect is that of a continuous sheet of faint luminosity.

The distance of stars can be stated intelligibly in light-years only, and their location around the sun seems nearly central, like the girle of meteoric masses comprising the ring of Saturn.

**The Nebulae** are located among the stars, and 12,000 are now known and catalogued. They appear like faint masses of luminous fog, mostly irregular in form and brightness. Many nebulae are glowing, incandescent gases, mainly hydrogen, as the spectroscopic shows. Some, however, are resolvable into separate faint stars, as in the Milky Way; a few are variable; and as a whole the nebula appear like the residue of original chaos from which the universe has, through uncounted millions of years, come into its present state.

**Classification.**—Nebulae are often classified as (1) annular, or ring-shaped, (2) spiral, (3) planetary, (4) nebular stars, (5) irregular nebulae, for the most part large, of which the great nebula in *Orion* is the finest example. Its light emanates from incandescent hydrogen and helium, it is intimately related to the neighboring stars of the constellation, its distance from the sun is increasing eleven miles a second, and this incomparably vast structure of tangled wisps and twisted cloud-shapes has, like nearly all the other nebulae, persisted for centuries without any certain change of form.

The nebulae are more thickly scattered toward the poles of the Milky Way, and their existence suggested the famous nebular hypothesis of Kant and Laplace, which forms the basis of the cosmogony of the present day.

**Cosmogony** is the science of the development of the universe. Beyond a shadow of doubt the universe is inconceivably old, and has come to its present being by an orderly process—an evolution through the long-continued action of fixed natural laws, especially the law of universal gravitation. For countless ages the universe existed only potentially; the celestial spaces were tenanted by nebulous masses of gas, "without form and void." Every molecule attracted every other molecule; centers of attraction formed, and as they drew other masses inward upon themselves, the collision of particles and friction upon each other developed heat; the gaseous condensations grew hotter and hotter; thousands upon thousands of nebular nuclei formed; condensation progressed, in some regions more rapidly than others. The sun itself, in its early history, was one of these centers, every star was such a center, or became one, in the slow process of world-building. As the gaseous masses could not usually fall directly toward their centers of attraction, huge nebular whirlpools were set in motion. No spiral nebulae were known to Laplace;

the first was discovered by Lord Rosse; but thousands were found by Keeler at the Lick Observatory, by means of photography. Next to the star itself, the spiral nebula is the type of object most frequent in the sky. Their existence is in full accord with the principles of dynamics, as pointed out by Chamberlain and Moulton in their planetesimal hypotheses.

Progressive development from a formless nebula tends toward the flat, revolving disk; contraction makes the inner regions whirl more and more rapidly, thus producing the spiral, or whirlpool structure. So the spiral nebula became the fundamental natural form. In great part the stellar systems, then, and probably our planetary system also, had their origin, not from Laplacian rings left behind as the nebular disk contracted, but from condensation into knots of nebulosity, ever and anon detached from the whirling nebulous mass, each knot subsequently condensing into a separate star or planet.

So Keeler's significant discovery of multitudes of spiral nebulae has greatly strengthened the evidence in general favor of a nebular hypothesis of origin of the stellar and planetary systems throughout the universe.

**BOTANY.**—One of the natural sciences, dealing with plants, as zoology deals with animals. In its widest sense it includes all kinds of inquiries in regard to plants, their structure, activities, distribution, origin, classification and uses. In fact the study of botany in its entirety includes every inquiry that may be made with regard to plants themselves and their relations to man and other living things, although for convenience the economic relations of plants are now more commonly relegated to agricultural, horticultural, forestry and pharmacy, while the more scientific problems are retained in botany.

**Departments of Modern Botany.**—The science may be divided for convenience into about ten departments, although sometimes fewer and again more divisions are recognized. The following is a conservative treatment:

**Cytology** deals with the minute structure of plants, especially with the *cells*, of which all plants are composed. A typical cell consists of a minute body of protoplasm (a softish nitrogenous substance) surrounded by a permeable membrane (wall of cellulose). The protoplasm is differentiated into a central denser, roundish part (nucleus), surrounded by a more watery part (cytoplasm). A still further differentiation has been made out for both nucleus and cytoplasm, the protoplasm consisting of a more active granular or fibrillar part (kinoplasm) scattered through the less active, nearly clear part (hyaloplasm). Moreover in the cytoplasm there are generally several (rarely one) rounded bodies of denser cytoplasm which are stained by a green pigment (chlorophyll).

Cells are the living units, and they produce other cells, and so increase the bulk of the plant. The usual method of the production of new cells is by the division of a cell into two. This is done by the cell itself, and in the process the granular matter of the nucleus (kinoplasm) divides itself very exactly into two equal portions, each of which becomes surrounded by its half of the clear nuclear matter (hyaloplasm); these equal parts of the nucleus now constitute two new nuclei, and each now draws around it its half of the cytoplasm. Thus there are now two cells

where there was but one, and these generally build up a partition wall between them.

**Histology** deals with the *tissues* as made up of different kinds of cells. Here a mass of similar cells constituting a portion of the plant substance is known as a tissue; accordingly tissues may be of as many kinds as there are kinds of cells. A convenient classification of tissues is as follows:

**Rudimentary Tissue** (meristem) consists of young, thin-walled cells which are still undergoing modification. It constitutes the bulk of all rapidly growing parts of plants.

**Soft Tissue** (parenchyma) consists of mature, thin-walled, usually short cells which have attained their growth, as the tissue of ripened fruits, the green tissue of leaves, etc.

**Thick-Walled Tissue** (collenchyma) consists of long prismatic cells with thin walls, but with the longitudinal angles much thickened. It occurs as a strengthening tissue just beneath the epidermis in many stems.

**Stone Tissue** (sclerenchyma) consists of thick-walled, usually short cells so tightly packed together that they form a hard mass, as in the shells of nuts; e. g., hickory nuts, walnut, filberts, etc., and in the "stones" of many fruits, as plums, cherries, etc.

**Fibrous Tissue** consists of thick-walled, elongated cells so tightly packed together that they make up the fibrous part of the wood (wood fibers) and bark (bark fibers) of the stems of most higher plants.

**Sieve Tissue** consists of elongated, usually large cells, more or less united into tubes, and having only slightly thickened walls. The name is given on account of the fact that the transverse partitions between the cells are perforated in a "sieve-like" pattern, and through these perforations the protoplasm connects from cell to cell. Sieve tissue occurs in the young bark.

**Tracheary Tissue**, like the preceding, is a tubular tissue, but here the continuity of the cavity is usually more complete. The walls are somewhat thickened, in rings, spirals, or reticulations. When young these tubes contain protoplasm, but eventually they contain air. Tracheary tissue occurs in the woody parts of stems and leaves.

**Milk Cells and Tubes** (lactiferous tissue) occur singly or in masses in many plants, and are easily recognized by their milky contents, as in the many kinds of milkweeds. The milk (latex) is often very poisonous, while more rarely it is wholesome. In some cases it contains caoutchouc, from which india rubber is manufactured.

**Morphology** deals with form as applied to the plant as a whole, or to corresponding parts. With respect to the latter it considers especially the correspondence and equivalence of parts of plants.

**Plant Body**.—Every kind of plant has a "body" of a more or less definite form. In every simple (primitive) plant the body is a single more or less rounded cell. There is the hint of root, stem or leaf. Plants a little higher are unbranched rows of nearly similar cells. Next the body is a row of cells differentiated into base and apex, the former rooting, the latter growing terminally. Branching simple rows rooted basally and growing terminally constitute a higher type.

A still higher type is seen where the

rows of cells are not simple, but consist of several parallel cells. From this structure, which is very common in aquatic plants, especially the red seaweeds, the step is an easy one to massive structures, as in the brown seaweeds and the flat plant bodies of many liverworts. Eventually the type of body characteristic of higher plants is reached, in which there are roots, stems, and leaves.

**Physiology** has to do with the activities of plants, particularly those that relate to nutrition, growth and reproduction.

**Absorption**.—In the nutrition of plants the first stage is that of absorption of food-matter, which includes the imbibition of water and the solutions held in it, and the absorption of various gases. Naturally those parts of the plant which are normally in contact with the water are those which absorb water, and in like manner those parts which are normally in contact with the air absorb gases, and it is pretty certain that this has come about as an adaptation of each part to its environment.

The method of absorption must be little more than a simple diffusion through the permeable membrane of the cell-wall. It is found that gases and watery substances are absorbed indiscriminately, and that the plant does not have any "power of selection." Thus the plant is supplied with everything gaseous or soluble with which it is in contact. If these are sufficient for its needs, and none is harmful, the plant may thrive, otherwise it will starve.

Ordinary higher plants in their development have accustomed themselves to many of the solutions in common soil, and apparently they are so habituated to these solutions that they languish without them. On the other hand there are solutions that are known to be quite essential; for example, those that contain nitrogen and phosphorus. The gases of importance to plants are carbon dioxide, and oxygen, both of which occur in sufficient quantities in ordinary air.

**Synthesis**.—The food matters absorbed are subjected to certain synthetic processes by which they are made more available for the plant at large. Thus some of the water and the carbon dioxide are broken up and recombined into carbohydrates of definite composition, which are then available for the use of growing cells.

This particular synthetic process, since it requires light for its accomplishment, is known as photosynthesis. It takes place only in the green cells of plants, and is thus the chief function of the leaves of higher plants. The product of this synthesis is usually a sugar, containing carbon, hydrogen and oxygen (commonly  $C_6H_{12}O_6$ ), which is commonly changed to starch ( $C_6H_{10}O_5$ ).

**Growth**.—The carbohydrates formed are sooner or later used as proper food for the cells, and here we may use the terms "digestion" for the earlier steps, and "assimilation" for the later steps. The result is that the cells are nourished and increased in substance. This increase in the substance of the cell due to the nourishment by carbohydrates is what we know as growth. Yet in ordinary growth there is usually another factor, namely, the forcible distension and enlargement of the cell by the imbibition of a great amount of water.

And so it is with the growth of tissues, each cell of which increases in substance by the assimilation of carbohydrates (mainly) and increases in size by the

distension due to its forcible imbibition of water. Along with this increase in substance and size in tissues there is usually an increase in the number of cells, by cell division as described.

The growth of organs and parts of plants is essentially like that of tissues, but here we have to do with more considerable masses of meristem cells in which cell division is the characteristic feature, especially in the earlier stages, and cell distension of the later stages.

**Water Loss**.—During the nutrition and growth of plants that grow partly or wholly in the air they are more or less constantly subject to a considerable loss of their water by evaporation, and unless there is a constant supply of water to counterbalance this loss such plants will dry up and die.

**Reproduction**.—All plants reproduce in some manner. Some merely break into fragments, each of which then grows into a new plant. This simple method is more common with lower, simpler plants, but that it still persists among some of even the higher plants is shown by the ease with which new plants may be grown from "cuttings."

Many lower plants regularly separate certain cells (spores) from particular portions of the plant body, and these on germination give rise to new plants. In many water plants such separated cells are motile by means of cilia, hence called zoospores. Such production of new plants is known as the asexual (nonsexual) reproduction.

In addition to the asexual modes of reproduction most plants reproduce sexually also. In its simplest form sexual reproduction consists of the union of two free-swimming similar zoospores (isogametes). The resulting cell sooner or later grows into a plant like that which gave rise to the isogametes. In passing upward we find successively free-swimming but unlike gametes (heterogametes), one free-swimming gamete (sperm), and one motionless gamete (egg); both gametes (sperms and eggs) motionless, and dependent upon other agencies for coming in contact with each other. The latter is the condition in the flowering plants.

Physiologically, sexual reproduction is a special activity of certain cells wherein two fuse into one, thus producing a new cell somewhat different from either. This in its growth produces a plant somewhat different from the plant or plants which produced the sexual cells. Sexual reproduction is thus a mode of growth. It is also a mode of variation.

**Pathology** considers the diseased or abnormal condition of plants. As physiology has to do with the normal, healthy activities of plants, so pathology has to do with abnormal activities. Diseased conditions of plants are due to many causes, which may be summarized as follows:

**Physical Injuries**, which may include all kinds of purely mechanical rupture, cutting or puncture of the tissues, due to wind, lightning, hail, or other violence, and the eating by insects, birds, and other animals. The mutilation by such agents interferes with the normal function of the plant. In this place may be named some of the injuries due to too low temperature (freezing) or too high a temperature (scalding) and probably also the scalding or scorching effect of too intense light.

**Errors of Nutrition** may include all cases where there is an insufficient amount of any or all of the food substances, in-

cluding water, solutions, gases, and the carbohydrates and other more complex nutrients. Here the word "starvation" may properly be used. When plants are supplied with too little light they suffer from starvation, there being a deficiency in carbohydrates. So also plants in too low a temperature are not able to make use of available food substances, and starvation is the result.

**Parasitic Injuries** may be due to the presence of living animals or plants in the tissues. Under the former the most notable are the nematodes, which are very minute thread-like worms, which seriously injure the parts of the plants that they infest. The nematode disease of sugar beets is a good example, as also the root-knot nematode disease of many different kinds of plants.

Of the plant parasites the most common are bacteria of several kinds which destroy the cells in certain tissues, as in apple blight; external fungi which injure young twigs and leaves, as the powdery mildews; internal fungi which grow through the tissues of stems and leaves, injuring or wholly destroying them, as in rusts, smuts leaf-spot diseases, fruit rots, etc.; flowering plant parasites, as the dodder, mistletoe, etc., which often attack plants and distort or destroy the stems, as clover dodder, pine mistletoe, etc. The number of known disease-producing parasites is very great, and the literature on the subject is very voluminous.

**Ecology** deals with the relations of plants to their environment. It has been recognized as a distinct part of botanical study for less than twenty years, and is still associated with physiology, of which it is an extension and development. It is sometimes spoken of as out-of-door physiology, and it certainly has led to a closer study of plants in their natural environment than had been the practice in ordinary plant physiology. How plants affect one another, how they come to occupy particular habitats, and how these affect the plants themselves, are among the more common inquiries made by the ecologist.

**Phytogeography**, or geographical botany, as it is more commonly called, includes all the inquiries that relate to the distribution of plants throughout the world. In its more local inquiries it is identical with ecology, but its scope is much broader in its world-wide application.

**Phylogeny and Taxonomy** deal respectively with the descent and consequently the relationship of plants, and their natural classification.

#### Outline of the Taxonomy of Plants.

Botanists are now somewhat acquainted with about 200,000 different kinds of plants, at least they have given names to that many and assigned them to their orders and families.

A careful consideration of this vast mass of plants enables us to recognize a dozen or more rather well-marked groups of related forms. These groups are regarded as the results of definite development along as many evolutionary lines and to these groups thus understood we now apply the name "phyla." So a phylum is a group of related plants, their relationship being due to the fact that they have had a common origin. Beginning with the lowest the phyla are as follows:

The **Blue-Greens** (*Myxophyceae*) are minute water plants of such simplicity of structure that we are warranted in giving them the lowest place in the vegetable kingdom. Their cells for the most part do

not have definite nuclei or chromatophores, and their walls are usually soft and more or less gelatinous. The color of the cells is never a bright green, but is blue-green, brown-green or smoky-green. They reproduce by fission, and the production of asexual spores, and there is no sexual reproduction whatever.

About 2,000 species are known, including many "bacteria" which are here regarded as blue-greens that have become heterophytic and as a consequence have lost their coloring matter.

The **Lower Green Algae** (*Protophyceae*) are also minute water plants, but their cells have well developed nuclei and chromatophores, and their walls are usually firm. Their color is a bright green, due to the presence of typical chlorophyll.

Like the preceding, these plants reproduce by fission, but in addition many of them form motile cells (ciliated zoospores) which swim away and eventually grow into new plants. Some of these zoospores fuse when two meet, the result being a new cell which then grows into a new plant, this process constituting a simple sexual act. There are above 1,100 species of the lower green algae now known. The lower members of the phylum are unicellular, but for the most part they are filamentous plants.

The **Pond Scums** (*Zygnophyceae*) are typically filamentous plants in which a marked sluggishness of habit has entered to such an extent as to have materially modified their structure. Although filamentous, the plants for the most part very easily break into segments, or single cells. Although related to zoospore-forming plants in the preceding phylum, they do not form zoospores, nor do they have free-swimming ciliated gametes; on the contrary the protoplasts of two contiguous cells sluggishly fuse together.

In the treatment here suggested the more filamentous forms are considered more primitive, and those in which the filaments segment early into single cells or short filaments of few cells are regarded as the later, or derived forms.

All told there are about 7,000 species of the pond scums and of these the diatoms include by far the greater number.

The **Tube Algae** (*Siphonophyceae*) show another peculiar modification of the filamentous structure found in the lower green algae, whereby the filaments instead of forming cross-walls to separate their cells are left partly or wholly tubular. In other respects the tube algae resemble the lower green algae, from which phylum they no doubt originated.

There are about 1,100 known species of tube algae.

The **Brown Algae** (*Phaeophyceae*) include plants ranging from small filaments to large massive plants many meters in length. They are peculiar in having a brown-green coloring matter instead of the bright green chlorophyll of ordinary plants. They are here regarded as a marine modification and development from the filamentous lower green algae.

The brown algae number somewhat more than 1,000 species.

The **Red Algae** (*Carpophyceae*) are green plants almost wholly marine, whose green color is mostly hidden by an additional red coloring matter which suffuses the protoplasm of the cells. The simpler species are filamentous and often very minute, but many of the higher species are large massive plants of a complex structure.

The red algae number about 3,200

species, by far the greater part of which are red or purple in color.

The **Fungi** (*Carpomycetaceae*).—Here are brought together a vast number of heterophytic plants, apparently related to the plants of the phylum just preceding, but which in becoming dependent have lost their green color, in addition to suffering many other changes.

**Structure.**—The plant body in all fungi is very simple (no doubt reduced), consisting of slender filaments which creep through the substance or the tissues upon which they feed. In most cases there is an asexual form of reproduction consisting of cells (conidia) that separate from the ends of certain filaments, and on germinating grow into new plants.

This phylum contains an enormous number of species, no less than 63,700 being enumerated in systematic works at the present time (1911), and every year hundreds of additional species are being identified and described.

The fungi may be summarily outlined as follows:

1. **Class Acosporae**, the sac fungi, including about fifteen orders and over one hundred families. Here we find the beetle fungi, the powdery mildews, black fungi, black lichens, script lichens, cup fungi, cup lichens, morels, tubers, etc.

2. **Class Teliosporae**, the rusts and smuts, including two orders and five families of excessively parasitic plants which live in the tissues of higher plants.

3. **Class Basidiomycetes**, the basidium fungi, including nine orders and twenty-two families. Here are found the subterranean fungi, stinkhorns, puff-balls, bird-nest fungi, toadstools and mushrooms, pore-fungi, bracket-fungi, shell-fungi, ear-fungi, jelly-fungi, etc., in all of which the structure which we see is the spore-fruit, while the plant itself is the webby mass of filaments from which the spore-fruit grew. Thus the toadstool, or any well-known umbrella-shaped structure, is the fruit of the minute filamentous plant growing beneath the surface.

The **Mosses** (*Bryophyta*) are green plants of a markedly higher degree of development than any of the preceding phyla. In them we have for the first time a distinct alternation of sexual and asexual generations in the round of life. Thus one generation produces the sperms (in antheridia) and eggs (in oogones) and the fertilized egg develops a second generation which does not produce sexual organs, but produces spores, and when the spores germinate they grow into sexual plants, and so on. The two generations are known in science as (a) the gametophyte, that is, the gamete-producing plant, (i. e., the sexual plant), and (b) the sporophyte, that is, the spore-producing plant, (i. e., the asexual plant).

There are all told somewhat more than 16,000 species of mosses.

1. **Class Hepaticae**, the liverworts, with mostly bilateral, often flattened, creeping gametophytes, and globose to elongated, mostly spiking sporophytes, usually with "claspers" mingled with the spores. Here are to be found the crystalworts, horned liverworts, great liverworts and scale-mosses.

2. **Class Musci**, the mosses, with multi-lateral, mostly erect, leafy-stemmed gametophytes, and more or less elongated, erect sporophytes, which usually delish by a large lid, and are without "claspers." There are more than fifty families of mosses, among which are species of pea:

mosses, cushion mosses, petioled mosses, bristle-stalk mosses, epheura mosses, wood mosses, hair-cap mosses, bumbleback mosses, tree mosses, bog mosses.

The Ferns (*Pteridophyta*) are much larger land plants than the mosses, to which they are closely allied. They show the same marked alternation of generations, but here the gametophyte is much smaller, sometimes in fact so small as to be actually microscopic, and in all cases it is much shorter lived than the sporophyte. The latter is early provided with roots and leaves, and so becomes quite independent of the gametophyte.

In common ferns the gametophyte is a small, flat, heart-shaped plant, a few millimeters in diameter, and growing attached to the moist soil by the hairs on its lower surface. It bears antheridia and archegones on its lower surface, and after the fertilisation of an egg in one of the latter, a leafy-stemmed and rooted plant (the sporophyte) develops. The fern as we see it is the sporophyte generation, and eventually it produces spores (in common ferns on the lower surfaces of the leaves) which on germination produce gametophytes again.

There are two great types of ferns, namely, the ancient and the modern, including all told somewhat more than 2,500 species.

The Calamites (*Calamophyta*) represent a phylum once very important but now almost extinct. In these plants the gametophyte is much like that of the ferns, while the sporophyte consists of cylindrical, jointed, often hollow stems, rooted below, and bearing narrow, whorled leaves above.

The spores of calamites are borne in whorled sporangia that compose terminal cones upon the stems. When they germinate they produce the small gametophytes referred to above.

There are only about twenty-four species of living calamites, all belonging to the genus *Equisetum* (horsetails).

The Lycopods (*Lepidophyta*) are represented to-day by about 900 species of small plants.

Here we find such living genera as *Lepidodendron* (club-mosses and ground-pines) and *Selaginella* (little club-mosses).

The Cycads (*Cycadophyta*), like the preceding, constitute a phylum from which many types have died out, and what we have left is a mere remnant of a much larger and much more diversified group. In this phylum the gametophytes are very small, so small in fact that they are made small with difficulty even with the aid of the compound microscope, while the sporophyte is large, massive and often of the dimensions of trees. This great difference between the gametophyte and sporophyte generations has obscured the alternation of generations, and this has been emphasised by the fact that the megaspore which gives rise to the archegonial gametophyte does not escape from the sporangium, but remains within it, developing its gametophyte within the sporangium. This retention of the megaspore is the most important step that has been taken in the evolution of this part of the vegetable kingdom, resulting as it does in the better nourishment and greater protection of the gametophyte. This retention of the megaspore necessarily results in the formation of the seed, which appears first in this phylum.

*Development of the Seed.*—The sporangia which produce the microspores are found

upon leaf-like structures (microsporophylls, or "stamens") and these are often aggregated into cones (staminate cones). In like manner the sporangia producing megaspores are on similar leaf-like structures (megasporophylls or "carpels"), and these again are often aggregated into cones (carpellary cones). Moreover, since the megasporangia are to retain the megaspores, they develop an external coat of protective tissue (the "seed coat"). When the megaspore is mature it at once develops a minute gametophyte in which several archegones are produced, each containing an egg. While this development is going on in the megasporangium, the microspore falls out from its sporangium and is carried by the wind to the summit of the young seed, where it germinates and produces a very simple, tubular, antheridial gametophyte, which in turn gives rise to two motile sperms, essentially like those in the preceding phyla.

Upon fertilisation of an egg by a sperm it grows and rapidly develops into a new plant (young sporophyte) within the protective coats, and a little later the megasporangium, with the embryo plant and the surrounding coat, ripens into a "seed." This falls to the ground, and upon the resumption of growth by the embryo the latter soon splits the seed-coat and escapes, sending its root into the ground and its little leaves into the air, and it is henceforth able to maintain itself independently.

There are four or five known classes of cycads, two of which are wholly extinct, and those remaining are mere remnants of larger groups. The living species number between 125 and 150.

The Conifers (*Strobilophyta*) are related to the cycads, but this is in many respects a more modern group. As in cycads so here the archegonial gametophyte is very small, and when it is included in the young seed. The antheridial gametophyte is tubular but the sperms are not motile. The development of the gametophytes and the fertilisation of the eggs and production of the seed are essentially the same in conifers as in cycads. The sporophyte of conifers is much branched, woody, and often developed into enormous trees; the leaves are never large, always simple, and are often narrow or even scale-like, and generally persistent (evergreen). The fact that the megasporophylls and microsporophylls are nearly always in cones (strobili) has given them their common name of "conifers."

About 500 species are known. The principal genera are *Taxodium* (the bald cypress), *Sequoia* (the redwoods), *Arucaria* and *Dammara* (the ancient pines), all of which have many extinct species; *Abies* (the firs), *Picea* (the spruces), *Pinus* (the pines), *Cupressus* (the cypresses), *Thuja* (the arbor vitae), and *Taxus* (the yew tree).

The Flowering Plants (*Anthophyta*) stand as the highest development reached in the vegetable kingdom. The particular structure which is characteristic of this phylum is the flower. This is a modification of the crude structures found in some ancient cycads, and now is typically composed of an axis on which are borne closed megasporophylls above, microsporophylls next lower, and below these one or more whorls of flower-leaves. More particularly, the megasporophylls are not open and more or less flat, as they are in preceding phyla, but as they grow their

edges come together and finally become attached so that the megasporangia are enclosed in the cavity so formed. This structure is known as a "pistil" in ordinary descriptive botany, and the megasporangia with their one or two coats are the young seeds ("ovules"). The microsporophylls (stamens) are much like those of the two preceding phyla, and the microspores themselves are known as "pollen." The flower leaves are typically two whorls, and then the inner whorl is usually more delicate and colored ("petals" composing the "corolla"), the outer whorl is typically of coarser texture and green ("sepals" composing the "calyx"). The principal modifications of the structure of the flower as here given will be indicated elsewhere.

*Fertilization of the Egg.*—The ovule develops as in the preceding phyla, but the archegonial gametophyte is delayed and the egg advanced in the sequence of changes, so that the gametophyte is still quite immature when the egg is ready for fertilization, and it is only after fertilization that it completes its development (as the "endosperm" of the seed). Fertilization is effected as follows: The microspore (pollen) falls upon a particular portion of the external surface of the pistil (the "stigma") and there develops a very simple tubular gametophyte which penetrates the soft stigmatic tissues in the direction of the ovule, which it eventually reaches and penetrates.

In the end of the tube there are now two motile sperm, one of which is passed through to the egg. After fusion of sperm and egg the resultant cell (zygote) divides and subdivides until a new plant is formed. At the same time the development of the belated gametophyte (endosperm) is resumed, the ovule tissues become less watery, the seed coat hardens, and the result is the mature seed.

*Number of Species.*—The flowering plants include an immense number of species, the number now known considerably exceeding 100,000, and with the additions of new species which are constantly being made it is safe to say that the number will eventually reach fully 120,000.

In the development of this vast number some marked modifications of structure have taken place, and these rightly understood give us a clew to the mode and sequence of the evolution, and since taxonomy must follow phylogeny, we have here the key to the classification of these plants.

While it is probable that the embryo plant in the seed of primitive flowering plants had two opposite leaf rudiments, (cotyledons) and hence were dicotyledonous, an early modification appeared in which the embryo had but one leaf rudiment, being monocotyledonous, and this has been adhered to in a group (the monocotyledons) which includes about one-fifth of all the flowering plants.

These may be briefly arranged as follows: The *Monocotyledons* (class *Monocotyledoneae*) have a single cotyledon, alternate leaves which are parallel-veined, and the fibrovascular bundles of their stems are scattered. There are seven or eight orders and nearly fifty families, beginning with the water plantains and their relatives, *Alisma* (water plantain), *Butomus*, *Potamogeton*, etc., in which the pistils are normally three and separate and the other parts of the flower separate also and normally in whorls of three each.

In the lilies the pistils have been reduced to three and these have fused into a single

structure (compound pistil), while the stamens have been reduced to six or three, and the petals and sepals are of three each.

In this central group of the monocotyledons are found such genera as *Lilium* (lily), *Tulipa* (tulip), *Gagea*, *Yucca*, *Asparagus*, *Allium* (onions), *Tradescantia*, *Juncus*, etc.

From the lilies have come at least five other orders by as many modifications of the lily structure. These are the calla lilies, with their crowded, soft, small, lily-like flowers and thick succulent stems and leaves, including *Calla*, *Caladium*, *Calceola*, *Arisaema* (Indian turnip), *Symplocarpus*, *Acorus*, etc., and the reduced duckwoods (*Lemma*).

Next to these are the palms, with small, firm, lily-like flowers and strong, stiff, spreading leaves upon the summit of woody trunks. Here are the date palms (*Phoenix*), cocoanuts (*Coccos*), palmettos (*Sabal*), royal palm (*Oreodoxa*), rattan palm (*Calamus*), etc.

Then come the grasses, with their stiff, leafy stems, and reduced, chaffy flowers of the lily type, including also the sedges with three-ranked leaves and three-angled stems, *Cyperus*, *Scirpus* (rushes), *Carex*, etc. The genuine grasses have two-ranked leaves, borne upon rounded stems.

The genera may be grouped into about a dozen tribes—viz., the bamboos (*Bambusa*), fescues (*Festuca*, *Bromus*, *Poa*, etc.), oats (*Avena*), wheats (*Triticum*, *Hordeum*, *Secale*), grammas (*Bouteloua*, *Buchloe*), red tops (*Agrostis*, *Sporobolus*), canary grasses (*Phalaris*), rice (*Oryza*), panic grasses (*Panicum*, *Setaria*), canes (*Sorghum*, *Saccharum*, *Andropogon*), maize grasses (*Zea*).

In all the foregoing the pistils, whether simple or compound, stand at the summit of the flower axis and are not overgrown or inclosed by any of the other parts of the flower, or the petals or sepals (pistil superior), but in the three following orders such overgrowth has taken place and the pistil is said to be "inferior."

The waterworts (*Hydrals*) include a few water plants, as *Yaltemeria*, *Hydrocharis*, etc.

The lilies include terrestrial, mostly erect plants, with regular and often showy flowers (*Amaryllis*, *Narcissus*, *Agave*, *Iris*, *Ananas* (pineapple), *Musa* (banana), *Zingiber* (ginger), *Conna*).

From this latter order, by the development of "irregularity" in the flower, came the orchids with their odd-shaped flowers adapted to secure the help of insects in the carrying of pollen from flower to flower. Here are *Cypripedium* (lady's slipper), *Orchis*, *Epipactis*, *Vanilla*, *Spiranthes*, etc.

The *Dicotyledons* (class *Dicotyledonae*) have two opposite cotyledons, opposite or alternate leaves which are reticulate veined, and the fibrovascular bundles are arranged in concentric layers in the stem.

The number of species of dicotyledons is probably about four times that of the monocotyledons, and accordingly we find more numerous and much greater modifications of structure in this class, and while the dicotyledons probably appeared earlier in time than the monocotyledons, it is true also that they have attained a higher development. In fact, when we consider the flowering plants as a whole, we are led to the conclusion that the dicotyledons are the typical flowering plants, and that the monocotyledons constitute a nontypical and much less important modification.

The flower of primitive dicotyledons consists of an axis bearing on its terminal portion a considerable number of pistils; below these are whorls of stamens, and still below these the whorls of flower leaves (petals and sepals). Such a flower structure is found in the buttercup and their relatives. From this point of beginning, development has progressed along two main lines, culminating in one case in the mints and in the other in the sunflowers and the dandelions.

**First Line.**—In the buttercup-mint line there are about fourteen orders and 145 families. The more important orders are as follows:

The buttercups (*Ranales*), with all of the flower parts typically free and distinct from one another. Here are such genera as *Myosurus*, *Ranunculus* (buttercups), *Anemone*, *Magnolia*, *Anisima*, *Berberis*, *Nymphaea* (water lilies), etc.

The crucifers (*Rhales*), with the carpels mostly two, and united, as in *Sanguinaria*, *Papaver* (poppy), *Sinapis*, *Brassica* (mustard), *Raphanus* (radish), *Keiske* (mignonette), etc.

The pitcher plants (*Sarraceniales*), *Sarracenia*, *Nepenthes*.

The pinks (*Caryophyllales*), with pistil of three or more united carpels, the petals separate and free, as in *Dianthus* (carnations), *Lycnis*, *Tamarix*, *Salix* (willow), *Populus*, *Portulaca*, *Amaranthus*, *Chenopodium*, *Polypodium*.

The geraniums (*Geraniales*), as in *Geranium* *Oxalis*, *Linum* (flax), *Ruta*, *Citrus* (orange), *Euphorbia*.

The guttifers (*Guttiferales*), as in *Thea* (tea), *Viola*, *Pasiflora*.

The mallows (*Malvales*), as in *Tilia* (linden), *Malva*, *Gossypium* (cotton), *Ulmus* (elm), *Morus*, *Ficus*, *Urtica*, in all of which the petals are free and distinct from one another.

In the following the petals are united (gamopetalous) and there is a gradual reduction in the number of carpels in the compound pistil. The primroses (*Primulales*), as in *Primula* *Dodecatheon*, *Plantago*. The heaths (*Ericales*), as in *Rhododendron*, *Kalmia* *Erica*, *Pirola* *Monotropa*.

The ebony (*Ebenales*), as in *Achras*, *Diospyros* (persimmon), *Styrax*.

The phloxes (*Polemoniales*), as in *Gilia*, *Phlox*, *Convolvulus* (morning glories), *Solanum*, *Capiscum*, *Datura*.

The gentians (*Gentianales*), as in *Olea* (olive), *Fragaria* (ash), *Gentiana*, *Asclepias*. The figworts (*Scrophulariales*), as in *Verbena*, *Gerardia*, *Catalpa*, *Orobancha*, *Utricularia*, *Acanthus*.

The mints (*Lamiales*), as in *Verbena*, *Nepeta*, *Lamium*, *Salvia* (sage), *Mentha* (mint).

These plants are at the summit of this line, and represent the highest development attained by plants with gamopetalous flowers whose pistils are superior.

**Second Line.**—In the rose-sunflower line there are about nine orders and eighty-nine families, the general sequence of which is as follows:

The roses (*Rosales*) are very much like the buttercup, having usually a considerable number of simple pistils, many stamens, and petals and sepals not united. The flower axis has a disk-shaped enlargement at its base, and this appears to be the dominant structure of this line. Here are such genera as *Potentilla*, *Fragaria* (strawberry), *Spiraea*, *Rosa*, *Pirus* (apple), *Prunus*, *Mimosa*, *Gleditsia*, *Trifolium*, *Medicago*, *Vicia*, *Pisum* (pea), *Saxifraga*, *Ribes*, *Crassula*, *Plantago*.

The myrtles (*Myrtiales*) have overgrown the compound pistil by the cup-shaped disk, as in *Myrtus*, *Jambosa* (clove), *Eucalyptus*, *Oenothera*, *Fuchsia*.

The cactuses (*Cactales*) have, in addition to myrtle-like flowers, a leafless, fleshy plant body, as in *Opuntia*, *Cereus*, *Cactus*, *Melocactus*, etc.

The loasas (*Loasales*) include such genera with inferior pistils as *Mentzelia*, *Cucurbita* (pumpkins), *Cucumis* (melons), *Citrullus*, *Begonia*.

The buckthorns (*Celastrales*) include *Rhamnus*, *Vitis* (grapes), *Celastrus*, *Ilex* (holly), *Elaeagnus*, *Viscum* (mistletoe), etc.

The horse-custards (*Sapindales*), which include a series of trees with more and more simplified flowers, from *Esculus*, *Acer* (maple) and *Rhus*, to *Juglans* (walnuts), *Betula* (birch), *Corylus*, *Fagus* (beech), *Castanea* (chestnuts), and *Quercus* (oaks).

The umbellifers (*Umbellales*), in which the mostly bicarpellary two-celled pistil is wholly inferior by the adhesion of the disk, and the five stamens and five petals are distinct, while the sepals are small. Here we find *Aralia*, *Hedera* (ivy), *Coriandrum*, *Conium*, *Cicuta*, *Pastinaca*, *Daucus* (carrot), *Cornus*, etc.

The madderworts (*Rubiales*), with the general structure of the umbellifers but with the petals united (gamopetalous), represented by *Galium*, *Coffea*, *Chinchona*, *Sambucus*, *Lonicera* (honeysuckle), etc.

The sunflowers (*Asterales*), with small flowers, mostly crowded into heads, the pistil typically bicarpellary but mostly one-seeded and one-celled, the corolla tubular and the calyx reduced to chaff or bristles (pappus) or entirely wanting. Here at the summit of the vegetable kingdom are found the bellworts (*Campanula*) and lobelias (*Lobelia*) and also a vast number of "composites," of which more than 13,000 species are now known. These represent the highest development to be found anywhere in the vegetable kingdom.

The sunflowers proper (species of *Helianthus*) are to be regarded as representing the lower or primitive composites, from which have come the ragweds (*Ambrosia*), as well as the asters (*Aster*) and golden-rods (*Solidago*) and ironweeds (*Veronica*) on the one hand, and the chrysanthemums (*Chrysanthemum*), groundels (*Senecio*), Arnica, thistles (*Cnicus*), the chicories (*Cichorium*), the lettuce (*Lactuca*) and the dandelions (*Taraxacum*).

The last-named genus is on many accounts to be regarded as the highest in this group, and as a consequence, in the vegetable kingdom.

**Bibliography of Botany.**—Only the most important works are here enumerated.

**CHEMISTRY** is that science which is largely concerned with a study of the different species of matter and of the changes from one species to another. When iron rusts, or when charcoal burns, the products of these chemical changes are species of matter that are different from the original iron or charcoal. The different species or kinds of matter are called *substances*. Granite, and also gunpowder, are mixtures of at least three different substances.

Substances are recognized and identified often by their *physical properties*, such as color, density, boiling point, melting point, and solubility. They can also be recognized by their *chemical properties*, such as combustibility, ease of rusting, or, generally, their *chemical reactions* or behavior toward other substances chosen to test them with.

**Pure Substances.**—In studying the different kinds of matter (different substances), such as iron, charcoal, salt, sugar, or niter, it is necessary to first prepare them in a pure state. To do this the chemist uses various processes. In *filtration* the insoluble solid matter is retained by a piece of unglazed filter-paper, while the liquid passes through the paper and is collected as the *filtrate*. Instead of filter paper, unglazed earthenware may be used to filter drinking water. The pores in this are so small (in Pasteur filters) that even the minute microbes, some of which cause disease, cannot pass through.

In *distillation* a liquid, by raising its temperature, is converted into gas and is so separated from any substances that accompany it which are less volatile, i. e., less easily gasified. In this way, for example, pure drinking water may be obtained on board ship from sea water, which contains difficultly volatile salts, including common salt, dissolved in it. The gaseous water (steam) is condensed to water again by passage through a cooling tube. It should be noticed that the changes from water into steam and vice versa are classed as *physical changes*, because analysis shows that steam and water consist of the same substance differing only in state, steam being in the gaseous state, water in the liquid, and ice in the solid state.

*Sublimation* refers to the distillation of solids. Sal-ammoniac, benzoic acid, etc., are purified by sublimation. *Lixivation* and *leaching* refer to the dissolving out of a soluble substance from its admixture with an insoluble substance.

**Physical Properties.**—The substance having been obtained in a pure state, a study may be made of its properties. Purity is extremely important; and chemists and

physicists alike have in the past often wasted years of their lives in studying substances that were seriously impure and that could not, therefore, be expected to yield constant results.

**Solubility.**—Among physical properties, solubility is one of the most important to the chemist. Liquids dissolve solids, other liquids, and also gases. If common salt be added to water, it dissolves, and, after stirring, the solution is said to be homogeneous because all samples, wherever taken, prove to be identical. Water is here the *solvent* and salt the *solute*. If more and more salt be added by degrees, the temperature remaining constant, a stage is finally reached at which the solution will take up no more salt. The solution is then said to be *saturated*, at that temperature, with common salt.

Its *concentration* may be stated in any one of three ways: (1) weight of salt contained in such a volume of the solvent; (2) weight of salt contained in such a weight of the solution; (3) weight of salt contained in such a volume of the solution. When the temperature is raised it is found that the solution can take up more salt. Tables of solubilities state the concentration of the saturated solution at a series of different temperatures. It is by making use of their differences in solubility that intimate mixtures of different solids can be separated into their components; for instance, radium bromide is separated from barium bromide by repeated *fractional crystallization*.

Most, but not all, solids are more soluble at higher temperatures than at lower. All substances seem to be slightly soluble in water, although in some cases the saturated solution is an exceedingly dilute one.

That gases dissolve in water is known to every one who has examined *soda-water*, which contains the gas carbon dioxide in solution. If the gas is under pressure, the weight of it that the solvent will dissolve is proportional to the pressure (Henry's law). Since *soda-water* is aerated at several atmospheres' pressure, a portion of the gas tends to escape when the pressure is released. Gases are less soluble the higher the temperature, and can often, though not always, be completely removed by boiling the solvent. By ten minutes' boiling, for example, the gases dissolved from the air by ordinary water may be removed and the water thus rendered flat or insipid to the taste.

**Molecular Hypothesis.**—In studying the physical properties of substances there is a hypothesis as to the structure of matter—the kinetic-molecular hypothesis—that has proved particularly illuminative. On this hypothesis each substance is supposed to be built up of minute particles of its own material called *molecules*, all alike and each incapable of finer subdivision if the substance is to remain the same. In the gaseous state of the substance the molecules are at distances apart that are great in comparison with their own diameter, and are moving about in straight lines with great speed, each occasionally colliding with some other molecule or with the walls of the vessel. The miniature bombardment of the walls of the vessel by myriads of molecules is the cause of the pressure of the gas on the walls.

**Boyle's Law.**—In agreement with this conception is the well-known fact that if a gas be compressed to  $\frac{1}{2}$  times its original volume, then its pressure is increased n-fold. For,

plainly, the molecules, and therefore their impacts, will now be n-times as many as before. It is also a well-known fact of experiment that the pressure of an inclosed volume of gas varies directly as its absolute temperature, i. e., its temperature measured from the absolute zero, which is  $-273^{\circ}\text{C}$ . This is accounted for by considering that the speed of motion of the molecules is increased as the temperature rises, and that the impacts of the molecules are therefore stronger. It is indeed strange that gases should all be precisely alike in conforming to these two laws, for in the case of solids and of liquids the behavior toward pressure and toward change of temperature is different for each substance. Gases must, therefore, all have something in common which liquids and solids have not.

It seems certain that all gases contain, at like temperature and pressure, the same number of molecules in equal volumes. Since this is so, by weighing equal volumes of different gases the relative weights of their molecules can at once be found. The *molecular weights*, compared with the weight of a molecule of oxygen taken as 32, of gases, or of gasifiable substances, are determined in this way.

**Vapor Pressure.**—In the case of liquids, the crowding together of the molecules is much closer than in gases. If a gas be at a temperature lower than its *critical temperature*, however, it may always be compressed into a liquid. From the surface of a liquid, supposed to be placed, for example, in an empty closed vessel, some of the molecules are constantly escaping into the upper part of the vessel, where they behave like gas molecules, giving rise to a (gaseous) pressure there, known as the *vapor pressure* of the liquid. Some of the vapor are constantly returning to the liquid, because of the course of their wanderings, but their places are taken by newcomers from the liquid. The vapor pressure, therefore, remains constant at any temperature. If the temperature is raised, this vapor pressure increases. For this reason, water in such a vessel, if raised sufficiently in temperature, might finally "burst its boiler."

**Chemical Analysis.**—The chemical properties of pure substances may be studied by testing by experiments their behavior under different conditions, both alone and toward other substances. In particular it may be discovered, for example, that red lead can be made to furnish the metal lead and the gas oxygen. The processes of finding out what substances or mixtures of substances are made up of are called *chemical analysis*.

**Qualitative Analysis** concerns itself with the kinds of matter present, and *quantitative analysis* with the proportions by weight or by volume in which they are present. It has been found that all substances are made up from only about eighty-two different kinds of matter, called *elements*, combined in different ways. These elements are, for example, carbon, hydrogen, oxygen, nitrogen, sulfur, phosphorus, iron, calcium, etc. Some compounds are so different, each contains only the three elements, carbon, hydrogen, and oxygen in different proportions. All compounds containing only oxygen in combination with one other element are called *oxides*, as calcium oxide (quicklime), lead oxide (litharge). Those compounds containing chlorine in combination with one other element are chlorides, as sodium chloride (common salt), etc. In general, compounds with the termination *ide* contain only the elements named. Those, whose names end in *ite* contain, besides oxygen, as sodium chlorite; those ending

in *etc* more oxygen still, as sodium chlorate, while sodium perchlorate contains still more oxygen than sodium chlorate. The majority of the elements are metallic elements (metals), while only about fourteen are nonmetallic elements (carbon, hydrogen, oxygen, nitrogen, sulphur, phosphorus, chlorine, silicon, *etc.*).

**Quantitative Analysis** has brought out many of the most remarkable facts of chemistry that were entirely missed by the chemists of antiquity and of the middle ages. It is found, by weighing, that no matter *case* be destroyed, although one compound may be changed into another. This principle is called the *conservation of matter*. A candle appears to burn to nothing merely because its products of combustion happen to be invisible. If it be allowed to burn in a large closed vessel, there is just as much carbon in the vessel after as before the burning, although it is now in the form of a gas (carbon dioxide) instead of combined as a solid compound with hydrogen.

Quantitative analysis of different samples of the same pure substance brings out the fact that the composition of every pure substance is invariably the same, or, in other words, that the elements combine in definite proportions by weight to form each particular compound. This observed regularity is known as the *law of definite proportions*. By analysis of different compounds made of the same elements, A and B, it is found, further, that the weights of B, which, in the different compounds, are united with the same weight of A, are related to each other in the ratio of small integers. This could not have been anticipated, and, when found, calls for explanation. The accepted explanation is most concrete in terms of the atomic theory.

The **Atomic Theory** supposes that the molecules of every compound are built up of units, called atoms, of the elements that are present, and that all the atoms of any one element are identical in material and weight. Thus, a water molecule consists of molecules each of which contains two atoms of the element hydrogen combined with one atom of the element oxygen. Symbols are given each element to stand for the weight of its atom compared to the weight of an atom of oxygen, which is taken as 16 (for arbitrary reasons of convenience). The formula for a molecule of water is thus  $H_2O$ , signifying that one atomic weight of oxygen (16 parts by weight) is combined with two atomic weights ( $2 \times 1 = 2$  parts by weight) of hydrogen. The formula for hydrogen peroxide is  $H_2O_2$ .

It will be seen upon reflection that this atomic hypothesis accounts perfectly for the experimentally found law of multiple proportions referred to above, as well as for the observed fact (*law of combining weights*) that the proportions by weight in which elements combine to form compounds can always be expressed perfectly by (usually) small integral multiples of particular numbers, one number belonging to each element.

**Combustion.**—A Christmas candle will burn less than ten seconds is half a pint of air. A kerosene lamp with a good Rochester burner will burn not more than four minutes in an empty flour barrel if tightly covered. The burning of the wax or the oil consumes a portion of the oxygen which constitutes one-fifth of the air, and they cease to burn when one-quarter of the oxygen, or one-twentieth of the air,

is used up. Air which contains not more than 15 per cent oxygen will extinguish a fire; it will also extinguish life. Hence a lantern is lowered into old wells to determine whether it would be safe for a man to descend into them. The air which comes from one's lungs is very nearly like that left in the barrel after the lamp had extinguished itself in it. A bottleful of air from the lungs will extinguish a candle flame.

**Formation of Compounds.**—Fuels in burning unite with the oxygen of the air, forming new compounds. For example, when we burn in an ordinary furnace fifteen tons of coal, the furnace consumes also about thirty-two tons of oxygen from the air, and pours out into the air about forty-four tons of carbon dioxide gas, leaving behind about three tons of ashes. These figures, although not exact, are intended to convey two ideas—first, that combustion is a union of oxygen with fuels; and, second, that the process neither destroys nor creates matter, but merely changes combinations of matter. The oxygen is quite as much fuel as the coal.

In the case of the coal, the kerosene or the candle, water vapor is produced as a product of combustion along with the carbon dioxide. This water vapor is noticed when a cool chimney is first put upon a kerosene lamp.

**Fuels and Foods.**—Our foods correspond to fuels and we take in also oxygen as a food, or fuel. By a process analogous to combustion we cause oxygen to unite with these foods, producing water vapor, carbon dioxide, and heat for our bodies.

When a bottle of pure oxygen is placed over a burning candle the candle of course burns brighter and longer than it would in a bottle of air, but goes out before all the oxygen is exhausted. The contents of the bottle will now act as a fire extinguisher, although it contains as much oxygen as ever. Part of the oxygen is now bound in chemical union with carbon in the candle, and the oxygen which is free does not constitute a sufficiently large portion of the whole to support combustion.

**Rust.**—As might be expected, many things burn vigorously in pure oxygen which burn but slowly or not at all in the air, since the air is greatly diluted oxygen. A thin strip of iron may be burned with great vigor in pure oxygen. The black substance which will be found on the bottom of the bottle after the close of this experiment is analogous iron rust. It weighs considerably more than the iron which was burned and the increase in weight represents the oxygen which was burned. Combustion and rusting differ only in the rapidity of the action. Combustion is rapid rusting, and rusting is slow combustion. Both are called oxidation and the products are called oxides. The oxidation of our foods in our bodies is slow—more like rusting than combustion. We cover iron with various things to prevent the oxygen of the air from rusting it. It is covered with tin in the tinware of the kitchen, with zinc in the case of "galvanized" iron, with a slick, with porcelain, with paint, with grease, with vasoline, *etc.*

**Extinguishing Fires.**—In fighting a fire at its start, the one thing to do is to make the fire smother itself. An ordinary living room does not contain oxygen enough to burn up five pounds of wood. If the doors and windows are closed perfectly tight, a fire burning in a pile of dry kindlings in such a room will smolder for a time and

finally go out precisely as does the candle burning in a bottle.

Most fire extinguishers are devices for producing carbon dioxide gas. With this they smother small fires by pouring into the atmosphere around them enough of the gas to reduce the proportion of oxygen below 15 per cent.

Streams of water, when thrown in sufficient quantity, as by fire engines, extinguish large fires both by cooling the fuel and by diluting the air with steam until the proportion of oxygen falls below 15 per cent.

**Atomic Weight.**—The choice of atomic weights is a matter of some little complexity. The atomic weight of an element is defined to be the smallest of the weights of the element found in the molecular weights of all its volatile compounds. To pick out the correct atomic weight for the element chlorine, for instance, the molecular weights of all the volatile compounds of chlorine must first be found. Next, to find out what part of the molecular weight of each compound is due to chlorine, each of the compounds must be analyzed. Thus a series of analyses is arrived at which might read as follows: 41, 100.5, 71, 35.5, 142, 35.5, 71, *etc.* From this it is seen that the smallest weight of chlorine occurring in any of these compounds is, on the scale used, 35.5. Since no compound is found to contain in its molecular weight a smaller weight of chlorine than this, 35.5 is adopted as the molecular weight of chlorine. It should be noted that the formula for the gas chlorine is  $Cl_2$ , because its molecular weight is found by experiment to be 71, and must therefore contain two atomic weights of chlorine.

The case is more difficult when we have to deal with an element that forms few volatile compounds. In such cases, we are aided by a regularity, or law, first observed by the French chemists Dulong and Petit in 1819, that the numerical product of the atomic weight of an element by its specific heat is usually close to 6.3. When in doubt between several plausible values for the atomic weight of an element, we may, therefore, settle the question by determining its specific heat and then selecting for atomic weight that value which will yield a product near to 6.3 when multiplied by the specific heat observed.

**Valence.**—If one examines the formulas for a number of different chlorides, as  $NaCl$ ,  $MgCl_2$ ,  $AlCl_3$ ,  $CCl_4$ ,  $PCl_5$ , it is evident that the atoms of sodium, magnesium, *etc.*, seem to differ in their power of holding chlorine atoms. Sodium, as also chlorine, is said to have a valence one; magnesium two; aluminum three; carbon four; and phosphorus five. The valence of oxygen is two, and the formulas for the oxides corresponding to the above chlorides are  $Na_2O$ ,  $MgO$ ,  $Al_2O_3$ ,  $CO_2$ ,  $P_2O_5$ . Thus two atoms of aluminum with their total of six valence "bonds" are found united with three atoms of oxygen, which also have, in all, six valence bonds. Many elements can function, under different conditions, with two or even more valences; thus iron in one series of compounds is dyad or bivalent, as in  $FeCl_2$ ,  $FeO$ , *etc.*; and in another series triad or trivalent, as in  $FeCl_3$ ,  $Fe_2O_3$ , *etc.* Phosphorus is triad in  $PCl_3$ , but pentad in  $PCl_5$ .

**Graphic Formulas.**—There are often good reasons for assigning certain arrangements of the atoms within the molecule. This

arrangement is expressed graphically in

acetic acid, the simple formula for which is  $\text{C}_2\text{H}_4\text{O}_2$ .

**Space Formulae.**—Pasteur was the first to study certain pairs of substances whose molecules contain atoms of precisely the same elements arranged precisely similarly, but with only this difference, that the molecules of the two "enantiomorphous" substances are related to each other as a right-hand glove is to a left-hand glove, or as an object is to its mirror-image. Such molecular arrangements can be imitated accurately by models in space of three dimensions.

**Reactions.**—Chemical reactions are represented by means of equations. Thus, the fact that 66 parts of iron will unite with 32 parts of sulphur to produce 88 parts of ferrous sulphide is written  $\text{Fe} + \text{S} = \text{FeS}$ . Again the equation  $4\text{Al} + 3\text{O}_2 = 2\text{Al}_2\text{O}_3$  indicates, if the atomic weights be known, the respective weights of aluminium and of oxygen that react to form a certain weight of aluminium oxide. This is a case of simple combination.

A more complex reaction, which takes place in solution, is shown by the equation  $\text{AgNO}_3 + \text{NaCl} = \text{AgCl} + \text{NaNO}_3$ , where we find the four "radicals"  $\text{Ag}$ ,  $\text{NO}_3$ ,  $\text{Na}$  and  $\text{Cl}$  exchanging partners. Such a change is called a *double decomposition*. A group of atoms such as  $\text{NO}_3$  that remain together throughout a series of reactions is called a *compound radical*.

Radicals are classified into *positive* and *negative* radicals. In the above example,  $\text{Ag}$  and  $\text{Na}$  are each positive, while  $\text{Cl}$  and  $\text{NO}_3$  are negative radicals. A compound containing both kinds of radicals is a *salt*—for example, silver nitrate, silver chloride, sodium nitrate, sodium chloride.

Those salts that have hydrogen for their positive radical are called *acids*, and their solutions have a sour taste and turn the blue coloring matter litmus red. Those salts that have the group  $\text{OH}$  for their negative radical are *bases*, and their solutions have a soapy taste and feel, and turn red litmus blue; for example, sodium hydroxide. When an acid is mixed with a base in solution, the radicals  $\text{H}$  and  $\text{OH}$  combine to form water  $\text{HOH}$ , and the remaining positive and negative radicals, on uniting, constitute a salt. If the resulting solution has no action on litmus, the acid and base have "neutralized" each other.

Salts may also be formed in the dry way by the union of an "acidic oxide" such as carbonic anhydride with a "basic oxide" such as calcium oxide,  $\text{CO}_2 + \text{CaO} = \text{CaCO}_3$ . The oxides of the nonmetals are acidic, while the lower oxides of the metals are basic. The higher oxides of the metals, *i. e.*, those with more oxygen, are frequently acidic. An acidic oxide yields an acid when it combines with water, while a basic oxide yields a base.

Besides involving changes from one form of matter to another, all chemical reactions are accompanied by some energy change. Heat, light, mechanical or electrical energy may be produced or consumed. The corresponding branches of chemistry that deal with such energy changes are *thermochemistry*, *electrochemistry*, *photochemistry*, etc.

**Thermochemistry.**—(1.) If the parts taken be grams, the above mentioned reaction

between aluminium and oxygen gives rise to 760,400 calories of heat. This is expressed by the thermochemical equation  $4\text{Al} + 3\text{O}_2 = 2\text{Al}_2\text{O}_3 + 760,400\text{cal}$ . This particular reaction has been chosen as an example because of its technical importance. Few other metals in combining with oxygen produce nearly so much heat as aluminium. Thus, for the burning of iron the thermochemical equation is  $4\text{Fe} + 3\text{O}_2 = 2\text{Fe}_2\text{O}_3 + 388,800\text{cal}$ . Now if aluminium filings are mixed with iron oxide and the mixture ignited, the aluminium deprives the iron of its oxygen, as shown by the equation  $2\text{Al} + \text{Fe}_2\text{O}_3 = \text{Al}_2\text{O}_3 + 2\text{Fe} + 185,800\text{cal}$ , and the amount of heat liberated is the difference between the heat supplied by the combination of aluminium with oxygen and that consumed in the decomposition of the iron oxide, *etc.*,  $(760,400 - 388,800) + 2 = 185,800$ . Since the materials are in close admixture, the reaction proceeds rapidly, and, as no volatile products are formed, no heat is thus carried away. A very high temperature is produced and may be utilized for welding rails, etc. (Goldschmidt process).

(2.) It is sometimes necessary, on the other hand, to produce a very high temperature before a chemical action will take place. In addition to the ordinary types of furnaces, electric furnaces have latterly been used for this purpose, their exceedingly high temperatures rendering possible the manufacture on a commercial scale of calcium carbide, carborundum, silicon, "electrical steel," artificial graphite, etc., thus giving rise to many industries which were not dreamed of before the advent of this type of furnace.

**Electrochemistry.**—A study of chemical reactions in their relations to electrical energy has developed enormously within the last twenty years.

(1.) Many chemical reactions may be so conducted as to furnish a supply of electricity. Such reactions are allowed to take place in primary batteries, *e. g.*, in the Daniell cell, Leclanché cells, and in a secondary cell, such as a lead accumulator, a chemical action is caused to take place by putting in electrical energy from the dynamo. When this reaction is complete, the cell is "charged"; and whenever the reaction is allowed to reverse itself, electricity will be given out.

(2.) There are many reactions which can be made to occur by the use of electrical energy. For example, salts, whether fused or in solution, may be decomposed by electrolysis. Thus gold, silver, nickel, copper, etc., may be deposited from solution of their salts (*q. d.* gold, etc., plating, electrotyping, etc.). Solution of common salt may yield on electrolysis sodium hydroxide, chlorine, sodium hypochlorite and sodium chlorate, all valuable products. Copper is refined electrolytically. The metals sodium, potassium, magnesium, calcium, aluminium, etc., are produced commercially by electrolysis of their molten compounds.

Electrical energy may also be used to produce electric discharges in which such actions as the making of ozone, nitrogen peroxide (and hence nitric acid) may be caused to take place. The latter application may prove of vast importance in the near future, when the world's supply of Chili saltpeter ( $\text{NaNO}_3$ ), upon which, as a nitrogenous nutrient, the wheat supply in particular depends, is exhausted.

**Photochemistry** finds its chief application in the field of photography. The efficiency of various mixtures of the earths

ceria and thorium in incandescent gas mantles, or of titanium carbide as a substitute for the carbons of arc-lamps, are really questions of physics, but have obviously a close connection with chemistry. **Physical Chemistry** includes besides the three branches just referred to that deal with the energy changes accompanying chemical reactions, the study of many other topics that are closely related to physics. This side of chemistry has developed in a quite phenomenal degree since the year 1887, in which the ionic theory was first propounded.

**Ionic Theory.**—According to the ionic theory, when salts are dissolved in water they are largely split up into their radicals, which are then present in the solution carrying electric charges. These charged radicals are called ions. Thus, the ions furnished by common salt in solution are  $\text{Na}^+$  and  $\text{Cl}^-$ , where the positive and negative charges on the ions are indicated by a '+' and a '-' respectively.

In a solution containing 58 grams of common salt per liter, 68 per cent of the molecules of sodium chloride are considered to be ionized, while the remaining 32 per cent remain in the form of unbroken molecules. It must be remembered that the ion  $\text{Cl}^-$  is not by any means the same substance as the gas chlorine, for, though it is made of the same kind of matter, its energy content is very different. The ions in a solution of sodium sulphate ( $\text{Na}_2\text{SO}_4$ ) are  $\text{Na}^+$ ,  $\text{Na}^+$ , and  $\text{SO}_4^{--}$ .

In alcoholic solution, salts are not so highly ionized as in water; that is, the proportion of un-ionized (or undissociated) molecules is larger. In solution in other liquids, salts are often scarcely ionized at all, and it is found that such solutions do not conduct electricity as aqueous solutions of the same salts do.

The mechanism of the (electrolytic) conductivity of a solution of a salt, acid, or base in water consists, on the ionic hypothesis, in a bodily attracting of the positive ions in the solution by the negatively charged pole, and of the negative ions by the positive pole immersed in the solution. The positive and negative ions, therefore, move or travel toward the electrodes or poles, and finally give up their charges there. In this way electricity is transported through the solution.

In terms of the ionic theory, an acid owes its acid properties to the presence of hydrogen-ion in its solution, while a base owes its basic properties to the presence of hydroxide-ion ( $\text{OH}^-$ ). The strongest acids and bases are those that under like circumstances yield the highest concentration of  $\text{H}^+$  and  $\text{OH}^-$  respectively.

**Subdivisions of Chemistry.**—In its treatment of the various forms of matter, chemistry divides itself into the two great branches of inorganic and organic chemistry.

**Organic Chemistry.**—The latter is so-called because it originally dealt with the substances that are found in the organic vegetable and animal kingdoms. Practically most of these substances contain carbon, so that organic chemistry is nowadays the chemistry of the carbon compounds. As the number of known organic compounds is well over 100,000, the subject is a large one, with a very voluminous literature, increasing year by year in yearly as well as in total volume.

**Carbon.**—The valence of carbon in most of its compounds is uniformly 4, a regularity which simplifies matters con-

siderably at the outset. Carbon atoms are found to have the faculty of linking themselves together to form chains and rings. In this faculty carbon is exceptional among the elements, and for this reason no other element approaches carbon in the multitude of its compounds, so as to merit the treatment of its compound as a separate branch of chemistry. The attaching of carbon atoms to each other does not utilize all four of the available valences, and the unoccupied valences are therefore able to attach to the molecule such other elements as hydrogen, oxygen, nitrogen, etc.

It is found that the same grouping of elements recurs as part of a complex molecule; and all substances that possess the same group somewhere in their molecule are fortunately found to show the same reactions in virtue of the presence of that group. Thus all the compounds containing the group  $\text{—CH}_2\text{OH}$  are classed as primary alcohols; those with the group  $\text{—CHO}$  are aldehydes; those with  $\text{—COOH}$  are acids;

those with the group  $\text{—C=}$  attached to carbon atoms on both sides, are ketones;

and so on. The fact that all primary alcohols, all aldehydes, acids, etc., behave chemically more or less alike makes it possible to bring order out of the chaos of organic compounds, since the chemical groupings of atoms are comparatively few in number.

**Hydrocarbons.**—Many important organic compounds contain only the elements carbon and hydrogen. These are called the *hydrocarbons*, and include marsh gas ( $\text{CH}_4$ ), acetylene ( $\text{C}_2\text{H}_2$ ), benzene ( $\text{C}_6\text{H}_6$ ) and the components of rock oil, which is a mixture of many hydrocarbons.

**Carbohydrates.**—Another set of organic compounds contains only the three elements carbon, hydrogen and oxygen, the latter two in the same proportion as in water, viz., two atoms of hydrogen to one of oxygen. These are the *carbohydrates*, and include grape and fruit sugars ( $\text{C}_6\text{H}_{12}\text{O}_6$ ), cane, malt and milk sugars ( $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ ), the starches and cellulose [ $(\text{C}_6\text{H}_{10}\text{O}_5)_n$ ], which last is the structural material of the vegetable world. The fats and oils, common alcohol, glycerine, and acetic, citric and tartaric acids contain only carbon, hydrogen and oxygen.

When to these elements is added nitrogen as a possible constituent of organic substances, the list becomes a very varied one, including nitroglycerine, nitrocellulose or gun cotton, aniline and a host of dyes, and most of the alkaloids—substances of very powerful physiological action that occur in plants. Adding also sulphur, the vastly important proteins are included, some of which (the nucleoproteins) may contain also phosphorus. Other than water, fats and mineral constituents, proteins constitute the building material of the animal body, and are necessary in the diet of animals.

**Inorganic Chemistry**, deals with over eighty different elements and their compounds, including those of the mineral world. Its extent is in part indicated in the subjoined table of *Chemical Elements*.

The selection and grouping together of the facts and principles of chemistry that bear on some particular topic gives rise to such divisions as "physiological chemistry," "agricultural chemistry," "biochemistry," "immunology," etc. Such titles are, for the most part, self-explanatory.

## CHEMICAL ELEMENTS

Tabulation of facts concerning all the known elements.

At. wt., atomic weight; S. G., specific gravity; M. P., melting point; B. P., boiling point; C. T., critical temperature.

NAME, WITH CERTAIN DATA	OCCURRENCE AND PREPARATION	PROPERTIES	CHIEF COMPOUNDS AND USES
<b>Aluminium.</b> Symbol Al. At. wt. 27.1. Valence III. S. G. 2.5. M. P. 658°.	Occ.—cryolite $\text{AlF}_3 \cdot 3\text{NaF}$ , bauxite, impure $\text{Al}(\text{OH})_3$ in feldspars, micas and clays, emery, ruby, sapphire ( $\text{Al}_2\text{O}_3$ ). Prep., com'l., by electrolysis of $\text{Al}_2\text{O}_3$ from bauxite, dissolved in cryolite, water-power usually furnishing the electrical energy.	Silver-white, ductile, malleable at 120°, tensile strength (rolled) 16 tons per sq. in. A better conductor of electricity, weight for weight, than copper. Molten metal not cast by itself, but is cast in sand, or turns badly in the lathe. Acted upon by dil. hydrochloric acid, slowly by sulphuric, but not by nitric or the weaker organic acids in foods. Soluble in alkaline hydroxides. The tarnishing action of moist air soon comes to an end as the tarnish acts as an adherent protective coating.	Used for cooking utensils, boat-building, military accoutrements and small articles requiring lightness and strength; for electric leads. The powdered metal is used as a body for paints; and its mixture with ferric oxide, called thermite, is used for producing very high temperatures (up to 3700°) in the welding of metals. Aluminums are reduced from their oxides by means of Al, hence its use in casting steel. Aluminium is about 10% of alloys, with a tensile strength of 40 tons per sq. in. Its sulphate forms alums, e.g., $\text{KAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$ , common alum.
<b>Antimony.</b> Symbol Sb. At. wt. 120.2. Valence III and V. S. G. 6.7. M. P. 630.7°. B. P. red heat.	Occ.—free, and as stibnite ( $\text{Sb}_2\text{S}_3$ ). Prep.—roasting stibnite gives $\text{Sb}_2\text{O}_3$ , which is then reduced by heating with carbon.	White, brittle, crystalline metal. Its alloys expand on solidification, and therefore give very sharp castings, e.g., for type. It does not tarnish, but may be burned in air, and unites directly with the halogens.	The metal is a constituent of the alloys type metal, Britannia metal and Babbitt metal (used for bearings). Its oxide ( $\text{Sb}_2\text{O}_3$ ) is both basic and acidic. The trichloride, butler of antimony ( $\text{SbCl}_3$ ), is easily hydrolyzed. Tartar emetic ( $\text{SbO}(\text{C}_2\text{H}_3\text{O}_2)_2$ ) is used in medicine and in dyeing.
<b>Argon.</b> Symbol A. At. wt. 39.96. Valence nil. Density 19.3 (oxygen = 32). B. P. $-186^\circ$ . M. P. $-190^\circ$ .	Present in the air 0.94% by volume. To isolate, air is freed from $\text{CO}_2$ by soda-lime, water by $\text{PyOH}$ , oxygen by red-hot copper, nitrogen by magnesium and calcium. From the residual mixture argon is obtained by fractional distillation.	Is a monatomic gas and is identified by its characteristic spectrum seen by examining the light emitted when the gas is placed in a vacuum tube at low pressure and sparked. More soluble in water than nitrogen, 100 vol. water dissolving 4 vol. argon under ordinary conditions.	Forms no compounds, hence its name—does no work.
<b>Arsenic.</b> Symbol As. At. wt. 74.96. Valence III and V. S. G. 5.7. M. P. 460° (sublimes). M. P. 480° (under pressure).	Occ.—free, as arsenical pyrites ( $\text{FeSAs}$ ), as orpiment ( $\text{As}_2\text{S}_3$ ) and as realgar ( $\text{As}_2\text{S}_4$ ). Prep.—by heating arsenical pyrites, $\text{FeSAs} \rightarrow \text{FeS} + \text{As}$ .	A steel-gray, ductile-metallic and crystalline element classed as a metalloïd because intermediate between metals and metalloïds. Its vapor has a density corresponding to $\text{As}_2$ at 644°, and to $\text{As}_4$ at 1700°. It burns in air and unites with the halogens, sulphur and with many metals.	Used for hardening lead for shot. All arsenic compounds are poisonous. White arsenic ( $\text{As}_2\text{O}_3$ ) is partly basic, forming a chloride and partly acidic, forming arsenates. Scheele's gas ( $\text{C}_2\text{H}_3\text{AsO}_2$ ) is a pigment dangerous in wall-papers. Traces of arsenic are detected by Marsh's test, in which the intensely poisonous arsine ( $\text{AsH}_3$ ) is formed.
<b>Barium.</b> Symbol Ba. At. wt. 137.37. Valence II. S. G. 3.6. M. P. red heat.	Occ.—as barites or heavy spar ( $\text{BaSO}_4$ ), and as witherite ( $\text{BaCO}_3$ ). Prep.—by electrolysis of the fused chloride.	A silver-white, lustrous, malleable metal harder than lead. Like calcium, it acts slowly on water to give barium hydroxide and hydrogen. The vapors of its compounds impart a green color to the Bunsen flame.	The peroxide ( $\text{BaO}_2$ ) is used in the manufacture of oxygen and of hydrogen peroxide. The nitrate and chloride in pyrotechny to give green fire. The sulphate as the body for a permanent white paint and for filling glazed paper. All soluble compounds are poisonous.
<b>Bismuth.</b> Symbol Bi. At. wt. 208.0. Valence III (and V). S. G. 9.8. M. P. 266.5°. B. P. c. 1200°.	Occ.—free and as trioxide ( $\text{Bi}_2\text{O}_3$ ) and trisulphide ( $\text{Bi}_2\text{S}_3$ ). Prep.—the ore is roasted and then heated with charcoal and metallic iron to remove traces of sulphur.	An exceedingly brittle, crystalline shining metal, white with a tinge of pink. Bismuth expands on solidification. It does not tarnish, but can be burnt in air. Dissolves in oxygen acids.	Used for making fusible alloys, e.g., Wood's metal. M. P. $-10^\circ$ , which are used in plugs of fire sprinklers and boiler safety valves, and for taking casts. The oxynitrate is used in medicine and as a cosmetic.
<b>Boron.</b> Symbol B. At. wt. 11.0. Valence III. S.G. (amorph.) 2.4. (cryst.) 2.5. B. P. 3500° (sublimes).	Occ.—as boracic acid ( $\text{H}_2\text{BO}_3$ ), borax ( $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ ), colemanite ( $\text{Ca}_2\text{B}_6\text{O}_{11} \cdot 5\text{H}_2\text{O}$ ). Prep.—amorphous boron by reducing $\text{B}_2\text{O}_3$ with Mg. Impure crystal, boron by reducing $\text{B}_2\text{O}_3$ with excess of Al.	Amorphous boron is a greenish black powder that burns in air at 600°, forming $\text{B}_2\text{O}_3$ and also BN. It is oxidized, by hot conc. sulphuric or nitric acids, to boric acid.	The compounds are analogous to those of silicon. Borax is used as a flux, and, in solution, as a mild alkali on account of its hydrolysis. Boric acid is used as a weak antiseptic and preservative.

## CHEMICAL ELEMENTS—Continued

NAME, WITH CERTAIN DATA	OCCURRENCE AND PREPARATION	PROPERTIES	CHIEF COMPOUNDS AND USES
<b>Bromine.</b> Symbol Br. At. wt. 79.92. Valence I. S. G. 3.2. M. P. 80°. M. P. -7.3°.	Oce.—in seawater as alkali bromide, and in the upper layers of salt deposits as sodium and magnesium bromide. Prep.—by treatment of the brines with sulphuric acid and manganese dioxide, or else with chlorine.	A dark red liquid, smelling like chlorine, whose vapor irritates eyes, throat and nose. Dissolves thirty parts of water (bromine water). Combines directly with most other elements, but less vigorously than chlorine.	Potassium bromide is used in medicine, silver bromide in photography. Bromine is used in course of the preparation of organic dyes.
<b>Cadmium.</b> Symbol Cd. At. wt. 112.40. Valence II. S. G. 8.6. M. P. 321.7. B. P. 770°.	Oce.—in association with the zinc ore, as carbonate and sulphide. Prep.—in the distillation of impure zinc, the cadmium comes over in the first portions.	A silver-white metal, more ductile and malleable than zinc. It burns in air, and is attacked by dilute acids.	All the compounds are poisonous, and little ionized. The sulphide (CdS) is the base of "cadmium yellow." The iodide is used in medicine.
<b>Caesium.</b> Symbol Cs. At. wt. 132.61. Valence I. S. G. 2.4. M. P. 26.3°. B. P. 670°.	Oce.—in certain mica, and in the ashes of certain plants. Prep.—by heating the hydroxide (CaOH) with magnesium.	A white silvery metal resembling potassium. It is one of the most active of metals, and decomposes water violently.	The compounds are characterized by giving, especially, two bright lines in the blue of the spectrum (cesium sky-blue).
<b>Calcium.</b> Symbol Ca. At. wt. 40.09. Valence II. (dual spars), and as complex silicates in great variety (feldspars, pyroxenes, amphiboles, etc.). Prep.—by electrolysis of the fused chloride.	Oce.—as carbonate (Island spar, calcite, aragonite, marble, chalk, limestone), sulphate (gypsum), phosphate (apatite), fluorides (fluor spar), and as complex silicates in great variety (feldspars, pyroxenes, amphiboles, etc.). Prep.—by electrolysis of the fused chloride.	A white crystalline metal, harder than lead, that can be cut, drawn, rolled and turned. It attacks water, and burns in the air at a red heat, forming the oxide (CaO) and the nitride (Ca <sub>3</sub> N <sub>2</sub> ). It unites with hydrogen to CaH <sub>2</sub> , whose action on water is a source of hydrogen for balloons.	Calcium oxide (quicklime) is used for mortar and to remove hair from hides. The hydroxide (Ca(OH) <sub>2</sub> ) mixed with sand forms mortar; its solution is lime-water. Plaster of Paris, a less hydrated sulphate, takes up water on setting to form CaSO <sub>4</sub> ·2H <sub>2</sub> O. The phosphates are fertilizers. Bleaching powder is CaClOCl and calcium carbide is CaC <sub>2</sub> . Common glass contains silicates of calcium and sodium.
<b>Carbon.</b> Symbol C. At. wt. 12.00. Valence IV. S. G. diamond 3.5; graphite 2.3; amorphous 1.9. N.C.—not realized.	Oce.—as diamond and graphite, in the free state; in combination with hydrogen as petroleum, with oxygen as carbon dioxide in the air, with these and other elements as coal, and in plant and animal tissues; and as many carbonates. Prep.—by dry distillation of wood or coal, yielding charcoal and coke respectively.	Diamond is crystalline and the hardest of minerals, the dark-colored "soft" being used for cutting and grinding. Graphite has a black metallic luster, is crystalline and may be scratched by the finger-nail. Charcoal is amorphous, and possesses the power of absorbing gases and also coloring matters. All three forms burn in oxygen to produce carbon dioxide.	The carbon compounds form the subject of "Organic Chemistry." Carbon dioxide results from the burning of coal, coke, wood, oil or illuminating gas, from fermentation and decay, which are slow burnings, and is exhaled in the breath. Carbon monoxide, arising from recently-stoked fires, is an exceedingly poisonous gas.
<b>Cerium.</b> Symbol Ce. At. wt. 140.25. Valence III, IV (and VI). S. G. 6.9; M. P. 623°.	Oce.—as silicate in cerite, along with Nd, Pr and La; also in monazite sand. Prep.—by electrolysis of the fused chloride.	A metal with the color and luster of iron, like tin in hardness, and very ductile and malleable. Burns in air more easily and brightly than magnesium.	Welbach incandescent gas mantles contain one per cent of cerium dioxide CeO <sub>2</sub> .
<b>Chlorine.</b> Symbol Cl. At. wt. 35.46. Valence I (and VII). S. G. (liquid) 1.3. M. P. -102°. B. P. -33.6°. M. P. -146°.	Oce.—in seawater as chlorides of the alkalis and alkaline earths, and as like compounds in salt deposits. Prep.—by electrolysis of alkali chloride, fused or in solution; or by the action of manganese dioxide on hydrochloric acid.	A greenish-yellow gas of characteristic odor, with a violent action on the respiratory tract. Unites directly with all elements save oxygen, nitrogen and the argon family. Displaces bromine and iodine from bromides and iodides, and substitutes hydrogen in organic compounds.	The gas is used in extracting gold and in preparing bleaching and disinfecting agents. In presence of water it bleaches many coloring matters. Forms chlorides (as HCl, HClO, CaCl <sub>2</sub> ), hypochlorites (as solution of Ca(OCl) <sub>2</sub> ), chlorates (as KClO <sub>3</sub> , used for matches and in pyrotechny), and perchlorates (as KClO <sub>4</sub> ).
<b>Chromium.</b> Symbol Cr. At. wt. 52.0. Valence II, III and VI. S. G. 6.9. M. P. 1535°. B. P. 1500°.	Oce.—as chromite [Fe(CrO <sub>2</sub> ) <sub>3</sub> ]. Prep.—by reducing Cr <sub>2</sub> O <sub>3</sub> with aluminium filings.	A steel-gray, lustrous, brittle and very hard metal. At high temperatures it burns in air to green Cr <sub>2</sub> O <sub>3</sub> . It is attacked by dilute sulphuric or hydrochloric acid, but not by nitric acid.	The alloy ferrochromium is used in steel-making. Chrome green, the pigment, is Cr <sub>2</sub> O <sub>3</sub> . Chrome yellow is PbCrO <sub>4</sub> . Dichromates (as K <sub>2</sub> Cr <sub>2</sub> O <sub>7</sub> ) are used in photo-processes, tanning and dyeing and as oxidizing agents, e.g., in batteries.
<b>Cobalt.</b> Symbol Co. At. wt. 58.97. Valence II and III. S. G. 8.5. M. P. 1500°.	Oce.—as smaltite (CoAs <sub>2</sub> ) and cobaltite CoAsS. Prep.—by igniting the oxide in hydrogen.	A white magnetic malleable metal, less tenacious than iron. By exposure it turns pinkish. It is less active chemically than iron.	Its intensely blue nitrates are used in coloring porcelain and constitute the pigment smalt.
<b>Columbium (Niobium).</b> Symbol Nb. At. wt. 92.5. Valence I, II, IV and V. S. G. 12.7; M. P. 1900°.	Oce.—in the mineral columbite. Prep.—by reduction of NbO <sub>3</sub> by paraffin.	A light-gray malleable and ductile metal, as hard as wrought iron, which is not affected by acids, even by aqua regia.	The hydride (NbH) burns in air. The compounds occur with those of tantalum, which they closely resemble.
<b>Copper.</b> Symbol Cu. At. wt. 63.57. Valence I and II. S. G. 8.9. M. P. 1084.1. B. P. 2100°.	Oce.—free, as cuprite (Cu <sub>2</sub> O), copper glance (CuS), chalcopryite (Cu <sub>3</sub> FeS <sub>4</sub> ), melachroite (CuCO <sub>3</sub> ·Cu(OH) <sub>2</sub> ). Prep.—after removal of iron and sulphur, the oxide is reduced by heating with carbon. It is refined electrolytically.	A red, lustrous, very ductile and malleable metal of tensile strength 14 tons per sq. in., second only to silver in electrical conductivity. In ordinary air it gradually becomes coated with basic carbonate. In absence of air, nitric acid alone among the dilute acids attacks it, but in presence of air even the acids found in foodstuffs can dissolve it.	The metal is used for coins, electroplating, electric leads, roofing, cooking vessels and for making alloys, such as brass, bell and gun metals, German silver and the bronzes. The soluble compounds are poisonous, and are therefore used as poisons in agriculture. Blue vitriol is CuSO <sub>4</sub> ·5H <sub>2</sub> O; the basic acetate is verdigris.
<b>Dysprosium.</b> Symbol Dy. At. wt. 162.5. Valence III.	Oce.—in monazite, gadolinite, etc. Prep.—not yet isolated.	The oxide dysprosia, along with three other rare earths, constitutes erbia.	The salts are green or yellow in color and show characteristic absorption bands.
<b>Erbium.</b> Symbol Er. At. wt. 167.4. Valence III.	Oce.—same as for dysprosium. Prep.—not yet isolated pure.	Crude erbia has been separated into erbia, holmia, thulia, and dysprosia.	The salts are rose-colored, and show characteristic absorption spectra.
<b>Europlum.</b> Symbol Eu. At. wt. 152.0. Valence III.	Oce.—in monazite and other rare minerals. Prep.—not yet isolated.	This element so closely resembles samarium that the analytical separation of the two is difficult.	The salts are pinkish and show a faint absorption spectrum.
<b>Fluorine.</b> Symbol F. At. wt. 19.0. Valence I. S. G. (liquid) 1.14 at -167°. M. P. -223°. B. P. -187°.	Oce.—as cryolite (AlF <sub>3</sub> ·3NaF), fluor spar (CaF <sub>2</sub> ) and very widely elsewhere in small quantities. Prep.—by electrolysis of dry hydrogen fluoride at -25°.	A pale yellowish-green gas that unites with every element excepting oxygen and the argon family. It rapidly displaces oxygen from water or chlorine from hydrogen chloride, but even the acids found in foodstuffs can dissolve it.	Hydrogen fluoride is used for etching glass and in silicate analysis. Silver fluoride is soluble and calcium fluoride insoluble, in contrast with the other halides of these metals.
<b>Gadolinium.</b> Symbol Gd. At. wt. 157.3. Valence III.	Oce.—in gadolinite and samarskite. Prep.—not yet isolated.	This element closely resembles terbium in its compounds.	The salts are colorless and show no absorption bands.

## CHEMICAL ELEMENTS—Continued

NAME WITH CERTAIN DATA	OCCURRENCE AND PREPARATION	PROPERTIES	CHIEF COMPOUNDS AND USES
<b>Gallium.</b> Symbol Ga. At. wt. 69.5. Valence III. S. G. 5.9. M.P. 30.1°.	Occ.—in zinc blende and in bauxite. Prep.—by electrolysis of a suitable solution of its salts.	A bluish-white tough metal that may be cut with a knife. Like aluminum, it is soluble in hydrochloric acid and in caustic alkali, but not in nitric acid.	It forms two chlorides ( $\text{GaCl}_3$ and $\text{GaCl}_2$ ) which yield spark spectra very characteristic of gallium.
<b>Germanium.</b> Symbol Ge. At. wt. 72.3. Valence II and IV. S.G. 5.5. M.P. 900°.	Occ.—in the rare mineral argyrodite. Prep.—by the reduction of the dioxide ( $\text{GeO}_2$ ) by carbon.	A grayish-white, brittle, lustrous metal. Insoluble in hydrochloric acid. It combines directly with the halogens.	The close relation of this element to carbon and silicon is shown in the compound germanium chloroform ( $\text{GeHCl}_3$ ).
<b>Gluclumum</b> (or Beryllium). Symbol Gl. At. wt. 9.1. Valence II. S.G. 1.8. M.P. below 900°.	Occ.—in beryl ( $\text{Al}_2\text{Ge}_2\text{Si}_2\text{O}_{10}$ ). Prep.—by electrolysis of the fused double fluoride $\text{GlF}_2 \cdot 2\text{KF}$ .	A hard white metal that tarnishes when heated in air, and is soluble in dilute acids when powdered.	Its hydroxide $[\text{Gl}(\text{OH})_2]$ is feebly acidic as well as basic, thus resembling the hydroxide of zinc. Emerald is beryl colored green by chromium.
<b>Gold.</b> Symbol Au. At. wt. 197.2. Valence I, and III. S. G. 19.32. M.P. 1062.4°.	Occ.—chiefly free, but also as telluride; many specimens of iron pyrites are auriferous. Prep.—from gold-bearing sands by washing away the lighter material, and dissolving the gold from the residue by mercury, which is subsequently separated from the gold by distillation. Quarts ores are pulverized in stamping mills, and the powder is then carried by water over amalgamated copper plates on which the gold collects.	A soft bright-yellow metal, easily scratched by the knife, an excellent conductor of heat and of electricity. The most ductile and the most malleable of all the metals. Chemically, gold is rather inert, and is not attacked by the oxygen of the air, by hydrogen sulphide, nor, indeed, by any single one of the common acids. It is attacked by fused alkalis, yielding aurates, and by aqua regia, yielding chlorauric acid ( $\text{HAuCl}_4$ ).	Pure gold is called 24-carat gold. American, French and German gold coins are 21.6 carats, while British sovereigns are 22 carats, the balance in all these cases being copper. Jewelry is made in 18, 14, 9, etc., carat gold, the addition of copper increasing the hardness and rigidity. Sodium chloraurate ( $\text{NaAuCl}_4$ ) is used for "toning" in photography, while potassium auricyanide ( $[\text{KAu}(\text{CN})_2]$ ) is used in electro-gilding.
<b>Helium.</b> Symbol He. At. wt. 3.99. Valence 0. S. G. (liquid) 0.15. B. P. -268.7°.	Occ.—in air to the extent of 1 to 2 volumes per million; also occluded in certain minerals. Prep.—neon and helium are boiled off crude argon, and the neon solidified by cooling.	The lightest gas after hydrogen, transparent, odorless and colorless, very inert, forming no compounds with other elements.	It is one of the decomposition products of certain other (radio-active) elements.
<b>Hydrogen.</b> Symbol H. At. wt. 1.008. Valence I. H. (liquid) 0.07. M. P. -259°. B. P. -252.8°.	Occ.—in air to the extent of 1 vol. per 20,000 vols. air; combined in water (11.19% by wt.) natural gas, petroleum and all animal and vegetable bodies. Prep.—by treating zinc with hydrochloric or sulphuric acid; by electrolysis of water.	The lightest gas, transparent, odorless and colorless, soluble in water (2 vols in 100 vols. water under everyday conditions), in platinum, in palladium (502 vols. in 1 of gas). Burns in air and in chlorine, and unites with many of the other elements.	Its two oxides are water ( $\text{H}_2\text{O}$ ) and hydrogen peroxide ( $\text{H}_2\text{O}_2$ ), the latter of which is used in solution as a bleaching agent. Every acid contains hydrogen as an essential constituent. Its compounds with carbon and other elements number over 100,000. Hydrogen gas is used for the oxyhydrogen flame and for filling balloons.
<b>Iodine.</b> Symbol I. At. wt. 126.92. Valence I, V and VII. S. G. 4.95. M. P. 114°. B. P. 184°.	Occ.—in zinc blende ( $\text{ZnS}$ ). Prep.—electrolytically from solutions of its salts.	A white metal, malleable and softer than lead.	Its compounds color the nonluminous gas flame blue and show a characteristic blue line in the spectrum.
<b>Iodine.</b> Symbol I. At. wt. 126.92. Valence I, V and VII. S. G. 4.95. M. P. 114°. B. P. 184°.	Occ.—in the ocean, in certain seaweeds, and in Chili mactopier, always in the combined state. Prep.—from iodides by displacement of their iodine by chlorine.	A dark gray brittle solid with a metallic luster. Its vapor is violet, as are its solutions in chloroform and in carbon bisulphide. It requires over 6,000 parts of water for its solution. Combines directly with many elements, but is much less active than chlorine and bromine.	Its structure is used in medicine as a counter-irritant. Potassium iodide ( $\text{KI}$ ) and iodoform ( $\text{CHI}_3$ ) likewise find application in medicine. The alkyl iodides ( $\text{R} \cdot \text{C}_2\text{H}_5\text{I}$ ) are much used in synthetic organic chemistry.
<b>Iridium.</b> Symbol Ir. At. wt. 193.1. Valence III and IV. S. G. 22.45. M. P. 1800°.	Occ.—along with platinum. Prep.—by a complex series of operations from platinum ores.	A white metal, brittle when cold, and very hard. It is attacked by fused alkalis, but not by aqua regia.	It is used for pointing gold pens. Its alloy with 9 parts of platinum is used for standard meter bars on account of its inalterability.
<b>Iron.</b> Symbol Fe. At. wt. 55.85. Valence II and III. S. G. 7.36; pig. 7.03 to 7.73. M. P. 1804°. wrought 1600°. cast 1378°. gray pig 1275°. white pig 1075°.	Occ.—as magnetic oxide ( $\text{Fe}_3\text{O}_4$ ), hematite ( $\text{Fe}_2\text{O}_3$ ), limonite ( $2\text{Fe}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ ), siderite ( $\text{FeCO}_3$ ), which are important ores; iron pyrites ( $\text{FeS}_2$ ); in rocks as complex silicates, and in plants and animals. Prep.—pig iron is prepared in the blast furnace by reduction of the ore by means of carbon monoxide in presence of a suitable flux. From pig iron, wrought iron is obtained by puddling, and steel by the Bessemer, Siemens-Martin or other process.	A white, malleable, ductile, magnetic metal, uncombined in dry air or air-free water, but rusting in moist air. Easily attacked by dilute acids, but not by fused alkalis. Cast iron contains 2 to 5% of carbon and other impurities, and is hard and brittle. Wrought iron contains less than 0.2% of carbon, and is softer and tougher, with a tensile strength of 22 to 25 tons per sq. in. Steel contains from 0.2 to 1.5% of carbon, is permanently magnetic, may be tempered, and possesses tensile strength up to 100 tons per sq. in.	The metal is used as a structural material, for rails, machinery, tools, etc. Jeweler's rouge and Venetian red consist of the oxide ( $\text{Fe}_2\text{O}_3$ ). Rust is chiefly the hydrated oxide ( $\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$ ). Hammer scale and lodestone have the composition $\text{Fe}_3\text{O}_4$ . Ferric chloride ( $\text{FeCl}_3$ ), ferrous iodide ( $\text{FeI}_2$ ) and other iron compounds are used in medicine. Green vitriol ( $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ) is used in making ink, and in dyeing. Potassium ferrioxalate ( $[\text{K}_2\text{Fe}(\text{C}_2\text{O}_4)_3]$ ) is used for making Prussian blue, potassium cyanide, etc.
<b>Krypton.</b> Symbol Kr. At. wt. 83.5. Valence 0. M. P. -169°. B. P. -152°.	Occ.—in minute quantity in the air. Prep.—from crude argon by fractional distillation.	An inert, colorless, odorless gas, resembling, but denser than, argon.	It forms no compounds, and is identified by its characteristic spectrum.
<b>Lanthanum.</b> Symbol La. At. wt. 139.0. Valence III and V. S. G. 6.15.	Occ.—as lanthanite $[\text{La}_2(\text{CO}_3)_3 \cdot 8\text{H}_2\text{O}]$ . Prep.—by electrolysis of fused $\text{LaCl}_3$ .	An iron-gray metal tarnishing in air to steel-blue; malleable and ductile. Attacked slowly even by cold water.	When heated in air it forms oxide ( $\text{La}_2\text{O}_3$ ) and nitride ( $\text{LaN}$ ).
<b>Lead.</b> Symbol Pb. At. wt. 207.19. Valence II, and IV. S. G. 11.4. M. P. 326°.	Occ.—as galena ( $\text{PbS}$ ), and in silver ores. Prep.—by calcination of partially roasted galena. Purification is effected by Parkes process.	A soft gray metal, malleable, but of low tensile strength. In presence of air, water acts on lead to produce the hydroxide, which, being slightly soluble, may cause lead poisoning if present in water supplies. When heated in air it is oxidized to litharge ( $\text{PbO}$ ), and, under suitable conditions, to minium ( $\text{Pb}_3\text{O}_4$ ).	The metal is used for water pipes, roofs and gutters and storage batteries. For shot it is alloyed with 0.4% of arsenic. Typometal contains 20% of antimony, 10% of tin, and 70% of lead. Solder and pewter are alloys of lead and tin. The basic carbonates $[\text{Pb}(\text{OH})_2 \cdot 2\text{PbCO}_3]$ , "white lead," is the basis of most oil paints.

## CHEMICAL ELEMENTS—Continued

NAME, WITH CERTAIN DATA	OCCURRENCE AND PREPARATION	PROPERTIES	CHIEF COMPOUNDS AND USES
<b>Lithium.</b> Symbol Li. At. wt. 6.94. Valence I. S. G. 0.53. M. P. 186°. B. P. above 1400°.	Occ.—as a raised fluoride with aluminum in amblygonite. Prep.—by electrolysis of the fused chloride.	A silver-white metal, softer than lead, that tarnishes quickly in air, and is easily acted upon by water. When heated, it unites vigorously with nitrogen.	The carbonate $Li_2CO_3$ is used in medicine as a solvent for uric acid, lithium urate being soluble. The lithium salts give a carmine flame coloration.
<b>Lutetium.</b> Symbol Lu. At. wt. 174.0.	Occ.—in euxenite. Prep.—it has not been isolated.		Its compounds resemble those of ytterbium.
<b>Magnesium.</b> Symbol Mg. At. wt. 24.32. Valence II. S. G. 1.75. M. P. 632°. B. P. 1100°.	Occ.—as magnesite ( $MgCO_3$ ), dolomite ( $MgCO_3 \cdot CaCO_3$ ), carnallite ( $MgCl_2 \cdot 6H_2O$ ) and in very many complex silicates. Prep.—by electrolysis of dried, fused carnallite.	A silver-white metal, ductile when hot. It tarnishes in air, and acts slowly upon water, rapidly on steam. Burns in air to the oxide $MgO$ , emitting a very bright light, used in photography. It unites directly with nitrogen.	The sulphate ( $MgSO_4 \cdot 7H_2O$ ) is known as Epsom salts and is used in medicine, as are the oxide (magnesia), the carbonates and citrate. Magnesium is a light, hard alloy with aluminium.
<b>Manganese.</b> Symbol Mn. At. wt. 54.93. Valence II, III, IV, VI, VII. S. G. 8.0. M. P. ca. 1300°.	Occ.—as pyrolusite ( $MnO_2$ ), besanite ( $Mn_2O_3$ ), hausmannite ( $Mn_3O_4$ ) and manganese spar ( $MnCO_3$ ). Prep.—by heating $MnO_2$ with aluminium filings.	A steel-gray, hard, brittle metal with a pinkish tinge. It rusts in moist air and is attacked by dilute acids.	Ferromanganese and spiegeleisen are alloys with iron, used in steel making. With copper it forms the hard, tough manganese bronze, with tensile strength up to 30 tons per sq. in. Impure sodium permanganate ( $NaMnO_4$ ) is used in disinfecting as Condy's fluid.
<b>Mercury.</b> Symbol Hg. At. wt. 200.0. Valence I and II. S. G. 13.6. M. P. -39.5°. B. P. 356.93°.	Occ.—free and as cinnabar ( $HgS$ ). Prep.—by roasting cinnabar $HgS + O_2 \rightarrow Hg + SO_2$ .	A silver-white, mobile liquid with a vapor pressure at 0° of 0.0002 mm. It tarnishes but slowly in air and is attacked only by dilute nitric among the dilute acids. The vapor is monatomic.	It is used for filling thermometers and barometers. Its alloys are called amalgams, some of which are used in dentistry. Calomel ( $Hg_2Cl_2$ ) is administered internally in medicine; corrosive sublimate ( $HgCl_2$ ) forms a solution with very powerful germicidal properties. The ferromolybdenum alloys are used in the manufacture of special steels.
<b>Molybdenum.</b> Symbol Mo. At. wt. 95.9. Valence III, IV, V, S. G. 9.0. M. P. 2110° (VI).	Occ.—as molybdenite ( $MoS_2$ ) and wulfenite ( $PbMoO_4$ ). Prep.—by reducing the oxides with aluminium powder.	A white metal, as malleable as iron, that will not scratch glass. Insoluble in hydrochloric or dilute sulphuric acid.	
<b>Neodymium.</b> Symbol Nd. At. wt. 144.3. Valence III and IV. S. G. 6.9. M. P. 640°.	Occ.—with cerium and lanthanum. Prep.—by electrolysis of the fused chloride.	A yellowish metal, tarnishing in air.	The salts are rose-violet in color, and their solutions show characteristic absorption spectra.
<b>Neon.</b> Symbol Ne. At. wt. 20.2. Valence 0. R. P. ca. -243°.	Occ.—in minute quantity in the atmosphere. Prep.—neon and helium are boiled out of crude argon, and the neon separated from helium by cooling with liquid hydrogen.	A colorless, transparent, odorless, inert gas, resembling argon.	It forms no compounds, and is recognized by its characteristic spectrum.
<b>Nickel.</b> Symbol Ni. At. wt. 58.68. Valence II and III. S. G. 8.9. M. P. ca. 1455°.	Occ.—as niccolite ( $NiAs$ ) and nickel glance ( $NiAs_2$ ). Prep.—by igniting the oxalate in hydrogen.	A white, very hard, lustrous metal, malleable, ductile and tenacious. It rusts but slowly in air, and is attacked easily by only nitric acid.	The metal furnishes a protective coating when plated on iron. German silver is an alloy of nickel, copper and zinc. Nickel steel is used for armor plates. Manganin, containing nickel, copper and manganese, is used for electrical resistances.
<b>Nitrogen.</b> Symbol N. At. wt. 14.01. Valence III and V. M. P. -214°. B. P. -194°.	Occ.—free nitrogen forms about four-fifths of air by volume. As Bengal saltpeter ( $KNO_3$ ), Chili saltpeter ( $NaNO_3$ ), and as an essential constituent of vegetable and animal protoplasm. Prep.—by heating ammonium nitrite, by oxidation of ammonia, etc.	A colorless, odorless, transparent gas, rather inactive chemically. At ordinary temperature and pressure, 100 volumes of water dissolve 1.5 volumes of nitrogen. It unites directly with strongly heated boron, lithium, calcium and magnesium.	Nitrous oxide ( $N_2O$ ), or laughing gas, is used, by dentists. Nitric acid ( $HNO_3$ ) has many applications in technical chemistry. Ammonia ( $NH_3$ ) is a very soluble gas. Ammonium sulphate $[(NH_4)_2SO_4]$ and Chili saltpeter are used as nitrogenous manures. Nitrogen is a constituent of the anilindyes, the proteins and many other important classes of organic substances.
<b>Osmium.</b> Symbol Os. At. wt. 190.9. Valence II, III, IV, VI, VII. S. G. 22.477. M. P. ca. 2400°.	Occ.—along with platinum. Prep.—by reducing $OsO_4$ .	A gray metal, harder than glass, the heaviest of known bodies.	Its alloy with iridium is used in tipping gold pens. Osmium tetroxide ( $OsO_4$ ) is used as a microscopic stain for fat.
<b>Oxygen.</b> Symbol O. At. wt. 16.00. Valence II. S. G. (liquid at h.p.) 1.13. M. P. -227°. B. P. -182.9°.	Occ.—free oxygen forms about one-fifth of air by volume. Water contains 88.8% of oxygen. The rocks of the earth's crust contain about 45% in combination, chiefly as silicates. Prep.—in the laboratory, by heating potassium chlorate ( $KClO_3$ ). Commercially, from the air.	A colorless, odorless, tasteless, transparent gas, slightly heavier than air. At ordinary temperature and pressure, 100 volumes of water dissolve 3 volumes of oxygen. It is very active chemically, combining directly with all but a few of the other elements, and with all oxides. Sulphur, phosphorus, etc., burn much more vigorously in oxygen than in air. Liquid oxygen is magnetic.	The gas is acid compressed in mild steel cylinders, and is used for the oxyhydrogen blowpipe and in medicine, besides for chemical purposes. It is necessary to support animal respiration and to sustain ordinary combustion. It enters as a constituent into all acids, most salts and many organic compounds.
<b>Palladium.</b> Symbol Pd. At. wt. 106.7. Valence II and IV. S. G. 11.9. M. P. ca. 1555°.	Occ.—along with platinum, and with gold in Brazil. Prep.—by a complex series of processes from platinum ores.	A silvery, malleable and ductile metal, related to platinum, unlike which, however, it is attacked by nitric acid. Under suitable conditions it can take up over 900 volumes of hydrogen.	Since it does not tarnish, it is used for coating silver goods and by dentists as a substitute for gold.
<b>Phosphorus.</b> Symbol P. At. wt. 31.04. Valence III and V. S. G. (white, 1.82, red, 2.25, black, 2.68). M. P. white, 44°, red, 260°.	Occ.—as phosphates, such as apatite $[Ca_5(PO_4)_3]$ , in bones, teeth, brain and seeds of plants. Prep.—by reduction of calcium phosphate by carbon in the electric furnace in presence of a suitable flux.	Phosphorus exists in two allotropic modifications: white phosphorus is waxy in consistency, soluble in carbon bisulphide, evil smelling and poisonous; red phosphorus is a solid, insoluble in carbon bisulphide, odorless and not poisonous. White phosphorus has a low ignition temperature, hence its former use in matches.	Red phosphorus is used in the manufacture of matches, as also is the compound $P_4O_6$ . In the form of superphosphate of lime $[CaH_2(P_2O_7)_2]$ phosphorus is an important agricultural manure. The chlorides ( $PCl_3$ and $PCl_5$ ) are much used in organic chemistry.
<b>Platinum.</b> Symbol Pt. At. wt. 195.2. Valence II and IV. S. G. 21.45. M. P. 1772°.	Occ.—free, alloyed with the platinum metals, as nuggets in alluvial sands in the Urala, California, etc. Prep.—it is freed from the metals with which it is alloyed by a complex series of processes.	A silvery, tenacious, ductile and malleable metal, unaltered in moist air and unattacked by any single common acid. Aqua regia, fused alkalis, alkali nitrates and cyanide attack it, however. Platinum "sponge" and "black" are finely divided forms.	On account of its resistance to acids, platinum is much used for chemical vessels. Since platinum has a coefficient of expansion very close to that of glass, platinum wires and crucibles fused through glass without danger of breakage on cooling. The salts are used in photography.

## CHEMICAL ELEMENTS—Continued

NAME, WITH CERTAIN DATA	OCCURRENCE AND PREPARATION	PROPERTIES	CHIEF COMPOUNDS AND USES
<b>Potassium.</b> Symbol K. At. wt. 39.10. Valence I. S. G. 0.86. M. P. 63.5°. B. P. 687°.	Occ.—as sylvite (KCl), carnallite (KCl, MgCl <sub>2</sub> ·6H <sub>2</sub> O); in plant and animal ashes, and in many complex silicates. Prep.—by reduction or by electrolysis of fused potassium hydroxide (KOH).	A silver-white lustrous metal, as soft as wax, tarnishing instantly in moist air. Chemically it is a very active metal, decomposing water in the cold and uniting violently with the halogens, sulphur and oxygen.	An alloy with sodium is used in filling high-temperature thermometers. Bengal salt-petre in the nitrate and is used in pyrotechny, for gunpowder and as a preservative. The iodide (KI) is used in medicine. The chloride, like the nitrate, is used as a source of oxygen in pyrotechny and for match heads. Caustic potash (KOH) has many chemical applications. The cyanide (KCN) is used in gold extraction. The salts are leaf-green in color, and their solutions have characteristic absorption spectra.
<b>Francium.</b> Symbol Fr. At. wt. 140.6. Valence III and IV. S. G. 6.47. M. P. 940°.	Occ.—with cerium and lanthanum. Prep.—by electrolysis of the fused chloride.	A yellowish metal, remaining untarnished in air.	The rays from radium compounds (such as RaBr <sub>2</sub> , RaCl <sub>2</sub> , RaCO <sub>3</sub> ) act destructively on living tissues and on bacteria. One gram of radium in any of its compounds gives off about 100 calories of heat per hour.
<b>Radium.</b> Symbol Ra. At. wt. 226.4. Valence II. S. G. 12.1. M. P. 940°.	Occ.—in minute quantity in pitchblende and other uranium minerals. Prep.—the metal has recently been isolated; the bromide separated from the barium bromide prepared from pitchblende by fractional crystallization.	In all of its compounds, the metal has the power of emitting certain radiations. These can pass through matter that is opaque to light, render air a conductor, affect a photographic plate and cause a silver-sulphide screen to fluoresce visibly.	The red chloride (RaCl <sub>2</sub> ) is formed by the action of chlorine upon the metal.
<b>Rhodium.</b> Symbol Rh. At. wt. 102.9. Valence II, III, and IV. S. G. 12.1. M. P. above 2000°.	Occ.—in the ore of platinum. Prep.—by a complex series of processes from platinum ore.	A silver, malleable and ductile metal, not tarnishing in air and not attacked by aqua regia.	The compounds show characteristic flame-spectra, and were recognized as those of a new element spectroscopically by Bunsen.
<b>Rubidium.</b> Symbol Rb. At. wt. 85.45. Valence I, III, and IV. S. G. 1.52. M. P. 38.5°. B. P. 696°.	Occ.—the salts are associated with salts of potassium. Prep.—similar to that of potassium.	A silver-white metal resembling potassium, like which it attacks water vigorously.	The following oxides are known: RuO <sub>2</sub> , RuO <sub>3</sub> , Ru <sub>2</sub> O <sub>3</sub> , as well as salts corresponding to RuO <sub>2</sub> and RuO <sub>3</sub> .
<b>Ruthenium.</b> Symbol Ru. At. wt. 101.7. Valence III, IV, V, VI, VII, and VIII. S. G. 12.1. M. P. above 2000°.	Occ.—in the ore of platinum. Prep.—by a complex series of processes from platinum ore.	A hard, white, brittle metal, oxidized when heated in air, scarcely attacked by aqua regia.	The salts are topaz-yellow in color, and are similar to those of ruthenium.
<b>Samarium.</b> Symbol Sm. At. wt. 150.4. Valence II and III. S. G. ex. 7.7. M. P. 1200 to 1400°.	Occ.—in the mineral samarskite. Prep.—by electrolysis of the chloride.	A whitish-gray metal, tarnishing in air.	The chloride (SmCl <sub>3</sub> ) shows a characteristic spark spectrum.
<b>Scandium.</b> Symbol Sc. At. wt. 44.1. Valence III.	Occ.—free in some specimens of sulphur, and in combination with lead, iron and other metals, as in pyrites. Prep.—(amorphous) by reducing selenium acid (H <sub>2</sub> SeO <sub>4</sub> ) by sulphur dioxide.	The existence of this element, whose oxide was discovered in 1879, was predicted by Mendeleev in 1869.	Selenium cells are used as indicators of intensity of illumination. The compounds strongly resemble those of sulphur. Hydrogen selenide is an evil-smelling, inflammable gas. Selenic acid (H <sub>2</sub> SeO <sub>4</sub> ) is a more powerful oxidant than sulphuric acid, and dissolves gold.
<b>Selenium.</b> Symbol Se. At. wt. 79.2. Valence II, IV, and VI. S. G. amorphous 4.27, monoclinic 4.47, hexagonal 4.8. M. P. amorphous 50°, monoclinic 170 to 180°, hexagonal 217°. B. P. 690°.	Occ.—in the minerals enargite and gadolinite. Prep.—the metal has not been isolated.	Three varieties are known: (1) red amorphous, soluble in carbon bisulphide, from which it is deposited as (2) red translucent monoclinic crystals, soluble in carbon bisulphide, (3) blue-gray metallic selenium, insoluble in carbon bisulphide. This last form conducts electricity many times better when exposed to light, and the better the brighter the light.	The chloride (SeCl <sub>4</sub> ) shows a characteristic spark spectrum.
<b>Silicon.</b> Symbol Si. At. wt. 28.3. Valence IV. S. G. amorphous 2.0, crystalline 24.9. M. P. 1200°. B. P. ca. 3500°.	Occ.—as silicon dioxide (SiO <sub>2</sub> ) occurs as flint, quartz, quartz sand, etc. The igneous rocks are composed largely of silicates, and the element constitutes over 25% of the earth's crust. Prep.—by reducing sand with coke in the electric furnace.	Amorphous silicon is a brown powder that burns when heated in air. Crystalline silicon forms black needles. It is less active than the amorphous variety and is attacked only slowly by a mixture of hydrofluoric and nitric acids. It unites with fluorine, however, at ordinary temperatures.	The "pigs" of silicon made at Niagara are used in steel-making. The ornamental variety of quartz find uses as gemstones. The element is used in the manufacture of several chemicals. Sodium chloride (NaCl) is a necessity of life to most animals; and is used in the manufacture of hydrochloric acid, chlorine and sodium compounds. Sodium carbonate (Na <sub>2</sub> CO <sub>3</sub> , 10H <sub>2</sub> O) or washing soda, and sodium hydroxide (NaOH) are used for cleaning, and in the manufacture of soap and chemicals. Baking soda is sodium bicarbonate (NaHCO <sub>3</sub> ). The sulphate (Na <sub>2</sub> SO <sub>4</sub> , 10H <sub>2</sub> O) is known as Glauber's salt; the bisulphate, by photophosphors, as "type." The nitrate and chloride are used in pyrotechny for red fire. All volatile compounds color the Bunsen flame red.
<b>Silver.</b> Symbol Ag. At. wt. 107.88. Valence I. S. G. 10.53. M. P. 960°. B. P. 2050°.	Occ.—native, as sulphide (Ag <sub>2</sub> S) often associated with galena; chlorides (AgCl), etc. Prep.—from lead by the Pattinson or the Parkes process; from the ore by the Mexican and other processes.	A white, highly lustrous, tough, very ductile and malleable metal, the best conductor of heat and electricity known. Liquid silver dissolves oxygen. It is unaffected by the oxygen of moist air, and its tarnishing is due to the action of hydrogen sulphide. It dissolves in dilute nitric and is concentrated hot sulphuric acid. A silver-white metal, as soft as wax, that may be welded at ordinary temperatures. Like potassium it is very active, uniting directly with many other elements, and attacking water vigorously in the cold.	It is employed for articles of use and of ornament and for coinage. U. S. sterling silver contains 90% silver, with 10% copper. Lunar caustic is silver nitrate. This salt and the halides of silver are extensively used in photography. For electroplating, a bath of potassium argenticyanide [KAg(CN) <sub>2</sub> ] is used.
<b>Sodium.</b> Symbol Na. At. wt. 23.00. Valence I. S. G. 0.97. M. P. 98°. B. P. 742°.	Occ.—in the sea as chloride (NaCl) in salt deposits as chloride, borate, nitrate; in many complex silicates in rocks. Prep.—by electrolysis of fused sodium hydroxide (NaOH).	A white metal, softer than calcium and harder than sodium, tarnishing to a yellow tinge. Like calcium, it is active enough to attack water vigorously in the cold.	The metal is used in the manufacture of several chemicals. Sodium chloride (NaCl) is a necessity of life to most animals; and is used in the manufacture of hydrochloric acid, chlorine and sodium compounds. Sodium carbonate (Na <sub>2</sub> CO <sub>3</sub> , 10H <sub>2</sub> O) or washing soda, and sodium hydroxide (NaOH) are used for cleaning, and in the manufacture of soap and chemicals. Baking soda is sodium bicarbonate (NaHCO <sub>3</sub> ). The sulphate (Na <sub>2</sub> SO <sub>4</sub> , 10H <sub>2</sub> O) is known as Glauber's salt; the bisulphate, by photophosphors, as "type." The nitrate and chloride are used in pyrotechny for red fire. All volatile compounds color the Bunsen flame red.
<b>Strontium.</b> Symbol Sr. At. wt. 87.63. Valence II. S. G. 2.55. M. P. ca. 800°.	Occ.—as strontianite (SrCO <sub>3</sub> ) and celestine (SrSO <sub>4</sub> ). Prep.—by electrolysis of the fused chloride.	A white metal, softer than calcium and harder than sodium, tarnishing to a yellow tinge. Like calcium, it is active enough to attack water vigorously in the cold.	The nitrate and chloride are used in pyrotechny for red fire. All volatile compounds color the Bunsen flame red.

## CHEMICAL ELEMENTS—Continued

NAME, WITH CERTAIN DATA	OCCURRENCE AND PREPARATION	PROPERTIES	CHIEF COMPOUNDS AND USES
<b>Sulphur.</b> Symbol S. At. wt. 32.07. Valence II, IV and VI. S. G. 2.06. Monoclinic 1.96. M. P. rhombic 112.4°, monoclinic 119°. B. P. 444.9°.	Occ.—native, in combination with most metals as sulphides, and with some metals as sulphates. Prep.—by melting the free sulphur away from the rocky matrix, and subsequent purification by distillation.	Natural sulphur is rhombic in crystalline form, yellow, brittle, of vitreous luster, and a poor conductor of heat and electricity. This and the monoclinic variety are soluble in carbon bisulphide, while amorphous sulphur is not. When heated, sulphur unites directly with most of the other elements.	Sulphur is used to prepare sulphur dioxide ( $\text{SO}_2$ ), which is used in making sulphuric acid and in bleaching; also, in the manufacture of vulcanizing rubber and in the manufacture of black gunpowder, fireworks and matches. Sulphuric acid ( $\text{H}_2\text{SO}_4$ ) is the chemical industry which iron is to engineering.
<b>Tantalum.</b> Symbol Ta. At. wt. 181.0. Valence II, IV and V. S. G. 16.6. M. P. bet. 2250° and 2300°.	Occ.—in tantalite and many other rare minerals. Prep.—by the action of sodium on sodium tantalochloride ( $\text{NaTaCl}_6$ ).	A hard silver-white metal, ductile and malleable when hot, of very high tensile strength. The hot metal can absorb 740 volumes of hydrogen. It is not attacked by aqua regia.	The metal is used for filaments for electric lamps, which possess twice the efficiency of the carbon filament lamp.
<b>Tellurium.</b> Symbol Te. At. wt. 127.5. Valence II, IV and VI. S. G. 6.25. M. P. 449°. B. P. 1400°.	Occ.—free and as tellurides. Prep.—by reducing telluric oxide ( $\text{H}_2\text{TeO}_6$ ) by means of sulphur dioxide.	The crystalline variety is white, has metallic luster, and conducts heat and electricity. The precipitated variety is black and of lower density. The element is related to sulphur but is more metallic in character.	The compounds find few applications. Telluric acid ( $\text{H}_2\text{TeO}_6$ ) has basic as well as acid characters, in keeping with the position of the element between metals and nonmetals.
<b>Terbium.</b> Symbol Tb. At. wt. 158.9. Valence III.	Occ.—in gadolinite, samarskite, and other rare minerals. Prep.—the metal has not been prepared.		The salts show no absorption spectrum.
<b>Thallium.</b> Symbol Tl. At. wt. 204.0. Valence I and II. S. G. 11.5. M. P. 303°.	Occ.—in crocoisite, and in small quantities in many samples of iron pyrites. Prep.—it is precipitated by zinc from a solution obtained by suitable treatment of the dust from sulphuric acid works.	A bluish-white lead-like metal, rather soft, malleable, but of low tensile strength. It decomposes water rapidly at red heat, and dissolves in dilute acids.	It forms two sets of salts, the thallous (e.g., $\text{TlCl}$ ) and the thallic (e.g., $\text{TlCl}_3$ ). All the compounds show a characteristic green line in the spectrum.
<b>Thorium.</b> Symbol Th. At. wt. 232.0. Valence IV. S. G. 11.0.	Occ.—in monazite sand. Prep.—by reducing potassium thorium chloride with sodium, or by electrolysis of the chloride in a mixture of fused potassium and sodium chlorides.	A metal with the color of nickel, that can be burnt in air. Hydrochloric acid attacks it but slowly.	The nitrate ( $\text{Th}(\text{NO}_3)_4 \cdot 6\text{H}_2\text{O}$ ) is used in making Welsbach incandescent mantles, which consist of 99% of $\text{ThO}_2$ . All the compounds are radio-active.
<b>Thulium.</b> Symbol Tm. At. wt. 168.5. Valence III. M. P. 1700°.	Occ.—in gadolinite and other yttrium minerals.		The salts are of a pale bluish color which is destroyed very easily by minute quantities of cerium.
<b>Tin.</b> Symbol Sn. At. wt. 118.0. Valence II and IV. S. G. 7.3. M. P. 232°. B. P. ca. 1600°.	Occ.—as cassiterite ( $\text{SnO}_2$ ). Prep.—after roasting, the ore is reduced by heating with carbon.	A silver-white, rather soft, very malleable and ductile metal, practically unchanged in air. When heated, it may be burned in air. Dilute nitric acid is the only dilute acid that attacks it rapidly. When kept long at temperatures below zero C., ordinary tin changes to a brittle gray powdery modification. This form is the stable one below 20°.	Large quantities of tin are used in the tinning of iron for tinplate. It is a constituent of the alloys Bismutella metal, pewter, solder, bronze, and type metal. Two sets of salts, stannous (e.g., $\text{SnCl}_2$ ) and stannic (e.g., $\text{SnCl}_4$ ). "Pink salt" ( $\text{Na}_2\text{SnCl}_6$ ) is used in dyeing. "Mosaic gold" is $\text{SnAu}$ .
<b>Titanium.</b> Symbol Ti. At. wt. 48.1. Valence II, III and IV. S. G. 4.5. M. P. below 1850°.	Occ.—as rutile ( $\text{TiO}_2$ ) and in titanite iron ore ( $\text{FeTiO}_3$ ). Prep.—by reducing the chloride ( $\text{TiCl}_4$ ) by means of sodium.	A hard, brittle metal, resembling polished steel in appearance, that may be forged at a low red heat. It dissolves in dilute sulphuric acid, and decomposes steam at 800°. It unites easily with nitrogen.	The element is very widely disseminated, though in small quantity. It is contained in the ashes of all plants.
<b>Tungsten.</b> Symbol W. At. wt. 184.0. Valence II, IV, V and VI. S. G. 19.3. M. P. ca. 2800°.	Occ.—as wolfram ( $\text{FeWO}_4$ ) and as scheelite ( $\text{CaWO}_4$ ). Prep.—by reducing tungstic acid ( $\text{H}_2\text{WO}_4$ ) by carbon at a high temperature.	A hard, brittle, gray metal, attacked by chlorine only at 250°, although it can be caused to burn in air. It is slowly acted upon by dilute acids and even by water.	The metal is used for the filaments of incandescent electric lamps, giving an efficiency of 1.3 watts per candle power. Tungsten steel has 8% W. Sodium tungstates are used as mordants in dyeing.
<b>Uranium.</b> Symbol U. At. wt. 238.5. Valence III, IV, V and VI. S. G. 18.7. M. P. ca. 1500°.	Occ.—as pitchblende, which contains $\text{U}_3\text{O}_8$ . Prep.—by reducing the oxides with aluminium.	A white lustrous metal, tarnishing in air and attacking water slowly in the cold. It combines directly with many of the other elements.	All the compounds of uranium are radio-active in proportion to their uranium content. Glass to which uranium compounds have been added shows a greenish-yellow fluorescence.
<b>Vanadium.</b> Symbol V. At. wt. 51.06. Valence II, III, IV and V. S. G. 6.5.	Occ.—in a few rather rare minerals. Prep.—by reduction of the dichloride ( $\text{VCl}_2$ ) in hydrogen.	A silver-white lustrous metal harder than quartz. It does not tarnish nor attack water at ordinary temperatures, but can be burnt in oxygen.	Vanadium added to steel in even small quantity (0.2%) increases the tenacity and elastic limit without reducing the ductility.
<b>Xenon.</b> Symbol Xe. At. wt. 131.2. Valence 0. B. P. 109°.	Occ.—in minute quantity in the air, less than one volume in 100 millions. Prep.—by fractionation of liquid argon.	A transparent, colorless and odorless gas, very inert like its congener argon. It is the densest of the argon family.	It forms no compounds.
<b>Ytterbium (Neodyterbium).</b> Symbol Yb. At. wt. 173.0. Valence III.	Occ.—in gadolinite, euxenite and other rare minerals. Prep.—the metal has not been isolated.		The compounds show a characteristic spark spectrum.
<b>Yttrium.</b> Symbol Y. At. wt. 88.9. Valence III.	Occ.—in gadolinite, euxenite and other rare minerals. Prep.—by electrolysis of sodium yttrium chloride.	A gray lustrous metal.	The chloride yields a characteristic, though complex, spectrum.
<b>Zinc.</b> Symbol Zn. At. wt. 65.37. Valence II. S. G. 6.9 to 7.2. M. P. 419.5°. B. P. 927°.	Occ.—as zinc blende ( $\text{ZnS}$ ), calamine ( $\text{ZnCO}_3$ ), zincite ( $\text{ZnO}$ ), etc. Prep.—after roasting, the ore is reduced by coal, the metal distilling off.	A bluish-white, lustrous, brittle metal, that is malleable and ductile at 120°. It tarnishes in moist air, attacking water slowly in the cold and rapidly when heated in steam. It dissolves in dilute acids and in sodium hydroxide solution.	Sheet zinc is used for roofs and gutters. Iron is galvanized by dipping it in molten zinc, and so protected from rusting. Zinc is used for galvanic batteries and alloyed with copper, to make brass. The salts are used in medicine; the chloride and sulphate yield antiseptic solutions.
<b>Zirconium.</b> Symbol Zr. At. wt. 90.6. Valence IV. S. G. 4.1.	Occ.—as zircon ( $\text{ZrSiO}_4$ ). Prep.—by reducing the oxide ( $\text{ZrO}_2$ ) with carbon in the electric furnace.	A hard gray metal, remaining bright in air and only slowly oxidized at a white heat. It is dissolved by aqua regia and by caustic potash solution.	The oxide is contained in some incandescent gas mantles.

**THE CHEMISTRY OF FOODS.**—Food is anything which, taken into the alimentary canal, furnishes heat and energy to the system, repairs waste and builds tissue.

The common idea of food is confined to solid or semisolid foods having the above properties. Liquid foods are usually spoken of as drinks or beverages. Condimental substances, such as salt, pepper, spices, etc., are generally segregated from the ordinary classification of foods. There is a legal definition of foods found in the act of Congress of June 30, 1906, which is as follows:

"The term 'food,' as used herein, shall include all articles used for food, drink, confectionery, or condiment by man or other animals, whether simple, mixed, or compound." This comprehensive definition will be followed in this article.

**Kind of Foods.**—According to their predominant characteristics for nutritive purposes, foods are recognized as of the following kinds:

**Nitrogenous.**—Food material containing nitrogen as a distinctive element. The common names, *protein* or *protein* is applied to this class of foods. Most of the true protein foods also contain sulphur as an essential ingredient. Examples of characteristic protein foods are found in lean meat, white of egg, gliadin of wheat, hordein of barley, zein of maize, etc. Among the liquid foods, milk contains casein, which is a most important ingredient, and albumen, a protein food soluble in cold water. Other forms of protein are insoluble in cold water but are soluble in salt solutions, alcohol, etc. By means of these various solvents protein matter can be separated into different classes. Protein food is often described as a tissue builder, but this is not a strictly correct classification. Only certain tissues of the body, such as the muscle, the nerve and the brain, are composed largely of protein. Tissues such as fat and bone are composed largely of other substances.

**Starch and Sugar.**—Carbohydrates form by far the largest bulk of human foods. They are typically represented by starch and sugar. There are many carbohydrates in foods, however, which are more or less useful but not important as regards quantity or digestibility. The so-called woody tissues and fiber in foods are composed of carbohydrates, but these are of more importance for the nourishment of domesticated animals than for man. For practical purposes the term *carbohydrates* applied to human foods embraces only starch and sugar. These substances in a pure state are characterized by being free of both nitrogen and sulphur, which are, as above stated, the most distinctive constituents of protein. They consist solely of carbon, oxygen and hydrogen, the oxygen and hydrogen existing in the proportions to form water.

**Kind of Sugars.**—Sugars are of various kinds, the most important for human nourishment being the substance known as cane sugar, which has the composition of  $C_{12}H_{22}O_{11}$ . Sugar is an abundant product of almost every plant. It is stored especially, however, in some certain plants in such a manner as to become available for extraction. The principal sugar producing plants are the sugar cane, sugar beet, the maple, and the sugar palm. Practically all the sugar of commerce comes from the sugar cane and the sugar beet. The amounts made from other sources are insignificant. In addition to cane sugar there are other varieties of sugar derived

from starch. Among these perhaps the most important for dietetic purposes is maltose. Maltose is a sugar derived from starch in the process of the sprouting of the grains containing starch, or by acting upon starch by sprouted barley (malt). The starch of cereal grains is largely converted into maltose by the ferment of the malt. Starch is also converted into sugar by the ferments of the digestive organism. The saliva begins this conversion and it is completed in the intestinal tract, especially in the small intestine. Starch is also converted into sugar by the action of a dilute acid at a high temperature, and the sugar thus formed is known as dextrose. Glucose, cane sugar, maltose and dextrose are all valuable foods, furnishing particularly heat and energy. Starch, as such, is not available for nutritive purposes, being insoluble and incapable of assimilation. There are many other forms of sugar or sugar-forming substances found in plants, among them levulose, the companion of dextrose, found in levulon particularly in the dahlia, artichoke and certain cacti. When cane sugar is eaten or when it is treated with a dilute acid it is converted into a mixture of equal parts of dextrose and levulose. Honey is sugar exuded by the blossoms of plants and collected and stored by bees, and consists chiefly of cane sugar which has been converted as described above by nature or the bees and hence is a mixture of approximately equal parts of dextrose and levulose.

**Glycerides.**—Fats are also important foods, furnishing weight for weight a larger quantity of heat and energy than any other food product. Fats exist in various forms. When they are solid or semisolid at ordinary temperatures they are called *fats*; when they are liquid at ordinary temperatures they are called *oils*. Among the fats some of the most important for food purposes are butter, lard and tallow; among the oils, olive, cotton-seed, peanut and sesame. The fats are chemically known as glycerides, being a compound produced by the union of a fat acid and glycerine. In the fresh, pure state they contain but little free acid, but on standing for a long time larger quantities of free acid are found. The rancidity of the fat, however, does not depend solely upon its quantity of free acid, but upon other conditions due probably to bacterial or enzymic action. Warmth and light tend to render fats and oils rancid, while keeping them cool and in the dark tends to preserve them from rancidity.

**Minerals.**—The fourth class of foods are those of a mineral character, namely, foods which are essentially composed of mineral substances. Among the most important of the mineral foods in the nutrition of man are phosphorus and lime. These two bodies go to make up the greater part of bone tissue and are found as essential ingredients in many parts of the body. Phosphorus and lime are not usually found in any concentrated form in food products, but are distributed in small quantities in nearly all foods. The phosphorus which nourishes the body is ingested usually in an organic combination and not as phosphoric acid. Certain food products, as, for instance, cereals and eggs, are particularly rich in organic phosphorus. Lime is found in nearly all food products and especially in cereals and wheat.

Mineral substances other than phosphorus and lime are also useful to some extent in nutrition, as, for instance, iron, potash, and soda, the latter being valuable

more for their incidental properties than because of their occurrence in the tissues of the body. In other words, it may be said that the blood in order to perform its functions must have a certain saline content, without which its circulation and the carrying of food to all parts of the body would be impossible. These saline materials, although not entering into the tissues of the body, must be regarded as essential parts of our food.

**Condimentals.**—Condiments are useful more for their effect on palatability than for purposes of pure nutrition. Palatability, however, has important relations to digestion, and hence condiments are properly classed as foods. Most condimental substances have some nutritive properties, containing as they do more or less starch, sugar, protein and fats. Vinegar, of which the most important ingredient is acetic acid, furnishes a certain degree of heat and energy, inasmuch as all the acetic acid is burned in the body, the products being water and carbon dioxide. Salt does not enter into the tissues of the body but affords hydrochloric acid, which is essential to digestion. On the other hand, wood smoke, a valuable condiment, does not have any food value.

**Manner in Which Food Performs Its Functions.**—All food products ingested in the alimentary canal, if not already in a condition suitable for digestion, are prepared by previous mastication. The importance of the mastication of the food is shown by two facts: (1) The food in order to be digested must be properly subdivided; (2) the mixing of saliva with starchy foods is an important adjunct to digestion. In so far as meat foods are concerned, the admixture of saliva is perhaps of no importance in digestion, and the need of complete mastication is not so evident. The chief functions of food have been noted in the original definition. All foods taken into the body, with the possible exception of water and wood smoke, undergo profound modifications. The process of digestion is essentially a chemical one, and consists in the thorough destruction of the ingested forms of matter and the building up of entirely new combinations. Attention may be called, for instance, to the fact that the fat of the human body does not consist of any particles of the fat ingested in the food, but is a substance which is generated by combinations of particles of matter in the processes of digestion and assimilation. The tissues of the body, under a selective influence which is not fully understood, build out from the current of circulating blood those particular particles of matter which go to build them up and reject those which are of no use.

**Metabolism.**—The building of tissue, especially in the growing animal, is one of the chief functions of foods. When an animal has reached maturity it remains in practically the same condition for a number of years. In this condition the building of new tissues ceases and nature is satisfied with restoring those which are destroyed and excreted. This process of repairing waste keeps the adult body in a state of equilibrium for a given time, but as old age comes on the repair does not keep pace with the waste and the natural decadence of age ensues. The process of change, which food undergoes from its entry into the body until excreta are voided is called *metabolism*.

**Foods as Fuel.**—The next most important function of the food is to furnish heat

and energy. The human body is a pure machine and its functions depend upon a supply of heat and energy just as much as a boiler or an engine. Foods furnish heat in varying quantities as already indicated. Starch and sugar furnish about 4,000 units of heat per unit of weight; proteid matter, if completely burned, furnishes about 5,500 units of heat per unit of weight; fats, when completely burned, furnish about 9,300 units of heat per unit of weight. In point of fact, however, proteid matter is not completely burned in the body, and a considerable amount of nitrogen is excreted without being reduced to the last state of oxidation. Hence, proteid matter does not furnish any more heat during the process of digestion and assimilation than an equal amount of carbohydrates, so that the heat value of a proteid, in so far as the human machine is concerned, is practically the same as that of a sugar or a starch, while the value of a particle of fat is two and a quarter times greater than that

under high pressure. The apparatus is so arranged that by means of platinum wire, or other appropriate device, the food substance may be ignited in the atmosphere of oxygen and burned completely into final forms of oxidation, producing water, carbon dioxide, nitric, phosphoric and sulphuric acids, according to the relative quantities of the various constituents present. Before igniting the particle of food, the whole apparatus is set in a measured quantity of water at a known temperature and the rise of temperature attained is carefully noted by a standard thermometer. This apparatus is called a calorimeter. In this manner the accurate data which have been mentioned are obtained.

**The Body a Furnace.**—An exactly similar process goes on in the human organism, though slowly, and experiments have shown that the data obtained by the calorimeter are entirely comparable with those obtained in the organism. This has

**Balanced Ration.**—Experience has shown that man eats from choice certain quantities of the kinds of food mentioned, and in a certain definite proportion. While the dietaries of different nations differ, it may be stated that men in the same ranks of life, having practically the same means of obtaining subsistence, live in a uniform manner the world over. It is possible, therefore, by experience and study to determine the normal diet of man. The total quantity of food which a man eats is usually determined by the heat units mentioned and known as *calories*. The average man eats an amount of food which produces a quantity of heat recognized by the expression *three thousand calories*. That is, if the food which the average man eats were burned, it would raise a unit volume of water from zero to a temperature of three thousand degrees. As water could not bear such a temperature, however, a better expression is that the food of an average man per day would raise the temperature of three thousand unit weights of water one degree.

A study of these data show that not only is the human organism a machine but it is the most economical machine known. This is true of the animal organism in general and not of the human system in particular.

A balanced ration may be regarded as that quantity of food which will furnish three thousand units of heat, and so distributed among the various kinds of foods as to secure the proper proportions of protein, carbohydrates, minerals, condiments, and fats. This quantity of food, if deprived entirely of its water, represents about one per cent of the weight of the individual eating it. In other words a man weighing 150 pounds in ordinary circumstances, and at light physical employment, eats one per cent of his weight of dry food a day, that is, one and a half pounds of dry food. As the ordinary foods used, however, contain about three times as much water as they do of dry substance, the total weight of food, including water, used by the average man of 150 pounds, is from four to five pounds per day.

**Average Distribution of the Dry Food.**—Assuming that the average man eats one and a half pounds of dry food per day, experience has shown that this is distributed in about the following proportions:

Proteid..... 0.25 lb.  
Fat..... 0.2 lb.  
Carbohydrates..... 1.0 lb.  
Mineral matter, etc..... 0.05 of a lb.

The above data are to be considered only as approximate expressions in round numbers of the general distribution of the diet of an ordinary person.

**Adulteration of Food.**—Adulteration of food has been largely practiced for the purpose of commercial gain. In so far as nutrition and palatability are concerned, and from the common point of view of the consumer, there is no possible excuse for adulteration of any kind. The sole purpose of the practice of adulteration is to secure unearned profit for the manufacturer and dealer. Adulteration of food is practiced in various ways, the most common of which are as follows:

- (a) *The abstraction of some valuable ingredient.* This is illustrated in the skimming of milk and the sale of the product as a whole milk.
- (b) *The addition of some agent which dilutes or weakens the product.* This is shown in the addition of water to milk;

of either a proteid or a carbohydrate. **The Calorimeter.**—A simple method of calculation is pursued in measuring heat value. A particle of food is inclosed in a strong steel vessel, called a bomb, and into this vessel oxygen is pumped

been proved by inclosing a human being in a tight compartment by means of which all the heat and all the products of combustion which are produced in his organism are measured. This experiment shows how complete a machine the human organism is.

of chieftain to coffee; of ground shells to pepper and other spices, etc.

(c) *The concealing of inferiority of a product.* This is done chiefly by coloring or bleaching, as for instance, the use of color in a distilled vinegar to make it appear like cider vinegar; the addition of an artificial flavor to an extract to make it resemble the genuine article; the bleaching of flour to make it look like high-grade patent flour, etc.

(d) *The addition of a substance to a food product which may render it injurious to health.* This is practiced chiefly for the purpose of preserving foods, though some of the coloring matters employed are undoubtedly injurious to health, such as sulphate of copper and many coal-tar dyes. Many authorities on hygiene are of the opinion that any kind of a preservative drug added to a food product is injurious. The reason for this belief is that a preservative only acts by destroying or paralyzing germ life and a preservative is only effective when enough of it is added to secure this effect. It is a very common opinion among experts, especially those charged with the protection of the public health, that all such practices are objectionable. On the other hand, there are experts, also eminent in their professions, who maintain that the use of preservatives is not deleterious. All nations that have food laws have either forbidden or restricted the use of these preservative materials, and this shows that the feeling of the community is decidedly opposed to them. When it is further considered that every kind of food which is suitable for human consumption may be perfectly preserved in some unobjectionable way without the use of preservatives, it is evident that their employment is wholly unnecessary and, therefore, always objectionable.

**Misbranding of Food Products.**—Almost as objectionable as adulteration is the practice of misbranding. As in the case of adulteration, this is done solely to secure undeserved profits on the part of the manufacturer or dealer. From the consumer's point of view there can be no excuse offered for the misbranding of foods. This misbranding takes various forms of which the following are some examples:

(a) *Misbranding as to the state or country in which the food is produced,* as, for instance, representing a domestic wine as of foreign manufacture, either by name or other device.

(b) *The giving of a false or fictitious name of manufacturer.* This is a very common practice among those who make different grades of products. Their own names are placed on the high grades and the names of fictitious firms on the low grades.

(c) *The calling of adulterated food by the name of the real article,* which is probably the most common form of misbranding, and is illustrated in the sale of milk which has been skimmed and watered as milk; a buckwheat flour which has been mixed with other materials as buckwheat flour, and maple sirup mixed with other sweets as maple sirup.

(d) *The misrepresentation of the qualities of a food product under another form of misbranding.* It is not uncommon to see advertisements calling attention to "superior qualities" which the article does not possess, such as "the most wholesome," "best made," "entire substitute for," etc. A most dangerous practice, and one which threatens health and often life, is found in

the claims made for certain varieties of infants' and invalids' foods. Another very common form of misbranding is where long stored foods are advertised as fresh—a form of misbranding which is now receiving attention in all the countries of the world, and regulations are being made looking to the minimizing of this evil. Infants' and invalids' foods of all others, should be pure, wholesome and free from misbranding and adulteration.

**ENTOMOLOGY.**—The branch of zoology which treats of the insects. The true insects are those animals of the division *Arthropoda* or *Articulata* distinguished from the other classes of the division by the fact that the three divisions of the body—the head, thorax, and abdomen—are always distinct from one another.

There are never more than three pairs of legs in the perfect insect, and these are all borne upon the thorax. The wings are expansions of the sides of the second and third sections of the thorax, and are attached by slender tubes called *nerve*s. In the beetle the anterior pair of wings becomes hardened so as to form protective cases for the posterior membranous wings, and are called in this condition *elytra* or *wing-cases*. The head is composed of several segments amalgamated together, and carries a pair of feelers or *antennae*, a pair of eyes, usually compound, and the appendages of the mouth. The thorax is composed of three segments, also amalgamated, but generally pretty easily recognized.

The organs of the mouth take collectively two typical forms, the masticatory and the suctorial, the former exemplified by the beetles, the latter by the butterflies, in which the mouth is purely for suction.

Generally the young are very different from the full-grown insect, and pass through a *metamorphosis* before attaining the mature stage. When this metamorphosis is complete it exhibits three stages—that of the larva, caterpillar, or grub, that of the pupa or chrysalis, and that of the imago or perfect winged insect.

**Classification.**—Insects have been divided into three sections—*Ametabola*, *Hemimetabola*, and *Holometabola*, according as they undergo no metamorphosis, an incomplete one, or a complete one.

**Ametabola.**—The young of the *Ametabola* differ from the adult only in size. They are all destitute of wings; the eyes are simple and sometimes wanting. This section is divided into three orders—*Anoptera* (lice), *Mallophaga* (bird-lice), and *Thysanura* (springtails).

**Hemimetabola** undergo an incomplete metamorphosis, the larva differing from the imago chiefly in the absence of wings and in size. The pupa is usually active, or if quiescent capable of movement. The section *Hemimetabola* comprises the orders *Hemiptera* (cicadas, bugs, plan-lice, etc.), *Orthoptera* (cockroaches, crickets, grasshoppers, locusts, carwigs, etc.), and *Neuroptera* (dragon-flies, May flies, white ants, etc.).

In the *Holometabola* the metamorphosis is complete, the larva, pupa, and imago differing greatly from one another in external appearance and habits. The larva is wormlike and the pupa quiescent. The *Holometabola* comprises the orders *Aphaniptera* (fleas), *Diptera* (gnats, botflies, gnat-flies, mosquitoes, house flies, etc.), *Lepidoptera* (butterflies and moths), *Hymenoptera* (bees, wasps, and ants), *Strepsiptera* (stylops, minute and parasites), and *Coleoptera* (lady-birds, glow-worms, cock-

chafer, weevils, and all of the beetle tribe). [See Dictionary of Animals.]

**ETHNOLOGY.**—Anthropology is that science which studies man. Taken in its most comprehensive significance it includes so great and such diverse material that it is necessary to subdivide it. Four main divisions are usually recognized—*somatology*, *ethnology*, *ethnography*, *culture history*. *Somatology*, sometimes called *physical anthropology*, considers man as a living organism, in himself and in his relations to other animal forms. It involves, anatomy, physiology, psychology. *Ethnology* and *ethnography* deal with races; the former is a philosophical, the latter a descriptive science. The difference between them is the same as that between *geology* and *geography*.

**Place Among Sciences.**—*Ethnology* is based on *somatology*; it defines the different races of mankind; it studies the great questions of origin, variation and distribution. *Ethnography* describes the different populations of mankind; it seeks to give a definite picture of the life and culture of each and every division of the human race; it deals little in theories, much in facts. *Culture history* studies the development of culture from lowest savagery to highest civilization; it is constructed from the facts supplied by *ethnography*.

**The Scope and Field of ethnology** may be briefly indicated. The philosophical study of the human race involves investigation of the origin of mankind; it attempts to reconstruct the primitive type of man; it aims to locate man's first home; it defines the definite types and varieties of the human species; it seeks to follow the movements of mankind from its first home, and to present the facts of the present distribution of human varieties.

**Origin of Man.**—To-day, science assumes evolution as an underlying principle. Man is commonly recognized as an exception to the general rule. He is part of animate creation, and is related by genuine ties of blood with other animals. His closest relatives are the various species of anthropoid apes living to-day in Africa, in southeastern Asia, and the adjacent islands. There are four types which so much resemble man as to deserve the name of anthropoid apes—the gorilla, chimpanzee, orang-utan, and gibbon. The gorilla and chimpanzee live in tropical Africa; the orang-utan and the gibbon live in the islands southeast from Asia, and in the neighboring portions of the continent. The gorilla is the largest of the four types, the different gibbons the smallest; all resemble man, but perhaps the nearest approach is in the chimpanzee and the orang-utan. Neither Darwin nor his followers have claimed that man is descended from any of the living types of anthropoids; they and he alike have descended from a common ancestor; they are collateral relatives.

**Unity of Mankind.**—The old question of monogenesis is no longer one of serious importance. Monogenesis is the doctrine that all men have descended from a single stock; that all are of one blood. The counter-proposition that the different races of man have absolutely different origins, that they are different in blood, that all men are not brothers, is called *polygenism*.

In the early days of ethnology the battle between these two views was bitter. Naturalists held the fixity of plant and animal species. It was recognized that within the range of a single species there might be

alike. When we compare the different ethnological schemes with one another, we usually find that they meet both these ends with fair success. All bring together groups which are alike, and but rarely do natural relationships of peoples seem to be disjointed.

We should recognize the same differences that Keane does, but shall apply to them the terms *Ethiopic*, *Mongolic*, *American*, and *Caucasic* races.

**Characters of Race.**—Topinard attempted to define the race types of the world. His study was the most careful and precise undertaken to that time. He based his types of races absolutely upon physical characters and made five features fundamental. These were the *stature*, *head form*, *nose*, *hair*, and *color*.

**Stature.**—In stature, man ranges from the tall Patagonian, with an average of six feet or more, to the pygmies of central Africa and the Negro of the Asiatic archipelago. Among all races there is no difference in stature, and, in general, it may be said that the female will average one-sixteenth less than the male. In stating that any race or people is of a given stature it is meant that the average of stature in adult males is to be understood. The average stature of mankind is perhaps 1.65 meters.

The term *pygmy* is applied to the populations of smallest stature and the French writers have agreed to call all populations *pygmy* where the average stature of adult males does not exceed 1,500 millimeters. Sir William Flower set the limit for pygmy stature in English measure at 5 feet, which is practically the same thing. The ethnologist divides people on the basis of stature into tall tribes (1,700 mm. and up) medium (1,600 to 1,699 mm.) and short (below 1,600 mm.).

**The Head Form** is difficult to define in words. To convey it to the mind, certain measures are taken and a numerical statement made. The two most important head measures are the length and breadth. Actual length and actual breadth, however, have but little value, and it is common to compare the two, expressing the ratio between them in what is known as an index.

Two head indices are commonly employed, one of which expresses the relation between the length and breadth of the skull and the other the relation of length and breadth upon the living subject. To the former the name *cranial index* is given; to the latter that of *cephalic index*. These indices are found by the same method, which is to divide the breadth by the length and drop the decimal point. Thus, if a skull measured eight inches in length and six inches in breadth, the cranial index would be 75. If, on a living head, the length were seven and one half inches and the breadth five inches, the cephalic index would be 66½. There are no normal skulls with an index so low as 50 or so high as 100; i. e., there are no normal skulls which are twice as long as they are broad, or which are as broad as they are long.

The indices are constantly employed in the defining of human races. The actual range as found in the averages of races is 69.4 to 88.7. Special terms are used to indicate the head form. Thus brachycephalic (85.3 and up), mesocephalic (85.2 to 77.1), dolichocephalic (below 77.1). The Arnenians are for the most part brachy-

cephalic with an index of 85.6; the Eskimo are dolichocephalic (76.8).

**Nose.**—The form of nose is one of the best distinguishing characters of race. Here again, an index is calculated from two measurements—height and breadth. The nasal index is found by dividing the breadth of the nose by the height and dropping the decimal point. The range is from 69.4 to 107.9. A nose as wide as it was high would have a nasal index of 100; one which was half as broad as high an index of 50. Individuals with an index of 100 or more are not uncommon among negroes.

On the whole, the white peoples of Caucasian race have the narrowest and most prominent noses. Three terms are used in connection with the nasal index—leptorhinian (below 70), mesorhinian (70 to 84.9), platyrhinian (85 and up). The northern type of European is leptorhinian, the Negro of the Philippines is platyrhinian.

**Hair** is one of the most distinctive marks of race. Huxley made it fundamental in his classification, and recognized two main divisions of mankind—the straight haired and the woolly haired. Various points should be observed regarding it. As regards its general form, hair may be straight, wavy, curly, crinkly or woolly. In cross section, it may be circular, oval or elliptical, or flattened. White peoples, generally, have hair oval or elliptical in cross section; yellow peoples have hair with circular cross section; and blacks have distinctly flattened hair.

Hair differs racially in diameter, texture, abundance, distribution and angle of emergence. There are marked differences between races in the matter of calvity (baldness) and canity (graying). There are notable differences also in distribution and in the quantity and development of face hair. In color, race differences of hair lead to the employment of the terms black, brown, medium, light and blond. Red hair is found exceptionally among all races, but is typical of some sub-types. There are actually two types of red hair, one of which is blond, the other a variety of black.

**Skin Color.**—The color of the skin varies with race. Its differences are so striking that they have attracted universal attention and in many attempts at classification the color basis is fundamental. It is difficult to suggest a serviceable series of color terms. There are no actual black populations and no truly white ones. For a careful discrimination, color scales are necessary, and ethnologists quite generally use a series of fixed color samples which they match with the skin of the subjects studied. The best known chromatic scale for use in race study is that of Broca, where some thirty-four shades are discriminated. In ordinary practice a list of half a dozen terms is employed.

**Four Great Races.**—The four great races may be characterized as follows:

**Ethiopic.**—Color, from brown to almost black; generally dolichocephalic; forehead, frequently retreating with heavy arches over the orbits; prognathic—i. e., the lower part of the face notably projecting; the cheek bones do not project notably forward and anteriorly; the nose is broad and flattened, platyrhinian; the eyes are large and prominent and lustrous, dark brown or black in color; the hair is black, frizzly or woolly; and presents a flattened cross section; the

stature is above the average of mankind at 5 feet 10 inches. The pygmy populations differ from the normal Ethiopic type in stature, in head form, tending toward brachycephaly, and in hair color, frequently a reddish brown.

**Mongolic.**—Color, a lighter or darker yellow; brachycephalic; the forehead fairly developed and without conspicuous orbital arches; the general impression given by the face is flatness and broadness with prominent forward development of the cheek bones; the nose is generally small and mesorrhine; the eyes black, with narrow almond-shaped opening, which appears to be oblique on account of a fold of skin at the inner edge; hair black, lank, coarse, circular in cross section; stature below the average at 5 feet 4 inches.

**American.**—Color, brown with a reddish or yellowish tinge; mesocephalic; large, coarse features; forehead well developed and usually slight prognathism; cheek bones are prominent; nose mesorrhine, prominent, large, often aquiline; eyes small, round, straight, sunken, black; hair, black, lank, coarse, long, round; the face is usually beardless and there is little body hair; stature above the average at 5 feet 6 inches.

**Caucasic.**—Color, ranging from white to almost black and presenting in white peoples distinctly fair and dark varieties; both types of head form occur, combined with both fair and dark colors; the face usually harmonizes in its form with the head form; prognathism rare; cheek bones not projecting; leptorhinian; eyes straight, rather large; hair, varying in color from light gray or blue to dark brown or black; hair, wavy, oval or elliptical in cross section, varying from flaxen to black; beard usually developed and body hair abundant; stature variable from tall to average.

**The Ethiopic Race** may be divided into continental and island divisions. The continental blacks occupy Africa from the Sahara desert southward. The insular group is found in Melanesia and it is customary to add the native population of Australia to this race. Both on the continent and in the islands, two sharply contrasted types are found—the large negroes and the small, or pygmy, populations.

**Pygmies.**—The pygmies present the typical hair, features and general character of the race, but in the average of adult males fall below 5 feet in stature. In central Africa they occur in little groups scattered over a wide area in the midst of large black peoples. They have practically no agriculture and depend on the chase for food, representing the culture stage of savagery. Their hair is frequently of a reddish or grayish brown. They are not to be considered a dwarfed or degenerate population, but a well-developed and active people of a type among the oldest known.

A curious condition of commensalism usually exists between these little people and their large neighbors. The populations among whom they live are settled agricultural peoples, living in large and well-built villages. The pygmy settlements are usually at the edges of these towns, and a constant trade exists between the two groups; the little people bring fresh meat, ivory, honey and other natural products and receive in trade field products, cloth, and iron.

To the little blacks of the island world, of whom those living in the Philippines

are typical, the name "Negrito" is usually applied. They present the same physical peculiarities, stage of culture, and mode of living. They live in practically the same relations with the neighboring Malays that the pygmies do with their large neighbors.

**Busmen.**—It is customary to group the Bushmen of southern Africa with the pygmies. They present some interesting points of difference. Their skin has a distinct yellowish tinge; they live in little wandering groups, taking refuge in caves and rock-shelters; they are hunters, but there is no distinct commensalism between them and their Bantu neighbors; their delight to mark their cavern walls with crude but lively representations of the animals they pursue. These peculiarities, to a less degree, mark the pygmies of central Africa. They are also found in the Hottentots, neighbors of the Bushmen, usually considered to be the result of intermarriage between them and the Bantu of the region.

**Negros.**—The large continental blacks have reached the stage of barbarism in culture, and live in good towns, depend upon the product of the fields (cultivated by women), or, especially toward the south, upon herds of cattle. Two great divisions are recognized—the true negro of the Soudan district and the Bantu populations farther south.

In the true negro the characteristics of the race already mentioned are carried to their fullest development; blackness, coarseness of features, flatness of nose, prognathism with accompanying thickness of lips, and dolichocephaly are emphasized in them. The Bantu present a fine, chocolate brown tint, more regular and, to the eye, pleasing features; prognathism is rarely pronounced and the head is by no means markedly dolichocephalic.

**Melanesians.**—In the islands, the large blacks include the Papuans of New Guinea and the Melanesians of Fiji, New Caledonia, the Solomons and other island groups. Their life is interesting and has been the subject of much study. Dark colored, woolly haired, dolichocephalic, platyrrhine and of good stature, they are actually comparable with the big blacks of Africa.

**The Mongolic Race** is the most populous of the divisions of mankind. There is reason to believe that of the great races it perhaps nearest approaches the primitive stock of humanity. It is vigorous, hardy, and expansive. Its primitive home is the great continent of Asia, which is still chiefly occupied by it. The race presents two chief divisions to which Keane gives the names Mongolo-Tatar and Tibeto-Indo-Chinese.

**The Mongolo-Tatar** is the northern in position. It has spread from Asia across northern Europe and occupies to-day the north of Russia and a considerable area in Scandinavia. To it belong the great wandering borders of Siberia—Mongols, Kalmyks, Buriats, Tungus, Yakuts and the like; to it also belongs the great Finn-Tatar group—with Tatars, Turki, and Ugrians. To this belong the Finns, Magyars and Bulgarians. In the far north are the Samoyeds and Lapps, the latter a people of small stature, who raise reindeer in the north of Sweden and Norway. To the great Mongolo-Tatar mass also belong the Koreans and the Japanese, relatives in blood and language. The Koreans are relatively pure Mongols, the Japanese much mixed with other elements, as we shall later see.

**The Tibeto-Indo-Chinese** division includes the Tibetans, the Chinese proper and the great mass of people in Indo-China and southeastern Asia, such as the Siamese, Burmese and the people of Annam. They are sedentary peoples, depending upon agriculture, with towns and cities, a dense population with distinctive culture, a true civilization. Linguistically, the southern group differs profoundly from the Mongolo-Tatar. Chinese and Japanese represent totally different types of language.

**Eskimo.**—Besides the two great divisions mentioned, the Mongolic race includes two interesting extra-continental groups—the Eskimo and the Oceanic Mongols, or Malays. Taxonomically, the Eskimo present a difficult problem. In color, face, features, stature—in fact, in the whole general impression—they are clearly Mongolic. But they are at the same time dolichocephalic; the Eskimo skull is one of the most sharply marked; it is long and narrow, has square jaws and ridged vault to the degree that, viewed directly from in front, it gives a distinct pentagonal outline.

The Eskimo occupy the whole arctic coast of North America from south and western Greenland to the western end of Alaska and overlap into eastern Asia. Throughout this enormous range of thousands of miles they present remarkable uniformity in type, language, and mode of life. The area occupied is chiefly American, not Asian; and the bulk of Eskimo population is found in the new world.

**Malays.**—The Oceanic Mongols, or Malays, occupy the islands of Malaysia, the Malay peninsula and a part of the great island of Madagascar off the east coast of Africa. Blumenbach considered the Malay one of the fundamental populations of mankind. It presents a fairly well-defined type, which, however, may be included in the Mongolic. The Malays and the Malayan peoples (for the word "Malay" proper is used chiefly in ethnology for those in the peninsula) are good seamen.

**The American Race.**—Keane refuses to recognize the Malays as distinct, but insists upon separating the American type from the Mongolic. For him they are an offshoot, but one of ancient date, which has had ample chance to develop peculiar characteristics in the American area. Contrasted with the other great races it presents a notable degree of physical uniformity. Writers have often said: "When you have seen one American Indian you have seen all!" "The American Indian presents the same type from the cold waters of the Arctic to the cold waters of Cape Horn."

This uniformity is striking but not absolute. Careful study shows tall and short tribes of American Indians, from the Patagonians, who are perhaps the giants of mankind, to Otomi, who almost touch the limit of pygmy height. There are long headed and short headed tribes, light and dark—from almost black to almost white; there are tribes with large faces and coarse features, like the Sioux, and tribes with soft and mild faces and delicate features, like the Chinantecs.

The American Indians present a notable uniformity in culture and it may be said that as a whole they are in barbarism. They represent every degree of barbaric culture from the lowest to the highest, and it may almost be said that not a single tribe of the many hundreds of American Indians represents either savagery or civilization. The rudest Athabascans of

British America had reached lower barbarism and the Asteas and Mayas of Mexico fall just short of civilization. While writers usually have claimed a single origin for the American peoples, it seems more reasonable to assume that immigrants have come by many routes from many regions. Within the new environment the fragments of old populations have approximated to each other until we have the present condition of relative uniformity.

**The Caucasian Race.**—The continent of Europe is chiefly occupied by people of Caucasian race. Light whites and dark whites are readily distinguished. No section of the world has presented more serious problems to the ethnologist and no race is more difficult of satisfactory discussion than the Caucasian.

So far as Europe is concerned, Ripley recognizes three races: the northern, which is fair, tall, dolichocephalic; the Alpine, which is short, dark, and broad headed; the southern or Mediterranean, which is short, dark and long headed. This classification is attractive for its simplicity. It seems indeed to be too simple, and with its acceptance, points of importance are lost from sight and real distinctions fail to be recognized. Deniker recognizes ten types of European whites speaking Aryan tongues, which he groups under six races and four sub-races. His characterization of these types is as follows:

- I. **Northern.**—Very lofty stature (5.73m.); dolichocephalic (73-79); fair; wavy hair sometimes reddish light eyes, usually blue; muddy white skin; long face; prominent, straight nose; e. g., Swedes.
- A. **Sub-Northerly.** Tall; mesocephalic; fair; straight hair; angular face; turned-up nose. e. g., Lithuanians.
- II. **Eastern.**—Short (1.63 m.); moderately rounded-headed (82-85); fair; straight light-yellow or fawn hair; light eyes; away skin; e. g., Russians.
- A. **Vulgaris.**—Very short; mesocephalic; fair; e. g., Poles.
- III. **Ibero-insular.**—Short (1.61 - 1.63 m.); dolichocephalic (73-76); dark; hair black, often curly; very dark eyes; away skin; straight or turned-up nose; e. g., Spaniards.
- IV. **Western, or Cevenole.**—Short (1.63-1.64 m.); very rounded skull (83-87); dark; brown or black hair; light or dark brown eyes; rounded face; thick-set figure; e. g., central French.
- V. **Littoral, or Atlantic-Mediterranean.**—Tall (1.66 m.); moderately dolichocephalic or mesocephalic (79-80); dark; hair and eyes very dark colored. Always near the Mediterranean coast.
- A. **Northerly.**—Tall; sub-dolichocephalic; chestnut hair, often brown; e. g., Welsh.
- VI. **Adriatic, or Dinaric.**—Tall (1.68 - 1.72 m.); brachycephalic (85-88); dark; brown or black wavy hair; dark eyes; straight eyebrows; elongated face; delicate, straight or aquiline nose; slightly away skin; e. g., Montenegrins.
- A. **Sub-Adriatic.**—Tall (1.66 m.); less brachycephalic (82-85); lighter hair and eyes; e. g., Luxemburgers.

There are truly European types, speaking related languages.

**Non-Aryan Whites.**—There are however other Caucasian peoples; thus, in the region of the Caucasus itself, a district of extraordinary mixture and ethnic confusion, are many interesting peoples. It is from this district of Georgians and Circassians that the name applied to the whole race was drawn. The Basques of the Pyrenean district, divided politically into French and Spanish Basques, are white men, Caucasian, European, but not included in Deniker's types, being unrelated in language to the races of Aryan Europeans.

The whole of north Africa is occupied by peoples who are neither Ethiopic nor Mongolic, and who, though dark in skin for the most part, are regularly classed in the Caucasian race. Although, in their entirety, the general name Hamitic is given to them, some of them have been profoundly

influenced by Semitic peoples and languages.

Many fine types occur within this area, which, of course, includes the Egyptians, past and present, the Libyans and the Berbers. While these peoples are for the most part dark, some remarkable groups of notably blond types occur among them. That these blond types are ancient is clearly shown by the wall-paintings of old Egypt, where the Libyan is regularly represented as blond. To the Caucasian race belong also the brunette populations, ancient and modern, who speak the pure and typical Semitic languages—Hebrews, the modern Arabs and their neighbors. With them, we enter Asia.

**Asiatic Caucasians.**—In Asia, also, are Caucasian peoples, some of them speaking Aryan languages, in Persia, Afghanistan, and parts of India. Caucasian elements in Asia date far back, and there is good evidence of their existence and influence even in that section of the great continent which is occupied by Mongolo-Tatar populations.

The Ainu of Yezo and Saghalien are a Caucasian people. They are the remnant of the aboriginal population of Japan. Perhaps they occupied the entire archipelago before the coming of the Japanese from the continent by way of Korea. They are dirty white in color, have abundant wavy hair, elliptical in cross section, horizontal, large expressive eyes, almost European features, abundant body hair and heavy beards. They are mild in disposition and in culture are almost in savagery. Their language differs notably from Japanese in structure and lexicon.

In India are the Todas, whom Keane considers Caucasian. In face, features, hair and heavy beards, in yielding character, they present considerable analogy to the Ainu. They are, however, cattle raisers, and their wild life is wrapped up in the care of their animals. There are in other parts of Asia scattered fragments of populations which one and another writer have suggested are Caucasian and it is not impossible that continuous populations of inoffensive and weak Caucasian type once occupied the whole of eastern Asia and

that they have been broken and separated by the flood of Mongolians coming from the west. The present tendency is to recognize the existence of Caucasian people in the island world.

**Indonesians.**—The term "Indonesian" is much used for certain people of Malaysia who do not present the true ("Malay") Mongoloid type. It is assumed by those who use the term that these Indonesians are in large part Caucasian, modified by Malay or other island blood. The Polynesians, too, are largely claimed at present as Caucasian. These peoples present a handsome, attractive type; of good stature, well built, with faces of regular features, they are beautiful, by our standards.

**Geographical Distribution.**—In general, each continent has a distinct type of mankind. Asia has its Mongoloid type; Europe and northern Africa its Caucasian type; south Africa its Ethiopian type; and the double continent of America its American type. Even Australia has a definite race type. While this is true, there has been so much of movement, interpenetration, and admixture that the population of no great land area is now uniform.

**European Peoples.**—Europe, with northern Africa, is the true home of the Caucasian race, but contains Mongoloid peoples as well. In the accompanying table of European peoples by countries the main or fundamental population is given in one column, the more important secondary elements in another.

**Asiatic Peoples.**—Asia is the continental home of the Mongoloid race, which still forms the greater part of its population, but a large Caucasian element has been present since ancient times and there is local mixture of Ethiopian blood. Deniker recognizes eleven physical types, which have intermingled to produce the Asiatic peoples of to-day. Five of them are peculiar to Asia—Dravidian, Aryan, Indo-African, Ainu, Mongolian; six occur elsewhere—Negrito, Indonesian, Arab, Egyptian, Turkish and Eskimo. Six of these are Caucasian—Dravidian, Aryan, Indo-African, Ainu, Indonesian, Arab; four are Mongoloid—Mongolian (Tibeto-Indo-Chinese), Ugric (Mongolo-Tatar),

Turkish (Mongolo-Tatar), Eskimo; one is Ethiopian—Negrito.

**Dravidian** appears to be the brown aboriginals of south India, who are short of stature, dolichocephalic and with curly or wavy hair. Pechel made of them a great race type. Their position among races has been disputed, but in our four-race classification they must be called Caucasian.

**Aryan** is so called because the type is common in the wall sculptures of old Assyria. It is well characterized, with tawny-white skin, narrow hooked nose with thick lips, brachycephalic, hair wavy or curly. It is the Armenian type and the oft-mentioned "Jewish" type is fundamentally Aryan. In our scheme it is Asiatic Caucasian. So, too, is Indo-African, the type of the invading conquerors of part of India. It has clear brown skin, black wavy hair, narrow straight or convex nose, dolichocephaly, tall stature.

The Arab, typical Semite—though the word Semite is properly linguistic, not ethnic—is dark, with black wavy hair, dark eyes, long elliptical face, dolichocephalic head, aquiline nose, prominent occiput.

**Jew.**—This term should be used in only a religious sense; in so far as it has ethnic application it is fundamentally Aryan or Arab or both; but it is everywhere mixed and approximates the people of the surrounding populations. Jews, of course, exist the world over. Gypsies, also world-wanderers, probably began in India and are Indo-African, at least in part.

**African Peoples.**—To draw up similar tables of the population of other continents would be more difficult and less satisfactory. The population of Africa falls into two well-marked divisions. Northern Africa to the Sudan must be ethnically joined to Europe. Brinton emphasized this fact by making one continent of the two land masses, to which he gave the name Eurafria. Its population is Caucasian, though many of its peoples are dark of skin. In features, head-shape, hair, nose, they are clearly related to European peoples. Among them are Berbers, Libyans, Egyptians, Nubians, Abyssinians. Collectively these north-African peoples are called Hamitic but they have been

Table of Peoples of European Countries

COUNTRY	CHIEF OR FOUNDATION PEOPLES	SUBORDINATE OR LOCAL
Austria.	Northern.	Western. In south, Adriatic.
Belgium.	Northern (Flemish). Western (Wallon).	Northwestern.
British Isles.	Northern, Subnorthern.	Northwestern; in Wales and Ireland.
Bulgaria.	Bulgars. (Mong.—Turko-Finn.)	Mixed with Slav elements.
Denmark.	Northern.	Along coast, Western.
France.	Western or Cevenole, in highlands.	Northwestern, in northern lowlands. Littoral in south, Adriatic.
Germany.	Northern, in lowlands.	Sub-Adriatic. Western.
Greece.	Diversified and uncertain.	Littoral. Western.
Italy.	Adriatic in north. Ibero-Insular in south.	
Montenegro.	Northern. Subnorthern.	
Netherlands.	Northern. Lapps, etc.	Sub-Northern and North-
Norway.	(Mong.) in north. Ibero-Insular.	Mixed with Slav elements.
Portugal.	Turki (Mong.). Western elements.	Northwestern.
Roumania.	(Cauc.) Northern. Sub-Northern. Eastern.	Viethian (Poles). Adriatic.
Russia.	(Mong.) Lapps. Finns. Samoyeds.	
Serbia.	Adriatic.	Western, north coast; Littoral, south coast.
Slovenia.	Ibero-Insular.	Subnorthern and North-
Sweden.	Northern. Lapps and Finns.	Mixed with Slav elements.
Switzerland.	Cevenole, or Western.	Adriatic. Sub-Adriatic.
Turkey.	Turki (Mong.).	

Table of Peoples of Asiatic Countries

COUNTRY	CHIEF OR FOUNDATION PEOPLES	SUBORDINATE OR LOCAL
Afghanistan.	Indo-African (Cauc. of Aryan speech).	Aasyroid (Cauc.).
Arabia.	Arabs. Syrians (Cauc.—Semitic).	
Baluchistan.	Baluchi (Cauc.—Indo-African).	Arab. (Cauc.—Semitic).
Burma.	Burmese.	Negroid.
China.	Chinese. (Mong.—T.-I.-C.).	(See Indo-Chinese).
India.	In north, Mongoloid.	Lolo, Maniche, (perhaps Caucasian). (Other fragments of aboriginal peoples).
Indo-China.	Ganges and Indus valleys, Aryo-Dravidians. In south, Dravidians. Cambodians, Annamese, Burmese.	In Punjab—Deccan; Brachycephal Caucas.; Ceylon; Veddas, aborigines (Cauc.).
Japan.	Japanese (Mong.—K.-J.).	(Aboriginal "Indonesians" mixed with incoming Mongoloid peoples).
Korea.	Koreans (Mong.—K.-J.).	Negrito.
Persia.	Persians (Cauc. of Aryan speech).	Ainu (Cauc.). Much Malayan influence.
Siam.	Siamese (Mong.—T.-I.-C.).	Trace of Caucasian elements.
Siberia.	Mongolo-Tungus, Tatars, Yakuts, etc.	Semites (Cauc.). Turki (Mong.—M.-T.). (See Indo-Chinese).
Tibet.	Tibetans (Mong.—T.-I.-C.).	
Turkey.	Turki (Mong.—M.-T.).	Aasyroid (Cauc.).

strongly influenced by Arab (Semitic) hordes which have swept over the area.

On the southern border there is much mixture with negro blood. To the rest of Africa, Britton applies the name *Aust-Africa*. It is divided between true negroes in the north and the Bantu peoples of central and south Africa. Bantu is a linguistic term, and the division between the two masses of population is primarily linguistic. But there are physical differences also. Scattered amid the big blacks of central Africa are the pygmy groups, and in the Kalihari desert region of the south live Bushmen.

**American Peoples.**—The double continent, America, was occupied solely by the American race, except along the northern coast, where Eskimo live. American Indians have never been seriously classified upon the basis of physical types, due to the uniformity already mentioned.

Language is the basis generally employed in dividing the race into study groups. There are hundreds of languages spoken among them, and even language families, or independent stocks, number scores. Powell recognized fifty-eight linguistic families in North America north of Mexico. Britton divides the double continent into five geographical regions—North Pacific, North Atlantic, Isthmian, South Pacific, South Atlantic. North Pacific, North Atlantic and Isthmian make up North America; the other two regions constitute South America.

While this division is geographical, Britton emphasizes the fact that these regions are really culture areas as well. In such an article as this further detail would but confuse by introducing a multitude of tribal names.

**Oceanic Peoples.**—The Island World is not a unit ethnologically. It includes four well-marked, clearly characterized, areas—Malaysia, Melanesia, Australasia and Polynesia.

**Australasia.**—These may be separated into the Australian and the Tasmanian types. The latter seem more primitive and approaches, perhaps, the Melanesian. The Australians are fundamentally blacks, Ethiopic, but have been influenced by Dravidian or other elements until they have lost the woolly hair. With chocolate brown skin, broad nose, dolichocephaly, and medium stature, they present a fairly uniform type, which some authors class among the great races.

**Melanesia** includes New Guinea or Papua and a number of groups of smaller islands. The true Papuan shows a fairly distinct

type, but he is usually included with the rest under the general term *Melanesian*, which includes all the large Oceanic negroes, Ethiopic in race.

**Malaysia** extends from Madagascar to Melanesia, thus lying west of the two areas just considered. It includes the great islands of Sumatra, Java and Borneo; also Celebes, the Philippines, and many smaller islands; Formosa, ethnically, is Malayan. Malays form the chief population, but Melanesians have had local influence, and negroes, little blacks, occur at many points.

The most interesting portion of Malaysia is the Philippine archipelago. Its ethnology is complicated. After making the first serious study of it, Blumentritt suggested the following theoretical explanation: Four populations occur—

(1) the aboriginal Negritos; (2) a great list of tribes representing an early Malayan immigration, tribes like the Igorot, Iugos, etc.; (3) a second Malayan immigration of people much further advanced in culture, represented by the civilized "Cristiano" populations, which form the bulk of the Philippine peoples to-day, Tagals, Visayans, Ilocano, etc.; (4) a third Malayan immigration, Mohammedans, the "Moros" of Mindanao and the Sulu islands. This immigration was just well under way when the Spaniards appeared in the sixteenth century and checked it. It seems to have been a northward streaming of Malaysians from the Philippines and Formosa that carried Malay blood and influence into Japan. The Japanese are not pure Mongols, but owe much to Malays.

**Polynesia** is singularly uniform in population. There are local mixtures, of course, where the area touches Melanesia.

The recent streaming out of white men into all parts of the world has had a remarkable influence on race vitality and characteristics. To-day in America and Australia, in Polynesia, and even in Africa, the original populations are disappearing or subordinated.

**OUTLINES OF GEOLOGY.**—Geology is the science which treats of the development of the earth.

**Departments or Phases.**—Astronomic or Cosmic Geology treats of the influence that the sun, moon, and other heavenly bodies have upon the earth.

**Chemical Geology** is that branch of dynamic geology in which are discussed the chemical and chemical processes active in the creation or modification of earth conditions. **Crystallography** is that branch of mineralogy

which is concerned with the investigation and recognition of the regular geometrical forms that many minerals assume when free to do so at the time of their formation.

**Dynamic or Philosophic Geology** is a discussion of the agencies and forces involved in the development of the earth.

**Economic Geology** is that branch of geology which treats of the occurrence, the distribution, and the laws governing the formation of the economically important earth constituents.

**Geognosy** is a study of the form and constituents of the earth, and of the structure or arrangement of the earth's components.

**Geotectonic or Structural Geology** is that branch of geognosy in which the structural arrangement of the constituents of the earth is discussed.

**Glacial Geology** is that branch of physiography which treats of the modifications of the earth's surface produced by masses of ice.

**Historical Geology** is a presentation of the sequence of events in the history of the earth and its inhabitants.

**Lithology** is that branch of geognosy which is concerned with the study of rocks without the aid of the compound microscope.

**Mineralogy** is that branch of geognosy which treats of the nature, appearance, occurrence, and value of minerals.

**Mining Geology** is that branch of geognosy in which are discussed the principles applicable to the solution of mining problems.

**Paleontology** is that branch of historical geology which deals with extinct or fossil fauna (animals) and flora (plants).

**Petrology** is that branch of geognosy which is concerned with the study of thin sections of rocks by means of the compound microscope.

**Physiography, or Physical Geography,** is that branch of dynamic geology which treats of the surface configuration of the earth, the forces which modify this, and the changes which thus result.

**Stratigraphical Geology** is that branch of geognosy in which stratification and the features found in, or connected with, stratified rocks are discussed.

**Geological Agencies or Forces.**—All features of the external form and accessible internal structure of the earth are due to the action of either air, water, or heat produced by pressure or chemical activity, and these are known, respectively, as the atmospheric, aqueous, and igneous geological agencies. These three great agencies have been active throughout geological time, their effects in past ages being essentially similar to those they now produce.

#### THE ATMOSPHERE AS A GEOLOGICAL AGENT

The work and functions of the atmosphere are suggested by the following outline:

I. Acts as a protective thermal blanket for the earth.

II. Sustains life.

III. **Chemical work.** Through evaporation, precipitates substances from solution in water. Oxidizes surface materials. Tends to disintegrate surface materials. Forms carbonates from surface materials. Tends to disintegrate surface materials. Forms hydrates from surface materials. Forms soils. Usual vapors and gases, often the products of volcanic activity, attack and change the nature of surface materials.

IV. **Mechanical work.** Wind removes loose surface material. Wind generates water waves and currents. Wind uproots trees and thus breaks up the soil. Wind transports seeds and small organisms. Wind transports and deposits sand as dunes. Wind transports and deposits fine material as loess. Wind aids in holding dust in suspension in the atmosphere, thus affecting the temperature and aiding condensation.

V. **Thermal work.** Changing temperatures tend to rupture rocks as a result of sudden contraction and expansion. Freezing of water in cracks involves expansion and tends to rupture rocks. Form soils.

VI. **Electrical work.**

Rocks may be ruptured by lightning, thus hastening their disintegration and aiding the formation of soils. Rocks may be fused by lightning and their mechanical or chemical disintegration be thus retarded.

VII. Is a medium for the evaporation and precipitation of water, forming clouds, fog, rain, snow, hail, and cloudbursts.

#### WATER AS A GEOLOGICAL AGENT

The work of water, outside of its influence upon the condition of the atmosphere, may be thus outlined:

I. **Moving surface water.** Erosion. Cuts all types of valleys and tends to remove, ultimately, all hills and mountains, thus reducing the inequalities on the earth's surface. Transportation. Eroded fragments are carried great or small distances, depending upon their size and the velocity of the current. Deposition. Flood-plain deposits and deltas of rivers are formed when a decrease in the velocity of the current causes the deposition of transported fragments, which are usually well rounded.

II. **Chemical work.** Solution. Dissolves soluble portions of rocks.

## WATER AS A GEOLOGICAL AGENT—Continued

	<p><b>EROSION.</b> Waves and currents cut into shores and tend to enlarge the area of lakes and seas.</p> <p><b>TRANSPORTATION.</b> Fragments derived from erosion by waves and currents are carried in suspension by currents.</p> <p><b>DEPOSITION.</b> Transported fragments are deposited, mostly near shore, forming sedimentary or stratified deposits.</p>	
<b>Mechanical work.</b>		
<b>II. Standing water.</b>		
<b>Chemical work.</b>	<p><b>SOLUTION.</b> Soluble portions of shore are dissolved.</p> <p><b>PRECIPITATION.</b> Soluble substances derived from tributary streams or the shore are deposited by evaporation or by the infolding of one on another, forming deposits of rock-salt, gypsum, limestone, borax, alkaline carbonates, etc.</p>	
<b>Mechanical work.</b>	<p><b>ENCLOSURE.</b> Unimportant, but may form caves.</p> <p><b>TRANSPORTATION.</b> Relatively unimportant.</p> <p><b>DEPOSITION.</b> Relatively unimportant.</p>	
<b>III. Underground water.</b>		
<b>Chemical work.</b>	<p><b>SOLUTION.</b> Soluble materials with which the water comes in contact are dissolved, forming caves, particularly in limestone, and making "mineral water."</p> <p><b>PRECIPITATION.</b> Substances in solution are deposited due to relief of pressure, lowering of temperature, or chemical interaction, forming mineral veins and spring deposits, partially or wholly filling cavities encountered, or acting as a cement for loose earth material.</p>	

## IV. Ice Mechanical work.

**KNOWNS.** Alpine or valley glaciers partially shape amphitheatres or cirques, where snow accumulates and melts into ice. They also form U-shaped valleys leading down-ward therefrom, and "bedded rock fragments grooved or glaciated" (the bedrock beneath).

Great continental glaciers strip off the mantle of softened, altered weathered soil, as well as some of the solid rock below, which is also grooved or glaciated by "striated rock fragments."

**TRANSPORTATION.** Material that falls upon a glacier is carried on the surface, either in the middle (medial moraine) or lateral (lateral moraine) or near its way down into the ice and forms a part of the englacial drift, while that eroded beneath the glacier is dragged along in the bottom of the ice or between the glacier and the solid rock below (ground moraine).

All the material transported by a glacier is apt to be unaltered, rather angular, although the edges of the fragments that form the ground moraine may be somewhat rounded, and they may be glaciated on one or more faces.

**DEPOSITION.** The melting of a glacier causes the deposition of the material in or on the ice, that which accumulates at the end forming a terminal moraine, while that along the sides forms lateral moraines. Medial moraines are apt to be washed away by the melting ice.

Beneath continental glaciers, the ground moraine is often heaped into low, smoothly rounded hills called drummings, while, over the subglacial streams, flowing in cracks in, or tunnels beneath, the ice, deposit long, winding, steep-sided ridges called eskers. The rounded hills or hummocks in terminal moraines are called eskers.

## HEAT AS A GEOLOGICAL AGENT

The internal heat of the earth is conducted slowly outward to the surface through the cool outward portion, and is also carried rapidly upward through the medium of ascending molten material. The effects of such transference of heat from one position to another may be thus outlined:

- I. Effects of the gradual outward conduction of heat, and consequent differential expansion and contraction of different portions of the so-called "crust."
  - a. Formation of mountains accompanied by folding of the materials involved.
  - b. Changes in the character (metamorphism) of the earth materials involved in such movements.
  - c. Production of cracks or fissures with or without the slipping of one side relative to the other.
  - d. Occurrence of earthquakes as a result of such fracturing or slipping.
- II. Effects of ascending molten material, and the consequent differential expansion and contraction of different portions of the crust.
  - a and b. Same as e and d above.

**MINERALOGY.**—The science which treats of the properties of mineral substances, and teaches us to characterize, distinguish, and class them according to their properties. Geology, or geognosy, was formerly included in the science of mineralogy, but this term has more recently become restricted to the study of the individual minerals, their aggregation into rocks and their relations to each other forming an important section of the science of geology.

The science of mineralogy, however, is not confined to the study of the external characters of mineral substances, their chemical composition being equally important.

**Classification.**—Minerals may be described and classified either in accordance with their chemical composition, their crystallographic forms, or their physical properties of hardness, fracture, color, luster, etc., or a combination of all, and thus various systems of classification have been adopted. Most minerals crystallize in definite forms, and this form is one of the chief characteristics of many mineral species. There are not a few, however, which are not distinctly crystalline, but are earthy or occur in masses; the latter exhibiting important varieties of structure, as laminated, fibrous, granular, reniform, botryoidal, etc. Other distinctive characteristics are color, which, however, varies even in the same mineral; luster, the character of the light reflected from the surface, and described as adamantine, vitreous, nacreous, greasy, silky, etc.; fracture, or the character of the freshly-broken surface; streak, or the appearance and color of a furrow made in the mineral by a hard-tempered knife or file; and hardness, which is now determined by what is called Mohs' scale.

In this scale certain minerals are represented by numbers from 1 to 10, viz.—

- (1) *Talc*, common laminated light-green variety.
- (2) *Gypsum*, a crystallized variety; (2.5) mica.
- (3) *Calcite*, transparent variety.
- (4) *Fluor spar*, crystalline variety.
- (5) *Apatite*, transparent variety. (5.5) *scapolite*, crystalline variety.
- (6) *Potash feldspar*, white cleavable variety.
- (7) *Quartz*, transparent.
- (8) *Topaz*, transparent.
- (9) *Corundum*.
- (10) *Diamond*.

To determine the hardness of a mineral, it is ascertained by experiment which of these it will scratch and which will scratch it; thus if a mineral will scratch fluor spar but not apatite, while the latter will scratch it, its hardness is between 4 and 5. Diaphaneity, refraction, polarization, electric properties, etc., are all distinguishing marks.

**Precious Stones.**—Are those which, because of their beauty, hardness, and rarity, are prized for use in ornamentation, especially in jewelry. The diamond, ruby, sapphire, and emerald are the only stones which are, strictly speaking, entitled to be called "precious" in this sense; but the opal, on account of its beauty, is often classed with the precious stones; as is also the pearl, which is really not a stone, but a secretion of a shellfish.

**Agate.**—A semiprecious, uncrystallized variety of quartz, in various tints in the same specimen. Its colors are delicately arranged in stripes or bands, or blended in clouds.

**Almandine.**—A variety of chrysoberyl found in the mica slate of the Ural mountains. It is of a rich garnet color by artificial light, by daylight of a dark moss green. It is the only stone that so

changes. The finest specimens of alexandrite are rare and valuable as diamonds.

**Almandine.**—A common maroon-red variety of garnet.

**Ametyst.**—A variety of crystallized quartz, of a purple or bluish-violet color, of different shades. It is much used as a jeweler's stone. The lighter colored ones come from Brazil, the deep purple ones from Siberia. In value they are about the same as the garnet.

**Aquamarine.**—A transparent, sea-green variety of beryl, used as a gem.

**Axehurine.**—A variety of translucent quartz speckled throughout with scales of yellow mica.

**Beryl.**—A very hard mineral of much beauty when transparent. It occurs in hexagonal prisms, commonly of a green or bluish-green color, but also yellow, pink, and white. It is a silicate of aluminum and beryllium. Beryl is very rich in colors. Their value is about four dollars per carat.

**Carne.**—A figure cut in stone or shell that is composed of different colored layers. The value depends on the artistic merit of the engraved figure.

**Chalcodony.**—A green siliceous stone sprinkled with red Jasper, whence the name.

**Chrysoberyl.**—A beautiful gem of a deep red color (with a mixture of scarlet), found in the East Indies. When held up to the sun it loses its deep tinge, and becomes of the color of a burning coal. The carbuncle of the ancients is believed to have been a garnet. The name is now given also to the ruby, sapphire, and the red spinel. The oldest and most valuable is a garnet cut as carbuncle, and is worth about one dollar a carat.

**Chrysoberyl.**—A variety of chrysoberyl, of a clear, deep red, flesh-red, or reddish-white color. It is moderately hard, capable of a good polish, and often used for seal stones.

**Carbuncle.**—A variety of quartz or chalcodony exhibiting opalescent reflections from within, like the eye of a cat. The name is given to other gems affording similar effects, especially the chrysoberyl.

A fine specimen about three-eighths of an inch across would be worth from two to three hundred dollars.

**Chalcodony.**—A cryptocrystalline, translucent variety of quartz, having usually a whitish color, and a luster somewhat like that of the opal.

**Chrysolite.**—A mineral, composed of silica, magnesia, and iron, of a yellow to green color. It is little used.

**Chrysoberyl.**—An apple-green variety of chalcodony. Its color is due to nickel contained in its composition.

**Dendrite.**—A stone or mineral in which are branching figures, resembling shrub or tree, produced by a siliceous mineral, usually by an oxide of manganese, as in the most agreeable.

**Diamond.**—A precious stone or gem encasing in brilliancy and transparency, and remarkable for extreme hardness. It is found in many hues—green, rose, straw, yellow, etc., but the straw-colored ones are the most common. The diamond is a native carbon occurring in isometric crystals, often octahedrons, with beveled edges. It is the hardest substance known. Diamonds are said to be of the first water when very transparent, and of the second and third water when the transparency decreases.

**Depend.**—A crystallized variety of pyroxene (a silicate of lime and magnesia), of a clear, grayish-green color, also called *maurand*. It is the most valuable variety of a rich green color; it is the most valuable variety of a rich green color; it is the most valuable variety of a rich green color.

**Emerald.**—A mineral, commonly of a yellowish-green color, occurring granular, massive, columnar, and in crystals. It is a silicate of alumina, lime, and oxide of iron, or manganese.

**Esmeralda.**—Cinnamon stone. A variety of garnet. It is not much used.

**Fluorite.**—Calcium fluoride, a mineral of many different colors, white, yellow, purple, red, etc., often very beautiful. When crystallized it is commonly in cubes with perfect octahedral cleavage. Some varieties are used for ornamental purposes, and others for glass, *fluor spar*, or simply *fluor*. The colored varieties are often called *fluor ruby*, *fluor emerald*, *fluor sapphire*, and *fluor topaz*.

**Fine.**—A mineral, somewhat like the variety of quartz, of a color usually of a gray to brown or nearly black, breaking with a conchoidal fracture into small, sharp edges.

**Flour spar.**—Same as fluorite.

**Garnet.**—A mineral having many varieties, differing in color and in chemical composition, but with the same general chemical formula. The commonest color is red; the luster is vitreous, or glassy; and the cleavage is greater than that of quartz, about half as hard as the diamond.

The common crystal forms are the dodecahedron and the trapezohedron. Besides these, however, there are also white, green, yellow, brown, and black ones.

The garnet is a silicate with various bases, such as alumina-lime (granularite compound or cinnamon stone), alumina-magnesia (pyrope), alumina-silica (spessartite), and chromium-lime (cymophane, or emerald-green). The transparent red varieties are used as gems. The garnet was first discovered in the granite of the Cornish hills, a very common mineral in granite and mica slate.

The finest specimens of red garnets come from Ararat, and a single carat stone is worth from two to four dollars. A green variety that comes from Russia is worth about half as much as the diamond.

**Gibbsite.**—Same as beryl.

**Hyalite.**—A green siliceous stone sprinkled with Jasper, as if with blood, whence the name.

**Imperial.**—An important one of iron, the sequoia, so called because of its red color when in the form of powder. It occurs in splendid rhombohedral crystals, and in massive and earthy forms, the last being called red ochre. It is now seldom used in jewelry.

**Jacinth.**—A red variety of silicon, sometimes used as a gem. It resembles closely a dark Spanish topaz, and is worth a little more than the garnet.

**Jasper.**—A mineral occurring in tetragonal crystals and also massive, of a brown to green color, rarely yellow or blue. It is a silicate of iron, lime, and lime, with some iron and magnesia. It is common at Mt. Vesuvius. It is little used.

**Jaspe.**—A variety of tourmaline of an indigo-blue color.

**Jaspe.**—A silicate of alumina, iron, and magnesia, having a bright blue color and a vitreous or glassy luster. It is remarkable for its dichroism, and is called *chalcid*.

**Jaspe.**—Same as jacinth.

**Jaspe.**—A stone commonly of a pale to dark green color, but sometimes whitish, as if with a very tough, capable of a fine polish, and is used for ornamental purposes and for implements, especially in some countries and among many primitive people.

**Jaspe.**—An opaque, impure variety of quartz, of various colors, and other dull colors, breaking with a smooth surface. (See quartz).

**Jaspe.**—A mineral occurring in thin-bladed crystals, of a crystalline structure, and is a silicate of aluminum. It is little used as a gem.

**Jaspe.**—A kind of feldspar, commonly showing a beautiful play of bluish-gray colors, and, hence, much used for ornamental purposes. The finest specimens come from Labrador.

**Jaspe-larv.**—A mineral of a fine azure-blue color, usually occurring in small rounded masses. It is essentially a silicate of iron, iron, and soda, with some sodium sulphide. It is often marked by yellow spots or veins of sulphide of iron, and is much valued for its color.

**Jaspe.**—A nearly pellucid variety of feldspar, showing poorly or opaline reflections from within.

The best specimens come from Ceylon. Their value is not much more than the expense of cutting.

**Jaspe.**—A hard, compact mass, of a dark green color, formerly used as remedy for diseases of the kidneys, whence its name *kidney stone*.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Jaspe.**—A kind of stone, of a reddish-yellow color. It is usually of a black color and opaque, except in thin splinters.

**Uranian emerald.**—A precious stone of a rich green color, a variety of beryl.

**Verd antique.**—A mottled-green, serpentine marble. Also a green porphyry, which is called *verd antique*.

**Zircon.**—A mineral occurring in tetragonal crystals, usually of a brown or gray color. It consists of silicon and zirconium, and is harder than the garnet. The transparent varieties are used as gems. The red variety is called *Hyacinth*; a colorless, pale yellow, or smoky-brown variety from Ceylon is called *Hyacinth*.

**ORNITHOLOGY.**—The science which teaches the natural history and arrangement of birds; or, to use the definition of Cuvier, of vertebrate oviparous animals, with a double circulation and respiration, organized for flight.

**Classification.**—Many systems for the classification of birds have been proposed. A common division is into seven orders, to which an eighth, the *Saururæ* of Huxley, is often added, to include the extinct archopteryx. These orders are:

**Order I.—Raptors or Accipitres.** Birds of prey, as eagles, vultures, hawks, and owls. Beak strong and curved, sharp hooked, and adapted for seizing and destroying other animals. Claws sharp, much hooked, and retractile. Hind toe on the same level with the others. Wings well developed.

**Order II.—Insectores, Passeres, or perching birds,** by far the most numerous order. It includes all the singing birds, and indeed, excluding the birds of prey, most birds which live habitually among trees. Feet formed for grasping and perching, claws moderately curved and not retractile. Hind toe on the same level as the rest. This order is usually divided into four tribes or suborders—*Conirostræ* (conebilled); *Dentirostræ* (tooth-billed); *Tenirostræ* (slender-billed); *Fistirostræ* (clef-billed).

**Order III.—Scoliopteres or Zypodactylæ.** Climbing birds, as the parrots, wood-peckers, cuckoos, toucans, etc. Feet formed for climbing, two of the toes directed forward and two backward; powers of flight not in general great; bill variously shaped.

**Order IV.—Rasores or Gallinæ.** Domestic fowls, pheasants, pigeons, etc. Legs large and strong. Feet with the hind toe situated above the heel, suited for scratching. Bill short, thick, and arched above.

**Order V.—Cursores or Struthionidæ.** Running birds, as the ostrich, emu, cassowary, etc. Wings rudimentary and quite useless for flight; legs long and strong; hind toe wanting or merely rudimentary; breastbone without a ridge or keel.

**Order VI.—Grallatoræ or Grallæ.** Waders, as the cranes, herons, snipes, sandpipers, etc. Legs long, bare of feathers from above the knee; toes often half-webbed. Bill in general long and slender.

**Order VII.—Natatores or Palmipedes.** Swimmers; web-footed birds, as ducks, geese, gulls, etc. Feet formed for swimming, in general webbed, that is, the toes connected by a membrane. Hind toe elevated above the plane of the others. Bill various, mostly flattened. (See Dictionary of Animals).

**HUMAN PHYSIOLOGY.**—Physiology in relation to the human body, the science which concerns itself with the functions of the various parts and the manner in which they perform their duties. The work done by any part depends primarily upon the character of the minute particles of matter of which it is formed.

**Cells.**—Each of these microscopic particles is called a *cell*. It consists of a thin skin enveloping a clear substance, the *protoplasma*.

*plasm*, which contains a less granular portion known as the nucleus.

**Tissues, Organs, Systems.**—A combination of similar cells forms a *tissue*, and the union of two or more tissues to constitute a structure for the performance of a special function is called an *organ*. The heart is an organ for pumping blood and the stomach is an organ for helping to digest food. Several organs working in harmony for the accomplishment of a common purpose constitute a *system*.

**Locomotion.**—The *osseous system*, composed of over 200 bones, and the *muscular system*, formed of over 500 muscles, serve chiefly for the purpose of locomotion. One kind of muscles known as the *involuntary* are present in nearly all tubelike structures, such as the alimentary canal and blood vessels. The marked power of contraction and relaxation possessed by all muscles enables them to render important service to the bodily welfare. They have, however, no power in themselves to act, but must be stimulated by another set of organs composing what is known as the nervous system.

**The Nervous System**, consisting of the brain and spinal cord, with their thousands of tiny nerve fibers branching to all parts of the body, controls every movement and the activity of each organ. The numerous nerve fibers, which are bound into bundles forming the white cord-like nerves, are the processes of cells located in the brain or spinal cord or near to them.

**Neurone.**—A nerve cell, with its two or more processes, varying from less than a half inch to more than three feet in length, is called a *neurone*. The purpose of the processes is to transmit a stimulus or message, while the function of the body-part of the neurone is to originate a stimulus or modify one sent to it by another neurone.

**Brain.**—The neurones in the thinking regions of the brain, *i. e.*, the frontal third and the portion adjacent to the crown, seem able to originate stimuli and direct at will the daily activities in which we engage. A band of neurones in front of the central fissure of the brain is called the *motor area* because these cells control the voluntary movements of the body. The bursting of a blood vessel in this area or along the processes of these cells extending down through the brain and cord often causes paralysis of the muscles which the neurones affected govern. The band of neurones behind the central fissure form the *sensory area* of the brain. Here the impulses aroused by touch, heat, cold and pain are received. The *hearing neurones* are located in the region of the brain adjacent to the ear and those concerned in *seeing* lie in the back part of the brain.

**Communication of Neurones.**—The neurones whose cell bodies form the gray matter, and their processes, the white fibrous portions of the brain and cord, are able to communicate with one another by contact of processes. The independent neurones of the brain direct the dependent neurones both in the brain and in the spinal cord.

**Reflex Action.**—The dependent neurones can also be made to act by an outside stimulus, such as touch or pain. A pin-prick on the toe of a sound sleeper will send an impulse up the sensory nerves to the spinal cord, where it will arouse the motor neurones to send an impulse causing the muscles to contract and withdraw the limb, but the brain will know nothing of

the operation. Such activities, carried on without the effort of brain neurones controlled by the will, are known as *reflex actions*.

**Sympathetic System.**—Many neurones concerned in reflex action are located at the base of the brain and in its stem, while others of the same character form the *sympathetic system*, whose nerves supply the viscera and other organs and all the involuntary muscles of the body. The work of the lungs, heart, stomach, liver and other vital organs goes on involuntarily because the neurones governing them are stimulated to act by the needs of the body.

The taste of food stimulates the neurones, causing the stomach to form gastric juice, but we can also make the stomach do this work to some extent by thinking of the delicious flavor of foods. In this case the neurones of the brain originate a stimulus and send it down to the neurones exciting the juice-making organs to work. Even though food is in the stomach and its presence has started the flow of gastric juice, the output may in a few minutes be greatly decreased by the inhibiting influence of the neurones of the brain, aroused to action by some excitement or great grief affecting the mind.

**Influence of Mind on Body.**—Although the exact relation of the mind to the brain and other parts of the body is not entirely understood, observations and experiments show that the mind may influence the work of all the organs of the body. This fact forms a vital part of the Christian Science faith, which teaches that thought is more efficient than drugs and hygienic measures in curing disease. In many disorders of the nervous system mental suggestion renders worthy service.

**Sense Organs.**—In order that the brain may be informed of the conditions in the external world, many of the nerve fibers called sensory nerves have special terminations on or near the surface of the body called *sense organs*. The eyes are the special sense organs which are so affected by the waves of light coming from objects that they can send to the brain through their nerves a message telling how things look. The ears receive and transmit to the brain only those impulses aroused by the waves of sound. The delicate nerve endings within the nose inform the brain concerning odors, while the peculiar nerve terminations in the tongue and other parts of the mouth receive and send to the brain all knowledge as to how foods taste. Special tiny organs at the ends of nerves are scattered throughout the skin to receive the stimuli aroused by touch, heat or cold, and inform the brain when the body is being hurt.

**Foods.**—While thought and action are the chief purposes of the body, the systems which effect these must be hourly repaired and nourished, the waste matter must be gotten rid of, and a means of reproducing the species must be provided.

The chief part of the living tissues consists of *proteids* whose worn-out parts can be replaced only by the consumption of other *proteids* found in the albumen of lean meat, the white of egg, casein of milk, and in peas, beans, corn and wheat.

**Oxidation.**—Starches, sugars and fats cannot repair the worn-out parts of the cells, but by the living action of the body these foods can be made to unite with oxygen. This *oxidation* may furnish heat to keep the body warm and may also supply the energy necessary for its activities. While

the fat of the body is largely made from the starches and sugars forming what is known as the carbohydrate foods, *proteids* can also be transformed into fat and used to furnish energy and heat.

**Diet.**—The daily food requirements of a man at ordinary labor are about three ounces of proteids and one pound of starches, sugars and fats. Some inorganic salts and water are also necessary.

**Digestion.**—In order that the nourishing materials may reach all cells of the body they must be prepared to enter the blood stream for transportation. This preparation is accomplished by a group of organs forming the digestive system. The two chief processes of digestion are mastication, or the breaking up of the food into small particles in the mouth, and the transforming action of the juices from certain organs called *glands*. The important elements in the watery secretions of these glands are known as *enzymes*. These are ferments which cause chemical changes in the food without any change in themselves.

The *ptyalin* from the salivary glands of the mouth changes starch to sugar, the *pepsin* from the thousands of gastric glands in the lining of the stomach transforms part of the proteids into peptones, while the other part is acted on by the *trypsin* of the pancreas. This chief gland of digestion also yields *lipase* to split up the fats and *amylase* to make sugars of the remaining starches.

**Absorption of Food.**—After the food has been acted on by the gastric juice from one to four hours, and by the intestinal and pancreatic juices a variable period, it is in a state capable of being absorbed by the cells forming the lining of the small intestine. The absorbing surface is greatly increased by the thousands of folds and millions of tiny projections called *villi*. Within these are thin-walled tubes to receive the liquid food and pass it on to the larger blood tubes, whence it is transported to all parts of the body.

**Liver.**—The liver serves as a storehouse for part of the food, which it deals out according to the needs of the body. Much of the food passes through the liver before it is distributed to the body, thus giving this organ opportunity to remove poisons which may be present and dispose of them in the bile sent into the intestine to aid digestion.

**Circulatory System.**—The circulatory system in addition to distributing the food throughout the body, conveys the oxygen from the lungs to all the tissues and transports the waste matter from all cells to the lungs, skin and kidneys for elimination. The *plasma*, or clear part of the blood, bears the food elements, while the red corpuscles, with a special affinity for oxygen on account of their hemoglobin, load up with this gas in the lungs and discharge it to the tissues throughout the body.

**Heart, and Course of the Blood.**—The blood stream is kept in perpetual motion by the beating of the heart, with valves so arranged as to prevent any backward flow. The blood is carried by the veins from all parts of the body to the right auricle of the heart, whence it passes to the right ventricle. This sends it through the pulmonary artery to the lungs, where the carbon dioxide is exchanged for oxygen through the tiny, thin-walled capillary branches of the artery. The oxygenated blood, from the lungs, by the pulmonary vein to the left auricle, passes to the left ventricle and thence out through the aorta,

branching again and again in all regions of the body until the final subdivisions are smaller than hairs and with walls so thin that the oxygen and food can easily pass through to nourish the cells. At the same time the carbon dioxide and part of the other waste products enter the blood stream of these tiny vessels called *capillaries*, which unite to form the veins carrying the blood to the heart.

**Lymphatics.**—Some of the blood plasma and the white corpuscles passing out of the capillaries, together with some of the waste matter, enter a set of vessels called *lymphatics*. These unite into larger vessels which ramify through firm bunches of tissues called *lymph glands* and terminate in veins in the neck.

Exercise renders the lymph system more active because the muscular contractions press the waste matter into the vessels and move it forward, as a series of valves prevents the backward flow. *Massage* accomplishes the same effect and therefore like exercise greatly aids the body in removing its waste. The purpose of the lymph glands, so abundant in the groin, the armpits, the neck and amid the intestines, is to catch and destroy any infection such as bacteria.

**Respiratory System.**—The sole purpose of the respiratory system, consisting of the lungs and the air passages leading to them, is to supply the body with oxygen and cast out the carbon dioxide constantly resulting from the living processes. The inspired air consists of four-fifths parts of nitrogen, one-fifth part of oxygen and only four-ten-thousandths part of carbon dioxide, while the expired air contains one-twentieth part of carbon dioxide and less than one-sixth part of oxygen.

**Excretory System.**—The dying tissues and a remnant of the oxidized food proteins form the nitrogenous waste which is removed from the body by the excretory system. This consists chiefly of the kidneys, with the two tubes called ureters carrying the urine drop by drop into the bladder, where it is stored and passed out at intervals through a small tube called the urethra. About one and a half quarts of urine, containing some salts and an ounce of urea, the tissue waste, are excreted daily.

**Diabetes and Bright's Disease.**—In persons with diabetes the urine contains sugar because too much sugar is free in the blood. This condition may be due to a disorder of the cells of the pancreas or liver. In Bright's disease the cells of the kidney fail to perform their work and allow some of the nourishing part of the blood to escape with the urine. Such a condition is sometimes due to a prolonged fever, the excessive use of alcohol, a heavy meat diet, lack of thorough mastication or too little exercise.

**Skin.**—The skin is also an organ of excretion, as its millions of sweat glands pour out daily from one quart to a gallon of perspiration containing some salt and a little urea. The chief use of the sweat, however, is to cool the body. The skin is filled with the terminations of the nerves of sense, whose stimulation by heat or cold excites to action the entire system.

**Bathing.**—On this point depends the physiologic effects of bathing and hydrotherapy. Many internal chronic disorders, as well as acute ailments, are frequently alleviated or entirely cured by the proper application of water when all other measures fail. Since a large portion of the blood passes through the skin each minute,

cold bathing relieves the body of much heat and is therefore the most efficient means of lowering the temperature in cases of fever.

**Hair.**—Each hair grows from a little papilla at the bottom of its sac and will be renewed every time it is pulled out so long as the papilla is uninjured. A pair of sebaceous glands in connection with each hair furnish an oily substance to soften the hair and skin. The loss of the hair on the scalp is seldom due to any microbe or germ, but to a diminishing of the nourishment from the blood-vessels in the papilla. The best remedy for falling hair is a thorough washing of the scalp fortnightly and a daily five-minute massage continued for several months.

**Reproductive System.**—The average length of life of each individual is about 45 years. To continue the race new individuals must arise. The only portion of the body, however, which can give origin to a new being is a special large cell called an *ovum* or *egg* developed in females from about the thirteenth to the fifteenth year within one of two small organs called the ovaries lying below the kidneys. This special cell or ovum is capable of further growth only after another special cell, the *spermatozoon*, from the testes of the male has united with it. After the union of the two cells, which process is known as *fertilization*, the egg continues down the tube leading from the ovary into a thick-walled sac, the *uterus* or *womb*. Here it becomes fixed to the soft lining, absorbs nourishment from the blood of the mother for a period of about nine months, when it is born as a complete individual.

**HYGIENE.**—Hygiene is the science which concerns itself with the prevention of disease and the maintenance of the body in vigorous health. Personal hygiene relates to the special care of one's own body, while public hygiene includes much of sanitary science and deals with the general food supply, water supply, disposal of sewage, quarantine regulations and other questions affecting the entire community.

**Death Rate.**—The development of the science of hygiene began about the middle of the nineteenth century and has made such rapid progress as to greatly lessen the death rate in communities regulating their living according to its teachings. In benighted India the death rate is 42, i. e., 42 people die annually among every thousand living. In the United States the death rate is 17, while in Norway, Denmark and Sweden, where hygienic living is practiced by the greatest numbers, the death rate is only 14 per thousand.

**Length of Life.**—The average length of life increases with our growing knowledge and practice of healthful living. The average length of life in the sixteenth century was about 18 years; to-day it is over 40 years in Germany, England and the United States. The life span in France in 1830 was only 39 years, while in 1900 it was over 47 years. In Massachusetts it increased from 39 years in 1850 to 46 years in 1900.

**Cause of Sickness.**—There are about 3,000,000 people sick every day in the United States and one-half this number die annually from disease. Recent investigations show that at least one-fourth of this sickness and death can be avoided by the individual and combined efforts of the people of our country. Much of the sickness and about one-half of the deaths result from diseases caused by the

countless army of unseen life called *microbes*.

**Contagious Diseases.**—Microbes are the agents concerned in all *infectious diseases*, some of which are spoken of as *contagious* because the healthy readily contract the ailments by associating with the sick or by handling articles from the sickroom. The germs of tuberculosis slay 150,000 persons yearly in the United States, pneumonia destroys more than 100,000 lives, while typhoid fever kills about one-tenth of its 250,000 victims. Over 100,000 infants perish yearly from digestive disorders due to bacteria, largely introduced by unclean milk and other food.

**How Disease Germs Are Scattered.**—The germs of typhoid fever, cholera, dysentery and diarrhoea leave the body in the excreta from the bowels and kidneys. The body of a sick person is a germ garden yielding a deadly harvest of microbes which if allowed to escape alive in the body waste are quite certain by the aid of wind, water or insects to find new victims. This fact shows the vital importance of treating the body excretions in such a manner as to destroy the agents of disease. If this were carefully done for even a decade, students of hygiene believe that tuberculosis and typhoid fever would be lessened by one-half.

**How Typhoid Is Contracted.**—The germs of typhoid generally reach new victims either in water or in food, though they may be transferred to the mouth by the fingers or other objects which have been in contact with the sick. Fortunately the germs will generally not live in ordinary river water more than ten days and most of them are destroyed by sedimentation, sunlight and other agencies during twenty-four hours transportation in a stream averaging two or three feet in depth and flowing at the rate of about three miles an hour. Investigations indicate that more than one-half of the cases of typhoid fever are due to contaminated water.

**Food as a Source of Infection.**—Such foods as shellfish, celery and cress are sometimes the source of typhoid and dysentery when they have been taken from water or earth contaminated by sewage or night soils.

Since tuberculosis is widely distributed among the cattle of this country and as many as 10 per cent are affected in many localities, market milk frequently contains tubercle bacilli. These germs enter the milk sometimes through the udder and more frequently by means of the feces which soil the cow and are then knocked as dry particles into the milk pail.

**Diarrhoea in Infants.**—The greater part of the diarrhoea and intestinal disorders of infants, resulting in over 10,000 deaths during each warm month of the year, is due to the large number of germs of various kinds in unclean milk. In many instances the milk when delivered to the customers in the city contains one million germs per cubic centimeter. Milk from healthy cows and properly cared for should not contain more than 30,000 germs per cubic centimeter when twenty-four hours old.

**Other Diseases Conveyed by Milk.**—In addition, to typhoid fever and tuberculosis, scarlet fever and diphtheria are frequently transmitted through the agency of milk. This fact explains why every one should wash his hands thoroughly before handling milk, in which diphtheria and typhoid germs multiply rapidly.

Since the year 1908 it has been clearly demonstrated that the germs of some diseases are introduced directly into the blood by insects.

**Insects Conveying Disease.**—The agents of malaria, yellow fever and filariasis are known to be transmitted by the bite of certain mosquitoes which have previously sucked blood from patients suffering from these diseases. Havana was freed from yellow fever for the first time within a century by destroying the breeding places of mosquitoes in the quiet waters. The destroying fevers which made it impossible for the French to dig the Panama canal are kept away from our laborers now accomplishing the task by driving away the *Siegmia* and *Anopheles* mosquitoes.

**Bubonic Plague, etc.**—Fleas of the rat and some other kinds transmit the germs of bubonic plague from man, rats and ground squirrels to man. The plague was stopped in California by killing the rats. The tsetse fly of Africa bears the deadly microbe of sleeping sickness from the sick to the well, and a certain tick seems to be responsible for the spread of the Rocky mountain spotted fever. The common body louse in some cases, if not always, serves as the carrier of the typhus fever from man to man. Leprosy and pellagra are probably also insect-borne diseases. Since pathogenic germs are so widely distributed and are even present occasionally in the air breathed it is impossible to prevent entirely their entrance into the system. In fact persons in health have frequently been found with germs of diphtheria or pneumonia in the mouth, and post-mortem examinations and tuberculin tests show that less than one fourth of the persons infected with the tubercular germs actually succumb to the disease. The explanation of the freedom of certain persons from some diseases is found in the fact that the body has been made immune. This condition of immunity or safety from certain maladies may be accomplished in several ways.

**Infection With Tubercle Bacilli.**—Experiments and observations show that the tubercle germs, especially in children, can pass from the alimentary canal into the blood and be carried to the lungs, where they most frequently cause disease. Extensive studies, however, show that probably 90 per cent of the victims of the white plague have been infected by the germs in human sputum carried to food by flies or transmitted by the drinking cup, fingers, or dust.

**Prevention of Disease.**—One effective method of preventing the ill-health due to these man-eating microbes, which give off a poison called toxin while they feed on the human flesh, is to wage a warfare seeking their complete destruction. Most of the pathogenic germs, i. e., those producing disease, are developed in the bodies of the sick and are distributed in their excretions. The germs of tuberculosis, pneumonia, diphtheria, scarlet fever, whooping cough and measles are present in vast numbers in the sputum discharged from the mouth and often smeared on drinking cups, pencils, books and the fingers. These deadly bacteria may remain in the saliva several weeks or in some cases even months after the recovery of the patient.

**Disinfection.**—The process of destroying agents of disease is called *disinfection* and the substance used is a *disinfectant*. Formaline, bichloride of mercury, carbolic acid, chloride of lime, hydrogen peroxide,

boiling water and sunlight absolutely destroy disease bacteria in a few minutes, and are therefore called *germicides*. Weak solutions of carbolic acid, boric acid and lime do not kill the germs but prevent their growth, and are on this account known as *antiseptics*.

One of the best methods of disinfecting the stools of a patient with typhoid fever, dysentery or diarrhoea is to add to them an equal part of 5 per cent formaline (5 parts of 40 per cent formaldehyde solution to 95 parts of water) and allow the mixture to stand two hours before disposing of it. This destroys not only the germs but also all odor.

**Vitality of Germs.**—One of the best disinfectants known is sunlight. Germs of typhoid fever, tuberculosis and diphtheria spread out in a thin layer are destroyed by exposure to a bright sun in less than one hour, while in a dark room they may live for weeks or even months. The fact that typhoid germs buried in the soil or remaining in privy vaults may retain their virulence for more than three months explains the danger in using night soil on truck patches.

**Purifying Water.**—Because of this fact several hundred towns and cities during the last twenty years have constructed large filters for removing germs from the water before it is delivered to the users. In many cities with a previously heavy typhoid mortality the filtration of the water supply has reduced the annual number of typhoid cases one-half, and in some instances, including Albany and Pittsburgh, effective filtration has lessened the typhoid morbidity three-fourths.

Contaminated water may also be made safe for drinking by heating it until the boiling point is reached. Actual boiling renders it insipid. A Berkefeld or Pasteur-Chamberland filter costing only a small sum may be attached directly to the spigot in the house, so that it will keep the water free of germs provided it is cleaned and boiled weekly.

**Public Sewage Disposal.**—In order to avoid the pollution of the water supply many cities have during the last decade constructed sewage disposal plants consisting of septic tanks and fermenting beds for breaking up the solid matter and reducing it in some degree to gases and inorganic substances. This also destroys many of the pathogenic bacteria and the others may be eliminated by the use of a sand filter or treatment with chemicals.

**Private Sewage Disposal.**—The improper disposal of the waste about the house results in the spread of typhoid fever, dysentery, and hookworm disease. Where there is no water supply to carry the waste off to the septic tank and contact beds, the dry-pail closet is the most sanitary arrangement. This consists of a water-tight tub or galvanized iron can to receive the excreta, and a box of dry earth of which about a pint should be scattered over the surface of the contents of the tub or can each time it is used. This process prevents unpleasant odors and helps to rapidly mineralize the organic matter. When the receptacle is full the contents should be emptied in the garden or field remote from the water supply and covered with a little soil.

**Insects and Disease.**—A feature of great importance in the disposal of body waste is the exclusion from it of flies. These insects have caused many epidemics of typhoid fever and dysentery by distributing in milk receptacles and on food the

germs collected on their feet from the filth upon which they often feed. The wisdom of protecting all food from flies is further shown by recent investigations demonstrating that they not only infect food with the germs of tuberculosis carried on their feet from sputum, but also with those diseases eaten in their feces on sputum and later deposited as fly specks. This fact clearly shows why it should be unlawful to spit upon floors or sidewalks, or use open spittoons which contain no disinfectants.

**Preventing Hookworm Disease.**—In the Southern states, where many persons in nearly every community are infected with hookworms, the tub for the excreta should be filled one-fourth full of a 5 per cent crude carbolic acid solution to kill the eggs which pass from infected persons by the thousands daily. Instead of using a tub or can for the excreta a cement vault may be built under the privy and emptied at intervals of a few weeks far away from the water supply.

Improper care of excreta has resulted in the pollution of the water and soil about many homes. Here the typhoid germs and young hookworms wait for their victims. The worms are able to enter the body not only in water and food but also by piercing the skin and boring into the blood vessels, in which they are carried to the lungs. Here they enter the air sacs, make their way up the windpipe, and then journey down the gullet, and through the stomach to their home in the intestines.

**Preventing Tuberculosis.**—Continuous living in the pure air, deep breathing for a few minutes several times daily, the use of nutritious foods, such as eggs, milk, meat and cereals, and the avoidance of excesses of all kinds will so strengthen the tissues of the body that they will be able to destroy any tubercular germs which enter. The habit of sleeping with wide-open windows summer and winter, taking a cold bath upon rising, and devoting one hour to outdoor exercise daily will do much more not only in fortifying the body against tuberculosis but also against colds, catarrh and other minor ailments.

Cancer and diseases of the kidneys and heart are greatly on the increase, while nearly all other diseases have decreased notably during the last decade. Many of the early superficial cancerous growths may be cured by the use of the X-rays, but the surest remedy for internal cancers is removal by the surgeon.

Late studies indicate that wrong diet, immoderate and lack of exercise have considerable influence in causing morbid changes in the blood vessels and kidneys and inducing rheumatism. The consumption of starches and sugars greatly aggravate diabetes, and rheumatism and Bright's disease are made worse by a meat diet and alcohol.

**Keeping Germs Out of the Body.**—Owing to the hygienic ignorance and carelessness of a considerable part of mankind the germs of contagious diseases are being scattered by the millions daily. For this reason it is necessary to take precautions to prevent the entrance of these into our bodies. Articles used by the sick and the rooms in which they have lived often harbor the germs of disease. Eating utensils and linen may be disinfected by placing them in boiling water a few minutes. The sickroom, after the recovery or death of the patient, should be treated with formaldehyde gas. This may be generated in sufficient quantity to disinfect a room

of a thousand cubic feet by adding one pint of formaldehyde solution to a gallon of water containing twelve ounces of potassium permanganate. The room should remain tightly closed for twelve hours. Clothing, metals and furniture are in no way injured by the gas.

**Vaccination**—Specific immunity against various infectious diseases may be acquired by vaccination. This consists in inoculating the body with weakened germs or the growth-products of the same kind of germs as those causing the disease to which one wishes to become immune. Immunity from typhoid fever, plague and cholera is often secured by injecting under the skin dead cultures of the germs of these diseases. Immunity from hydrophobia is secured by several successive inoculations with hydrophobia germs which have been weakened in the spinal cords of rabbits exposed to dry air from two to fifteen days.

The most successful vaccine produced is that which prevents smallpox, the most dreaded malady of the eighteenth century, when it killed 60,000,000 people in Europe. This vaccine is prepared by weakening the smallpox germs by growing them in the skin of calves. These weakened germs when smeared on the broken skin of the arm result in the formation of a large scab, some fever and slight indisposition due to the products of the germs, which cause the body tissues to react and form substances capable of destroying the strong smallpox germs which may later reach the body. Owing to the fact that these substances so inimical to the smallpox germs in the body become successively weaker each year after four or five years, it is necessary for one to be vaccinated every ten years until middle life.

**Antitoxins**.—Immunization against such diseases as lockjaw and diphtheria is effected by introducing into the body substances which nullify the poisons generated by the growing germs. These substances are called antitoxins. They are secured from the blood of animals which have developed them to fight off the poisons of these germs injected into them at varying intervals.

The constitutional diseases, such as diabetes, rheumatism, Bright's disease, arteriosclerosis or hardening of the arteries, and certain affections of the heart, are not well understood as to their causation, and therefore efforts to prevent them have not met with success.

**The Certified Milk** to be had in many cities is usually of high quality and contains less than 30,000 bacteria per cubic centimeter. Such milk is taken from cows shown to be free of disease by periodical physical examination and tuberculin tests. The stables are kept scrupulously clean and free from flies and all the milk receptacles after being rinsed in cold water are sterilized in steam or boiling water. The milk is cooled immediately after it is drawn and stored in ice water, because warmth causes a rapid growth of the bacteria which poison the children.

**Pasteurized Milk**.—It is unsafe to give to young children milk not known to be clean and from healthy cows. When it is necessary to use questionable milk it should always be pasteurized. A special apparatus for pasteurizing may be purchased, but with some care the process may be accomplished by placing the milk in a Mason jar or tall pail, which is then set into a kettle of boiling water just removed from the stove. The water in

the kettle should stand at least as high as the milk in the pail, which must be stirred ten minutes and then left standing covered ten minutes longer. The milk should then be cooled as quickly as possible by placing it in cold water and stirring it a few minutes. Milk thus treated will usually remain sweet in an ordinary refrigerator three or four days, but it is preferable to use it within twenty-four hours.

The commercial pasteurized milk sold in many cities is often unreliable because the pasteurization has not been properly accomplished, and frequently the milk is of too dirty a quality at the beginning. Experiments prove that children thrive almost if not quite as well on properly pasteurized milk as upon clean raw milk. In pasteurization the temperature should never exceed 160 degrees and it is preferable to maintain it at about 148 degrees. Boiled or sterilized milk should not be used as the regular food for children because some of the albumin has been coagulated and salts precipitated.

**Mastication**.—Toxins injurious to the heart and other organs are commonly generated in large quantities in the large intestine of those consuming much meat. A vegetarian diet with milk, especially buttermilk, and eggs lessens the formation of these toxins and thorough mastication, often called Fletcherizing, in some way stimulates the bowels to clear the waste matter with a coat of mucus preventing the absorption of any toxins present.

The careful preservation of the teeth, the thorough mastication of a largely vegetarian diet, regular daily exercise in the open air, daily evacuation of the bowels induced by laxative foods and exercise and not by drugs, and eight hours of sleep in a room with open windows, together with a cold morning bath, are the best known means for maintaining a vigorous constitution which will have marked power in warding off both infectious and constitutional diseases, and for enabling the organs to continue in the healthy performance of their functions even beyond four score years and ten.

**PHYSICS**, or Natural Philosophy, is the science, or rather group of sciences, relating to the phenomena of the material world, or of the laws and properties of matter; more restrictedly it treats of the properties of bodies as bodies, and of the phenomena produced by the action of the various forces on matter in the mass. Its chief branches are *mechanics*, *heat*, *electricity*, *electricity* and *magnetism*.

**Electricity**.—Is the name given to the unknown cause of certain effects of very various kinds which are found to be closely connected one with another. They include two distinct kinds of attraction and repulsion—*electrostatic* and *electrodynamical*—the magnetization of iron, the deflection of magnetic needles, the production of heat and light in certain circumstances, the separation of certain chemical compounds into their constituents, and spasmodic actions on the nervous and muscular systems of animals.

The name is derived from the Greek *electron* (amber), the fact that amber when rubbed attracts light particles, such as small pieces of paper, having been known to the ancient Greeks. Friction was the only artificial source of electricity employed until Galvani, near the close of the eighteenth century, accidentally obtained it by the contact of two metals with the limbs of a frog; and Volta, developing Galvani's

discovery, invented the first galvanic or voltaic battery. Electricity produced by friction is called *frictional electricity*; that produced by chemical action on metals *voltaic electricity*.

**Conductors and Nonconductors**.—All substances which, like amber, can be made to show electrical attraction by rubbing them, are called nonconductors. Bodies which are not susceptible of excitation by friction are called conductors. They include glass, amber, sulphur, shellac, resin, silk, flannel, etc.

Electricity can be excited by the friction of a conductor against a nonconductor, and is, in fact, so excited in the ordinary electrical machine, in which glass rubs against an amalgam spread on a cushion. A metallic rod furnished with a glass handle can be electrified by rubbing it with flannel, the glass preventing the electricity from being conducted away through the hand. Substances thus electrified exhibit two opposite kinds of electricity, known respectively as *positive* and *negative*. Bodies charged with the one kind of electricity repel each other, those charged with opposite kinds attract each other. An instrument for indicating the presence of electricity is called an *electroscope*.

**Electric Conduction**.—All solid and liquid substances allow electricity to pass through them to some extent, but the differences of degree are enormous. The best conductors are the metals, especially gold, silver, and copper. Perfectly pure copper conducts about seven times as well as iron. Substances which have excessively small conducting power are not called conductors, but *insulators*, so that a good insulator is another name for an excessively bad conductor.

Among the best insulators may be mentioned glass, paraffin (the wax, not the oil), ebonite, shellac, mica, india-rubber, and gutta-percha.

The word *resistance* is used in the opposite sense to conducting power; a good insulator is said to have high resistance, and a good conductor to have low resistance.

**Electrostatics** is that branch of the general science of electricity which treats of the repulsions between like and the attractions between unlike kinds of electricity. The fundamental law of electrostatics is that if *e* and *e'* denote two quantities of electricity collected in two spaces very small in comparison with the distance between them, the mutual force which they exert upon each other is directly as the product *ee'*, and inversely as the square of the distance, if the two quantities *e* or *e'* are both positive, or both negative, the force is a repulsion; but if one is positive and the other negative, it is an attraction.

**Electric Discharge**.—The rapid escape of electricity from a charged body is an electric discharge. When the discharge takes place through a conductor it is called *continuous*, and when it takes place through a nonconductor (for example, through air) it is called a *disruptive discharge*. The name "electric discharge" is especially applied to cases in which the escaping electricity produces luminosity.

Three kinds of such discharge have been distinguished—the *spark*, the *brush*, and the *glow*. The *spark* is accompanied by a sound which varies from a faint crack to a loud bang. In nature it is seen on the largest scale in the case of lightning, which is a discharge of atmospheric electricity. The *brush* discharge is only faintly luminous. It occurs especially at sharp

points and edges of highly-charged bodies. It is barely visible by daylight, and its appearance in the dark is that of a luminous halo. It projects only a small distance into the air surrounding the body from which the charge is escaping.

The glow discharge simply renders the surface of the body luminous, and does not extend into the air at all. In some modern electric apparatus beautiful effects of electric discharge are obtained.

**Electric Currents.**—What is known as an electric current is a peculiar condition of a wire or other conductor of electricity, in virtue of which it deflects magnetic needles in its neighborhood, magnetizes a piece of soft iron around which it is coiled, has its own temperature raised, and exhibits various other effects. What is conventionally called the direction of the current is the direction in which the positive electricity may be regarded as flowing. The "strength" of a current denotes the quantity of electricity that passes through the wire in the unit of time.

Instructions for measuring the strengths of currents by chemical decomposition are called *reometers*, and instruments for measuring them by the deflection of magnetic needles are called *galvanometers*. The currents by which telegraphs are worked are usually obtained from galvanic batteries; but the far stronger currents required for other purposes are usually produced by machines called *dynamoes* driven by steam or water power. The currents in such machines are due to magneto-electric induction.

**Electro-Dynamics** is that branch of electrical science which treats of the attractions and repulsions exhibited between wires or other conductors through which currents are passing. If two wires are parallel, they will attract each other when currents are passing the same way through them both, and will repel each other when the currents are opposite. If the wires are inclined to each other at any angle, there is not only an attraction or repulsion, but a still more marked tendency to rotation, which is not satisfied till the wires have become parallel and the currents flow in the same direction through them both. When there are only two straight wires these forces are feeble and require delicate apparatus for their exhibition; but by employing coils of wire the forces are multiplied, and an instrument constructed on this principle called the *electro-dynamometer* has been much employed for the measurement of currents. The whole science of electro-dynamics is due to Ampère, who discovered its main facts and reduced them by ingenious experiments, combined with very abstruse reasoning, to a single mathematical formula which includes them all.

**Velocity of Electricity.**—Daily experience with the electric telegraph shows that electrical action is propagated with great rapidity. Electricity has not a definite velocity like light or sound. It is rather comparable to waves on water, which travel with very various speeds according to their length and the depth of the water. The highest speed ever observed in the transmission of electric effects was that obtained by Wheatstone, at the rate of 230,000 miles per second, a velocity greater than that of light, which is between 165,000 and 180,000 miles per second.

**The Electric Transmission of Power** is the transmission of power to a distance by electricity, effected by employing the source of power to drive the *dynamo*, which

generates an electric current. This current is conveyed by a copper conductor insulated from the earth to the distant station, where it passes through a machine called an *electro-motor*, one part of which (called the *armature*) is thereby made to revolve, and imparts its motion to the machinery which is to be driven.

This is the simplest arrangement, and is that which is commonly employed when the original currents are not of such high tension as to be dangerous to life in the case of accidental shocks. When the original currents are alternating they are made to generate induced currents by means of an instrument called a *transformer*, which is similar in principle to an ordinary Ruhmkorff coil, with the important difference that the primary wire is long and thin, and the secondary wire short and thick.

These methods of transmission and transformation are employed not only for giving out mechanical power, but also for electric lighting.

**Distribution of Electricity** means the supplying of strong currents of electricity from central stations where they are generated, to houses, streets, lamps, etc., in their vicinity. The central station contains a few powerful dynamo machines, driven usually by steam-power. The positive and negative terminals of the dynamo are put in connection with the positive and negative main conductors which are to supply the district, and from these main smaller conductors branch off to the houses or lamps. In some systems of distribution, instead of the two main conductors being one positive and the other negative, each is positive and negative alternately, the reversals taking place some hundreds of times per second. The currents are then said to be *alternating*. When such reversals do not take place, the currents are said to be *direct*.

**Sources of Electric Energy.**—The chief sources of energy in practical use are coal, petroleum, wood, water at a height, and wind. Of these coal is by far the most important; water power comes perhaps next in importance; while the power of the wind is as yet almost undeveloped.

**Applied Electricity.**—The principal applications of electric energy are the lighting of streets and houses, the driving of machinery, the propelling of trains, street-cars, carriages, and boats, the heating of rooms, the heating of electric forges and furnaces, electro-chemical processes, various signaling operations, etc.

**The Dynamo.**—The dynamo is the most effective means for generating electricity. It costs about fifty times less to produce electricity by it than by batteries. It consists of nothing else than iron and copper wire, and when generating electricity some portion of the machine must be in rapid rotation.

The following characteristics of arrangement are to be noted:

(1) An outer iron ring [which remains stationary. Portions of this are wound with many turns of insulated copper wire. Its purpose is to furnish a strong magnetic field, and it is generally, though not always, called "the field."

(2) An inner mass of iron, arranged for rapid rotation. Portions of this also are wound with insulated copper wire. This is called the *armature*, while the other is called the field.

(3) A commutator, if the machine is to send out a *continuous current*. This consists of the ends of the conductors in the

moving armature arranged in a circle so that the two line conductors may be brought in contact with them, each serially by brushes rubbing over them as the armature rotates. If the machine has no commutator, it must send out an *alternating current*.

Before the days of the dynamo, electricity although well known was of little use. The dynamo has made practicable the following: (1) Electric lighting and heating. (2) Electric traction. (3) Electric motors for the manifold applications of power. (4) A large number of chemical industries which depend upon large electric currents for producing chemical changes; such, for example, as extracting aluminum from clay. (5) Storage batteries. (6) Electric welding. (7) The dynamo is rapidly displacing batteries for telephoning, telegraphing, operating clocks, bells, etc.

**Mechanics.**—Is that branch of physics which treats of forces and their applications. The tendency of force acting upon matter is to produce motion, but two such tendencies may oppose one another, as the direction of the motions which they seek to produce may differ. When two do not completely counteract one another, it is possible that three or four or any number of forces—so many of them acting in one general direction and so many in another, so many for instance trying to produce motion eastward, and so many motion westward—may produce no motion whatever. From the application of any number of forces there may be rest produced, and it is quite evident that there may be motion.

Mechanics treats these two cases, embracing in its sphere the theory, as well as practice, of motion and equilibrium, both with and without the aid of machinery. The theory of mechanics properly comprehends (1) dynamics; (2) the motion of projectiles; (3) the theory of simple machines, or the mechanical forces; (4) the theory of compound machines, and their maximum effects; (5) the doctrine of the center of gravity; (6) the doctrine of the center of oscillation, gyration, etc.; (7) the collision of bodies; (8) the theory of rotation; (9) the theory of torsion; (10) the strength of materials; (11) and lastly, the equilibrium of arches and domes.

The elementary machines, or mechanical powers, properly speaking, are six in number, and may be thus enumerated—the *lever*, the *wheel and axle*, the *pulley*, the *inclined plane*, the *wedge*, and the *screw*.

**Applied Mechanics** is the practical application of the laws of matter and motion to the construction of machinery, etc.

**Heat.**—Heat is sometimes called invisible light. It is conceived to be an ether vibration of a little longer wave length than light. When these waves strike against any substance they cause its molecules to vibrate rapidly, and as a result the substance expands, and sometimes melts, or perhaps evaporates, or, under the influence of the waves, it may undergo chemical change, either resolving itself into simpler substances or uniting with other substances to make more complex ones. These molecular motions may stimulate motions among the molecules of other substances at a distance through the intervention of ether waves. These ether waves, in passing upon our bodies give us the sensation of heat.

**Absorption.**—Substances whose molecules most readily respond to the heat vibrations of the ether are called good

absorbent of heat. The barefoot boy walking about a field has plenty of evidence that although the sun may shine alike on all substances, some of them get much hotter than others. The New York subway is much of it built underneath the streets with a comparatively thin roof of concrete over it. This concrete is a particularly good absorber of the sun's radiation and keeps the subway hot as a garret in summer.

**Applied Heat.**—Heating a stove oven is a good deal like lighting it. The walls of the oven send heat rays to the bread. If two loaves of bread set side by side in the oven each is in the shadow of the other and must be turned around occasionally to bake uniformly. The oven would bake quite as well without air as with it. Like light rays, heat rays pass better through a vacuum than through air. The most economical way of heating a house is by radiators, although this method is objectionable on the score of ventilation. Proper ventilation necessitates a wasteful method of heating our dwellings and public buildings.

Air is a particularly poor absorber, carrier, and radiator of heat. In our common thought we have given it far too much credit in the distribution of heat. When the walls, furniture, etc., of a room get warm, we may displace all the warm air in it by cold air—even freezing cold air—without its perceptibly affecting the thermometer.

**Conductors.**—There are no very good conductors of heat. With very great loss we do conduct electricity several miles by copper wires, but there is nothing which will conduct heat as many inches. The mystery is that copper wires should conduct or give direction to electric waves at all. Ice must absorb a very large amount of heat radiation before it can change to water, hence its usefulness in the ice box. Vast volumes of air may pass through the ice box without melting the ice, since air has so little capacity for heat radiation. Salt strangely assists ice in absorbing heat rays; hence ice which cannot freeze the cream alone, may, if mixed with salt, absorb the heat radiation from the cream quickly—changing itself to brine and reducing the temperature of the cream many degrees below freezing.

Water in changing to vapor absorbs a large quantity of heat radiation, hence boiling water in the double boiler may prevent the hottest flame from raising the temperature in the inner boiler above 212 degrees.

**Temperature.**—Changes of temperature are best measured by the expansion and contraction of a column of mercury in a glass tube. An arbitrary scale is attached to this. Freezing temperature is in this country indicated by 32 degrees. The temperature of boiling is 212 degrees. The temperature of the inner portion of the human body is 98 degrees. The proper temperature of a living room is about 64 degrees to 68 degrees. It seems to be necessary to our welfare that the internal heat of our bodies should be about 30 degrees above our surroundings when we are not exercising. Chemical action within raises the temperature and evaporation of moisture from the skin reduces the temperature. The balance is kept very constant amid a great variety of surroundings.

Volatile liquids, such as alcohol and gasoline, feel cold because they absorb our heat in changing their state from liquid to gas. In the fall of the year, when the

nights begin to be cold, paper tied over plants may keep them from freezing. Just as a paper shade may be put over a lamp to cut off its rays of light, so paper over the plant cuts off the heat radiation from the plant and prevents its getting cold enough to freeze.

**Light.**—It is now a quite universally accepted theory that light is a wave motion in the ether which pervades all space. A microscopic examination of the interior of the eye shows that, like the ear, it is adapted to respond to wave motions of extreme rapidity. The highest tone which the human ear is capable of responding to is produced by about forty thousand air waves per second coming in upon it, but the human eye responds to nothing short of four hundred trillion ether waves per second.

**Color.**—As sound has tones of various pitch, so light has various colors. The sensation which we get from the tone called middle C on the piano is produced by 256 air waves each 4 feet long beating upon the ear each second. 512 air waves each 2 feet long (that is, twice the number each half as long) beating upon the ear each second will give the sensation of the tone called C, one octave above middle C.

**Red.**—So the eye is stimulated to the sensation of red by having 400 trillion ether waves each  $\frac{1}{100,000}$  of an inch in length borne in upon it each second, while twice that number of ether waves per second each of half the length will give the eye the sensation of violet at the other end of the spectrum. The sensation of heat is produced by ether waves longer than the red, and ether waves shorter than the violet produce chemical change, such as tanning the skin, fading our garments, fogging the photographic plate, making the green material in plants, etc.

**Reflection.**—Light waves are reflected from all objects in the same manner that sound waves are, or indeed as water waves are. All objects which we see are either themselves stirring up waves in the ether or are reflecting ether waves which have been sent out from other sources. When six amperes of electricity are sent through a piece of number 24 iron wire, the wire sends forth in great abundance those ether waves which we call heat, but no light waves. Seven amperes of the electric current will cause it to send forth those ether waves which will affect the eye with red light and we call it red hot. Eight amperes will cause it to send forth violet ether waves, which, mingled with the red, will produce white light, and we say the iron wire is white hot.

**Refraction.**—Light waves pass through glass much more readily than heat waves do. Hence a glass screen before an open fire allows one to see the fire without heating his face scorched. Glass, however, offers some resistance to the passage of light waves and hence when these waves strike upon a disk of glass which is thicker at the center than at the edges (such a piece of glass is called a lens), the waves are retarded at the center and the outer portions of the waves are turned inward so that they are concentrated at a point, or focus, on the other side of the lens. This bending of the waves is called *refraction*.

A large size lens, sometimes called a burning glass, serves in this way to concentrate the sun's light and heat waves to an intensely bright and hot point which may cause wood or paper to burn. The red light waves being akin to heat waves are

retarded more than violet waves in passing through glass.

**Spectrum.**—Thus in passing white light, which is a combination of all colors, through a glass prism, the red waves are turned from their course more than any of the other colors and the violet is refracted least.

**Prismatic Colors.**—The colors thus shown are usually said to be seven—red, orange, yellow, green, blue, indigo, violet; although in reality there is an enormous, if not an infinite, number of perfectly distinct colors in light. The seven colors are frequently called the primary colors, and other tints and shades are producible by mixing them; but in a stricter sense the primary colors are three in number, namely, red, green, and violet (or blue). These three colors or kinds of light cannot be resolved into any other.

In the scientific sense of the word white and black are not considered colors, a white body reflecting, and a black body absorbing, all the rays of light without separating them, whereas the colors proper are due to separation of the rays of light by partial absorption and reflection or by refraction. If a body absorbs every other kind of light and reflects or transmits red light only, it will appear of a red color; if it absorbs every kind except blue rays, it will appear blue; and so on. If more than one kind of light be transmitted or reflected, the object will appear of a color compounded of these different rays of light.

**In Painting,** the term color is applied to that combination or modification of tints which produces a particular and desired effect. The colors of the spectrum have to be distinguished from colors used in reference to pigments.

**Primary Colors.**—The pigments red, blue, and yellow, regarded in the arts as the primary colors, produce effects, when mixed, very different from those produced by admixture of the corresponding spectrum colors. These three pigment colors form other colors thus: Red and yellow make orange, yellow and blue make green, and red and blue make purple; but red, blue, and yellow cannot be produced by any combination of the other colors.

**Local Colors** are those which are natural to a particular object in a picture, and by which it is distinguished from other objects.

**Neutral Colors** are those in which the hue is broken by partaking of the reflected colors of the objects which surround them.

**Positive Colors** are those which are unbroken by such accidents as affect neutral objects.

**Complementary Colors** are colors which together make white; thus any of the primary colors is complementary to the other two.

**Subjective or Accidental Colors** are the imaginary complementary colors seen after fixing the eye for a short time on a bright-colored object, and then turning it suddenly to a white or light-colored surface.

**In Heraldry,** the colors used are generally red, blue, black, green, and purple; which are called *gules*, *sable*, *vert*, *or*, and *purpure*. *Tenne*, or tawny, and sanguine or blood-color, sometimes occur, but they are not common. Yellow and white, again, are not colors in the heraldic sense, but metals; they are called *or* and *argent*, and are always represented by gold and silver. It is a fundamental and invariable rule in blazon not to put color upon color, or metal upon metal; thus, if the field be of a metal, the bearing must be of color, and vice versa.

## CHART OF COLOR HARMONIES

In Decoration, Dress and Ornamentation

**Sound and Musical Instruments.**—The most noticeable thing about instruments for producing sound is that they are all devices for causing the air to vibrate, and the most interesting thing about the inner ear is that it is evidently a mechanism for receiving and responding to air vibrations. If no air intervenes between the ear and the sounding body no sound can be heard. This is shown to be true by operating an alarm clock or an electric bell in a closed vessel from which the air has been exhausted.

**Intensity.**—Most instruments for producing sound have some sort of device for reinforcing or intensifying the sound. The jewsharp is a simple reed, or steel spring fastened to a convenient handle. When this reed is made to vibrate, by plucking it with a finger, it emits a faint sound. This sound is intensified by holding it between the lips before the cavity of one's mouth.

**Pitch.**—Close attention will reveal the fact that the shorter reeds vibrate faster, and hence the pitch of a tone is related to the rapidity of the vibrations which produce it. The short tuning forks vibrate faster than the long forks and produce tones of higher pitch. These tones are heard only faintly until they are reinforced. This may be done by holding the fork, while it is vibrating, before the mouth of a suitable sized bottle, or by pressing the stem of the fork upon a table, or, better, upon a thin wooden box of certain dimensions which will act, like the body of a violin, as a resonator.

One type of music box has a steel comb with teeth of various length. A cylinder with teeth revolves so as to pluck the various teeth of the comb and produce sounds of various pitch.

**Reeds.**—The harmonica has brass reeds of various length. The mouth of the operator both causes the reeds to vibrate

by forcing streams of air over them and furnishes a cavity which reinforces the sound. The mouth moves from right to left to bring into operation the reeds of different length. An accordion is an harmonica with bellows attached to be worked by the hands. This leaves the mouth of the player free to sing to the accompaniment of his instrument if he chooses. Keys are provided by means of which the player may direct streams of air to whichever of the reeds he chooses. A reed, or cabinet organ, is the next step in the evolution of this instrument. In this the bellows are worked by the feet, leaving the hands more free to play the keys.

**Strings.**—The harp has strings to produce air waves, long strings to vibrate more slowly and produce the low tones and short strings to vibrate faster and produce the high tones. The high-toned strings are likewise thinner and tighter than those which produce the low tones. It is generally true of all stringed instruments that high tones are produced by short, tight strings, while those which produce the lower tones are relatively longer, thicker and looser.

A piano is like a harp with a "sounding board" attached. This sounding board acts like the body of a violin to intensify the sound. The player upon a harp causes the strings to vibrate by plucking them with his fingers, while the strings of a piano are made to vibrate by hammers which the player operates by means of the keys.

Viols, violas, guitars, mandolins, banjos, violoncellos, and bass viols, etc., all have thin and tight strings for the high tones and thick, loose strings for the low tones, but the player changes the length, and hence the pitch, of each by fingering it. Some strings are wound with wire to make them thicker and heavier and hence vibrate more slowly.

**Tones.**—When a player puts his finger at the middle point of the string it vibrates in two separate sections, each section vibrating twice as fast as before and the pitch of its tone is raised one octave. By skillful manipulation a string may be made to vibrate in halves, in thirds, in quarters, in fifths, and in sixths, and the vibrations of these various sections will be two, three, four, five, and six times as rapid as those of the whole string. The most curious fact is that a string may vibrate in all these ways at once.

**Classes of Tones.**—The tone produced by the string vibrating as a whole is called its fundamental and the tones produced by its various segments are called overtones. The most pleasing sounds are those in which the greatest number of overtones abound. The most famous players are those who are most skilled in producing overtones and the most highly valued instruments are those most capable of yielding rich combinations of overtones.

An interesting relationship exists between a series of overtones and their fundamental. If we take, for example, a string whose length, tension and thickness are such that when it vibrates as a whole it gives the tone designated as C—the middle C of the piano—produced by 256 vibrations per second, the relationship of its overtone is shown by the following table:

Fundamental C, in the middle of the piano 256 vibrations per second.  
1st overtone, C, 1 octave above C (2×256) = 512 vibrations per second.  
2d overtone, G, 1½ octaves above C (3×256) = 768 vibrations per second.  
3d overtone, C, 2 octaves above C (4×256) = 1,024 vibrations per second.  
4th overtone, E, 2¼ octaves above C (5×256) = 1,280 vibrations per second.

5th overtone, C,  $2\frac{1}{4}$  octaves above C ( $6 \times 256 = 1,536$  vibrations per second).

**Wind Instruments.**—The so-called wind instruments, such as the organ pipe, the various horns, etc., are devices for producing air waves without the intervention of reeds or strings. A strong wind blowing across the top of a chimney causes the column of air within to vibrate until the chimney roars. In like manner the column of air in an organ pipe is made to vibrate by a stream of air blowing, not through the pipe but across one end of the column. The flutist blows, not into his flute but across one end of it.

**Relation of Pitch to Length of Pipe.**—A two-foot open pipe produces middle C, the tone of 256 vibrations per second. A similar pipe one foot long produces C<sub>2</sub>, one octave above middle C. While one four feet long produces C<sub>3</sub>, an octave below middle C. This is true whether the pipes are straight, as in the case of most organ pipes, or curled up as in the case of most horns. A French horn with

eight feet of pipe coiled up will produce C<sub>2</sub>, two octaves below middle C. The trombone has sliding joints for changing the length of the tube and thus giving a variety of tones. The flute has holes along its sides which have the effect of changing the length of the air waves, and hence the tones produced. The cornet has three extra loops of pipe, each of which may be added to the whole length of tube by pressing down a key.

This would account for a few extra tones, but how can a pipe with only three keys produce, say, thirty tones? The answer is that these instruments are the most marvelous devices for bringing out overtones. The player, by slightly changing the shape of his lips and varying slightly the wind pressure may make the air column in the instrument vibrate as a whole or in halves, or thirds, or fourths, or fifths or sixths. The scale for a French horn eight feet long whose fundamental is C<sub>2</sub>, is shown in the following table (read from the bottom upward):

	0	2	1	3	2 and 3	1 and 3	1, 2 and 3
384 vibrations per second	G	...	...	...	...	...	...
	F <sub>1</sub>	...	...	...	...	...	...

† Sharp.

The column headed 0 shows the fundamental and overtones which may be produced when none of the keys are pressed. The second column shows the series of tones which may be produced when the second key is pressed. This lengthens the tube sufficiently to depress each note in the series half a tone. The next column shows the series produced when the first key is pressed. The next the series obtained by using the third key, and the remaining columns by combinations of the second and third, first and third, and finally the first, second and third keys.

It will be noticed from this table that the player upon a horn with only three keys is able to produce every tone and half-tone in something over two octaves

and that he has two different ways of getting nine of these tones.

**Conversational Tones.**—The tones which men use most frequently in conversation fall within an octave of C<sub>2</sub>—128 vibrations; while the tones most frequently heard in female conversation are near to middle C—256 vibrations.

One might sing by waving his hand in the air if he could wave it fast enough. He might fill a large hall with his music by waving his hand at the mouth of a suitable sized bottle as resonator. He might even fill the hall with people if he could wave his hand skillfully enough to produce a rich combination of overtones.

**Speed of Sounds.**—All sounds, whether high or low, loud or soft, travel at the same

rate of speed through the air, else the music of the band would not sound well in the distance. One may see a steamship blow its whistle two miles distant and count ten seconds before hearing its sound. The sound waves travel a mile in five seconds, or 720 miles an hour. In rifle practice one, standing near the target, may hear the bullet hit the target before he hears the discharge of the gun, and frequently he hears the same sound waves several seconds later reflected back to him from the distant hills in echo.

Terrific explosions upon the sea send light waves to us through the ether in eight minutes, but there, no air to bring the sound tones. If there were air and if the sound could come to us without loss it would require fifteen years for the journey.

**Range of Tones.**—The range of the tones of a piano is usually from  $2\frac{1}{4}$  vibrations per second to 4,096 vibrations per second. Between these limits are all the tones which may be called musical. Many persons who hear perfectly well tones within the range of the piano are totally deaf to a tone one octave above the highest tone on the piano, and all persons are incapable of hearing sounds whose pitch is higher than three octaves above the piano. It requires other apparatus than the human ear to detect them.

**ZOOLOGY** is that half of biology, or the science which treats of life and living things, that deals with animals. It is impossible to frame a definition of animal, for although we can distinguish between a cow and a cabbage, the simpler forms of animals grade into the plants. Indeed, there are forms which at one period of their life would be classed with the animals, at another with the plants.

Animals may be studied from many standpoints and there have thus arisen different subdivisions of zoology, each of which has its own name. Thus *anatomy* deals with the gross structure, *histology* with the minute anatomy, *embryology* or *ontogeny* with the development from the egg, *physiology* with the way in which the parts perform their functions. The term zoology is usually restricted to the recent animals, the fossils forming the province of paleontology, or, better, paleozoology.

The classification of animals, or taxonomy, is based upon structure and development (morphology), the attempt being made to arrange the species into groups of different grades so as to show their actual relationships which are the results of their lines of descent (phylogeny). Then there is the subject of geographical distribution, while the special study of several groups has been dignified by special names, like ornithology (birds), ichthyology (fishes), entomology (insects), and malacology (mollusks).

**Classification.**—The animal kingdom is divided into groups of different values, the series beginning with phyla and ending with species or varieties, the relative rank of these being:

Phylum, divided into classes.

Class, divided into orders.

Order, divided into families.

Family, divided into genera.

Genus, divided into species.

Species, represented by individuals.

There are besides, intermediate grades like super and sub families, suborders, legions, etc. Each of those divisions has its name in Latin form, those of the orders frequently ending in *oides*, those

of families in *idae*. These groups are not readily defined. We say that a species consists of those individuals which are very closely alike and which will interbreed, while the genus is based on more general characters.

Each animal has a double name, in Latin form, the first word representing the genus, the second the species. Thus all cat-like animals are included in the genus *Felis*, while the species name indicates the kind of cat. Thus the lion is *Felis leo*; the tiger, *Felis tigris*; the wildcat, *Felis caten*; and the domestic cat is *Felis domesticus*. These names enable naturalists in all countries to understand exactly what form is meant, and to a certain extent they indicate the relationships of the animals.

All animals are divided, at first, into two great groups of subkingdoms, the *Protozoa*, in which the whole animal consists of but a single cell, and the *Metazoa*, in which the body is composed of multitudes of cells.

**Protozoa.**—As the *Protozoa* are single-celled animals they are all small, only a few being visible to the naked eye. All of the functions of life are carried on by the one cell, and hence these animals have great interest for the student, as they show the simplest kind of organization and also the great variety of shapes possible in a single cell, for thousands of these forms have been described. Most of the *Protozoa* reproduce by dividing into two, but there are some in which the body breaks up into great numbers of small particles or *spores*, each of which is capable of growing into an animal like the parent.

**Porifera.**—The sponges, the lowest of the *Metazoa*, bear this name because the surface of the animal is covered with numerous pores. These are the openings to canals by which water and food pass into numbers of small sacs which act as stomachs and from which one or more larger canals carry the water and the waste to the exterior. The familiar bath sponge is only the skeleton from which the flesh has been washed away, but it is always possible in this to recognize the outgoing canals. The best of the commercial sponges come from the Mediterranean, those of Florida and the West Indies being of a coarser character.

**Coelenterata.**—This phylum consists of the hydroids, jellyfishes, sea anemones and corals, in all of which the cells of the body are arranged in two layers, one forming the external skin, the other the lining of the digestive tract. There is but a single opening into the body, and this serves as both mouth and vent. There is but a single cavity inside the body and this is at once digestive and circulatory.

The *Hydrozoa* have an interesting life history. There is one stage in which the animals are fixed to some submerged object, and by a process of budding they develop into large colonies of individuals connected together by a common stalk. Each individual has tentacles armed with nettle cells around the mouth, by means of which it kills its prey. The digestive cavity is continued through the stalk, connecting all of the individuals. At certain places, varying with the species, other buds are formed. These resemble a bell in shape and have a mouth at the end of the tongue. Each of these bells soon separates from the parent and swims away as an independent animal.

The description above applies to the subclass *Hydrozoa*; in the *Siphonophora* we have colonies of jellyfish, connected by a hollow stem, and the fixed stage is absent. Most of the *Hydrozoa* are small, the individuals of the colony usually measuring but a fraction of an inch in length, while the medusae are rarely an inch across.

The *Scyphozoa*, also include fixed and free forms. The fixed forms, called *Actinozoa*, are cylindrical animals, attached by one end and bearing a circle of tentacles around the mouth at the other. Internally there is but a single cavity, but this is divided by radial partitions into a series of chambers, thus greatly increasing the digestive surface.

The sea anemones, which are usually brightly colored, form no hard parts, and each individual is usually distinct.

In the *corals* there are some forms which are solitary, but usually the coral individuals reproduce by partial division, so that large colonies (sometimes several feet across) may occur. In these the base and usually the sides of each animal secrete a skeleton of carbonate of lime, the secretions of the adjacent individuals joining, so that large masses of coral result. In most of the species this skeleton is porous, but in the precious corals (occurring mostly in the Mediterranean and in Japan) it is dense and takes a high polish. Its color ranges from white to deep red.

The scyphozoan jellyfishes may attain a distance across of six feet, with tentacles a hundred feet in length. All pass through a fixed stage, like a sea anemone, which becomes cut across, each portion forming a jellyfish.

The *Ctenophora* are distantly related to the other jellyfish. Most of them are spherical and all have eight rows of swimming organs, arranged like the meridians on a globe. Each row consists of plates of tentacle hairs, each plate roughly resembling a comb, when the *Ctenophora*, which means comb-bearer. These forms are very voracious, holding the prey by means of numerous adhesive bodies which replace the nettle cells of the other *Ctenophora*.

The *Platodes* (flatworms) have elongate flattened bodies, and with the exception of the *Acantharia*, have but a single opening (mouth) to the alimentary canal, which is the only cavity in the body. (In a few of the *Turbellarians* and in all of the *Cestodes* there is no digestive cavity.)

The *Turbellaria* are small forms occurring in both fresh and salt water, only a few being airmen parasites on other animals. The *Trematoda* on the other hand are all parasites, some living on the outside, others in the interior of other animals, sometimes causing severe disturbances and even death. Some of the internal parasites have strange life-histories, the immature stages being passed in the bodies of mollusks, the adults occurring in the organs of vertebrates. The life history is best known of the liver fluke of the sheep, which killed a million and a half of sheep in England in a single year. Other species may attack man, especially in warm climates.

The *Cestoda*, commonly called tapeworms, are all internal parasites, and this method of life in the intestine of other animals has resulted in a complete loss of the digestive and nourishment being absorbed through the surface of the body. Usually

these animals pass through two different hosts, the common tapeworms of man passing the immature stages in the pig or cow; less common is one which lives a part of its life in fishes. The immature stages of these are taken with uncooked flesh into the human stomach, where they are set free and then they attach themselves to the lining of the intestines and gradually grow into the adult, becoming divided into a series of joints, each of which is composed almost exclusively of reproductive organs.

The *Nematoda* are nonparasitic forms occurring in salt and fresh water. They differ from the other *Platodes* in having a vent to the digestive tract. They have little interest except for the student.

The *Rotatoria* (rotifers or wheel animals) are microscopic animals occurring in the water, in which a circle of cilia around the mouth is in constant vibration, giving the impression of a wheel in rapid rotation.

The *Coelhelminthes* include worms in which there is a well-developed body cavity surrounding the digestive tract, which always has both mouth and vent.

The *Nematoda* (round or thread worms) are cylindrical and have no jointing of the body. Some live in moist earth or in the water, but the great majority are parasites in man and other animals, some of them causing severe disturbances or even death. The human parasites longest known are the stomach and pin worms (*Ascaris*). Much more serious is the *Trichina*, not over a sixth of an inch in length, which man obtains from raw pork and which is frequently found when occurring in large numbers. Another *Nematode* is *Ankylostomum*, the so-called lay worm which occurs in the Southern states, while many less known forms attack man in the tropics. All of these, as well as the *Trematodes* and *Cestodes* obtain entrance to the body with food or water; hence the rule should be not to eat flesh raw, but to cook it in the usual condition. Salads are also a frequent source of infection.

The *Annelida* are worms in which the body is divided into a series of rings or segments, one or more of the anterior rings being differentiated into a head, usually bearing eyes and other sense organs. It also contains the mouth, which may be provided with jaws. Among these *Annelida* are the earthworms, of great use in working over the soil, and a number of small forms living in fresh water. But the great majority of the *Annelida* live in the sea, some of them brilliantly colored. The earthworms have no appendages, but many of the marine species have a pair of fleshy appendages which serve as oars on each segment of the body. None of the *Annelida* are parasitic and none have much economic importance.

The *Polychaeta* (*Brachyochaeta*) are minute colonial forms whose relationship to the other *Coelhelminthes* can only be recognized by careful study. Only a few live in fresh water, the great majority being marine.

**Echinodermata.**—The members of the phylum *Echinodermata* also have a large body cavity. They derive their name (which means spiny skin) from the fact that the skin contains numerous calcareous plates, an unusually these plates bear numerous spines which protect the animal. There is a complete alimentary canal, with mouth and vent, and the other parts of the body are arranged on the plan of five, radiating from the axis

connecting mouth and vent. Around the mouth is a ring canal filled with fluid, which gives off branches to each of the radii of the body, and connected with these radial canals are peculiar structures, the tube feet, used in locomotion. All of the *Echinodermata* are marine.

**Asteroida** (or starfish) have a central disk, with the mouth on the lower side, and radiating from this, like the spokes of a wheel, are the arms with the tube feet on the lower surface. Starfish feed largely on mollusks and prove great enemies to oyster beds. They have great powers of regeneration and lost arms are rapidly replaced.

**The Ophiuroidea** (brittle or serpent stars) differ from the other starfish in the more slender arms and in the sharper line between arms and disk.

**Crinoida** (or sea lilies) have both arms and disk and are attached to the sea bottom by a stalk arising from the disk on the side opposite the mouth. Thus they live with the mouth uppermost, the branched arms forming a funnel, conveying food to the mouth. There are only a few species of Crinoida living, but their skeletons are very abundant in the older rocks, where there also occur two related groups, the *Cystoida* and *Blasidoida*, now extinct.

**The Echinoidea** include the sea urchins. These are usually spherical, with the parts arranged as if the arms of a starfish had been folded up over the back, the rays being still distinguishable, each bearing its row of tube feet. The body wall is very strong and the spines are movable, aiding in locomotion. Several species are eaten in Europe. Other species, like the sand dollars, are flattened, and still others are heart shaped, with a marked bilaterality.

**The Holothuroidea** include the sea cucumbers, which may be compared to a sea urchin, long drawn out between mouth and vent, so that the body is cylindrical. Spines are rare. In the eastern seas some species are taken, dried, and, under the name of trepang, are sent to China, where they are used as a basis for soups.

**The Mollusca** derive their name from the fact that the body is soft, a matter of little importance. The clams, oysters, snails and squids forming the group have the body cavity greatly reduced; they lack a segmentation to the body; on the lower surface is a projecting part, the foot, while on either side is a fleshy lobe called the mantle, which usually has the power of secreting a shell. This shell, in some forms belonging to several groups, has such a structure that it has an iridescent appearance, and is called mother of pearl. Such mollusks have also the power of forming true pearls, but the majority of pearls come from the pearl oyster of tropical seas.

**The Amphineura** include the *Chitons* of the seashore, in which the foot is a broad, creeping disk, while the shell consists of eight overlapping plates on the back.

**The Acalepha** have a bivalve shell, the two halves being right and left. Just inside the mantle are two pairs of leaf-like gills, while the foot is a muscular organ projecting from the ventral surface and is used in boring, creeping, and in a few even for leaping. Here belong several forms of economic importance, including the shipworm or *Teredo* (which does great damage to submerged wood), and the oysters, clams, scallops and mussels which serve for food.

Of the scallops the part eaten is the muscle which closes the two halves of the shell. There are two edible clams on our eastern coast. The oyster is found to-day in the Gulf of St. Lawrence and from Cape Cod south, but not in the intermediate region. The fresh-water mussels (*Uniona*) have a pearly shell, and large numbers (65,000 tons a year) are used in the Mississippi valley in the manufacture of pearl buttons.

**The Scaphopoda** (or tooth shells) are shaped like an elephant's tusk. All are marine and none is of any economic importance.

**The Gastropoda** have a broad creeping foot on the lower surface and a single shell, usually coiled in a spiral. (In a few the shell has been lost.) There is usually a single gill; a few have two; while in the land snails the gills have been lost, their place being taken by a so-called lung. Few of the group have any economic value. A few are eaten; some of the land snails destroy vegetation and some of the marine species eat oysters and other shellfish. Some shells are used for cameo engraving and one of the cowries passes as money in some parts of Africa. In a few species there are glands, the secretions of which become red or purple on exposure to the air. The celebrated Tyrian purple of the ancients was derived from one of the *Gastropoda*. The *Helicopoda* and *Oteropoda*, often given as distinct groups, are really aberrant *Gastropoda*.

**The Cephalopoda** have a circle of eight or ten (in *Nautilus* about a hundred) tentacles, usually bearing suckers, around the mouth. They have a muscular mantle and either a single external shell or a rudimentary one concealed within the body. The cuttle bone fed to cage birds is the internal shell of the form known as the cuttlefish. Another feature common to the group is the ink sac which secretes the ink, a colored fluid used in clouding the water when the animals wish to escape from some enemy. This ink of one species forms the pigment sepia. All of the *Cephalopoda* are marine. In the seas of Newfoundland and Japan there are immense species, one measuring twenty feet in length, with tentacles thirty-five feet long. Chambered shells, belonging to extinct species (*Ammonites*, *Goniatites*, *Orthoceras*, etc.), are common in the rocks.

**Arthropoda**.—The members of this phylum differ from the *Annelida* chiefly in the reduced body cavity, the differentiation of the segments into regions (usually head, thorax and abdomen), and in having jointed appendages, specialized for sensory purposes, for eating, for locomotion and for reproductive and protective purposes. All have the segmented body and the presence of compound eyes is common.

**The Crustacea** are mostly aquatic, breathing by means of gills attached to some of the appendages. Usually the head and thorax are united in a cephalothorax, but the abdomen is distinct and two pairs of appendages are in front of the mouth. Here belong the barnacles (*Cirripedia*) of our shores, the minute *Copepoda* which occur in such enormous numbers in fresh water and in the sea as to be an important food supply for fishes; and the *Decapoda*. This last division, characterized by having five pairs of walking feet, contains the lobsters and crabs, important elements in our food supply.

**The Acrota** have only six pairs of appendages attached to the cephalothorax. The class includes the horseshoe crabs of

the ocean and the spiders and scorpions of the land. The scorpions of the warmer climates have a poison sting at the end of the abdomen which is rarely if ever fatal to man. The spiders are celebrated for their spinning powers, the silk coming out of two or three pairs of glands at the end of the abdomen, each species spinning its peculiar type of web. The first pair of appendages of the spiders contain the poison glands. Allied to the spiders are the mites, common on plants, and the ticks, which are a pest in warm climates.

**The Malacostraca** include a few tropical animals (*Peripatus*) which are interesting to naturalists from their primitive structure, as they show many resemblances to *Annelida*.

**The Insecta** breathe by air tubes (tracheae) which open on the sides of the body and ramify the interior. They have a head with four pairs of appendages, only one pair, the antennae or feelers, being in front of the mouth, the others being subservient to eating. These latter, the mouth-parts, may be adapted for biting or they may be adapted to form a tube suited for piercing and sucking, in the case of the mosquito. The *Insecta* include the *Hexapoda* and the *Chilopoda*. (See *Entomology*.)

**The Chordata**, the highest phylum of the animal kingdom, include animals of very different appearance, but all of them, in either the young or the adult, have the following features: There is an early axial skeleton, the notochord, lying between the digestive canal and the central nervous system; there are gill slits extending from the pharynx to the exterior, and the central nervous system is confined to one side of the alimentary canal. There are four great divisions or subphyla—*Leptocardii*, *Tunicata*, *Enteropneusti*, and *Vertebrata*.

**The Leptocardii** include a few fish-like forms (*Amphioxus*) in the sea, in which the notochord and the only skeleton, even a skull being absent. They are of great interest to naturalists from their simple structure.

**The Tunicata** are also marine. In the young stages they are tadpole shaped, but when they become adult, they are sacular attached forms, commonly called sea squirts, from the way in which they eject water from the two openings in the body wall. In some the animals reproduce by budding, so that colonies of many individuals result.

**The Enteropneusti** are worm-like forms with no interest except for the zoologist.

**The Vertebrata** have a backbone composed of vertebrae formed around the notochord; the brain is enclosed in a skull, and has five regions, and usually there are two pairs of appendages. In the lowest vertebrates, the *Cyclostomes* (lampreys and hagfish), there are no jaws nor paired fins. All other vertebrates have true jaws and hence are called *Gnathostomes*.

**The Pisces** (or fishes) are aquatic, breathing throughout life by gills. Their appendages are fins and they have a two-chambered heart. Here belong the sharks (*Ela-mobranchia*), the *Ganoids* or garpikes and sturgeon, the bony fishes or *Teleostei*, including all of the common fishes, and the lung fishes (*Dipnoi*), in which besides gills, lungs are developed.

**The Amphibia** include the salamanders, newts, frogs and toads. The embryo is by means of gills in the young stages, while in the adult they have lungs and usually the gills are absorbed. Except the *Cecilians*, they have legs in the place

of fins. All live on the earth or in fresh water, not a single species occurring in the sea.

**The Cyclostomes, fishes and Amphibia** are grouped together as *Ichthyopsida* (fish-like), as they breathe by gills for at least a part of their lives. The remaining groups of vertebrates are included under the head of *Amniota* from the fact that they have a peculiar envelope, the amnion, which appears in the development.

**The Sauropsida** include the reptiles and the birds which agree in having scales on the whole body or upon the legs (birds) and in a number of peculiarities of the skeleton. The *Reptalia*, besides the scales, have a heart with three chambers (one partially divided in the crocodiles) and are cold blooded, or, better, have a blood of the same temperature as the surroundings. Of recent forms there are the groups of turtles (*Chelonina*), snakes (*Ophidia*), lizards (*Lacertina*), and crocodiles and alligators (*Crocodylia*). In geologic time there were several other groups, some including enormous animals (*Dinosauria*) and some that were capable of flight (*Pterodactyla*). The birds or *Aves* are marked off from all other animals by the feathers. All of them lay eggs and all have a four-chambered heart and the blood is always of the same temperature (warm blood), no matter what the surroundings. About twelve thousand different species of birds are known, nine hundred in North America.

**The Mammalia** are as sharply marked off by the presence of hair and by the presence of milk glands, by the secretions of which the young are nourished. They also have a four-chambered heart and blood of a constant temperature. The lowest group (*Monotremata*), occurring only in the Australian region, lay eggs, but all other mammals bring forth living young.

The *Marsupialia*, represented in America by the opossum, in Australia by the kangaroo, wombat, and a number of other forms, have a pouch (marsupium)

on the ventral surface in which the young are carried for some time after birth.

**Placentalia**.—All other mammals have a peculiar structure in their early development, known as the placenta, and hence they are grouped as the *Placentalia*. There are twelve orders of these.

(1) The *Edentata*, in which the teeth are poorly developed or are lacking and the toes are clawed. Here belong the anteaters, sloths, etc.

(2) The *Insectivora* are small animals (shrews, moles, hedgehogs) which largely feed upon insects.

(3) The *Chiroptera* (or bats) have the fingers greatly elongated and connected by membrane, the whole forming a wing. Most species are insect feeders, but some are fruit eaters in the tropics of the old world.

(4) The *Rodentia* (or gnawers) have two or four chisel-like teeth in each jaw, and clawed feet. Here belong the rats, mice, squirrels, beaver, porcupines, rabbits and hares.

(5) The *Ungulata* have hoofs on the tips of the toes and are herbivorous. They are subdivided accordingly as the feet have an odd or an even number of toes. To the odd-toed group belong the tapirs, rhinoceroses and horses. The even-toed group includes the hippopotamus, pigs and camels, as well as a large number of species grouped as *Ruminantia* because they chew the cud. The giraffes, deer, elk, cattle, buffalo, sheep, goats, and antelopes belong here. As will readily be seen, the *Ungulata* is the most important group of mammals from the standpoint of human interest.

(6) The *Proboscidea* includes the elephants, of which two species are now alive. In these the nose is drawn out into the well-known trunk and the upper incisors grow into the familiar tusks. In former times the group was larger, including the mammoths and mastodons, much like the elephants, and the dinotherium, in which the tusks were in the lower jaw.

(7) The *Hyrcacoidea* include a few

species from the old world, one of which is supposed to be the corner of the bible.

(8) The *Sirenia* are aquatic mammals with the fore limbs fin-like and the hinder ones lacking. The manatee and the dugong represent the group.

(9) The whales, or *Cetacea* externally resemble the *Sirenia*, but they are separated by several anatomical points. The whales are the most aquatic of all mammals and have almost entirely lost the hair, one species having only a scanty mustache in the young stage. The tail is flattened into a caudal fin which differs from that of any fish in being horizontal.

There are two great groups of *Cetacea*, the one having teeth, the other lacking them. To the toothed group belong the dolphins, blackfish, sperm whales and the narwhal. The sperm whales have an enormous mass of a peculiar fat (spermaceti) on the upper side of the head; the narwhal has a single tooth drawn out into a long twisted spine projecting from the front of the head. The toothless whales have a peculiar series of horny plates developed from the roof of the mouth. These form a strainer by means of which the animals are able to strain the minute life on which they feed from the water. This is the whalebone so important in woman's apparel.

(10) The *Carnivora* are the flesh eaters which prey on all other mammals. They have clawed feet and teeth adapted to a diet of flesh. Most of the species are terrestrial, and here may be mentioned the hyenas, raccoons, mink and weasel, ermine, otters, dogs, foxes, bears, and all of the cat tribe. Some of the *Carnivores* have taken to the water and have become almost as aquatic as the whales. These are the seals, sea lions and walruses. As will be seen, the group of *Carnivores* is possibly the most important source of furs, the *Rodentia* only approaching it.

(11) The *Prossima* (or lemurs) include, a few species of monkey-like animals from Madagascar and India.

#### THE PRINCIPAL GROUPS OF THE ANIMAL KINGDOM

<b>Protozoa</b> .—One-celled animals of microscopic size.	<b>REINOPODA</b> .—FLAGELLATA. CILIATA. SPOROZOA.	<b>Metazoa</b> .—Cont.	<b>Arthropoda</b> .—Jointed animals with distinct feet and hard external skeleton.	<b>CRUSTACEA</b> .—Trilobites, trilobites (fossil), Phyllopus, fairy shrimp, Copepoda, Ostracoda, Cirripedia, barnacles, Malacostraca, crabs, lobsters, shrimp, beach fleas, sowbugs.
<b>Metazoa</b> .—Many-celled animals.	<b>Porifera</b> .—Sponges.	<b>CALCIPORONIA</b> .—SILICIPORONIA.		<b>ACERATA</b> .—Gigantostoma, horseshoe crabs, Arachnida, spiders, scorpions, mites.
	<b>Coeleenterata</b> .—Corals, jellyfish, etc.	<b>HYDROIDA</b> .—Hydroids, hydroids, jellyfish, Siphonophora, tubular jellyfish.		<b>MALACOPODA</b> .—Foripatus.
		<b>SCYTHOZOA</b> .—Actinopora, sea anemones, corals, Scyphomedusa, larger jellyfish.		<b>INSECTA</b> .—Chilopoda, centipedes, Hexapoda, true insects, Apterygota, bristle tail, spring tails, Pseudoscorpionera, white ants, dragon flies, Orthoptera, locusts, grasshoppers, roaches, Neuroptera, May flies, dobsonas, Coleoptera, beetles, Hymenoptera, bees, wasps, ants, sawflies, Diptera, true flies. Lepidoptera, butterflies, moths. Diplopoda, thousand legs.
		<b>Ctenophora</b> .—Comb-bearing jellyfish.		
<b>Platodes</b> .—Flat worms.		<b>TORRELLARIA</b> .—Nonparasitic Trematoda. Fluke worms, etc.		
		<b>CERATODA</b> .—Tapeworms, NEMATINI.		
<b>Rotalia</b> .—Coelenterates.—Worms with body cavity.		<b>ROTIFERA</b> .—Wheel animalcules.	<b>Chordata</b> .	<b>Leptocardia</b> .—Lanceolates.
		<b>NEMATODA</b> .—Round worms.		<b>Tunicata</b> .—Sea squirts, sea peaches, etc.
		<b>ANNELIDA</b> .—Jointed worms, earthworms, etc.		<b>NAUPEUSTIA</b> .—Worm's tongue, worm's vertebrae, backbone animals.
		<b>MOLYDIA</b> .—Moss animals.		<b>Ichthyopsida</b> .
		<b>BRACHIOPODA</b> .—Lamp shells.		
<b>Echinodermata</b> .—Starfish, sea urchins, etc.		<b>ARTERIOIDA</b> .—Starfish.		<b>CYCLOSTOMATA</b> .—Lampreys, hagfish.
		<b>OPHIOUROIDA</b> .—Brittle stars.		<b>FISCHIA</b> .—Fishes. Elasmobranchii, sharks, skates. Ganadoi, sturgeons, garpike. Teleostei, ordinary fishes. Dipnoi, lung fishes. Amphibia. Urodela, newts, salamanders.
		<b>ECINUROIDA</b> .—Sea urchins.		<b>Amniota</b> .
		<b>HOLOTHUROIDA</b> .—Sea cucumbers.		<b>SACROPOIDA</b> .—Reptilia, snakes, lizards, turtles, alligators.
<b>Mollusca</b> .—Mollusks, usually with a calcareous shell.		<b>AMPHINEURA</b> .—Chitons.		<b>Aves, birds.</b>
		<b>ACEPHALA</b> .—Bivalve mollusks, clams, oysters.		
		<b>SCYTHOPODA</b> .—Tooth shells.		
		<b>GASTROPODA</b> .—Univalve mollusks, snails.		
		<b>CEPHALOPODA</b> .—Squid, cuttlefish.		
			<b>Mammalia</b> .	<b>Mammals</b> .

## DICTIONARY OF ANIMALS

**Arm-tank.**—The *Oryctopus capensis*, an insect-eating animal which perforates of the nature both of the ant-eater and the armadillo; agreeing with the former in its general habits, but, although extremely destitute of scaly armor, more resembling the latter as to its anatomical structure. It resembles about the size of a mole, and has a thin skin is short, coarse, and covered with stiff hair; limbs thick, thick, and very muscular. This animal is very common in South Africa, and has received its popular name from its habit of burrowing beneath its super head and powerful claws excavating its passages, as well as from its fancied resemblance to a small pig.

**Aard-wolf.**—The *Proteles b. inandensis*, a singular carnivorous animal. It forms the connecting link between three genera widely separated from each other, having externally the appearance and bone-structure of the hyena united to the head and part of the body of the wolf. It is the cleverest and most sagacious of all the animals of the country, and is a sort of king about that of a full-grown fox, which it resembles in both its habits and manners, being nocturnal, and constructing a subterraneous abode.

**Ahon-hannes.**—An African bird, considered by some naturalists to be identical with the ancient *Phoeniceus*, but which is now generally held to be a distinct species. It is a very common bird, and is sometimes seen in small bands of from six to ten, and is capable of a lofty and powerful flight.

**Acanthurus** (or surgeon-fish), chiefly distinguished by the sharp and lancet-like spines with which it is armed on each side of the tail. They abound in the tropical seas, where they are generally seen in large shoals of two or three hundred each, swimming with great strength, and feeding principally on different kinds of seaweed. The genus contains a large number of species, many of which are extremely beautiful, both in form and color.

As extremely beautiful, both in form and color, the viper is rightly feared, but is widely distributed throughout Europe, the only British venomous snake. It attains a length of over two feet, brown, with a black zigzag line down the back, feeds chiefly upon mice, and is viviparous. Its bite rarely proves fatal, unless to very weak persons and children. In the United States the term is applied to some poisonous snakes without rattles, as the moccasin, or "water-adder," and the copperhead, or "red adder," and also to the harmless hogsnake, which resembles in appearance and thus the defensive attitude of a viper when threatened.

**Aguara** (or crab-eater).—A carnivorous animal, allied to the raccoons, a native of South America. It equals in size an ordinary fox, to which it bears a slight external resemblance. It derives its name of crab-eater from its habit of feeding on all kinds of crustacea and mollusks, whether marine or terrestrial.

**Agouti.**—A South American animal belonging to the *Rodentia*. The agoutis live for the most part upon the surface of the ground, not climbing nor digging to any depth; and they commonly sit upon their haunches, when at rest, holding their food between their forepaws, in the manner of squirrels. By eating the roots of the sugar-cane, they are often the cause of great injury to the planters.

**ALBATROSS.** A genus of birds of the family *Procellariidae*. The species are the largest of all aquatic birds, the wings, when extended, measuring some times fifteen feet, and weight often exceeding twenty pounds. The plumage is white, with some brown bands on the wings and back. It has a strong, hard, long beak, of a pale-yellow color; the feet, flesh-colored, are short and webbed, and the wings are long, strong, and narrow. It preys on the wing and on the water, and is especially common and usually met with in the Southern ocean, and are also seen in immense flocks about Behring strait in the early part of summer, attracted thither by the walrus and seals, which they follow and follow. Their powers of flight are prodigious.

**Alligator.**—A genus of very formidable and ferocious reptiles, found in the tropical regions of America, and closely resembling the crocodile. They differ from the true crocodiles in having a shorter and flatter head, cavities or pits in the upper jaw, into which the long canine teeth of the under jaw fit, and feet much less webbed. Their habits are less perfectly aquatic. The largest grows to the length of seventeen or eighteen feet. The female lays her eggs in the sand, to be hatched by the heat of the sun.

**Alpaca.**—The *Peruvian sheep*, a variety of the guanaco or llama. It inhabits the more elevated parts of the mountain ranges, living almost on the border of perpetual snow. The Peruvians keep vast flocks of them for the sake of the silky luster and fineness of their wool, which furnishes material for the best of fabrics.

**Macranda.**—The popular name of two of the largest species of the aspidel tribe, viz., a Ceylonese species of the genus *Python* *tigris*, said to have been met with thirty-three feet long; and *Eunectes murina*, a native of tropical America, allied to the boa-constrictor, and the largest of the serpent tribe, attaining the length of forty feet. They frequent swamps and rivers, are destitute of poison fangs, and kill their victims by constriction.

**Anas.**—A genus of birds of the subfamily *Anatinae*, distinguished by a bill broad, depressed, larger than the head, and a pointed tail. The common wild duck or mallard. *Anas boschas* is the original

stock of our tame or domesticated duck. The stock of the wild duck is highly esteemed as an article of food. The widgeon (*Marca penelope*), a species of the same genus, is a migratory bird, bred in the morasses of the north, which they quit on the approach of winter, spreading themselves along the shores, and over the marshes and inlets in various parts of the United States. They are easily domesticated in places where there is plenty of water, and are much admired for their beauty and suppleness.

**Anchovy.**—The *Engraulis encrasicolus*, a well-known small fish of the herring family, abounding in many parts of the Mediterranean, particularly on the coasts of Italy, Greece, Spain, and France. It is about four inches long, of a bluish-brown color on the back, and silvery-white on the belly. They were known to the ancients, and were used both by the Greeks and Romans as a pickle or sauce under the name of *carum*.

the most important of all the varieties of the goat, the *Capra montanus* of the Himalayas. Minor, unsuitable for producing not only a peculiar race of goats, but also sheep, cattle, rabbits, and other animals. The goat of the Himalayas of Angora is generally of a beautiful milk-white color, short-legged, with black, spreading spirally-arranged horns, and a long, shaggy tail. Its distinguishing excellence, however, is the wool, which covers the whole body in long pendulous locks, which are combed out and made into yarn. That the finest camels are made. To the same genus belong the *Camelus bactrianus* and *Camelus ferus*; the latter is descended from the goat of Tibet, which pastures on the Himalaya. It is now domesticated in Persia, and has a long neck and long, fine, silky wool. These goats are now acclimated in the United States, both pure and crossed with the American goat. It was predicted, it is found that in some parts of the country even the American goat is improved by crossing with the evident signs of improvement resulting from the

shagreened, and the name of hymenopterous (or membranous-winged) insects of various genera of the family *Formicidae*, found in most temperate regions, and in some of the tropics, among the most useful insects, and have long been noted for their remarkable intelligence and interesting habits. In the laws, each member of the society bearing a well-defined and separate part in the life of the community. Each consists of males and females, the males being much larger than the males; and of barren females, the workers, which are the most numerous. The neuters are wingless, and the males and females only acquire wings for their "nuptial flight," after which they die. The males and females are able to escape the pursuit of their numerous enemies by divesting themselves of their wings, and either return to their old colonies, or migrate to form new ones. The neuters perform all the labors of the ant-hill or abode of the community; they are the soldiers, the carriers of food, the nurses of the larvæ or young ants, which are destitute of organs of locomotion. We find, therefore, they carefully carry their young to the surface, and deposit them in the sand's nest, and as attentively carry them to a new nest, when the old one is abandoned. The neuters of the ant-hill is distinguished in like manner they watch over the safety of the nymphs, or pupæ, and the young adults, and protect them from all enemies. The neuters possess a special type of neuters, known as "soldiers," from the duties that specially require them. They are larger than the workers, and have powerful jaws. There is a very considerable variety in

[illegible]

order *Hemiptera*. The ant-eaters have no stingers, have the body covered with rather long hair, an elongated slender head, with very long exertible tongue, and walk on the sides of their feet with the claws. The *Myrmecophaga jubata*, is a native of Brazil and Guiana, and is much the largest of all the ant-eaters. It is covered with long black hair, and is capable of remarkably large tail, with which, when at repose, it can wrap itself up so as to be effectually protected from heat or rain. It is a powerful animal, and is capable of tearing open the hide of a dead animal more than eight feet in length from the extremity of the nose to the end of the tail. It lives exclusively on ants, and is able to tear open the hard shells by tearing open their hills with its hooked claws, and then drawing its long tongue, which is covered with glutinous saliva, over the swarms which flow out.

[illegible]

**Ant-Bees.** The most remarkable of the old world wasps is the ant-bee, *Myrmecodia formicivorus*, which in its perfect state greatly resembles a dragon-fly; curious on account of its ingenious method of catching the insects—chiefly ants—on which it feeds. It digs a funnel-shaped hole in the driest and finest sand it can find, and when the pit is deep enough, and the sides are quite smooth and sloping, it buries itself at the bottom with only its formidable mandibles projecting, and waits till some luckless insect stumbles over the edge, when it is immediately seized and jerked out, and the head body jerked out. It inhabits southern Europe.

**Argonaut.**—A molluscan animal of the genus *Argonauta*, but not the argo-oid cuttlefishes, distinguished by the females possessing a single-chambered external shell not organically connected with the mantle, and by the males having no shell and are of much smaller size than the females. The shell is fragile, translucent, and boat-like in shape, it serves as the receptacle for the ovum or eggs. The mantle is attached to it with the respiratory tube or "funnel" turned down the carina or "keel." This famed mollusk swims by the aid of the mantle, and in the manner it can crawl in a reversed position, carrying its shell over its back like a snail. The argonaut, or paper nautilus, is not a nautilus, but a mollusk from the *pearly-nautilus* or *nautilus* proper.

*Argus phasianus* (*Argus gigantus*).—A large, beautiful, and very singular species of pheasant, found in the mountains of Assam, and especially in Sumatra and some of the other islands. The males measure from five to six feet from the tip of the beak to the extremity of the tail, which has two greatly elongated central feathers. The plumage is exceedingly beautiful, the secondary quills of the wings, which are longer than the primary feathers, being each adorned with a series of ocellated or eye-like spots of brilliant metallic hues. The general body plumage is brown.

**Armadillo** (genus *Dasypus*).—A mammal peculiar to South America, consisting of various species, belonging to a family intermediate between the sloths and ant-eaters. They are covered with a hard bony armor, the plates of which are joined by separate plates like a coat of mail, flexible everywhere except on the forehead, shoulders, and haunches, where it is not movable. The belts are connected by a series of rings, which enable the animal to roll itself up like a hedgehog. These animals burrow in the earth, where they lie during the daytime, seldom going abroad except at night. *Dasypus virgatus*, being three feet in length without the tail, and the smallest only ten inches. They subsist chiefly on fruits and roots, sometimes on insects also. They are very inoffensive, and their flesh is esteemed good food.

**Asp** (*Apsa*, or *Vipera*, *Aaje*).—A species of viper found in Egypt, resembling the cobra de capello, or spectacle-serpent, of the East Indies, and having

than the other pairs, and present on the exterior a triangular depression, resembling a *palette*, in which is secreted the pollen. The borders of a sort of basket in which the insect deposits the pollen of flowers. To each of these legs is attached a small, pointed process, which might be termed the ankle, smooth on the exterior, but having hairs on its interior surface which are caused to rise in the manner of a comb, and which is employed in collecting the pollen. The other tools of the working bee consist of a pair of movable mandibles, which have two teeth on its two sides, and of a trunk, or proboscis, which may be considered as a sort of tongue; this organ has a leathery surface, whereas the honey of flowers adheres, whereas it is conveyed to the mouth, and from it to the stomach, to be subsequently digested. The mandibles are much larger and more hairy than the working bees; they emit a buzzing sound, have a longer body than the workers, and the wings shorter in proportion. The only part she has to play is that of laying eggs, and so she has no palates or brushes. Only one queen lives in each hive, of which she is perfect sovereign, all the workers submissively obeying her. The number of males is scarcely one-tenth that of the working bees, and they live only about three months. The was of which the cells of the honeycomb are constructed is supposed to be secreted by an organ situated in the abdomen, but it is not the case. The secretion was, another substance, much resembling it, but not identical, called *propolis*, is elaborated by the juices of certain plants, and is used to line the inner surface of the hive. The cells are hexagonal in shape, that is, having six equal sides; the most common cells are of two kinds, and are of two kinds, namely, store-cells, which are filled with honey, as a reserve store of food, and middle-cells, in which the eggs are deposited. At a certain time of the year the queen leaves the hive, accompanied by the drones, and takes what is called her nuptial flight. After this flight. About forty-eight hours after her return to the hive she begins laying her eggs, at the rate of about one hundred a day. The eggs which are destined to develop into workers are first laid, then those which are to produce males, and lastly those which are laid to females. The eggs which are long in being hatched, and the *larvæ*, or caterpillars, which emerge from them are tended by the workers, and fed by them on a mixture of honey and apparently a preparation of pollen. In five or six days the larvæ pass into the condition of pupæ, and in twelve or thirteen days they are hatched, and this the perfect insect is hatched.

**Beetle.**—A name often used as synonymous with *insect*. Coleridge, but it is not the case. Others to include all those insects that have their wings protected by hard cases or sheaths called elytra, and they are very numerous. The beetle of a man's fist, the largest, the elephant beetle of South America, and a whole series of night beetles, and a whole series of kitchen and cellar are not properly beetles at all, but cockroaches, and so on.

**Bird-catching spider.**—A name applied to gigantic spiders of the genera *Mysale* and *Epeira*, more especially to the *Mysale araneus*, a native of Surinam and elsewhere, which preys upon insects and small birds, which it hunts for and pounces on. It is about two inches long, very hairy, and almost black; its feet when spread out occupy a surface of nearly a foot in diameter.

**Bird of paradise.**—The name for members of a family of birds of splendid plumage allied to the crows, inhabiting New Guinea and the adjacent islands. The family includes eleven or twelve genera and a number of species, some of their remarkably beautiful. The largest species is the bird of two feet in length. The most beautiful (Paradisea regia) is possibly the most beautiful species, but is rare. It has a magnificent plumage of blue, white, and delicate iridescent tints. It feeds from under the wings, and falling over the back like a jet of water. The feathers of the *Paradisea regia* and *Paradisea* have the most beautiful plumage. These splendid ornaments are confined to the male bird.

**Bison.**—The name applied to two species of ox. One (the European bison, or aurochs, *Bos bison* or *Bison europæus*), is now nearly extinct, being found only in the forests of Lithuania and the Caucasus. The other, American bison, (improperly termed buffalo (*Bison americanus*), is found only in the region lying north and south between the Great Salt Lake and the Yellowstone river, and is rapidly becoming extinct. The wild state, to which it is confined, is an immense herd. The two species closely resemble each other, the American bison, however, being more numerous, and the European bison is weaker and blind-quarer. The bison is remarkable for the great bump or projection over its forehead, which is covered with hair, and is about six feet in height; and for the long, shaggy rust-colored hair over the head, neck, and forepart of the body. The skin of the bison is shaggy and backward, the surface is covered with a very short fine hair, smooth and soft as velvet. The tail is short and tufted, the feet are small, and the bison used to be much hunted for sport as well as for its flesh and skin. Its flesh is rather coarse

grained than that of the domestic ox, but was considered by hunters and travelers as superior in flavor. The bison is a very hardy animal, celebrated for its richness and delicacy. Their skins, especially that of the cow, dressed in the manner of the bison, are used for making defenses against the cold, and are known as buffalo robes; the wool has been manufactured into hats, and the skin into boots. The American bison is found to breed readily with the common ox, the issue being fertile among themselves.

**Butterfly.**—The name of several insect birds, family *Asteria* or *herona*, genus *Butterfly*. There are two British species, the common *Butterfly* (*Herona*), and the little *Butterfly* (*Herona minuta*), a native of the south, and only a summer visitor. British *Butterflies* are distinguished from the reclamation of the marshy grounds that form their favorite haunt. The common *Butterfly* is about two-and-a-half inches in length, about forty-four in extent of wing; general color, dull yellowish-brown, with spots and bars of black or dark brown; feathers on the breast long and loose; tail short; bill about four inches long. It is remarkable for its curious booming or growling sound, which varies the notes of the *Butterfly* and *Butter-bug*, etc. The eggs (greenish-brown) are four or five in number. The little *Butterfly* is not more than fifteen inches in length. The American bison (*Butterfly lentiginosa*) has some resemblance to the common European *Butterfly*.

**Blackbird** (*Turdus merula*), called also the *merle*, a well-known species of thrush, common in Britain and throughout Europe. It is larger than the *Merle* in its length, and its bill is about four inches. The color of the male is a uniform deep black, the bill being an orange-yellow; the female is of a brownish black, with black on the head, neck is usually in a thick bush, and is built of grass, roots, twigs, etc., strengthened with clay. The eggs are four or five in number, and are greenish-blue, spotted with various shades of brown. The song is rich, sweet, and melodious, but of no great variety or complexity. Its food is worms, snails, fruits, etc. The blackbirds, or crows, of North America are quite different from the European blackbirds, and are nearly allied to the starlings and crows. The red-winged blackbird, which is common in America, is the starting family, is a familiar American bird that congregates in great flocks.

**Bloodhound.**—A variety of dog with long, smooth hair, and a keen, ravenous, and much esteemed for its smell, and employed to recover game or prey which has escaped wounded from the hunter. It is a large, powerful animal, with a black and white spinal; whence the name of the dog. There are several varieties of this animal, as the English, and the French, and the American. The former times bloodhounds were not only trained to the pursuit of game, but also to the chase of fugitive slaves. The American bloodhound is a hunting fugitive slave.

**Bluebird.**—A small, dainty, insectivorous bird, of the family *Sialia*, which is common in the United States. The upper part of the body is blue, and the throat and breast of a dirty red. It makes its nest in the hole of a tree, or in the hole of a rock, and is commonly provided for its use by the friendly farmer. The bluebird is the harbinger of spring to the Americans; its note is cheerful, continuing with little interruption from March to October, but is most frequently heard in the warm days of the spring. Its song is also called *blue bird* or *blue robin*, and is regarded with much poetical sentiment as the harbinger of spring.

**Bluefish** (*Pomatomus* or *Pomatomus salator*).—A fish common on the eastern coasts of America, allied to the mackerel, but larger, growing to the length of three or four feet, and weighing from ten to twenty pounds for the table. It is very destructive to other fishes. It is also called horse-mackerel, green-back, etc.

**Boa.**—A genus of serpents, family *Boide*, having the jaws so constructed that these animals can bite and crush with sufficient force to swallow the animal whole. The bores are peculiar to the hot parts of South America. The *boa constrictor* is the largest, and the largest specimen of the genus exceeding twenty feet in length; but the name *boa* or *boa constrictor* is often given popularly to the large serpents of the tropics, and so as to include the pythons of the old world and the anacondas and other large serpents of the tropics.

**Bony pike** (or garfish).—A remarkable genus of fishes inhabiting North American lakes and rivers, and is the few living species of the order *Ganoid*, the order of ganoid fishes so largely developed in previous geological epochs. The body is covered with bony scales, and the scales are so thick that it is impossible to pierce them with a spear. The common garfish attains a length of five

feet, and is easily distinguished by the great length of its jaws.

**Bower bird.**—Certain birds of Australia and New Guinea which have the habit of building bowers. These are constructed on the ground, usually in some retired spot, and are formed of twigs, hanging branches, and are decorated with feathers, shells, stones, bones, etc. The bowers are not built by the male, but are ready-made at the mating season.

**Buffalo.**—The name of a certain wild cattle of the warmer parts of the old world, living in marshy places. Some of them have been domesticated and are used for carrying loads, and for other purposes. They were first introduced into North America, a very different kind of animal. When first introduced into North America, they were used as Ohio, while farther west they occurred in enormous herds. With the opening of the transcontinental railroads, they were nearly exterminated, so that now there are only a few protected herds. The attempt has been made, with some success, of crossing them with domestic cattle.

**Bug.**—A name loosely applied to any insect, but strictly belonging to insects of the order *Hemiptera*, which have sucking mouthparts and the wings partly hardened, partly membranous. Most of them feed on the juices of plants which they suck by means of the beak, but a few prey upon other animals, the bedbug attacking man. Most of the genus are of no great value, but a few are of value, like the lace insects and the cochineal, the red dye of which is obtained from the cochineal.

**Bulldog.**—A variety of the common dog, remarkable for its short, broad muzzle, and the projection of its lower jaw, which is furnished with sharp teeth to protrude beyond the upper. The head is massive and broad; the lips are thick and pendulous, and the ears are at an extremity. The neck robust and short; the body long and stout; and the legs short and thick. The bulldog is a slow-moving, ferocious animal, better adapted for savage combat than for any purpose requiring activity and intelligence. For this reason he is often used in the chase of the fox, and is also used—as its name implies—for the barbarous sport of bull-baiting. The *bull terrier* was originally from a cross between the bulldog and the terrier. It is smaller than the bulldog, lively, docile, and very courageous.

**Bufo.**—The name of the largest species of frog. It occurs through a large part of the United States and has its name from the loud croak which some of them utter. It is a large, stout animal, with a dusky brown above, yellowish-green beneath, and is spotted with black.

**Bullhead.**—A common name for several species of fish. In the United States the name is given to some species of the order *Acipenser*, and is also applied to a smaller fish, allied to our miller's thumb, but belonging to a different group from the catfish.

**Bustards.**—Birds of the order *Gallina*, restricted to the old world, and somewhat closely related to the quails. The *great bustard* is the largest about the size of a turkey, is the largest bird in Europe, and ranges east to Tartary. The little bustard is common in southern Europe. Other species occur in Asia, Africa and Australia. They are vegetable feeders and all are strong runners, and though they are slow to take wing, they fly well.

**Butterflies.**—A group of insects with broad wings belonging to the order of *Lepidoptera*, which are easily distinguished from the moths by their habit of flying in the daytime and by having the antennæ feelers at the end of the head ending in a club, and never tapering or feathered. Like many other insects these hatch from the egg with the shape of the caterpillar, and are very different from the adult. This is usually the case with the caterpillar, and it is usually passed the winter. Then the chrysalis case splits down the back and from the opening the butterfly comes out. It is at this stage in which it lays the eggs which are to go through the same history. There are several thousand species of butterflies known, the majority being inhabitants of the tropics.

**Bustard.**—A name applied to several diurnal birds of prey formerly denominated the hawks, our common hawk being a bustard. These birds feed on mice, moles, small birds, insects, etc., and on the whole are benefited to agriculture. The common bustard is spread over the whole of Europe and America, and is a very common bird. The bustards are not so numerous as the hawks, and the honey bustards of the old world feed on honey and on the larvae of bees.

**Camel.**—A family of animals which includes a few forms of animals that chew the cud but are without horns. In the warmer parts of the old world are two species of camels, the dromedary and the Arabian camel, which serve as beasts of burden. One, the dromedary, has a single hump of fat, etc., upon the back; the Arabian camel has two humps. There is some exaggeration in the common accounts of their endurance and of their ability to go for a long time without water. The hair of the camel is very coarse. In Persia and adjacent parts of North America are four members of the family, two of

which, the llama and the alpaca, have been domesticated.

**Camelopard.**—See giraffe.

**Canoe shells.**—Certain small shells from the sea, in which the natives of the Pacific employ a thin layer which makes these of value for canoes. The manufacture of these is mostly carried on in Genoa and Naples.

**Canary.**—One of the finches, originally coming from the Canary Islands, but domesticated for three hundred years. In the tropics, the canaries are favorites with many, and the best songsters bring high prices. While the usual color in cage birds is canary yellow, the wild birds are a dull green.

**Canasack duck.**—An American duck, breeding in the far north and shot in summer in the Canadian lakes. In the Chesapeake they feed on the roots of the *Fadiscaria* (wild celery), a marsh plant which gives the flesh a peculiar taste, and makes these the most esteemed of game birds.

**Cardinal bird.**—One of the finches, also known as the redbird. It is a native North American and is a good singer. Its common name is due to the bright red plumage.

**Carp.**—A group of fishes without spines in the fins. The true carp originated in China and was introduced into Europe three hundred years ago, and much later into America. It has little value as a food supply, aside from the fact that it is readily reared in confinement. The carp has numerous varieties, among them the familiar gold and silver fishes. Less known in America are the leather carp, in which the scales have been lost, and the mirror carp, with only a few scales on the head and scales on either side of the body.

**Carpel beetle.**—A small beetle of inconspicuous colors which originates upon flowers, but which has taken to animal food, and especially to woolen goods. It is the larva which does the damage.

**Catbird.**—A well-known species of American thrush, which, during the summer, is found throughout the Middle and New England States. The plumage is a deep slate color above and lighter below, and the nightingale whistling in the song is largely imitative of those of other birds, but it also has the cat-like note which gives it its common name. It is a native North American, the extreme south of the United States, and is found also in Mexico and Central America.

**Catfish.**—A large family of fishes including the lion, tiger, panther, leopard, lynx, puma, and a number of other forms, among them our domestic pussy. All have a family of sharp teeth and sharp teeth and elongate pupils to the eyes. The common cat is probably a native of Egypt. Certain it is that it was domesticated by the Egyptians, and was an object of worship and was frequently mummified. It was not known to the ancient Greeks and Romans, and was taken by the rats and mice being taken by domesticated man. The domestic cats are cleanly animals, never attached to poisonous or noxious food, and many domesticated animals, are very variable in color. Besides the ordinary kinds, there are common the tailless (Manx cats, from the Chinese as well as from the island of Man) and the Angora or Persian cats, with long silky fur. The oon cats are merely a race of the latter. The original of the domestic cat was probably marked with black bar on a ground of tawny and white, these colors rendering them inconspicuous among the grasses and shrubbery where they ranged.

**Catpup.**—A group of jointed animals belonging to the order *Myriapoda*, characterized by having numerous segments to the body, each with a pair of walking feet. The head is very like that of an insect, but the remaining segments of the body are not divided into regions. The legs of the first segment behind the head contain a poison gland, and its secretion is fatal to man and many other insects in length. The bite of these larger forms causes considerable pain, but authenticated cases of death following the bite of a centipede are rare.

**Cephalopoda.**—A group of mollusks in which the mouth is surrounded by a number of arms, each usually bearing a suckling organ. The suckling organs, eyes, a sack enveloping the body, and a shell which may be either external or internal. The group includes the squid, cuttlefish, and nautilus, and many other forms without common names.

**Chameleon.**—A genus of lizards, natives of parts of Asia, Africa, and Europe. The best-known species has a naked body six or seven inches long, with a prehensile tail about five inches long, and is famous for grasping branches. The skin contains small grains of a bluish-gray color in the shade, but in the light of the sun it changes to a brilliant green of a grayish-brown or tawny color. It possesses the curious faculty of changing its color, either in accordance with its environment, or with its temper when disturbed, the change being due to the presence of clear or pigment-bearing contractile cells placed at various depths in the skin, their contractions and dilations being under the influence of the nervous system. Other lizards have the same power of changing color, and the name has been also applied to them. Their power of fasting and habit of inflicting themselves give rise to the fable that they can live for a long time

in reality insectivorous, taking their prey by rapid leaps, and using a long, muscular tongue. In general habit they are dull and torpid.

**Chamois.**—A species of goat-like antelope inhabiting the high mountains of the Alps and the western Asia. Its horns, which are about six or seven inches long, are round, almost smooth, and are straight until they are about half grown, where they suddenly terminate in a hook directed backward and downward. Its hair is brown above and white below, the tail coarse and bushy in spring. The head is pale yellow with a black band from the nose to the ears and surrounding the eyes. The animal is a very sure climber, the nature of its haunts, and its powers of smell, render its pursuit an exceedingly difficult and laborious task for the hunter.

**Chimpanzee.**—The native Guinea name of a large West and Central African ape belonging to the anthropoid or man-like monkeys, and to the same genus as the gorilla. When full grown it is sometimes about five feet high, with black hair, and is not so large and powerful as the gorilla. It walks erect better than most of the apes. It feeds on fruits, often robs the gardens of the natives, and conducts a sort of most amicable warfare. It is common in menageries, where it shows much intelligence and docility.

**Chinchilla.**—A small animal, about nine inches long, occurring on the west slope of the Andes, and hunted for its beautiful fur. The chinchillas are members of the order *Rodentia*.

**Chiton.**—Bivalve mollusks which form a considerable element in the food supply. The name is locally used for the tail of the gull, which is applied to the quahog, with a heavy shell capable of closing completely, and to the long clam, with lighter outer and thicker inner valves. In the latter two long tubes up to the surface, and through these it obtains the food and water necessary for its existence.

**Cochineal.**—A bug allied to the plant lice, which feeds on the leaves of the cochineal cactus, when dried and treated with alum, and the extract is dried, gives the brilliant red dye, carmine.

**Cockroach.**—A member of the order *Blattaria*, some small, others two inches long, which feed upon decaying vegetable matter. Several species have taken to domestic life, and many of them prove most unwelcome boarders. Many methods have been advocated for their extermination, but none has been successful. They are very numerous, and for individual species, and a continuation of this for months.

**Codfish.**—A species of marine fishes with barbels about the mouth and with three lines upon the back and all fins without spines. This is probably the most common food fish of the world, and numbers on the coasts of Europe and of eastern North America. It occurs in the northern Pacific from Alaska down upon the coast of California, and large specimens weigh over one hundred pounds. Allied to the cod are the haddock, the turbot, and the halibut.

**Condor.**—A South American bird, one of the largest of the vultures. It resembles the common vulture, differing from the latter in the form of the carilaginous caruncle which surmounts its beak, and in the large size of its oval and longitudinal nostrils. Despite stories of its gigantic proportions, Humboldt met with no specimens whose wings exceeded nine feet in expanse, though it has been known to expand to fourteen feet. It is found in the Andes chain, frequenting regions from 10,000 to 15,000 feet above the level of the sea. They only descend to the plains under stress of hunger, when they attack sheep, goats, deer, and bullocks. They prefer carrion, however.

**Coney.**—A small animal mentioned in the Bible and supposed to be the *Hyrax* of science. Its home is around the eastern and southern coasts of Africa. The animal is without near relatives.

**Coral.**—The living structure of certain low animals allied to the lime-secreting corals, and grouped by zoologists as *Celesterales*. The coral is secreted by the animals, and is taken up by the skeleton of something of the radiate structure of the animal. As the animals usually form colonies of hundreds or thousands of individuals, each secreting a little cup in which each individual was seated. When the animals die these coral masses are left behind, and the solid structure of the coral reefs and islands are formed by them. The precious coral of the Mediterranean and of Japan is a solid and is taken up by the skeleton of the animal. The value of the coral depends upon the color and size of the piece, the pale pink commanding the highest price. The coral is used in jewelry, and for counterfeits, made of marble, and for dyed coral.

**Crab.**—The common name of a large number of the arthropods, to which the group is allied, and folded under the anterior part of the body—the cephalothorax. Over two thousand species are known, differing so widely in size and in other respects. The great majority are marine, but there are a few which spend their entire life on land, only going to the water once a year to lay their eggs. The largest is the great spider crab of Japan, whose legs may stretch out a dozen feet. Like all arthropods, the crabs molt their skin, and after the molt, their skin is soft. One species on the Atlantic coast is taken at this time in great numbers, and is the favorite soft-shell crab

of the table. The hermit crabs have the abdomen and legs protruding from a shell, and carry this about with them wherever they go.

**Crane.**—A genus of birds, including the largest bird in the world, the ostrich, and the smallest, the quail. The crane is remarkable for its long migrations, in which they usually fly in large flocks led by a single leader. The male and female cranes are monogamous, and the leadership is continually changed. The common crane breeds in the north of Europe and in Siberia, and migrates to the south in the fall of winter. It attains nearly five feet in height; with the exception of the neck, which is black, the body is uniformly gray. It is a very strong swimmer, and it frequents large plains and marshes, and feeds on fish, reptiles, frogs, mollusks, worms, leeches, and even small mammals. It is very tame, and the birds pair for reproduction and rearing the young. The games and dances in which they indulge are noteworthy. They form groups in various fashions, advance toward one another, make a kind of salutation, and adopt postures of various kinds. In some species occur in America, the whooping crane being noticeable for the convulsions of the trachea within the throat.

**Crayfish.**—The common name of the small crustaceans of fresh water which resemble the lobsters in appearance. They usually live in burrows in the banks or bottoms of streams and feed on decaying animal matter. In Europe they form a considerable element in the food supply, and are found in ponds. A large number of species occur in the United States, and in the larger markets they are sold by the dozen.

**Crocodile.**—A genus, family, and order comprising the largest living reptiles. The characters of the crocodile are the following: The body is covered with square, bony plates; the tail is long and compressed. The feet are short, and there are five on each side. The head is broad, and the jaws are the latter more or less webbed. The jaws are long and the teeth are small. The nostrils are at the extremity of the snout, and are capable of being closed to prevent ingress of water. The heart is four-chambered, and the blood is red. The crocodile is the alligator, crocodile, and gharial. The alligators are all new world forms. The gharial proper is found in the Indian Archipelago. The crocodile of the Nile is the best-known member of the order; another species is met with in southern Europe, and the crocodile of the Nile is the largest. The crocodile is formidable from its great size and strength. It is exclusively carnivorous, and always preys upon the weak and the sick. It is found in Egypt it is no longer found except in the upper or more southern parts. It grows sometimes to a length of thirty feet, and apparently lives to a vast age.

**Crow.**—The family, widely diffused over the world, including the raven, the jay, and the magpie. The common crow of North America is remarkable for its intelligence and cunning. It is very wary, as well as for its intelligence and cunning. They pair in March; the male repairs their nests, the female builds them. They are very thieves that while the one is fetching materials the other must keep watch to prevent the rising birds from being plundered by their neighbors. As soon as the nest is finished and the eggs produced (five, bluish-green, with dark blotches), the male takes upon himself the care of providing for his mate, which he continues during the whole period of incubation. They frequent the same rookeries for years, but allow no intruders into their community. They feed chiefly on worms and the larvae of insects; they also eat grain and seeds, whence they have sometimes been supposed injurious to the farmer; but they simply repay him for what they take by destroying the vermin in his fields.

**Crustacea.**—One of the great groups of animals, including the lobster, crab, barnacle, shrimp, etc. They are characterized by having two pairs of feelers (antennae) at the front of the head, and by a skeleton by gills attached to some of the legs, and a laborious nervous system. As they have a hard, chitinous covering, they are able to live in water in size by shedding the external skin at irregular intervals. Several thousand species are known.

**Cuttlefish.**—A member of the order *Cephalopoda*, the class of *Cephalopoda*, in which there are ten arms around the mouth. The internal shell is calcified, and is called the cuttlebone. It is a very common bird. They have also an ink bag, the secretion of which furnishes the pigment sepia. Cuttlefish is an important article of food in southern Europe.

**Deer.**—A group of ruminant quadrupeds constituting the order *Ruminantia*, and including the reindeer, combining much compactness and strength with slenderness of limb and fleetness. They use their horns for defense, but are not so much as in general they trust to flight for their safety. They have a long neck, a small head, which they carry on a long neck, and large, full eyes. They have acute glands, usually beneath the eyes, which serve as sexual attractions. Deer are divided into two groups, the antelope and the branching horns (antlers), which in most species exist in the male only; they are solid, fall off annually, and are renewed with increase of age.

and number of branches, according to the kind, and said the animal had reached old age. Deer are found in almost all parts of the globe, except Australia and the south of Africa, their place in the latter region being supplied by antelope; the greater number inhabit the warmer temperate countries, and they are chiefly found in wide plains and hills of moderate height. The flesh (venison) of most kinds of deer is highly esteemed for the table, and they have long been regarded as among the noblest objects of the chase. Only one species, the reindeer, can be said to have been fully domesticated.

the large, lightless pigeon formerly living in the Mascarene islands in the Indian Ocean. It was a large bird, and the last individual disappeared before 1700. "An animal well known for its attachment to its young," says the author, "it was of various varieties, as to size, form, color, and quality of its food." The author is not sure whether it belongs to the order of *carnivorous mammals*, and to that section distinguished as *edentate*, or to the order of *birds*, and to that section called *procellariæ*. It is a question of considerable interest what was the parent stock of the dog. "The dog is a domestic animal derived from the wolf; others think that it is a domesticated animal derived from the jackal, and that the jackal is in a primitive state of nature. That there are wild dogs, we know. The tribe of India and the dog of the East are the same, and are in a state of complete independence, and throw no light upon the question. The dog will live on cooked vegetables, and will eat the refuse of the kitchen, and it lags with the tongue." It never perspires, and it has no sweat glands. "The dog is a creature that hangs out of the mouth. The female goes with young sixty-three days, and usually produces six or seven puppies. The puppies are blind at birth, and do not acquire their sight until the tenth day. The dog attains its full size at the age of six months, and lives to be a old at fifteen, and seldom lives beyond twenty years."

**Dormouse.**—Small animals, in some respects intermediate between the squirrels and the true mice. They live in the trees of Europe, but in their hibernations they become so torpid that "he sleeps like a dormouse" is proverbial.

doves.—A name for several of the more familiar pigeons, like the mourning doves of the United States and the turtle doves of the old world.

**Dragon Fly.**—One of the insects of the order *Pseudoneuroptera*, which has an elongate body and long and slender wings. They lay their eggs in the water, where the young are hatched and feed upon all kinds of aquatic insects. The adults

**Duckbill.**—A peculiar mammal of Australia, living in the streams, and feeding, like a duck, on the matter contained in the ooze at the bottom. In accordance with these habits the toothless jaws are prolonged into a duck-like beak and the feet are webbed. The animal has many other peculiarities of structure, among them the presence of but a single opening (as in reptiles and birds) for the digestive and urogenital organs. It also does not bring forth living young, like all other mammals, but it lays eggs. It is about 6 feet

**Ducks.**—A group of swimming birds, too well known to need description. Most of the species are migratory and some, like the mallard and the shoveler duck, are found in both the old and the new worlds. Among the interesting forms are the eiders, well-known from their soft down. They are found in the colder parts of both continents. The Labrador duck was formerly very abundant, but is now probably extinct. Specimens are far rarer in museums than of the great auk. The wood duck is possibly the most beau-

bird species. The group of birds belonging to the order *Falconiformes* and to the same family as the falcons are the hawks. They are found in all parts of the globe. The size varies according to the species, but all attain imposing dimensions. The golden eagle measures about three feet nine inches in length, and the spread of its wings is nearly ten feet. It is the largest of its kind, and its power of vision is very acute. It builds its nests in the crevices of inaccessible rocks, and lays generally two or three eggs; the period of incubation is thirty days. Besides the golden eagle, there are other species, such as the American eagle, the bald eagle, the tawny eagle, the booted eagle, and numerous smaller species in tropical regions.

**Earthworms.**—A group of burrowing worms, found in the earth in almost all parts of the world. They are without eyes or well developed appendages. They live on the organic matter in the soil, and to obtain this they swallow the earth through which they move, and cast the refuse on the surface. This makes them of great value to the agriculturist, as they work over and loosen the soil. In the winter they burrow down beneath the frost, and the large numbers frequently seen after a storm is not due to their having descended with the rain, but to their having been drowned out of the earth.

**Echinodermata.**—A great group of animals with a radiate structure, and with a spiny skin. They

are all marine. The class includes the starfish, sea urchins, sea lilies, and some other less commonly known forms.

**Edentates.**—A group of mammals in which the teeth are not always lacking, as the name would imply, but in which they are imperfectly developed. The group is largely American and includes the armadillos, sloths and anteaters.

**eels.**—Fishes of very elongate form, living in the sea. There are several species belonging in very different groups. The lamprey eels have no true jaws, no limbs, and a large number of gill openings. They ascend the rivers in the spring to deposit their eggs, while the true eels descend from the rivers in the fall to the sea for the purposes of reproduction.

[illegible]

Alceen.—A male of various birds of prey, member of the family Falconidae. The falcons proper are the *Falco* group, and the falcon is the most perfectly developed of the feathered race. They are distinguished by having the beak curved and the mandible with a notch or tooth on its cutting edge on either side, wings long and powerful, the second feather rather the longest, and short tail. Among the birds of prey, the falcons are the peregrine falcon and the gyrfalcon. These were the principal birds used in falconry during the Middle Ages, and were especially valued in the East. At one time the sport was almost solely the nobility. Falcons were carefully trained, and were immediately set upon any other game that might be in sight. The pleasure was in watching the falcon getting the better of birds, sometimes many.

fishes.—The lowest class of vertebrate or backboneed animals. They are adapted for an aquatic life, and are able to move with rapid progress through the water. They breathe by means of gills, and are divided into the sea and the fresh water species. The sex, and their appendages (fins) are such as to make efficient paddles. There are usually two pairs of fins, the dorsal and the ventral, and one or two in a corresponding position beneath the dorsal. The tail is usually terminated by a caudal fin, the chief organ of swimming. The caudal fin presents two different forms, the diploid and the teleost. In the teleost the caudal fin is straight at the tip, and the lobes on each side are of equal length. In the diploid the fin is in the horizontal tail the backbone is turned upward at the tip, this making one lobe, while the other is divided into two. This is the type of tail in the shark. The teleost form is the most common of the two, but the last, but the two lobes are equal. Most fishes have the latter type. All of the fins are of cartilage or bone, and are of various shapes in character. There are but two chambers to the heart, and the occurrence of a ventral fin is a character of the teleost. The depth of the water in which the fish is, is very often indicated by the position of the dorsal fin, and the position of the fish, distinguished by the presence of a cartilage or a bony skeleton, by having the gills situated in the mouth, by the position of the dorsal fin, by the skull, presence or absence of air bladder, and by the position of the pectoral fins.

**Flamingo.**—A genus of web-footed birds, in some respects intermediate between the storks and

the ducks, their long legs and necks giving them a resemblance to the former, while their webbed feet connect them with the latter. Their food consists of aquatic vegetation. They are said to appear to be mollusk-eaters, but were found with insects, etc. They breed in companies in mud flats or inundated marshes, raising up the mud into high hills, and then sitting on the eggs so as to form a nest. In this hollow the female lays her eggs and hatches them by sitting on the eggs. The young are hatched in the mud. The young, which never exceed three in number, do not fly till they have nearly attained their full growth, though they can run very swiftly and swim. This species is common in the Southern States, but the common American species is deep red with black bills. It is peculiar to tropical America, migrating southward to the Southern, and rarely to the Middle States.

**Flea.**—A group of wingless insects, mostly parasitic on other animals. They have a hard skin, covered with spines so arranged that they can easily move themselves through the hair, legs admirably adapted for jumping, and the mouthparts fitted for sucking blood. They are everywhere, and are found in cracks in floor or some similar place where there is dirt, and when they are mature they attack all animals. The irritation and annoyance of the bites are sufficient to make them a nuisance, but now it is known that they are an important agent in the transmission of certain diseases, bubonic plague being communicated to man by the black rat flea.

**Flatfishes.**—A group of fishes, including the halibut, sole, turbot, flounder, etc., in which the extremely flattened body has undergone a strange modification, both of the eyes of the adult being on the same side of the head. In correlation with this the fishes live on the bottom of the ocean with the eyed side uppermost, waiting for their prey. The lower, eyeside, side is white, the other colored similarly to the bottom.

flies.—A term applied to various insect different groups, but strictly belonging to the two-winged insects, the *Diptera* of science. Besides the sun-burner, or house fly, which is the most common, there is a metamorphosis, and by its sucking mouthparts. There are some thirty or forty thousand species of flies, of which we will not discuss the habits of the individuals as such. Some species are closely connected with man, and of these the common house fly is especially noticeable. This lays its eggs in manure, and the young fly passes through all its stages and emerging as perfect insects in a few days. Their unclean habits make the house fly more efficient agent in the transmission of disease than any other insect in the typhoid fever and others which attack the digestive tract. Flies are therefore not merely a nuisance, but they may be depicted as the most pestiferous of mankind. Among other flies are the carrion flies, black flies, the gnats and the mosquitoes, which all trouble to man while others attack the animals.

**Flounder.**—One group of flatfishes of moderate size, common near the shore. They are held in moderate esteem as food fishes.

**Flying-fish.**—A name common to various fish which have the power of sustaining themselves for a time in the air by means of their large pectoral fins. Generally, however, the name is limited to the species of the genus *Xerocetus* which belongs to the family *Scomberesocidae* (mackerel-pikes). These can pass through the air to a considerable distance, sometimes as much as 200 yards, to escape from the attacks of other fishes, especially the dolphin. They are most

**Flying-squirrel.**—A genus of rodents, family *Sciuridae* (squirrels), which, by means of the skin of the flank, extending between the fore and hind legs can support themselves for a moment in the air as with a parachute, thus making great leaps. The American flying-squirrel lives in the northern parts of North America.

**Fox.**—Carnivorous animals of which there are several species, belonging to the same family as the dog, and distinguished by their long and long bushy tail; as well as by its cunning, which is perhaps the most remarkable quality of the animal, and is elongated, and not circular as in the dog, the ears are triangular and pointed. A very singular circumstance is, that the animal has no root of the tail; this odor is so fetid that even other animals avoid its locality. The common fox is found in the interior of North America, and extends also into Northern Asia. Its senses are extremely acute. It usually remains concealed in its hole, and only comes forth during hours abroad chiefly at night, in search of food. Birds, rabbits, or hares constitute its usual prey, but it is not confined to these alone, and is wont to rob other food, and has a predilection for certain fruits. It is very destructive to the sheep, and is destructive. Though slightly tame, the fox has great muscular vigor, and bites with much severity. It is not so much tamed as the dog, and is not properly domesticated; and adults, when placed in confinement, show great ferocity, and would destroy their young. It is very cunning, and as well as the cunning which dictates various expedients for escape, makes the chase of the animal very difficult.

common name is due to its gelatinous consistency. Most of the species start in life as buds from attached animals, while later separate and become freed from the animal by opening and closing the bell. The jellyfish are the sexual animals, producing the eggs from which the fixed polyps arise. Most of the species have a practical value; they have stinging organs which are used for defense and to kill their prey. In some the strong current is used to draw food to man. A general name for the group is *Medusae*, while the fixed stages are called polyps.

**Kangaroo.**—A name applied to marsupial animals. They are the most highly developed members of the order, and occur in Australia. Outside the place of origin, the kangaroos comprise over fifty species, and of these the great kangaroo may be taken as a type. This species is formerly placed in the order of marsupials, is now retiring before the colonist. The females are small, the hind-limbs very large and thick; the head small with rather long ears, and a long, dusky-brown mane; the body long, with the fur shortish but thick, and of a gray-brown tint. In height it is as tall or taller than a man. The female carries her young in a pouch on the underside of the belly. When moving quickly the hind-limbs alone are brought into action, and by means of these the animal bounds along in leaps of from three to four feet. It is usually being carried in a nearly horizontal position, and the tail extended to balance it. The fore-limbs are chiefly used in pushing and pulling, and the females lift their young, and place them in the pouch. The kangaroos are vegetable feeders.

**Lamprey eels.**—Eel-shaped animals of a very low form, mostly living in the sea, and sucking fresh water to lay their eggs. The large sea lamprey is nearly three feet long. It has no lower jaw, its mouth is permanent, and it is provided with horny teeth by which the animal fastens itself to other fishes, on the blood and mucus of which it lives. There is a small opening, the gill openings on the side of the neck. They are used as food in some places. Allied are the hagfish, which become true parasites, attaching the body of a fish through the gills and completely devouring the flesh in a single night. The hagfish are not common on our east coast; they are more abundant in Europe and California.

**Lark.**—The common name of birds comprising the groups *Aloues* and *Sturnes* in the zoological nomenclature of Europe, the most harmonious of this musical tribe, commences its song early in the spring, and continues it during the whole season. It is one of those few birds that sing while on the wing. When it first rises from the earth, its notes are few and interrupted, and then, as it ascends, they gradually swell to their full tone, and long after it is out of the sight it continues to charm the ear with its melody. It is not dangerous, and is generally harmless, but descends in an oblique direction, and is sometimes dangerous, when it drops like a stone. The meadow lark, of North America, about ten inches long, somewhat resembles the skylark in its habits, but its song is not so sweet.

**Leeches.**—A group of flattened worms found almost entirely in fresh water, though in Asia there are species which live on the land or in trees. At the anterior end is a sucker, and there is a second at the hinder end. The anterior sucker surrounds the mouth, and this, in some species has radiating tentacles, and in others like a pair of jaws. With these they suck the blood of higher animals, sucking their blood through the wound. Half a century ago leeches were extensively used by physicians in the attempt to relieve certain diseases, but it has since been found out that the system needs strengthening, not weakening, and the use of leeches has ceased.

**Leopard.**—The *Felis pardus* differs from the panther by having small spots thickly set, while the panther's spots are large and open. The species is found in both of Africa and Asia, and is one of the fiercest and rapacious animals in about four feet long. It can take surprising leaps, swim, crawl, and climb trees.

**Lion.**—The largest and most majestic of carnivorous quadrupeds. It is, in many matters, of a nearly uniform tawny or yellowish color, and on the under parts, the young alone exhibiting a paler color. It is like those common in the *Felidae*; the male has usually a mane, and the mane of the male and the tail, which is pretty long, terminate in a tuft of hair. The whole frame is covered with a short, but very coarse hair, of extremely muscular, and the muscles of the head, are remarkably powerful, giving, with the broad, bright eyes and the noble appearance to the animal, which, with its mane, has led to its being called the king of beasts. A lion is the largest of the mammalia, and is from the nose to the tail, and the tail is eight feet long. The lioness is smaller, has no mane, and is of a lighter color on the under parts. The strength of the lion is such that he can carry off a buffalo as a cat carries a rat. The lion is chiefly an inhabitant of Africa, although it is found in Asia, particularly in certain parts of Arabia, Persia, and India. It was anciently much more common in Europe, and was found in the parts of Europe (Macedonia and Thracia), according to Herodotus and other authors. The lion is an

inhabitant of open plains in which the shelter of occasional bushes and thickets may be found. It is easily tamed, at least when taken young and well fed, and is supplied with good food, and was made to contribute to the sports of the ancient Romans; a combat of lions was an attractive sight, and the Roman emperors were reported to have been, for the amphitheater.

**Lizards.**—A group of four-footed reptiles occurring in warmer climates, and especially in the tropics. The body is covered with scales on both back and belly, while the head is covered with large scales, and scutes. It is important when the question comes up regarding a legless form, which look like snakes, the presence of the scales, instead of scales, is a good guide at a glance their proper position. Most of the lizards are insect eaters and thus do much good. Only a single one, the Gila monster, is poisonous. Some of the larger tropical species are used as food. Some of the species have a great capacity for changing the color to correspond to the surroundings. This is most marked in the chameleons of Africa, and exists to a less extent in some of our American species which are popularly called by the same name. The change of color is due to the enlargement or contraction of small colored bodies in the skin. Among the interesting lizards are the horned toads of our southwest, the glass snake of the tropics, and the old world lizard, which break off at slight provocation, and then grow again; the frilled lizard of the East, which is a beautiful lizard; the lizard which is called the gecko of southern Europe, which crawl about on the ceilings of the rooms, uttering the noise of their claws on the floor.

**Llama.**—An animal of Peru, allied to the camels in structure and serving as the native beast of burden. It is a native of the high mountains of Peru, and is about the size of the common deer, with a long neck. It is capable of carrying about one hundred pounds of weight, and is a very hardy animal, which is kept for the hair, used as a textile material and greatly in vogue some forty years ago. When the llama is first sent to England, it should be kept on account of the difficulty of working it satisfactorily. Titus Salt solved the problem, and the llama is now used in the woolen industry, and alpacas defend themselves by spitting and biting, and many a visitor to ecological gardens has been a victim of the llama's spittle. These beasts, Llamas and alpacas are only known in a state of domestication; wild relatives are the vicuñas and guanacos of the high mountains of Peru, from which the llama and alpaca have descended from the wild.

**LOBSTER.**—The most important crustacean, occurring in the seas of all the world. It is found on the coast of northern Europe. The body is divided into two regions, the anterior bearing the head, and the posterior the tail. The body is large and pincers and four pairs of walking feet. At the front of the head are two pairs of feelers, the first pair being the largest, and the second pair of short stalks. The lobsters are fond of decaying fish and are among the scavengers of the sea. In the United States, the lobster is a valuable food, made out of lard and baited with decaying fish. The number taken is enormous, and overhunting has greatly reduced the numbers in the sea, so that almost everywhere laws have been passed to protect them. The annual catch on the New England coast is estimated at about thirty million pounds, the average weight of a lobster being between two and three pounds. Farther south on our east coast, in California and the Mediterranean a different animal is called lobster.

**MACAW.**—A genus of beautiful birds of the parrot tribe, distinguished by having their cheeks decorated with thick, fleshy, and brightly colored lobes. They are natives of tropical South America. The largest and most splendid is the great scarlet or red macaw, and the blue and yellow macaw are somewhat smaller.

**Mackerel.**—An important food fish occurring in the North Atlantic and characterized by the slender shape, the series of little fins on the tail and the very numerous scales. It is found in the waters of the North Atlantic states, but recently it has been comparatively scarce, possibly the result of overfishing. The black mackerel is common in the Spanish mackerel of our southern waters, and the large horse mackerel, which is not very abundant with us, but which is more common in the Mediterranean, where it is called the tunny. Large individuals may weigh over half a ton. It is a very voracious fish, and is found everywhere, being around nearly.

**Magpie.**—A bird belonging to the crow family. There are several species, and it is found in all parts of America. The common European magpie is about eighteen inches in length; the plumage is blue and white, but the black is more common; the bill is stout, and the tail is very long. The magpies continue in pairs throughout the year, and are very faithful to their mate, and are very intelligent. They are determined robbers of other birds' nests, destroying the eggs and young birds. They are celebrated for their sagacity and instincts, their power of imitating words, and

their propensity to purloin and secrete glittering articles.

**Mammals.**—One of the great groups of vertebrates, including all the so-called land animals. The term animal really has a much wider meaning and includes all living forms that do not plant and animal life. The mammals are the warm blooded, by bringing forth the young alive and nourishing them with milk secreted by the mother. The mammals are the most numerous of the animals, and do not lay eggs the only exceptions are three small forms found in Australia (marsupials). These forms are called marsupials. Next above them are the macropods, in which the young are very immature when born. Therefore they are taken into the group on the ventral side of the mother, where they remain until able to shift for themselves. To this group belong our opossum, all of the others, including the kangaroo, wombat, sugar squirrel, etc., belong to Australia and the adjacent islands. Next are the insect eaters or insectivores, including our mole and shrew; then come the rodents or gnawers (squirrels, rats, mice, porcupines, rabbits, beaver, etc.), in which the front teeth are fitted for gnawing. The ungulates are the hoofed animals and are divided into two groups according to the number of toes on each foot. The odd-toed group includes the horse, the even-toed group (cattle, sheep, deer, antelope, camel, etc.). The highest group is the primates, which are restricted to Asia and Africa, but forms spread over Europe and America is the species known as the man.

Another group in the bats, the only flying mammals, which have a wing of skin supported on the extremely long bones of the forelimbs. The bat feeds on insects, but in South America there is one which is said to suck blood (vampire), and in Asia there is one which feeds on man. The bat forms an additional group, wonderfully adapted for aquatic life, also are the sirenia (manatees) and dugongs, which are large aquatic mammals, with teeth adapted to eating fish and cracking bones. Here are the bear, weasels, otters, moles, muskrats, fish-eaters, and the long line of cats, while the seals and sea lions form an aberrant aquatic side branch. Lastly come the primates, a group including the monkeys, apes and man.

**MANATEE.**—The sea-cow, a gregarious aquatic mammal, found on the coasts of Florida and tropical America. They generally frequent the mouths of rivers, and are found in the shallow waters of littoral vegetation as they can reach at high tide. Their anterior limbs or swimming paws are furnished with webbing, and they are able to move themselves along the shore. They are large, awkward, whale-like animals, attaining a length of eight to ten feet, and weighing from five hundred to twenty-five tons. The skin is grayish-brown, sparsely covered with hairs. Their flesh is excellent food, and is much valued, but the animal is not become rarer. An ally with similar habits is the dugong of Australia.

**Mandrill.**—A species of baboon distinguished by the short or rudimentary tail, by the elongated, dog-like snout, and by the presence of buttock coloration which are generally brightly colored. It has cheek protuberances colored with stripes of brilliant red and blue. The mandrill inhabits western Africa, where they associate in large troops. Full-grown males measure about five feet; they are exceedingly strong and muscular, and fierce disposition.

**Mice.**—Small mammals of the group of rodents, belonging to the order of mammals. They are the most common of all mammals, and are an immigrant from our common house mouse is an immigrant from Europe. Its habits are well known. There are some twenty species of mice, and the white or albino mice, which are interesting as pets, since they are less apt to bite than the wild stock. The Japanese house mouse is a pest, and is known turning around every few seconds. The field mice are different species.

**Moccasins.**—A species of snake of the warmer United States, related to the rattlesnake, but lacking the rattles characteristic of the latter. It is more common in the southern states, and is found in marshy places in search of frogs and other animals on which it feeds. It is a very venomous snake.

**Mocking bird.**—A genus of the family *Turdidae*, or thrushes, exclusively American in its distribution, and ranging from the Gulf of Mexico to the Pacific. These birds are remarkable for their power of song. The best known species is *Mimus polyglottus*, which has made it famous, and is able to imitate almost any species of animals, as well as notes produced artificially. Its own song is loud and clear, and its plumage is decidedly somber, being of a general ashy-gray hue, paler beneath; its sweet and varied notes, and its power of imitating other birds, is a prime favorite.

**Mongoose.**—One of the small carnivoran mammals of India, much used by the natives for its voracity and courage. It does not hesitate to attack the most venomous serpents, killing them by its bite and having no fear of the venom. It is an excellent hunter and is able to dodge the blow. An

resemble small pigs. The best-known species are the collared peccary and the white-tipped species. The former occurs abundantly in South America, and also occurs in North America, being generally in small packs, which do not hesitate to attack with their tusks any one who comes within their reach. Their food consists of roots, tubers, sugarcane, melons, and cultivated fields suffer much from their raids. The flesh is savory, and the animal has wings. The peccary possesses a glandular skin, situated in the loins, which secretes a strongly-smelling substance. This must be rubbed on the animal, killing a peccary, to avoid contamination of the flesh.

**Fish.**—Fish-eating swimming birds of the warmer regions, with a large pouch of skin between the halves of the lower jaw. In fishing they swim, striking the surface of the water with their wings, scooping the fish into the pouch, and later retiring to the shore to devour them. There are two species in the Gulf states, one white, the other brown in color.

**Fregul.**—The name of birds which form the order Fregulæ. Their wings are very small and hard; are covered with small stiff feathers of a bristly nature, and are absolutely useless for flight; the birds swim well, using both their webbed feet and their wings. There are about eighteen species, entirely confined to the Southern Ocean, and are a marvellous rapid swimmer, and are the aunts and divers of the northern sea. During the breeding season they resort to rocky islands in immense numbers, and are very noisy and noisy birds under them. Their food consists chiefly of fish.

**Fresh.**—The common name for several species of fish in both fresh and salt water, all of which are characterized by having spines in the fins and hard scales. The name properly belongs to the fresh-water species, which are of some value as food.

**Fowl.**—A species of birds related to the albatrosses and varying in size from Mother Cary's chickens, an inches long, to the fulmars, three feet in length. All of them live on the high seas, and many of them will follow a ship for days for the scraps thrown overboard. At night they follow close behind the stern of the ship.

**Fowls.**—A group of birds, including some three hundred species, distributed in nearly all parts of the world, all of which are so numerous that no one is in any doubt about the membership of any form in the group. Most of the domesticated animals, with the exception of the pig, are of the differences which in other groups would be considered as distinct species or even genera, are derived from the same stock. The most interesting species are the passenger pigeon, which yearly years ago formed one of the most numerous of the eastern part of our country, but which is now nearly or quite extinct. The most beautiful of the group is the peacock, which was the pride of the Indian ocean, and the most beautiful of the group. The largest member of the group was the dodo of the islands in the Indian ocean, which became extinct. The dodo was a very large bird, it lacked the power of flight. It was somewhat larger than a turkey, with the same external appearance but with a head and a pair of legs, like those preserved in the museum at Oxford.

**Fowl.**—A name common to several species of the weasel family. The common polecat is found in Europe. It is about seventeen inches long, the tail six inches. The color is dark brown. It is nocturnal, sleeping during the day and searching for its prey at night. It is destructive to poultry, rabbits, and game, so that in Britain it is being rapidly exterminated. It has glands beneath a cold finger, somewhat like the glands of the American skunk, which it ejects when irritated or alarmed. Its fur, which is imported in large quantities, is known as fisher's hair from the superior artist's brushes.

**Porcupine.**—A group of large rodents characterized by having some of the scales of the tail large spines or quills. These ordinarily lie flat, but when disturbed the animal rolls itself into a ball, and the quills with their barbs stand out, and stand outward, forming a very efficient defense. The quills come out very easily but there is no loss to the statements that some animals have the power to shoot them. Our American species has quills about three inches in length. It feeds upon bark of trees, which it gnaws off with its teeth, and it may do great damage. The species found in southern Europe and northern Africa lives in the ground and is about the size of a mole, and is as large in diameter as a lead pencil.

**Pogey.**—A food fish on the eastern coast from Cape Cod south, known also as pogey, anahone, one of the herrings, which is taken extensively for oil.

**Pogey.**—A very small whale, belonging to the group of dolphins, usually known as pogey in length. It is usually blackish above, lighter even white beneath. It feeds on fish, and schools of porpoises are seen following schools of small fish. Like all of the whales the porpoise is compelled to come to the surface to breathe. They are one of the most common whales on an ocean voyage.

**Pogey.**—Small rodent animals of the squirrel family, found on the plains east of the Rocky

mountains. They resemble their allies, the marmots, in appearance, and have well-developed claws on all the toes of the fore-feet; shrill creaks (sometimes with a rattling sound) are the only foot in length, and has a tail of about four inches. On the upper surface it is reddish-brown, and on the under surface it is black. It is found in great societies on those portions of the prairie where the buffalo grass grows luxuriantly. Here it is very tame, and is not afraid to approach to each other, and when the little creature is out, quite a busy scene is presented. The name is derived from the resemblance between its cry and the bark of a small dog.

**Puma (or cougar).**—A carnivorous animal peculiar to the mountain regions of the western part of the continent as a destructive or dangerous creature. It is known as the American lion, but it is considerably smaller than the lion of Asia. Its body length is about fifty inches, exclusive of a tail of twenty-six inches; its height is about two feet. The range is extensive, though it is less abundant in North than in South America, where it haunts a variety of situations, equally at home in dense forests, open plains, and the Andes to at least 10,000 feet. It is cowardly, and is not regarded with fear by man. Unlike most of the larger cats it is remarkably silent.

**Python.**—A genus and family of serpents allied to the family of boas. They are not venomous, but are very dangerous to man, and are not to be trusted. A python is a large snake, and belongs exclusively to the old world, and are of enormous size, sometimes attaining a length of thirty feet. A rudimentary pair of arms, called hinder limbs exist, terminating externally in a hooked claw. The head exceeds the neck in length, and the mouth is very large. It is aided by their prehensile tails, the pythons avoid themselves from the branches of trees and do not wait near water for animals which come to drink.

**Quail.**—A common name of different species of

**Raccoon.**—A small family of plantigrade carnivorous mammals, bear-like in appearance and of small size. The raccoons are peculiar to America, where they range from British Columbia and Canada to Paraguay. The common raccoon is a pretty animal, about the size of a cat, but stout; it has a long brown or grizzled coat, a ringed and bushy tail, and a turned-up nose. It is a very useful animal, and is very useful for digging or climbing. In its attitudes it is somewhat monkey-like, and usually sits upon its haunches, with its feet and its head raised forewards. It has a curious habit of washing articles given to it, and of soaking food in water before eating it. Its skin is very valuable.

**Rat.**—The common name of a group of rodents which have accompanied man over the earth. They were introduced into America by the Spaniards about two hundred years ago the musk ferret gray rat (also called Norway rat) appeared in the United States from Asia, and has since become a large part of the earth, practically exterminating the black rat. White rats are almost varieties of the black rat. The damage done by these verminous has always been so great as to warrant all sorts of measures for their extermination, but more recently the indifference against them has been more severe, as it is found that they are important means of distributing disease, especially the bubonic plague, which is apparently the same as the black death that made such ravages during the middle ages.

**Rattlesnake.**—A genus of poisonous snakes of America in which, when the skin is shed each year, a portion of the old skin remains, in a dry condition, until the end of the tail, this forming the rattle. When the snake sheds its skin, the rattle of the tail rapidly and the dried rings of skin are thrown off, and the rattlesnake is thus made of the snake may be known by counting the rings of the rattle, one for each year and one for the first year. The rattlesnake is a very dangerous animal, being injected by means of the poison fangs, two long teeth in the upper jaw, which are tubular; the poison gland is in the head, and the poison is secreted into the fangs.

**Redbreast.**—A bird of the family Sylviæ, familiarly known in the British Islands and throughout most of Europe. It is generally designated as the robin, and is a very common bird. Its length is about five and three-fourths inches, but it is of a rounder and fuller form than many of the birds of the same size. Its plumage is strikingly contrasting with the form of the body. The wings are rather short. The tail is scarcely longer than the head, and the under surface is a reddish orange-brown is a conspicuous characteristic, particularly of the male. The name robin is given to the European bird, and is applied to a species of thrush.

**Reptiles.**—A great group of vertebrates, including the snakes, lizards, crocodiles, and alligators. A number of extinct species, some of bizarre shapes and enormous size. Reptiles are characterized by having a scaly skin, breathing by lungs, served by gills, and by having blood which is about the temperature of the surroundings, commonly called cold blood. They give rise to a great variety in internal structure, some of which may be mentioned. Thus the heart has three chambers, the third not being completely divided, except in the

alligators. There are two aortic arches carrying the blood back from the heart. The skull articulates to the vertebral column by a single rounded knob (condyle) which produces eggs, but some of the snakes retain them, and the body of the snake hatched. Reptiles and birds resemble each other in several parts of their anatomy, such as the group of *Saurapoda* (reptile-like). Snakes and lizards are closely related, both having the scales merely horny plates, and both having a movable body inserted between the lower jaw and the skull. In the crocodiles and turtles this is not the case, but the body of the snake is inserted between the lower jaw and the skull. In the crocodiles the scales are strengthened by the formation of bone beneath the horny portions. Most reptiles have teeth, but the turtles lack them, the jaws being covered with horny sheaths. Some of the snakes and a single lizard (the Gila monster) are poisonous, and the poison glands being developed in the mouth.

**Rhinoceros.**—The name of a family of mammals, represented by nine living species, characteristic of Africa south of the Sahara, India, Borneo, and Java. They have large unwieldy bodies; short thick legs, terminating in large pads, and a few bearing toes; large elongated heads, with a long horn or horns springing from the snout in existing species, and in some extinct species the horn or horns are extremely thick. Five species belong to Africa, all possessing two horns. Of these, the white rhinoceros is the largest, and has a length of over twelve feet and a height of nearly six feet; but the black rhinoceros is best known. The Asiatic species is the Indian rhinoceros, and the appearance of armor plates. They are smaller and two of the species possess double horns, and a single one. The Indian rhinoceros, a one-horned species, is the one usually seen in menageries in this country. It leads a tranquil, indolent life, wallowing in mud, and grazing in the rivers. Owing to the keenness of its smell and hearing, the rhinoceros cannot be easily attacked; but when provoked it rushes with great fury and impetuously.

**Sable.**—A carnivorous mammal, nearly allied to the common raccoon and placed in the same family in Siberia and Kamchatka, and hunted for its fur. Its length, exclusive of the tail, is about twenty inches, and its weight is about thirty pounds, and hence of the very highest value, is generally brown, grayish-yellow on the throat, and with a white patch on the side of the neck. It is denser during winter, and owing to the mode of attachment of the hairs to the skin it is very smooth in any direction. Two other species are the sable and the muskrat, the latter a North American species. The Tartar sable is the name given to a species of the weasel genus found in the mountains of the Altai, and the pekan of North America is sometimes known as the Hudson bay sable. The skins of all these animals are frequently used in the manufacture of hats to imitate the true Russian sable. Sable hair is also used in the manufacture of artist's pencils. Sable fur has been of great value from early times.

**Salmanders.**—A group of amphibians which have four legs and a well-developed tail. Like all of the amphibians, they breathe when young by means of gills, some retaining them through life. They may be distinguished from the fish by which they are often confined, by the smooth skin, in which there are never any scales. Most of the species live in water, usually in the water. From these the gilled young hatch out. They are carnivorous or insectivorous. In the adult stage, some are more than two feet in length, and are burrowing beneath the soil or under stones, seeking their prey at night. None are poisonous, except the hellgramite, which is a very small, and secretes an acrid juice. Our largest species is the mud puppy (*Necturus*) of the Mississippi basin; the largest of the salamanders is the giant salamander of Japan, three feet in length.

**Salmon.**—A well-known fish, forming the type of the family Salmonidæ, and is found in both salt and fresh waters, and ranks among the food-fishes. It generally attains a length of from three to four feet, and has an average weight of from twelve to thirty pounds, but these limits are frequently exceeded. The adult fish is a steel-blue on the back, and the sides becoming lighter to the sides and belly. It usually continues in the shallows of its native stream for two years after hatching, and then it migrates, attaining a length of eight inches. When the season of its migration arrives, the fish have become darker and the fish use ascending to the head of the stream, and a small or salmon fry. The smolts now congregate into shoals and proceed seaward. On reaching the open sea, the smolts are then called salmon, and after a short time and then make for the open sea. Leaving its native river as a fish weighing, it may be more than two pounds, it may be less than three months' absence, may return to fresh water as a pike, weighing four or five pounds. In the gill stage, the fish is very delicate and tender. After spawning in the fresh water the gill stage begins the sea in the autumn, and when it comes stay in the ocean is over a year after a few

that its bite causes madness which can be cured only by music. So far as is known there is only one species which can cause serious effects by biting man, and even these cases are not sufficiently authenticated.

**Squid.** *Loligo*, mollusks closely related to the cuttlefish. It has a barrel-shaped body, with a head in front bearing ten pairs of tapering tentacles, each with numerous suckers. On the side of the head is a well-developed eye. Squid live largely on the bottom with a few species that come to the surface biting them with a pair of parrot-like jaws. They are largely used as bait in fishing, and to a limited extent as food. The average length is a foot or two, but in the seas around Newfoundland and Japan giants are occasionally found with bodies 10 feet in length and 10 inches in diameter, weighing 100 feet in size. These were comparatively abundant about 1875, but none has been reported for years.

**Squirrels.**—A group of rodents, too well known to need description. They are abundant in all of the northern hemisphere, living in trees and feeding largely on nuts, etc. There are several species in the United States, the fur of the larger kinds having considerable value. Nearly related are the ground squirrels or chipmunks, and the flying squirrels, which really do not fly but glide by means of a parachute of skin extending between the legs of each side.

birds or each side.

**White Stork.** A family of birds, chiefly confined to the old world. The true storks number six species, ranging over Europe, Asia, and Africa, and found also in South America. They resemble the herons, but are more robust, and have larger bills, shorter toes, with a nonretracted claw on the middle toe. They inhabit the vicinity of marshes and rivers, where they find their chief feeding of frogs, fish, snakes, and even young birds. They are migratory, arriving at their breeding haunts in the early spring and departing again in the autumn. The white stork is common in Europe, constructing a large nest, most frequently on the chimney of a

**Swallow.**—Any one of 125 species of birds belonging to the family *Hirundinidae* characterised by the very wide gape of the mouth, to which the common name may allude. All are noted for their graceful flight habits. They feed almost exclusively on insects and hence are very valuable. Among our common swallows are the purple martin, the cliff swallow, the barn swallow and the sand martin. The so-called chimney swallow is, strictly, not a swallow, but a swift.

**Swans.**—Swimming birds, closely related to the ducks and geese, with long and slender neck, bills about as long as the head, and with a soft cere. Nine species are known, one coming from Chile, the black swan from Australia, and the others from the northern hemisphere. We have two white species, the whistling and the trumpeter swans, but the tame species are all of European origin. As swans were bred for the table, now

**Taptars.**—A genus of hoofed animals with an odd number of toes on the hind feet. All are tropical, some living in Asia, others in America. All are bulky beasts, recalling somewhat the swine in appearance. They have the snout prolonged into a flexible proboscis with the nostrils at the tip. Their flesh is said to be good.

**Thrush.**—Any singing bird belonging to the family *Turdida*. They are represented with us by the wood thrush, Wilson's thrush, our common robin and several others. The wood thrush is the best singer of our species; the European song thrush is much like our wood thrush but is less

**Ticks.**—A group of semiparasitic animals nearly related to the spiders. The young attach themselves to some higher animal, and then begin to burrow the head under the skin in order to suck the blood. Man and domestic animals are affected by them, and one species is now known to convey the Texas fever to cattle.

[illegible]

**Toads.**—The common name of any amphibian without a tail, no teeth and a warty skin. They are common in most parts of the world, there being few in the Australian region. They are mostly nocturnal, and, as they feed on insects, they are among the best friends of man and deserve en-

couragement. The warts are caused by glands in the skin which secrete an acrid fluid, the chief means of defense, as few animals will touch them. It is scarcely necessary to say that they are perfectly harmless to man, and that they cannot

**Trout.**—A common name for several fishes with soft rayed fins and a small fin without rays on the back, behind the large fin. They have very small scales. All are excellent eating and all are regarded as good for the table. Trout is typical of cold water fishes. This thrives in the coldest and clearest streams, laying its eggs in December or January. Other species in North America are the lake trout and the salmon trout in the east and the rainbow and the brook trout in the west. Europe has the brown trout and the sea trout. The rainbow trout is native to the Pacific coast of the northern hemisphere, but they have been introduced into Australia and New Zealand.

**Turkey.**—A large scratching bird, a native of America, from Canada to Central America. It is chiefly known now in domestication, but is still found wild in some parts of the United States. The tame birds differ some in appearance from the birds in a state of nature. The name was given under the misapprehension that they came from Turkey.

**Turkey buzzard.**—A large vulture, common in the southern half of our country. It feeds on carrion and thus makes an important scavenger and is protected in some states. It is remarkable for its sustained sailing flight.

[illegible]

vertebrates.—One of the great groups of the animal kingdom. The vertebrates have a backbone, or vertebral column, which protects the spinal cord and contains the brain. The alimentary canal lies entirely below this central skeleton, and the organs of respiration are always connected with the body by a blood vessel from the back of the throat to the exterior, or lungs connected with the throat by a windpipe. The heart is always between the lungs and the alimentary canal, and the blood, but in the higher forms it is carried back into the chest. Some lack legs or their equivalent fins, but most have two pairs of these structures. The reproductive system is always on the ventral line of the back and belly. All reproduce sexually by eggs, there being no cases of division or budding, so common in the lower divisions of the animal kingdom.

**Walrus.**—A marine carnivorous mammal, closely related to seals and sea lions, with enormous downward-curving tusks, or canine teeth, projecting from the upper jaw, which sometimes reach a length of six inches. The skin is covered with small scales, and a thick slummy body, deep-set at the shoulders, and their feet are adapted for swimming. They reach a length of twelve feet or more and a weight of 10,000 pounds. They are found in species on the Atlantic and on the Pacific. The Atlantic form is found on the coast of Labrador and Hudson's bay, but formerly extended farther southward. They feed largely on clams and other mollusks, and also on fish, especially herring and capelin. Their tusks are hunted for their hides and oil.

**Wasp**—A pup of insects with two pairs of wings, the hinder pair the smaller, and a well developed stinging with a poison gland connected, at the hinder end of the body. They dig deep nests in the soil, and their stings in common words that will separate them from the ants and the bees. Some are solitary, and some form colonies in which the individuals work together. The honey bees, bumble bees, and wasps are the digger wasps, which excavate holes in the soil, or in wood, which they store with insect food. They lay their eggs in the mass, so that the young, or hatching out will have abundant food. Others make a mud nest, and lay their eggs in the mud, and some make nests for the eggs by sticking mud to beams in barns and in other similar places. The social wasps make a nest in common, sometimes in the holes of trees, and sometimes in the holes of old nests make paper nests from bits of decaying wood, which they chew into a real paper pulp. In the latter case the males make the nest, and the females live to form a new colony in the

**Weasel.**—The name of a number of small carnivorous mammals related to the sable, mink, and

skunk. They have a remarkably slender, round body with a long neck, which gives the animal the appearance of having the fore legs set back too far. The legs are short and stout. The animal is found mostly in the old and the new worlds, reaching a length of eight or ten inches; it is light reddish-brown and whitish below, and in northern distributions it is more or less black. It is found in mice, moles, and rats, following them into their holes, and even rabbits fall a prey to it. It rarely visits hen-yards. The stoat, or ermine, likewise has a long neck and a slender body, and is known to eleven inches long. In summer its color is mahogany brown, with a black tip to the tail. In winter it changes in northern regions to a pure white.

**Weevils.**—A group of beetles in which the head is prolonged into a snout with the jaws at the end. With this they bore into plants of all kinds to lay the eggs, the grub hatching out feeding upon the substance. Hence they are considerable pests. Over 400 species have been described from the United States. Farmers often apply the name to other injurious insects, some of which are not even beetles.

of the popular name of the larger Isopoda, particularly of all those belonging to the families *Balanoidae* and *Palaeodidae* or *Catenodidae*. In the latter the head is furnished with a pair of antennae, and is entirely destitute of teeth, instead of which the palate is furnished with an apparatus of baleen, or bristles, which are attached to the sides of the water the small crustaceans, which form the food of these whales. The fibrous structure of baleen, and the manner in which it is attached to the jaws, are well known. The plates of it in the mouth of a whale are very numerous, several hundred in number, and are so closely joined together, so that the mouth is filled with them. The head of whales usually has a small, pointed, cartilaginous snout, of great length. The lower surface of the true skin extends into a thick layer of blubber, an open network of blood vessels, and a white fat is deposited between the skin and the blubber. The thickness of the blubber varies from one foot to two or three feet. The blubber is the most important source of food for the whale. The most important species of baleen whales is the *Meleagris*, or right whale. It inhabits the seas of the northern part of the world, and abounds chiefly in the arctic regions. It is the largest of all whales, and attains a great length. It was formerly supposed that the Greenland whale was an inhabitant of the southern part of the world, but it is now known to be a

[illegible]

**Whip-poor-will.**—A bird widely known on account of its peculiar cry of "whip-poor-will." It is seldom seen, although abundant in the western part of the eastern United States. It usually rests on the ground during the day and is active at early nightfall, sending forth its cry, and also courting the female by flying over her head and catching the long grass in search of insects. It is about the size of a thrush, with a long, straight, grayish bill, more variegated with black and buff. Its bill is very broad, its mouth large and provided with a tuft of long bristles. It builds no nest, but deposits its eggs on leaves or a slight depression in the ground. It is often called the "screech-whip-widow and the night-hawk."

**White ants.**—A group of insects which are not at all related to the true ants, but which are so called because they live in colonies like the true ants. So the name termites is better for them. In the colonies there are different kinds of individuals. Only the king and queen (male and female) are winged, and these have only to do with the perpetuation of the species. Then there are the workers and the soldiers, whose duties are indicated by their names. The white ants feed upon wood, burrowing holes in every direction through it and never, if they can help it, coming into the

daylight. In the tropics they are very destructive and they will frequently riddle a house with their ravages being suspected. They are more rare in cooler climates, but they extend into New England. Some of the most common are immense nests of clay and chewed wood, ten or fifteen feet high and twice that across.

**Wolf.**—The name applied to several species of carnivorous animals, belonging to the dog family. The common wolf is about five feet in length including the tail, which is twenty inches, and about thirty-two inches in height at the shoulders. The muscle much resembles that of a sheep; but the ears are upright and pointed, and the eyes are set obliquely. The coat is subject to variation in tint, depending much upon the country the animal inhabits. Perhaps the most usual tint is a yellowish-gray; but it is sometimes almost black. In Europe the animal is still found in Lapland, Norway, Sweden, Russia, Poland, Hungary, and some districts of Germany, France, Italy, Spain, and Greece. In Britain, the last wolf was slain in 1860, but in Ireland the species lingered until 1710. The wolf of India is considered a distinct species, and has a dingy reddish-white fur. The North American wolf has a wide

range, extending from Greenland to Mexico, and is closely similar to the European race. **Woodcock.**—A famous game bird belonging to the snipe family, and found in northern parts of both the old and new worlds. The American woodcock is about eleven inches long, variegated in black, brown, gray, and rusty colors. The bill is very long and flexible at the apex. It is thrust into the soft ground, in search of earthworms, and the presence of woodcocks can often be detected by a cluster of these holes. The European bird is larger.

**Woodpecker.**—The common name of any of three hundred birds which have climbing feet, stiff tail feathers and which bore into trees for grubs on which they feed, though some of them are fond of fruit and other vegetable food. Most of the species have barbed and pointed tongue with which they spear the larva, but in some the tongue is armed with a sticky substance, secreted by glands in the throat. There are no woodpeckers in Australia or Madagascar, but they occur in all other parts of the world.

**Wren.**—A genus of birds having a slender, slightly curved, and pointed bill; the wings very short and rounded; the tail short, and carried erect, the legs slender, and rather long. Their plumage

is generally dull. They live on or near the ground, seeking for insects and worms among tree trunks and in other similar situations. The European wren is next to the smallest bird in Europe; it is most numerous in the south both in the central and southern parts. It frequents gardens, hedges, and thickets. The North American species of wren are numerous, and in some are larger than the European wren, and is abundant in the eastern parts of the United States. It often builds its nest near houses, and in boxes prepared for it. The song is very sweet. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself as the titmouse and swallow.

**Zebra.**—A name sometimes given to all the striped *Equidae*, native of South Africa, but also, in a more restricted use, designating a single species, *Equus zebra*. All resemble more the ass than the horse. The zebra is about eight hands high at the shoulder. It is light and graceful, with slender limbs, the ground color creamy; the head, neck, body, and legs striped with black, closely related are Burchell's zebra and the quagga, differing in the distribution of the stripes. Zebras are practically untamable, though they have been driven in herds.

**WEIGHTS AND MEASURES.**—Practically all the commerce of the world is conducted through the medium of two systems of weights and measures, namely, the English system and the metric system. Practically all the engineering work done in the world was the exception of that done in Japan is based upon one or the other of these systems. In the United States and in Great Britain its possessions both systems are legal and in use, the English being used in all ordinary commercial transactions and the metric in all scientific work and to a lesser extent in technical work.

**The English System.**—The customary system of weights and measures in use in the United States is the same as the system in everyday use in Great Britain, with some important differences in some of the units which must be noted. For all practical purposes the units of length and mass are identical in value, although the fundamental standards of the two countries are quite different. In Great Britain the standard yard is a bar of metal in the custody of the board of trade and preserved in the standards office, Westminster. Its legal value in terms of the international meter is, one yard equals  $\frac{3600}{3937}$  meters.

In the United States the meter is the fundamental standard and the yard is defined as  $\frac{3600}{3937}$  meters. The difference in the value of the two yards in terms of the meter only amounts to a little more than one part in 400,000, which is about the difference found in comparing the imperial yard with its authentic copies at different periods. It is therefore doubtful whether there is a real difference between the length of the English standard yard and United States yard derived from the meter.

A similar condition exists with respect to the avoirdupois pounds; in England a certain platinum cylinder deposited in the standards office is regarded as the standard pound, while in the United States the pound is defined as  $\frac{453.592427}{1000}$  grams, of which the international kilogram contains 1,000. This is the same as the legal value in Great Britain, so that the only difference in the two pounds is one of standards. On the other hand the capacity measures of the two countries are quite different. The United States gallon of 231 cubic inches and the Winchester bushel of 2150.42 cubic inches have not been legal measures in Great Britain since 1825, having been superseded by the present imperial gallon, which is defined as the volume of 10 pounds of pure water at 62 degrees Fahrenheit, weighed against brass weights in air at the same temperature as

the water, and with the barometer at 30 inches. The imperial bushel is defined as the volume of 80 pounds of water weighed under the same conditions as the gallon. The bushel of Great Britain is, therefore, exactly equal to 8 gallons.

The volume of the imperial gallon, according to the most reliable data available at this time, is 277.420 cubic inches and the bushel 2219.36 cubic inches, the first being larger than the United States gallon by approximately 20 per cent, and the latter larger than the United States bushel by 3.2 per cent.

The methods of subdividing and multiplying the yard, pound, gallon, and bushel in the two countries are substantially the same.

#### Standard Weights and Measures of United States

##### AVOIRDUPOIS WEIGHT

Dram	.....	gr.	= 27 1/2 grains (7.34375).
Ounce	.....	oz.	= 16 drams, 437.5 grains.
Pound	.....	lb.	= 16 oz., 256 dr., 7,000 grains.
Long	.....	st.	= 14 lb., 112 oz., 3,500 grains.
Quarter (Eng.)	.....	qr.	= 28 lb., 448 oz., 14,000 grains.
Quarter (Can.)	.....	qr.	= 25 lb., 400 oz., 12,500 grains.
Hundredwt. (Eng.)	.....	cwt.	= 100 lb., 1,600 oz., 50,000 grains.
Hundredwt. (Can.)	.....	cwt.	= 100 lb., 1,600 oz., 50,000 grains.
Ton (Eng.)	.....	T.	= 20 cwt., 2,240 lbs.
Ton (Can.)	.....	T.	= 20 cwt., 2,000 lbs.

**Ton of Coal.**—The United States ton is legally defined in some states as 2,000 pounds and in other states as 2,240 pounds. In Arizona, Colorado, Connecticut, Idaho, Indiana, Kansas, Kentucky, Louisiana, Massachusetts, Montana, Nebraska, New Jersey (net ton), New York, Ohio, Rhode Island (net ton), Vermont, Washington, and Wisconsin it is fixed at 2,000 pounds, and in the District of Columbia, Pennsylvania, New Jersey (gross ton), Rhode Island (gross ton), it is fixed at 2,240 pounds. For tariff purposes Congress has fixed the ton of coal at 2,240 pounds.

##### TROY WEIGHT

Carat	.....	.....	= 3.17 grains.
Pennyweight	.....	wt.	= 480 grains.
Ounce	.....	oz.	= 20 pennyweights, 480 grains.
Pound	.....	lb.	= 12 oz., 240 pennyweights, 5,760 grains.
Hundred	.....	.....	= 100 lbs.

Troy is the weight used by goldsmiths and jewelers. The grains troy, apothecaries', and avoirdupois are equal in some states in England, France, and the United States, Holland, and in most other countries. The oz. troy and apothecaries' = 1.09714 oz. avoirdupois, but the lb. troy and lb. apothecaries' = 1.036226 lb. avoirdupois, while 175 lbs. troy and apothecaries' = 144 lbs. avoirdupois.

##### APOTHECARIES' WEIGHT

Scruple	.....	.....	= 20 grains.
Dram	.....	.....	= 3 scruples, 60 grains.
Ounce	.....	.....	= 8 drams, 240 grains.
Pound	.....	.....	= 12 ounces, 480 grains.

##### APOTHECARIES' FLUID MEASURE

60 minims	.....	= 1 fluid dram.	Marked
8 drams	.....	= 1 ounce.	.....
16 ounces	.....	= 1 pint.	.....
8 pints	.....	= 1 gallon.	C, or Cong.
1 dram	.....	= 1 teaspoonful.	.....
1 ounce	.....	= 1 dessertspoonful.	.....
4 drams	.....	= 1 tablespoonful.	.....
2 ounces	.....	= 1 wineglassful.	.....
1 ounce	.....	= 1 teacupful.	.....

##### LIQUID MEASURE

4 gills	.....	1 pint (O)	Cubic inches = 28.875
2 pints	.....	= 1 quart.	.....
4 quarts	.....	= 1 gallon (gal.)	= 231.0
63 gallons	.....	= 1 hogshead (hd.)	.....
2 hogsheads	.....	= 1 pipe or butt.	.....
2 pipes	.....	= 1 tun.	.....

##### DRY MEASURE

2 pints	.....	1 quart (qt.)	Cubic inches = 67.20
4 quarts	.....	= 1 gallon (gal.)	= 268.80
2 gallons	.....	= 1 peck	= 537.60
8 quarts	.....	= 1 bushel	.....
4 pecks	.....	= 1 struck bushel	= 2150.42

##### HOUSEHOLD MEASURES

120 drops water	.....	= 1 teaspoon.	.....
60 drops thick fluid	.....	= 1 teaspoon.	.....
2 teaspoons	.....	= 1 dessertspoon.	.....
3 teaspoons	.....	= 1 tablespoon.	.....
16 tablespoons	.....	= 1 cup.	.....
1 cup	.....	= 1 pt.	.....
1 pint	.....	= 1 qt.	.....
4 tablespoons	.....	= 1 oz.	.....
2 tablespoons	.....	= 1 oz.	.....
3 teaspoons	.....	= 1 oz.	.....
4 teaspoons	.....	= 1 oz.	.....
2 cups granulated sugar	.....	= 1 lb.	.....
2 cups confectioners' sugar	.....	= 1 lb.	.....
2 cups wheat flour	.....	= 1 lb.	.....
2 cups white wheat flour	.....	= 1 lb.	.....
2 cups wheat flour	.....	= 1 lb.	.....
2 cups coffee	.....	= 1 lb.	.....
2 cups butter	.....	= 1 lb.	.....
2 cups rice	.....	= 1 lb.	.....
2 cups lard	.....	= 1 lb.	.....
2 cups butter	.....	= 1 lb.	.....
2 cups Graham flour	.....	= 1 lb.	.....
2 cups rye flour	.....	= 1 lb.	.....
2 cups corn meal	.....	= 1 lb.	.....
2 cups rolled oats	.....	= 1 lb.	.....
2 cups powdered sugar	.....	= 1 lb.	.....
2 cups brown sugar	.....	= 1 lb.	.....
2 cups raisins	.....	= 1 lb.	.....
2 cups currants	.....	= 1 lb.	.....
2 cups bread crumbs	.....	= 1 lb.	.....
9 eggs	.....	= 1 lb.	.....

##### CUBIC OR SOLID MEASURE

Cubic foot	.....	= 1,728 cubic inches.	.....
Cubic yard	.....	= 27 cubic feet, 21,033 bushels.	.....
Cubic inch	.....	= 12 cubic feet, 1,728 bushels.	.....
Shipping ton	.....	= 40 cubic feet merchandise.	.....
Shipping ton	.....	= 42 cubic feet of timber.	.....
Ton of displacement	.....	= 35 cubic feet.	.....

##### LINEAR MEASURE

3 barleycorns, or.....	.....	1 inch (in.).	.....
12 lines, or.....	.....	= 1 inch.	.....
72 points, or.....	.....	= 1 inch.	.....
1,000 mils (mils), or.....	.....	= 1 inch.	.....
1 inch	.....	= 1 palm.	.....
4 inches	.....	= 1 hand.	.....
9 inches	.....	= 1 span.	.....
1 foot	.....	= 1 foot (ft.).	.....
18 inches	.....	= 1 cubit.	.....
3 feet	.....	= 1 yard (yd.).	.....
21 feet	.....	= 1 military pace.	.....
5 feet	.....	= 1 geometrical pace.	.....
3 yards	.....	= 1 fathom.	.....
64 yards	.....	= 1 rood, pole, or perch.	.....
66 feet, or.....	.....	= 1 Gunter's chain.	.....
4 rods	.....	= 1 furlong (fur.).	.....
40 rods	.....	= 1 mile.	.....
2,200 yards, or.....	.....	= 1 mile.	.....
1,760 furlongs, or.....	.....	= 1 mile.	.....
5,280 feet, or.....	.....	= 1 league.	.....

The hand is used in measuring horses' height. The military pace is the length of the ordinary step of a man. One thousand geometrical paces were reckoned to a mile.

## LAND MEASURE (LINEAR)

7.92 inches.....	1 link.
100 fathoms.....	1 chain (ch.).
164 feet.....	1 furlong (fur.).
10 chains.....	1 mile.
8 furlongs.....	

## LAND MEASURE (SQUARE)

144 square inches.....	1 square foot (sq. ft.).
9 square feet.....	1 square yard (sq. yd.).
360 square yards.....	1 square pole, rod, or perch.
16 square poles.....	1 square chain (sq. ch.).
40 square poles, or.....	1 square rood.
1,210 square yards.....	
4 square rods, or.....	1 acre.
10 square chains, or.....	
100 square poles, or.....	
4,840 square feet.....	
43,560 square feet.....	
640 acres, or.....	1 square mile.
2,087,680 square yards.....	
1 yard of land.....	1 rod of land.
100 acres.....	1 hide of land.
40 hides.....	1 barnum.

## GEOGRAPHICAL AND NAUTICAL MEASURE

6086.44 feet, or.....	1 nautical mile.
1000 fathoms, or.....	
10 cables, or.....	
1.1528 statute miles.....	1 knot.
1 nautical mile.....	
60 nautical miles, or.....	1 degree.
67.168 statute miles.....	1 circumference of the earth at the equator.
90 degrees.....	1 nautical mile.
1 league.....	120 fathoms.
1 cable's length.....	

## TIME

The unit of time measurement is the same among all nations. Practically it is  $\frac{1}{86400}$  of the mean solar day, but really it is a perfectly arbitrary unit, as the length of the mean solar day is not constant for any two periods of time. There is no constant natural unit of time.

1 minute.....	= 60 seconds.
1 hour.....	= 60 minutes, 3,600 seconds.
1 day.....	= 24 hours, 1,440 minutes, 86,400 seconds.
1 sidereal day.....	= 86,164.1 seconds.
1 sidereal month.....	= 27.212161 mean solar days (average).
1 lunar month.....	= 29.530589 mean solar days (average).
1 anomalistic month.....	= 27.55455 mean solar days (average).
1 tropical month.....	= 27.312182 mean solar days (average).
1 nodal month.....	= 27.212222 mean solar days (average).
Mean solar year.....	= 365 d. 5 h. 48 m. 46.4 s. with annual variation of 0.00539.

The change in the length of the mean sidereal day,  $\frac{1}{4}$  s. of the time of the earth's rotation upon its axis, amounts to 0.01262 s. in 2,400 mean solar years.

## ANGULAR MEASURE

There is perfect unanimity as to the standard angle (i. e., the right angle) and practical unanimity as to its subdivision, for the subdivision into grades, etc., once favored by the French, is now abandoned.

1 minute of angle or arc = 60 seconds.
1 degree of angle or arc = 60 minutes.
90 degrees of angle or arc = 1 right angle or $\frac{1}{2}$ of circumference.

Radius of angle or arc =	= arc same length as radius.
Radius of angle or arc =	= 0.01745329252.
Length of arc of 1" =	= 0.015707963268.
Length of arc of 1' =	= 0.000290888209.

**Time on Shipboard.**—The twenty-four hours are divided on board ship into seven parts, and the crew is divided into two parts or watches, designated *port* and *starboard* watches. Each watch is on duty four hours, except from 4 to 8 p. m., which time is divided into two watches of two hours each, called *dog watches*, by means of which the watches are changed every day, and each watch gets a term of eight hours rest at night. *First watch*, 8 p. m. to midnight; *middle watch*, midnight to 4 a. m.; *morning watch*, 4 to 8 a. m.; *forenoon watch*, 8 a. m. to noon; *afternoon watch*, noon to 4 p. m.; *first dog watch*, 4 to 6 p. m.; *second dog watch*, 6 to 8 p. m. The bell is struck every half-hour to indicate the time, as follows:

1 bell.....	12.30 a. m.	1 bell.....	12.30 p. m.
2 bells.....	1.00 a. m.	2 bells.....	1.00 p. m.
3 bells.....	1.30 a. m.	3 bells.....	1.30 p. m.
4 bells.....	2.00 a. m.	4 bells.....	2.00 p. m.
5 bells.....	2.30 a. m.	5 bells.....	2.30 p. m.

6 bells.....	3.00 a. m.	6 bells.....	3.00 p. m.
7 bells.....	3.30 a. m.	7 bells.....	3.30 p. m.
8 bells.....	4.00 a. m.	8 bells.....	4.00 p. m.
1 bell.....	4.30 a. m.	1 bell.....	4.30 p. m.
2 bells.....	5.00 a. m.	2 bells.....	5.00 p. m.
3 bells.....	5.30 a. m.	3 bells.....	5.30 p. m.
4 bells.....	6.00 a. m.	4 bells.....	6.00 p. m.
5 bells.....	6.30 a. m.	5 bells.....	6.30 p. m.
6 bells.....	7.00 a. m.	6 bells.....	7.00 p. m.
7 bells.....	7.30 a. m.	7 bells.....	7.30 p. m.
8 bells.....	8.00 a. m.	8 bells.....	8.00 p. m.
1 bell.....	8.30 a. m.	1 bell.....	8.30 p. m.
2 bells.....	9.00 a. m.	2 bells.....	9.00 p. m.
3 bells.....	9.30 a. m.	3 bells.....	9.30 p. m.
4 bells.....	10.00 a. m.	4 bells.....	10.00 p. m.
5 bells.....	10.30 a. m.	5 bells.....	10.30 p. m.
6 bells.....	11.00 a. m.	6 bells.....	11.00 p. m.
7 bells.....	11.30 a. m.	7 bells.....	11.30 p. m.
8 bells.....	12.00 n.	8 bells.....	12.00 ngt.

## Board and Timber Measure.—A board one foot square and one inch thick is the unit of board measure, the number of feet in a board being determined by the number of times its volume equals that of the unit:

Thus a board 2 inches thick,  $\frac{1}{2}$  feet wide and 10 feet long contains 30 feet.

A board of the same length and width  $\frac{1}{2}$  inch thick would contain 71 boards of the same length and width.

## The Doyle Rule.—Known in some sections as the Connecticut River Rule, the

Moore & Beman Rule, and the Scribner Rule—is used throughout the entire country and is more generally employed than any other. It is constructed by the following formula: Deduct 4 inches from the diameter of the log as an allowance for slab; square one-quarter of the remainder and multiply the result by the length of the log in feet. It is the usual custom to measure the diameter inside the bark at the small end. One cord of wood is 128 cubic feet.

In metric countries all wood is measured in cubic meters.

Water Measure.—The *Miner's Inch* is usually defined as the quantity of water that will pass through an orifice 1 square inch in cross section under a given head.

The head has been fixed in various localities at from 4 to 61 inches to the center of the orifice. In states where the miner's inch is defined by statute it varies from  $\frac{1}{10}$  to  $\frac{1}{100}$  of a cubic foot per second.

The miner's inch is rapidly becoming obsolete, its place being taken by the cubic foot per second or the gallon per second. The United States reclamation service uses the cubic foot per second.

## Visibility Distance at Sea.—Table of elevations of objects above sea level, with their corresponding distances of visibility.

Height in Feet	Distance in Nautical Miles	Height in Feet	Distance in Nautical Miles
5	2.555	110	11.986
10	3.014	120	12.000
15	4.228	130	13.030
20	5.111	140	13.522
25	5.714	150	13.997
30	6.260	200	16.162
35	6.761	250	18.070
40	7.228	300	19.875
45	7.666	350	21.361
50	8.081	400	22.657
55	8.478	450	24.244
60	8.852	500	25.555
65	9.214	550	26.832
70	9.562	600	27.994
75	9.897	650	29.137
80	10.222	700	30.170
85	10.536	800	32.375
90	10.842	900	34.286
95	11.139	1000	36.140
100	11.428		

**Metric System.**—The unit of length in the metric system is the *meter*, a length originally planned to be equal to the one ten-millionth of the distance between the equator and the pole, measured along a

terrestrial meridian. A platinum bar of this supposed length was constructed and deposited in the archives of the French republic in 1799. At the same time a platinum weight was constructed which was made equal to the mass of a cube of pure water at 4 degrees centigrade, the sides of the cube being one-tenth the length of the meter. This weight, which is equal to one thousand units of mass in the metric system, is called the *kilogram*.

Subsequent geodetic measures showed that the lengths of arcs differ on different parts of the earth and also that the value of the arc from which the meter was derived was in error by about one part in a thousand, causing a similar error in the length of the meter. Nevertheless the length of the original meter bar, known as the meter of the archives, has been retained, although its reference to the quadrant has been abandoned.

In 1875 an international bureau of weights and measures was established near Paris, France, by the concurrent action of the principal nations of the world for the purpose of constructing exact copies of the meter and kilogram deposited in the archives. Thirty-one standard meters of iridium-platinum and forty kilograms of the same alloy were constructed and carefully compared with the standards of the archives and with one another.

**International Prototypes.**—This great work was completed in 1889 and the meter and the kilogram which agreed most nearly with the original standards of the archives were called international prototypes and were deposited at the international bureau, where they are maintained to-day subject to the authority of the international committee on weights and measures.

The remaining meters and kilograms were distributed by lot to the different nations which contributed to the support of the bureau. The United States secured two copies of the meter and two copies of the kilogram, which are in the custody of the bureau of standards at Washington. One of the meters known as No. 27 and one kilogram, No. 40, were selected as the United States standards, while the other meter and kilogram are used as working standards.

**Determinations of the Units.**—The length of the international meter has been determined in terms of the wave lengths of the red, green and blue radiations of cadmium, so that if every meter in the world were destroyed the length could be reproduced within less than one part in ten million. The number of wave lengths of the different radiations at 15 degrees centigrade and 760 millimeters pressure are as follows:

Red 1 m. = 1,553,163.3
Green 1 m. = 1,965,249.7
Blue 1 m. = 2,062,372.1

The unit of capacity in the metric system is the *liter*, which was intended to be both equal to the volume of a cubic decimeter and to the volume of pure water under normal atmospheric pressure and at the temperature of maximum density (4°C.) that would exactly balance one kilogram in vacuo.

**Extent of Use.**—The use of the metric system is obligatory in France, Germany, Austria, Hungary, Belgium, Brazil, Bulgaria, Chili, Colombia, Denmark, Spain, Holland, Italy, Mexico, Montenegro, Peru, Portugal, Argentina, Roumania, Servia, Sweden, Norway, Switzerland, and Uruguay. Also in Cuba, the Philippine Islands, Porto Rico, and Guam. Its use is legal in the United States, Great Britain and possessions, in Russia, Japan, Egypt,

\* Not defined.

† Small white beans, 60 pounds.

‡ Green apples.

§ Sugar beets and mango-wurzel.

|| Shelled beans 60 pounds; velvet beans, 78 pounds.

¶ White beans.

/ Wheat bran.

\* Corn in ear, 70 pounds until December 1st next after growth; 68 pounds thereafter.

† English blue-grass seed, 22 pounds; native blue-grass seed, 14 pounds.

‡ Rice corn.

/ Corn in ear from November 1st to May 1st following, 70 pounds; 68

pounds from May 1st to November 1st.

\* Soy beans, 56 pounds.

† Cracked corn, 50 pounds.

‡ Green unshelled beans, 30 pounds.

§ Canals coal, 70 pounds.

|| Standard weight in borough of Greensburg, 75 pounds.

¶ Dried beans; green unshelled beans, 30 pounds.

/ Red and white.

\* Unwashed plastering hair, 8 pounds; washed plastering hair, 4 pounds.

Kale.....	30	Tennessee.	Velvet-grass seed.....	7	Tennessee.
			Walnuts.....	50	Tennessee.

**Foreign Weights and Measures.**—Japan.—In Japan the kwan, equal to 3.75 kilograms or 8.28 pounds avoirdupois, is the unit of mass. It is divided into 1,000 mommes, the mommes into 10 fuus and the fuu into 10 rins, the rin into 10 mos, and the mo into 10 shis.

The unit of length is the shaku, equal

to  $\frac{10}{33}$  (0.30303) meter, or 0.9941919 United States ftwt. The shaku is decimally divided into sun, bu, rin, mo, and shi. Multiples of the shaku are the ken, equal to 6 shaku; the cho, equal to 60 ken, and the pi, equal to 36 cho, or 12,960 shaku.

The shaku (land measure) is equal to 0.00033 acre, or 0.988417534 square foot,

10 shaku equal 1 go and 10 go equal 1 bu or tsubo, 30 bu equal 1 se, 10 se equal 1 tan, and 10 tan 1 cho.

The shaku (capacity measure) equals 0.01806 liter, or 0.180616 United States liquid quart, 10 shakus equal 1 go, 10 go 1 sho, 10 shos 1 to, and 10 tos 1 koku. The metric weights and measures are

3 eabs = 1 bath, or ephah (1 Kings vi, 26; John ii, 6). . . . .	3	6	4.5
10 ephahs = 1 kor, or homer (Isa. v, 10; Exek. xiv, 14). . . . .	75	5.25	

**Time.**—Three kinds of time are recognized by astronomers, viz., sidereal, apparent solar and mean solar time.

**Sidereal Time.**—The sidereal day is the interval between two consecutive transits of a given fixed celestial object across any given meridian, or it is the interval required by the earth to make one complete revolution on its axis. This interval is constant but it is inconvenient as a time unit because the noon of the sidereal day occurs at all hours of the day and night.

**Apparent Solar Time.**—The apparent solar day is the interval between two consecutive transits of the sun across any given meridian. On account of the variable distance between the sun and earth, the variable speed of the earth in its orbit, the effect of the moon, etc., this interval is not constant and consequently cannot be kept by any simple mechanism, such as a clock or watch.

**Mean Solar Time.**—To overcome the objection noted above, the mean solar day was devised. The mean solar day is the length of the average apparent solar day. Like the sidereal day it is constant, and like

the apparent solar day its noon always occurs at approximately the same time of day.

The sidereal or astronomical day begins at mean noon and the hours run from one to twenty-four, while the civil day (mean solar) begins twelve hours earlier, at midnight, and the hours run from one to twelve, and then repeat from noon to midnight. The hours are in both cases divided into sixty minutes, and the minutes into sixty seconds.

**The Year.**—In dealing with longer periods, such as the life of a man, the day is not small a period, and for all chronological purposes the year has always been employed.

There are three different kinds of year used—the sidereal, the tropical, and the anomalistic.

**The Sidereal Year** is the time taken by the earth to complete one revolution around the sun from a given star to the same star again. Its length is 365 days 6 hours 9 minutes 9 seconds.

**The Tropical Year** is the time included between two successive passages of the

## WEIGHTS AND MEASURES OF THE BIBLE—Continued

DRY MEASURES		Pcks	Gallons	Pints
A gachal. . . . .	0	0	0	0.1410
20 gachals = 1 eab (2 Kings vi, 25; Rev. vi, 6). . . . .	0	0	0	2.8333
1 eab = 1 omek (Matt. xiii, 53). . . . .	0	0	0	8.1
3.3 omers = 1 eab (Matt. xiii, 53). . . . .	0	0	0	3
3 seahs = 1 ephah (Exek. xiv, 11). . . . .	3	0	0	3
5 ephahs = 1 ephah (1 Kings vi, 26). . . . .	5	0	0	0
2 ephahs = 1 kor, or homer (Num. xii, 37; Hos. iii, 2). . . . .	10	0	0	0

N. B.—The foregoing table will explain many texts in the Bible. Take, for instance, Isa. l, 10. "Yes, ten acres of vineyard shall yield one bath, and the seed of an homer shall yield an ephah." This curse upon the covetous man was that 10 acres of vines should produce only 7 gallons of wine, i. e., one acre should yield less than 3 quarts; and that 32 pecks of seed should only bring a crop of 3 pecks, or, in other words, that the harvest reaped should produce but one-tenth of the seed sown.

### TIME

The natural day was from sunrise to sunset.  
The natural night was from sunset to sunrise.  
The civil day was from sunset on one evening to sunset the next; for, "the evening and the morning were the first day."

### NIGHT (Ancient)

First watch (Lev. xix, 19), till midnight. . . . .	Morning till about 10 a. m.
Middle watch (Judg. vii, 19), till 3 a. m. . . . .	Heat of day till about 2 p. m.
Morning watch (Exod. xiv, 24), till 6 a. m. . . . .	Cool of day till about 6 p. m.

### NIGHT (New Testament)

First watch, evening = 6 to 9 p. m. . . . .	Third hour = 6 to 9 a. m.
Second watch, midnight = 9 to 12 p. m. . . . .	Sixth hour = 9 to 12 midday.
Third watch, cock-crow = 12 to 3 a. m. . . . .	Ninth hour = 12 to 3 p. m.
Fourth watch, morning = 3 to 6 a. m. . . . .	Twelfth hour = 3 to 6 p. m.

## JEWISH MONEY

With its value in English and American money; the American dollar being taken as equal to 4s. 2d.

English		American	
pounds s. d.		Dols. Cts.	
A gerah (Exod. xxi, 13). . . . .	0	0	0.7
10 gerahs = 1 shekel (Exod. xxviii, 20). . . . .	0	1	1.85
2 shekels = 1 shekel (Exod. xxi, 13). . . . .	0	2	3.7
50 shekels = 1 maneh. . . . .	0	14	25.5
60 manehs = 1 kikkar (talent). . . . .	342	3	9
A gold shekel. . . . .	0	0	70
A kikkar of gold. . . . .	5,475	0	26,380
N. B.—A shekel would probably purchase nearly ten times as much as the same nominal amount will now. Remember that one Roman penny (s'd.) was a good day's wages for a laborer.			
The Hebrew maneh, according to 1 Kings x, 17, compared with 2 Chron. ii, 16, contained 100 shekels; though according to one interpretation of Exek. xiv, 11, it contained 60, but more probably 50. The passage reads thus: "Twenty shekels, five and twenty shekels, fifteen shekels shall be your maneh." This is variously interpreted: (1) 20+25+5 = 50; (2) 20, 25, 5 are different kinds of gold, silver, and copper, bearing the same name. It is well to refer the meaning of these names: Shekel simply, weight; Bekah = split, i. e., the shekel divided into two; Gerah = grain, as in our currency, a grain and a half, the original standard weight; Maneh appointed; Maneh appointed, to sterling, a specific sum; Kikkar = round mass of metal, i. e., a weight or coin. Hebrew names in the Bible are not the same as the names in the Bible, as shown in Luke xii, 13, is Greek, though possibly identical with the Hebrew maneh.			

## ROMAN MONEY

English		American	
pounds s. d.		Dols. Cts.	
A "farthing," quadrans (Matt. v, 26) = nearly. . . . .	0	1	25
A "farthing," as in 4 quadrans (Matt. x, 29) = nearly. . . . .	0	5	1
A "denarius," 16 asses (Matt. x, 29) = nearly. . . . .	0	1	17
The Roman sestertius = 24 asses, is not named in the Bible.			
N. B.—Here we learn that:—			
Naaman offering to Elisha of 5,000 pieces (shekels) of gold amounted to more than £10,000 = 48,000 dollars.			
The Debtor (Matt. xviii, 24), who had been forgiven 10,000 talents, i. e., £3,000,000 = 14,000,000 dollars, refused to forgive his fellow-servant 100 pence, i. e., £3 10s. 10d = 17 dollars.			
Judas sold our Lord for 30 pieces of silver, i. e., £3 10s. 8d = 16 dollars 96 cents, the legal value of a slave, if he were killed by a beast.			
Joseph was sold by his brethren for 20 pieces, i. e., £2 7s. = 11 dollars 28 cents.			

vernal equinox by the sun, and since the equinox moves westward 50.2 seconds of arc a year the tropical year is shorter by 20 minutes 23.5 seconds in time than the sidereal year. As the seasons depend upon the earth's position with respect to the equinox, the tropical year is the year of civil reckoning.

**Anomalistic Year.**—The third kind of year is the anomalistic year—the interval between two successive passages of the perihelion, namely, the time of the earth's nearest approach to the sun. The anomalistic year is not used in special calculations in astronomy.

**The Calendar.**—Various attempts were made by the ancients to reconcile the month, which originally depended upon the changes of the moon, with the tropical year, but a satisfactory solution is not possible, and the calendars of civilized nations now disregard the moon entirely. The Mohammedan nations, however, still use a lunar calendar with a year of twelve lunar months, which alternately contain 355 and 356 days. According to their method of reckoning the same month falls

in different seasons, and their calendars gain one day on ours every thirty-three years. The *Julian Calendar*, which was established 45 B. C., by Julius Caesar, discarded all consideration of the moon and adopted 365½ days as the true length of the year. He ordained that every fourth year should contain 366 days, and transferred the beginning of the year from March to January 1. The Julian calendar is still used in Russia and generally by the Greek church. The *Gregorian Calendar*.—The true length of the tropical year is not 365½ days, but 365 days 5 hours 48 minutes 45.5 seconds, a difference of 11 minutes 14.5 seconds by which the Julian year is too long. This amounts to a little more than three days in four hundred years, and consequently the date of the vernal equinox had in Pope Gregory's time fallen back to March 11th instead of occurring on March 21st as it did at the Council of Nice, A. D. 325. This pope therefore decreed that the calendar should be corrected by dropping ten days, so the day following October 4, 1582, should be called October 15th instead of October 5th, and also in the future only such century years shall be leap years as are divisible by 400. Thus 1700, 1800, 1900, etc., are not leap years, while 1600, 2000, 2400, etc., are. The change was immediately made in all Catholic countries, but it was not until 1752 that the Gregorian calendar was adopted by England.

**Standard Time.**—Prior to 1883 each city had its own time, which was determined by the time of passage of the sun across the local meridian. Consequently the traveler going from one city to another had to continually change his watch to the local time. Largely through the efforts of the railroads a system of standard time was introduced. According to this system the United States, which extends from 65 degrees to 125 degrees west longitude, was divided into four sections, each of 15 degrees longitude.

The first (or eastern) section includes all territory between the Atlantic coast and an irregular line drawn from Detroit, Mich., through Pittsburg to Charleston, S. C., its most southern point. The time of this section is that of the 75th meridian, which is five hours slower than Greenwich time.

The second (central) section includes all territory between the line mentioned and an irregular line drawn from Bismarck, N. D., to the mouth of the Rio Grande.

The third (mountain) section includes all territory between the last-named line and a line which passes through the western part of Idaho, Utah and Arizona.

The fourth (Pacific) section covers the rest of the country to the Pacific Ocean. Standard time is uniform in each of these sections, but the time in one section differs by exactly one hour from the section next to it. Thus the time of the first section is five hours slower than Greenwich time, the time of the central section six hours slower, the time of the mountain seven hours, and the time of the Pacific section is eight hours slower than Greenwich mean time.

In cities situated on the border line of two sections, as, for instance, Pittsburg and Atlanta, the standard time of both sections are used; for example, if at Pittsburg it is 7 a. m. eastern time, it is 6 a. m. central time, and in such cities when the time is given, it should be specified as eastern, central, etc.

The system of standard time has been practically adopted in almost all civilized countries. All continental Europe, except

Russia, uses a time one hour faster than that of Greenwich; in Japan and Australia the time is nine hours faster, etc.

**Temperature Scales.**—Temperature is the term used to designate the state of a body as regards hotness or coldness. Two bodies are said to have the same temperature if, when they are put in contact, there is no tendency for one to get hotter while the other gets colder; if there is such a tendency, the one which tends to cool off is said to have the higher temperature. A *Scale of Temperature* is a system of numbering temperatures, the numbers being larger as the temperatures are higher. Such scales are based upon two fixed temperatures, viz., the "ice-point" or temperature at which pure ice melts, and the "steam point" or temperature at which pure water boils, both under the standard barometric pressure of 760 millimeters or 29.92 inches of mercury. Three such systems or scales are in use—the centigrade or Celsius, the Fahrenheit, and the Reaumur.

**Centigrade.**—On the centigrade scale, which is used almost universally in countries which have adopted the metric system of weights and measures, as well as in scientific work everywhere, the ice-point is numbered zero degrees (0° C.), and the steam-point one hundred degrees (100° C.), the unit of measurement, or the centigrade degree (1° C.) being the one-hundredth part of this interval.

**Fahrenheit.**—On the Fahrenheit scale, which is generally used in English-speaking countries, except among scientific men, the ice-point is numbered 32° F., and the steam-point 212° F., the difference being 180°, and the Fahrenheit degree (1° F.) being the one-hundred-eightieth part of this interval. The Fahrenheit degree is thus  $\frac{180}{100}$  or  $\frac{9}{5}$  as large as the centigrade degree. The Fahrenheit zero, at 32° below the ice-point, corresponding to  $-2^{\circ} \times 32 = -17.8^{\circ}$ , is approximately the lowest temperature that can be obtained with ordinary freezing mixtures of ice and common salt.

**Reaumur.**—The Reaumur scale is used in a few European countries, but is fast being superseded by the centigrade. It has 0° at the ice-point and 80° at the steam point, so that the Reaumur degree (1° R.) is  $\frac{2}{5}$  of the centigrade degree or  $\frac{3}{4}$  of the Fahrenheit degree.

**Conversion.**—To convert from one scale to another we have, in accordance with the above definitions, the following practical rules: Centigrade to Fahrenheit; multiply by  $\frac{9}{5}$  and add 32°.

Centigrade to Reaumur; multiply by  $\frac{4}{5}$ . Fahrenheit to centigrade; subtract 32° and multiply by  $\frac{5}{9}$ .

Fahrenheit to Reaumur; subtract 32° and multiply by  $\frac{4}{5}$ . Reaumur to Fahrenheit; multiply by  $\frac{5}{4}$  and add 32°.

Care should be taken to make the addition or subtraction algebraically, i. e., taking account of the negative sign when the temperature in question is below zero.

**Absolute Temperature.**—By the absolute temperature of a body is meant its temperature, measured in either of the three kinds of degrees, not from the ice-point or from the Fahrenheit zero, but from a point known as the absolute zero, which is at about  $-273.1^{\circ}$  C. or  $-459.6^{\circ}$  F. or  $-218.5^{\circ}$  R. This

mode of numbering temperatures is frequently convenient in scientific and engineering work. To convert centigrade temperatures into centigrade-absolute temperatures add 273.1°.

To convert from Fahrenheit to Fahrenheit-absolute add 459.6°. To convert from Reaumur to Reaumur-absolute add 218.5°. To convert in the other direction, subtract the same amounts. The Reaumur-absolute scale is seldom or never used, and the Fahrenheit-absolute scale only by engineers in English-speaking countries. When the term "absolute temperature" is used without further qualification, it usually means the centigrade temperature plus 273.1°, though this value, which may also be looked upon as the centigrade-absolute temperature of the ice-point, is sometimes taken as high as 274°.

**Barometric Measurements.**—By barometer reading is meant the height in inches or millimeters of the column of mercury, under standard conditions, that exactly balances the pressure exerted by the atmosphere at the instant the reading is made. The pressure exerted by a given column of mercury depends upon the altitude of the barometer, and upon the latitude, and it is customary, in order to get accurate comparisons, to refer the readings to latitude 45°, and to sea level. Also since the density of the mercury is affected by the temperature it is usually referred to 0° centigrade.

Since all air movements are the result of difference in pressure, important conclusions regarding the weather to be expected may be deduced from barometric readings, hence their use by mariners and weather experts.

Their value in determining altitudes depends upon the fact that the pressure of the atmosphere decreases with the altitude according to a fairly well established law, which is illustrated by the following table:

PRESSURE OF THE ATMOSPHERE AT DIFFERENT ELEVATIONS

Elev. Feet	Barom. Inches	Elev. Feet	Barom. Inches	Elev. Feet	Barom. Inches
0	29.92	600	29.25	4000	25.81
50	29.845	700	29.14	5000	24.88
100	29.79	800	29.03	6000	23.98
200	29.68	900	28.92	7000	23.11
300	29.57	1000	28.82	8000	22.28
400	29.46	2000	27.78	9000	21.48
500	29.35	3000	26.78	10000	20.70

**Beaufort's Wind Scale.**—The Beaufort Scale is used by seamen for recording the force of wind. For the guidance of those unaccustomed to its use, the corresponding velocity per hour in statute miles and in nautical miles is added. The force of wind varies from 0, a calm, to 12, a hurricane.

INTENSITY OR FORCE OF WIND

INTENSITY OR FORCE OF WIND	VELOCITY Statute Nautical miles per hour per hour
0. Calm. "Full raged ship, all sail set, no headway."	0 to 3 to 2.6
1. Light Air. Just sufficient to give motion to smoke.	8 6.9
2. Light Breeze. Speed of 1 or 2 knots, "full and by."	13 11.3
3. Gentle Breeze. Speed of 3 or 4 knots, "full and by."	18 15.6
4. Moderate Breeze. Speed of 5 knots, "full and by."	23 20.0
5. Fresh Breeze. All plain sail, "full and by."	28 24.3
6. Strong Breeze. Topsails set over single-reefed topsails.	34 29.5
7. Moderate Gale. Double-reefed topsails.	40 34.7
8. Fresh Gale. Triple-reefed topsails or reefed upper topsails and courses.	48 41.6
9. Strong Gale. Close-reefed topsails and courses (or lower topsails and courses).	56 48.6

## ELECTRICAL UNITS

NAME	SYMBOL	UNIT OF	HOW OBTAINED	CGS*	EQUIVALENT
Ohm.....	R	Resistance	The electrical resistance of a column of mercury 100 centimeters long and of 1 square millimeter section, at that current of electricity that decomposes 0.0026521 gram of water per second.	10 <sup>9</sup>	1 true ohm = 1.0112 British Association ohms.
Ampere....	C	Current	One ampere of current passing through a substance having 1 ohm of resistance = 1 volt.	10 <sup>9</sup>	Deposits 1.118 milligrams of silver per second.
Volt.....	E	Electromotive force	A current of 1 ampere during 1 second of time.	10 <sup>9</sup>	0.025 of a standard Daniel cell.
Coulomb....	Q	Quantity	The capacity that a current of 1 ampere for 1 second (= 1 coulomb) charges it to potential of 1 volt.	10 <sup>9</sup>	Deposits 1.118 milligrams of silver.
Farad.....	K	Capacity	The capacity that a current of 1 ampere for 1 second (= 1 coulomb) charges it to potential of 1 volt.	10 <sup>9</sup>	2.5 knots of D. U. S. cable.
Watt.....	P	Power	The power of 1 ampere current passing through resistance of 1 ohm.	10 <sup>7</sup>	0.0013405 (or 1/746) of a horsepower.
Joule.....	WJ	Work	The work done by 1 watt of electrical power in 1 second.	10 <sup>7</sup>	0.238 unit of heat (Therm).

\*CGS—Electro-magnetic units.

**Specific Gravity.**—By the specific gravity of a body is usually meant the ratio of the mass of the body to an equal volume of water at some standard temperature. At the present time 4 degrees centigrade is almost exclusively used, although much important older data is given in terms of water at other temperatures, such as 15 degrees centigrade, 20 degrees centigrade and 62 degrees Fahrenheit, etc. Also the specific gravity of gases is frequently expressed in terms of hydrogen.

The density of a body is its mass per unit volume. If the gram is used as the unit of mass and the cubic centimeter as the unit of volume, the density of a body is the same as its specific gravity referred to water at 4 degrees centigrade.

The following table gives the specific gravity or density of some of the more common substances:

## DENSITIES OF MISCELLANEOUS SOLIDS

SUBSTANCE	DENSITY (Grams per Cubic Centimeter)
Aluminum, cast.....	2.59 - 2.55
Aluminum, wrought.....	2.65 - 2.80
Ash wood.....	0.56 - 0.84
Asph.....	0.65 - 0.85
Burch.....	0.51 - 0.77
Brass (yellow, 70 Cu + 30 Zn, Cast).....	8.44
Brick.....	2.0 - 2.2
Cedar.....	0.49 - 0.57
Cherry.....	0.70 - 0.90
Coal, anthracite.....	1.2 - 1.5
Coal, bituminous.....	0.22 - 0.28
Cork.....	0.80 - 0.95
Copper, wrought.....	8.85 - 8.95
Copper, liquid.....	8.217
Gold, cast.....	19.30 - 19.34
Gold, wrought.....	19.33 - 19.34
Glass, flint.....	2.9 - 4.5
Glass, common.....	2.4 - 2.8
Hickory.....	0.60 - 0.93

## DENSITIES OF MISCELLANEOUS SOLIDS—Continued

SUBSTANCE	DENSITY (Grams per Cubic Centimeter)
Ice.....	0.91
Iridium.....	21.78 - 22.42
Iron, wrought.....	7.80 - 7.80
Iron, grey, cast.....	7.03 - 7.13
Lead, cast.....	11.340 - 11.340
Limestone.....	2.40 - 2.80
Lucite.....	0.97 - 1.21
Mahogany.....	0.50 - 0.85
Maple.....	0.62 - 0.75
Marble.....	0.5 - 2.8
Nickel.....	8.20 - 8.90
Oak.....	0.60 - 0.90
Opal.....	2.2
Paraffin.....	0.87 - 0.91
Platinum.....	21.2 - 21.7
Podiat.....	0.25 - 0.70
Silver, cast.....	10.4 - 10.5
Silver, wrought.....	10.50 - 10.57
Steel.....	7.8 - 7.7
Sycamore.....	0.40 - 0.60
Teak, Indian.....	0.66 - 0.88
Teak, African.....	0.98
Tin, wrought.....	7.300
Walnut.....	0.64 - 0.70
Willow.....	0.40 - 0.60
Zinc, wrought.....	7.190

## DENSITY OF LIQUIDS

SUBSTANCE	DENSITY (Grams per Cubic Centimeter)
Alcohol, ethyl.....	0.791
Alcohol, methyl.....	0.810
Chloroform.....	1.480
Ether.....	0.736

Chlorine.....	0.003132
Hydrogen.....	0.000090
Hydrogen sulphide.....	0.001176
Nitrogen.....	0.001251
Oxygen.....	0.001430

## FINE ARTS AND RELIGION

**FINE ARTS.**—This term is generally applied to those arts in which the artist seeks chiefly to give pleasure by the immediate impression produced on the mind by his work. These arts are thus distinguished from arts which are designed to answer some practical purpose, and so have been termed *useful*. By some, the term *fine arts*, which is generally taken to include those which appeal to the eye and ear alike, has been limited to the arts of painting, sculpture, architecture, and music.

The minor fine arts may be defined as those domestic and industries which add to the quality of usefulness certain elements of pleasure and beauty, such as embroidery, ceramics, glassmaking, goldsmiths' work, jewelry, and cabinet-makers' work. Poetry, dancing, acting, and studied eloquence, inasmuch as they are related, are classed as fine arts.

**Antique Arts.**—In its general acceptance the term *antique art* is understood to be that

of a period antecedent to the revival of the classical studies in western Europe, or before renaissance of the arts from their assumed period of lethargy. There was, in fact, a distinct character about the productions of the artists of the more ancient and the more modern times, which was sufficiently marked to produce in the best of them a separate style of art, and which has led to the establishment of the schools of the so-called antique and modern styles; the medieval arts form, as it were, an intermediate class, which was as distinctly marked as any of the other styles. The antique school was distinguished by an anthropomorphic and a divinization of the human form. Medieval Art was formed upon, and characterized by, a species of contempt for the human figure, and an aspiration after an ideal perfection, and therefore there is something vague and undefined in its efforts to represent the objects it copied.

Modern Art has united the indefiniteness of its aim with that clearness of the perception of its objects which is so marked a characteristic of its productions.

The antique schools date from the dawn of civilization to the end of the tenth century; the medieval schools date from the tenth to the fifteenth century; and the modern schools have continued the traditions of the masters of art to the present time.

**Architecture.**—The art of building or constructing is coeval with the earliest dawn of civilization, and may be said to present largely the history of the human family written in stone, brick, or other durable material. In process of its growth it came to be classed under five different heads or orders—the Tuscan, the Doric, the Ionic, the Corinthian and the Composite. These orders progress in ornamentation from the Tuscan, which is the most ancient and severe, to the Corinthian and the Composite, which are the more florid. There are, besides these, various styles of architecture, such as the Gothic, the Moorish, etc., but these are not classed as orders, being styles merely.

Architecture is divided into three classes—civil, military, and naval. Civil architecture, when taken in the widest sense, may be regarded either from an artistic, a scientific, or a utilitarian point of view. In the first case, as a means of giving external form and sensible expression to mental conceptions or ideas, it is a branch of aesthetics, or of the fine arts properly so called, and takes rank with sculpture and painting; in the second case it consists in a knowledge of certain laws of physical nature and a power of raising them into play or counteracting their operation, and is consequently a branch of that wider department of science to which the name of mechanics is given; whereas in the last it becomes a practical art, which has for its object the application of the principles, both artistic and scientific, which architecture embraces, to the elevation of national and individual character and the increase of the physical comfort and well-being of mankind.

The abstract conception of an all-pervading deity as embodied in the Greek temple, the religious aspirations after a personal God as shadowed forth in the Gothic cathedral, can be realized only in accordance with the principles of mechanics and the most rigorous adaptation of means to ends; whereas, in the opposite direction, the grand of the Hottentot, the hut of the Indian in the American wilderness, or

even the vulgar chimney-stalk in the dingy manufacturing suburb, if properly constructed for their respective purposes, will be found to have obeyed such æsthetic principles as they may have come in contact with.

Though a strict adherence to all the principles of architecture be indispensable to every genuine architectural structure, whatever be its object, it by no means follows that equal prominence must be given to each of these principles on every occasion. If a building has for its primary object the expression and commemoration of such feelings as grief, gratitude, devotion, or the like, this object manifestly will be best attained by subordinating the scientific and utilitarian to the æsthetic principles of architecture, and the reverse will be the case where mere convenience, or convenience in combination with beauty or magnificence, is sought.

The speculative and poetical character of the Greeks was exhibited in their temples, while their preference of the state to the individual appeared in the fact that their structures were designed for the worship of the protecting divinity of the city by the citizens, not for the worship of a personal god by the individual man.

Among the Romans, again, terrestrial power and material aggrandisement were the exclusively national aspirations, and consequently their architecture had their own honor and glory primarily in view. The basilicas, amphitheatres, and triumphal arches of the Romans were their own; but the temples which they raised in honor of the gods were little else than imperfect copies from the Greek.

Then, when we come to mediæval times, though on the revival of spiritual tendencies æsthetic principles again become prominent, they exhibit themselves under totally different forms; and the distinctions between heathen and Christian thought could scarcely be more distinctly stated in words than they are exhibited to the eye in the difference between a Greek temple and a Gothic cathedral.

Domestic life again appeared in full purity and vigor only in modern times, and then only do we see the utilitarian principles of architecture finally prevailing over the æsthetic. But apart from the mental characteristics and tendencies of a people there are many other circumstances which modify their architecture. Of these one of the most important is climate. Arrangements for the permanent and commodious residence of the family within doors could not be expected to attain much perfection among a race like the Greeks, whose life was passed in the open air.

**References.**—Hamlin's *Text-Book of the History of Architecture*; Rosenkranz, *Handbook of Architectural Styles*; Fletcher, *History of Architecture on the Comparative Method*. The most complete general work in English is Fergusson's *History of Architecture*; and also the French *Dictionnaire de l'Architecture*; and the English *Encyclopædia of Architecture*; but Sturgis' *Dictionnaire of Architecture* is best for exhaustive study.

**Sculpture.**—The art of giving form and expression, by means of the chisel and other implements, to masses of stone or other hard substances, so as to represent figures of every description, animate and inanimate; the term *carving*, sometimes applied to sculpture, being more generally limited to works in wood or ivory.

In whatever country the earliest attempts were made, the Egyptians were the first who adopted a certain style of the

art. Their works were gloomy and grave, but still they were full of deep sentiment; and connected, as would appear by the hieroglyphics which covered them, with poetry and history, and by the mummies, with the belief of immortality. The progress of this beautiful art reached its highest stages in the classic days of Greece, and though all the treasures of the Grecian sculptors had been carried to deck the Roman capital, the art never became naturalized.

During the long and gloomy interval of barbarism that succeeded the downfall of imperial Rome, sculpture, with the sister arts, lay dormant and forgotten. At length, however, through the genius of Michelangelo and the skill and perseverance of some of his distinguished successors, the treasures of antiquity were collected, and modern art nobly tried to rival the grace and sublimity which existed in the ancient models. For three centuries these antiques have been gathered, and now constitute the present inestimable collections of the Vatican, the Capitols, of Naples, Paris, London, and Berlin.

Modern sculpture has attempted little in comparison with modern painting; yet in Angelo and Thorwaldsen it has produced works holding rank with those of the best period of Greece.

The sculptor's art is limited in comparison with others, but it has its variety and intricacy within its proper bounds. Its execution is correct; and when to correct and perfect form is added the ornament of grace, dignity of character, and appropriate expression, as in the *Apollon Belvidere*, the *Venus de Medici*—which is the finest remnant of ancient art—the *Laocoon*, the *Moses* of Michelangelo, and many others, this noble art may be said to have accomplished its purpose. Few American sculptures worthy of note were executed previous to Greenough's time, but within the last half century the works of Hiram Powers, Crawford, Brown, Clevenger, Rogers, Palmer, Miss Hosmer, Vinnie Ream, and others, have brought American talent in this department of art to the pinnacle of reputation not inferior to that of contemporary European sculptors.

**Painting.**—The art of representing objects in nature, or scenes of human life, with fidelity and expression, upon a plane surface, by means of a pencil or crayon, and of various colored bodies called *pigments*. It consists of two parts—*design*, or the art of representing the contour of objects; and *color*, which gives to the image not only the color but also the form and relief proper to each object.

Coeval with civilization, painting was practiced with success by the Greeks and Romans; obscured for many ages, it revived in Italy in the fifteenth century, producing the Roman, Venetian, and Tuscan schools; afterward the German, Dutch, Flemish, French, and Spanish schools. The painting of the Egyptians, as is evident from the specimens found in their tombs, was very rude; that of the Etruscans, as seen on their vases, was extremely elegant; that of the Greeks, from the praises bestowed on some of their productions by the ancients, must have had considerable merit; and that of the Romans, as evinced by what we find in Pompeii, must have attained a high degree of excellence.

The art of painting is distinguished into *historical*, *portrait*, *landscape*, *animal*, *marine*, etc.; and, as regards the form, the materials, into painting in oil,

*water colors*, *fresco*, *distemper*, *miniature*, *mosaic*.

Historical painting is the noblest and most comprehensive of all branches of the art; for in that the painter vies with the poet, embodying ideas, and representing them to the spectator. He must have technical skill, a practiced eye and hand, and must understand how to group his well-executed parts so as to produce a beautiful composition; and all this is insufficient without a poetic spirit which can form a striking conception of an historical event or create imaginary scenes of beauty.

Van Dyke, L.H.D.; *The History of American Painting*, Samuel Isham; *Cyclopedia of Painters and Paintings*, Champlin and Perkins; *The Index Guide to Travel and Art Study in Europe*, Lafayette G. Loomis, *Modern Gallery Pictures*.

**Tuscan School.**—Style elevated and bold, seeking rather to ascend to ideas than to imitate; sometimes gigantic; neglects coloring and grace.

**Representatives.**—Cinabrese, Giotto, Andrea di Saffi, Masaccio, Bernardo Rossellino, Verrocchio, Andrea Castagna, Pisanelli, Ghirlandajo, Leonardo da Vinci, Bartolommeo di San Jacopo, Baldassari, Giovanni Veronesi, Buonarroti, Domenico Beccafumi, Andrea del Sarto, Jacopo Caraccioli da Pontormo; Del Rosso, Perino del Vaga, Daniele da Volterra, Francesco Salviati, Giorgio Vasari, Antonio Tempesta, Luigi Carracci, Francesco Albani, Marco Rinaldi, Pietro Berraini, called Pietro da Cortona, Paolo Testa, Benvenuto da Garofoli, Carlo Dolci, Benedetto Luti, Giovanni Geronimo Serravallo, Pompeo Battoni.

**Roman School.**—Carries invention and design to the highest perfection; by the analytical study of the antique and of nature; heads of the most sublime beauty; coloring and chiaroscuro less perfect.

**Representatives.**—Bernardino Pinturicchio, Pietro Perugino, Raphael, G. P. Penni, Giulio Romano, Federico Barocci, Taddeo Zuccaro, Jacopo Zuccheri, Domenico Fetti, Nicholas Poussin, Giovanni Lorraine, Bernini, Andrea Sacchi, Claude Gellée, called Le Lorrain, and Corradini. G. B. Salvi, called Il Sanseverino, Gaspar Dughet, called Poussin or Guaspre, Luigi Serravallo, Francesco Albani, Giovanni Stanetti, Giovanni Lauri, Carlo Maratti, Ciro Ferri, Pietro Bianchi, Raffaele Menga.

**Venetian School.**—Faithful imitation of well-chosen subjects of nature, excellent coloring, admirable effect; design less perfect through the neglected study of the antique and of the classical art.

**Representatives.**—Gentile Bellini, Andrea Mantegna, Giorgione, Titian (Tiziano Vecelli da Cadore), G. A. Baglioni, Sebastiano del Piombo, Jacopo da Ponte, J. Robusti (called Il Tintoretto), Paolo Veronese, Andrea Schiavone, Gerolamo Musiano, Paolo Cagliari, Giuseppe Porta, Dorio Varotari, Felice Riccio, Jacopo Palma (Il Vecchio), Jo. Palma, Gio. Contarini, Maria Tintoretto, Leonardo Corbelli, Tiberio Tinelli, Alessandro Turchi, Gio. B. Langetti, Andrea Poma, Francesco Trevisani, Sebast. Ricci, Ant. Balestra, Rosa Albani, Gio. Antonio Pellegrini, G. B. Piazzetta, Ant. Canale, Gio. Batt. Tiepolo, Giuseppe Nogari.

**Lombard and Bolognese Schools.**—Correggio, born in Lombardy, not having founded a permanent school, having been imitated by the painters of Bologna, these two schools are united. Correggio's distinguished characteristics are a seducing and voluptuous (though perhaps somewhat affected) grace in his figures and attitude and a magic harmony in his coloring. Tibaldi and the Carracci, called the Bolognese, of a more character of design, and many of their pupils unite therewith the fine coloring and the grace of Correggio.

**Representatives.**—Francesco Franco, F. Primaticcio, Correggio Antonio Allegri, Polidoro Caldari Jr., Massaccio, Pellegrino da Sanseverino, Francesco, M. Angelo Amerighi (called Caravaggio), Lodov. Caracci, Apollonio Caracci, Annibale Caracci, Giovanni Battista Tiepolo, Giovanni Guido, Lionello Spada, Alex. Tiarini, Francesco Albano, Giacomo Carvedone, Dom. Zampieri (called Donato), Felice Lanfranco, Francesco Gessi, G. F. Barbieri, Lodov. Lanzi, Mic. Ang. Colonna, Grimaldi, Giorg. And. Strani, Simone Tintoretto, F. F. Bassano, Jac. Canali, F. C. Lodov. Quilici, Ant. Francheschini, Guis. del Sole, Fer. Galii, Balderna, Gio. Maria Crespi, Rom. Michelini, Gio. Maria Crespi, Gio. P. Zanotti, G. P. Panini.

**Neapolitan, Genoese, Spanish.**—These nations are not particularly having founded a permanent school; their productions follow the masters of the great Italian schools.

**Neapolitan.**—The painters of this nation are reproached with being in general somewhat

Neapolitan.

Neapolitan.

Neapolitan.

Neapolitan.

Neapolitan.

Neapolitan.

affected. Pietro and Tommaso Stefani, Fil del Tesararo, Gio Cesare d'Appino, Ansaldo Falcone, Mario Nuzzi, Matteo Nuzzi, Salvatore Nuzzi, Anna Luciana, Frac. Solimando, Nunzio Ferajoli, Sebast. Cosca, Carl Corrado.

**Genese** are often *incognita*. In design.—Nich. da Vottri, Camisias, B. G. Pagni, Ben. Castelli, Bernardo Strossi, Gio. Carione, Benedetto Casalingo, F. M. Borroni, G. M. Biondi, Greg. Ferrari, Bart. Guidoboni, Il Molinarotto.

**Spendars**.—These painters have especially imitated the Venetian school. In design.—Giov. Battista, brilliant coloring.—Alonso Berragente, Blaise de Prado, Morales, Luis de Vargas, J. F. Ximenes de Navarrete, Pablo de Villalpando, Juan de Ribera, Don Diego Velasquez de Silva, Alonso Cano, Henriquez de las Marinas, Bartolome Esteban de Murillo, Frac. Ribal, Alvaro de Torres, Pedro de Nunez, Juan de Alifaro, Juan C. Faleo, P. di Pietro.

**German School**.—This school, having never had a common point of union, bears no general and distinctive character; it produces, in the different styles of painting, rival artists to the great masters of Italy and of the Netherlands.

**Representatives**.—Th. de Malina, Theo. de Pragen, N. Wurms, Albert Dürer, Lucas Möller, Hans Holbein, Lucas Cranach, Tobias Stimmer, Christ. Schwartz, John Van Aachen, J. Rottemmayer, J. Ley, Adam Elsheimer, J. M. W. Hauser, Jo. Sandrart, Ch. Lott, Goyardt, J. J. van der Fae, J. Spilberg, Leht. Ropkorp, J. J. Langelbach, J. J. Langelbach, J. J. Langelbach, Gasp. Netscher, Abt. Mignon, M. S. Merian, Godfrey Kneller, O. F. Hogenbuech, J. B. Huber, J. B. Huber, H. Huber, J. B. Huber, J. E. Nidegger, Brinkman, C. W. E. Dietrich, Rudolf Menze, Riemann, G. W. E. Dietrich.

**Flemish or Belgic School**.—This school excels in coloring and in the faithful imitation of nature, but does not always exhibit sufficient nobleness of design; it produces excellent artists in every style; that to which Teniers has affixed his name and its birth in this school; the academy at Antwerp, the cradle of this school, was founded in 1560, but there was a society of painters at Antwerp from the year 1409.

**Representatives**.—Hubert van Eyck, Jan van Eyck, Quentin Messia, Ber. V. Orley, J. de Mabuse, Peter Knock, Frans Flinck, Pieter de Keyser, F. Forbus, B. Spranger, C. Van Mander, H. Breenyck, Deysa Calvert, Otto Venius, P. Van Breughel, P. Neefs, S. Forbus, J. F. X. Forbus, Paul Rubens, David Teniers, James Jordens, Anthony Van Dyck, Philip de Champaigne, David Teniers, J. Van Arden, G. W. E. Dietrich, J. B. Huber, Simon Varet, G. P. de Vuerghen, Abt. Breughel, Henry de Court.

**Dutch School**.—This school is especially distinguished by an entire neglect of the chiaroscuro; exhibits good coloring, and a faithful imitation of nature in the minutest details. The microscopic style of this school is called the highest pitch in this school.

**Representatives**.—Erasmus, Lutz de Leyden, Martin Schenk, An. More, Abt. Blomart, Sol. de Bred, Cornelius Poelenberg, Leo Brainer, B. D. de Heven, John Wynants, Albert Cuyt, Paul Rembrandt van Ryo, Gerard Terburg, Adrian van Ostade, Gerard Dou, Gabriel Matzu, Philip Wouvermans, Nicholas Bergham, Paul Potter, Ludolf Bakhuizen, Van der Velde, Jac. Ruysdael, Hobbema, Fran. Mieris, John Steen, Van den Heyden, Adrian van der Velde, Karel du Jardin, John Wessels, Jan van der Werf, Jan van Huysum.

**English Painters**.—Formed in general on the masters of the French and Italian schools; excel in portraits and landscapes, are unrivaled in water-colors.

**Representatives**.—Hans Holbein, F. Zuercher, Isigo Jones, P. Oliver, B. Cooper, W. Dobson, Ric. Gibson, John Greenhill, Godfrey Kneller, Luke Lindock, James Thornhill, William Verelst, Rich. Wilson, Joshua Reynolds, Thomas Gainsborough, Hawley Gilpin, P. J. de Louthbourg, David Allan, Benjamin West, John Sturt, James Northcote, J. F. Nollekens, Philip Reinagle, William Hamilton, Wm. Beechey, Thos. Stothard, Francis Bourgeois, John Opie, Geo. Morland, Thomas Lawrence, Edward Bird, John Constable, Will. Hilton, Geo. Hen. Harlow, Thomas Daniel, David Wilkie, R. B. Haydon, A. W. Calcott, W. Etty.

**French School**.—The good painters of this school are formed on the models of the schools of Flanders, of which they bear the general characteristics; they are in general more successful in composition and design than the school of Italy, and are emancipated by Venetian from the degradation and affected style it assumed after the death of Le Brun, and has become the most numerous and flourishing school of all.

**Representatives**.—Fran. Primaticcio, Rosso de Rossi, Jean Cousin, Jean Veret, Claude Lorraine, Jean Petitot, Sebastian Bourdon, Etienne Le Sueur, Charles Le Brun, Jacques-Louis David, John Jouvenet, Joseph Vernet, Nicholas Bertin, Anth. Rivet, Ant. Watteau, Francis Le Moine, Noel N. Coyppe, Chas. Le Brun, Joseph Vernet, Vien, J. B. Deshayes, J. L. David, Carl Veret, A. L. Girodet.

**Music**.—Is a combination or succession of sounds, having the property of *pitch*, so arranged as to please the ear. The pleasure derived from music arises from its excitation of agreeable sensations, and consequent pleasing mental images and emotions. Apart from words, it expresses passion and sentiment, and, linked to words, it loses its vagueness, and becomes a beautiful illustration of language. The doctrine of musical sounds is based on the principles of acoustics.

**Forms**.—Musical compositions are either for the voice, with or without instrumental accompaniment, or for instruments only. Of vocal music, the principal forms may be classed as church music, chamber music, dramatic music, and popular or national music. The first includes plain song, faux bourdon, the chorale, the anthem the sacred cantata, the mass and requiem of the Roman Catholic church, and the oratorio. Vocal chamber music includes cantatas, madrigals, and their modern successors, glee, as also recitatives, arias, duets, trios, quartets, choruses, and generally all forms, accompanied or unaccompanied, which are chiefly intended for small circles. Dramatic music comprehends music united with scenic representation in a variety of ways, in the ballet, the melodrama, the vaudeville, and the opera, in which last music supplies the place of spoken dialogue. Instrumental music may be composed for one or for more instruments.

**History**.—A certain sort of music seems to have existed in all countries and at all times. Even instrumental music is of a very early date: representations of musical instruments occur on the Egyptian obelisks and tombs. To the music of the Egyptians, nothing analogous seems to have existed among the nations of antiquity. The early music of the Christian church was probably in part of Greek, and in part of Hebrew origin. St. Ambrose and Gregory the Great directed their attention to its improvement, and under them some sort of harmony or counterpoint seems to have found its way into the service of the church. The opera, which appeared nearly contemporaneously with the reformation and revival of letters, greatly enlarged the domain of music. Italy advanced in melody and Germany in harmony. Instrumental music occupied a more and more prominent place. Corelli's compositions exalted the violin. Lull and Rameau, with their beautiful music, added the characteristics of French taste. In the German Gluck drove them out of the field. The scientific and majestic figure reached its highest perfection under J. S. Bach. The changes introduced in ecclesiastical music in England at the Restoration gave birth to the school of Purcell; and a little later, England adopted the German Handel, who was the precursor of Haydn, Mozart, Beethoven, Spohr, and Mendelssohn. The principal fact in recent musical history is the movement with which the name of Wagner is connected, having for its aim the production and perfection of a true musical drama, in which, unlike the opera, the words and music shall be of equal importance.

Initiative music suggests something external to the mere melody and harmony, as *motion*, *notions*, and objects of sight. By ascending and descending strains and cadences modern composers express soaring, sinking, etc. The varied sounds of battle, funeral processions, domestic

sounds, tempests, notes of birds, etc., are produced by variation of tone. A certain correspondence has been found between sight and hearing to admit of the representation of objects of the latter sense by musical tones, but the interpretation must be assisted by words.

**References**.—For general histories of music see by Burney, Hawkins, Fétis, Ritter, Naumann, Rockstro, and Parry; also *The Oxford History of Music*; Chappell's *Popular Music of the Olden Time*; Hullah's *Modern Music*; Davy's *History of English Music*; Riemann's *Dictionary of Music*; Grove's *Dictionary of Music and Musicians*; and Hullah's *Musical Glossary*.

**Ceramics**.—As here used is that branch of art which comprises all objects made of clay or sand, as vases, cups, urns, statues, etc., including all ornamental or artistic varieties of pottery, porcelain and glassware.

Of all the industrial arts, there is perhaps not one which can rival the stilet art in the harmonious combination of utility and beauty. Porcelain and glass exhibit the most marked triumph of scientific industry over the original worthlessness of the materials on which that industry is exercised. The change wrought in clay, sand, and flint, by the annealing and vitrifying processes, is hardly less wonderful than that which the alchemists hoped to effect by the transmutation of metals. The Babylonians, the Egyptians, and the Etruscans became potters from their vicinity to the Euphrates, the Nile, and the rivers of northern Italy. The Etruscans improved on the Egyptians, as the Greeks afterward improved on them, produced forms of the most elegant kind. The Roman vessels were generally less slender and graceful than those of the Greeks; they partook more of the utilitarian spirit of the *masters of the world*; still they were not without beauty, and were surpassed by their vessels being often decorated with much elaborate display. But in the following centuries the art almost disappears, until it was reintroduced into Europe from China in the fifteenth century.

The beautiful ware called *majolica* was invented by Luca della Robbia at Florence, and greatly extended by Orazio Fontano, of Pizzaro, at the close of the fifteenth and beginning of the sixteenth centuries. In 1553 the celebrated Palsay discovered at Saintes the art of glazing or enameling a gray paste, and introduced dishes and other objects with fruit, fish, and animals moulded from life, distributed over the surface, as a kind of ornamented ware. The German and Flemish pottery, ranging from 1540 to 1620, is remarkable for the quaint variety of its designs; it is, however, exceedingly original and artistic. None of this ware, however, was of the nature of the Chinese porcelain, and various unsuccessful attempts to discover the secret of its manufacture had been made in several countries, when Bottger discovered white *kaolin* at Aue, and produced from it a white hard porcelain at Meissen, near Dresden, where the first porcelain establishment was founded under royal auspices in the beginning of the eighteenth century.

In 1720 and 1751 respectively were founded in Vienna and Berlin the works in which the famous wares of those places have since been made. In France, porcelain was first manufactured in 1735 at Chantilly, whence, in 1754, the works were removed to Sevres, where they have continued in operation to the present time. Porcelain was made in England in the middle of the last century, first

\* After Holfbein settled in England he practically founded the English school.

at Chelsea, and afterward at Stratford le Bow, Derby, Plymouth, Worcester, etc. Staffordshire is also an important seat of the porcelain manufacture. In the United States, the materials for many

sorts of ware are good; but, owing to the cheapness and perfection of the porcelain imported from Europe, the manufacture has made little progress until recently. Trenton, N. J., claims to rank as the

chief manufacturing center of this industry. References.—*Prime's Pottery and Porcelain of All Times and Nations*; Barber's *Pottery and Porcelain of the United States*; E. ### WORLD'S FAMOUS PAINTINGS

#### I. In the Rijks Museum, Amsterdam

TITLE OF PAINTING	PAINTER	SCHOOL	OBSERVATIONS
THE NIGHT WATCH.	Rembrandt (1607-1669).	Dutch.	Captain Banning Cock's company of musketeers coming out of the guard house. Wonderful arrangement of light and shade on figures. A masterpiece of portrait arrangement.
DIRECTORS OF THE CLOTH-MAKERS' GUILD.	Rembrandt (1607-1669).	Dutch.	
BANQUET OF THE GUARD.	Van der Helst (1612-1670).	Dutch.	On the occasion of the peace of Westphalia in 1648. Sir Joshua Reynolds called it as one of the first pictures in the world.
THE NIGHT SCHOOL.	Gerard Dou (1613-1675).	Dutch.	One of his celebrated works, containing ten figures, with the dead Christ in the center.
A LADY.	Netcher (1639-1684).	Dutch.	Excellent rendering of water in movement, by one of the great landscape painters of all times.

#### II. In the Antwerp Museum

CRUCIFIXION.	Peter Paul Rubens (1577-1640).	Flemish.	Considered one of this master's chief d'œuvre. Sir Joshua Reynolds ranked it as one of the first pictures in the world.
THE ENTOMBMENT.	Quinten Matsys (1466-1531).	Flemish.	One of his celebrated works, containing ten figures, with the dead Christ in the center.
THE WATER WHEEL.	Hobbema (1638-1709).	Dutch.	Excellent rendering of water in movement, by one of the great landscape painters of all times.
THE MANDOLIN PLAYER.	Terburg (1617-1681).	Dutch.	Equisite treatment of surfaces and intimate surroundings of a Dutch interior.

#### III. In the Berlin Museum

LEDA AND THE SWAN.	Correggio (1494-1534).	Parmaese.	A theme the artist painted many times, with great success.
CHILDREN OF CHARLES FIRST.	Van Dyke (1590-1641).	Flemish.	Justly considered one of the greatest of all the world's portraits of children.
THE WINDS OF THE ADORATION.	The brothers Hubert and Jan Van Eyck (1390-1440).	Flemish.	One of the most elaborate altarpieces ever painted.
BOY BLOWING BUBBLES.	Vermeer (1632-1675).	Dutch.	Highly representative work of a most brilliant craftsman, one of the best of the series known as "the Little Dutchmen," and of recent years more fully appreciated at his true worth.
MADONNA COI BAMBINO.	Raphael (1483-1520).	Umbrian.	An early work by this most famous painter of Madonnas. One of his best figures in a rocky landscape. There are several other important examples by this master in this gallery.
SAINT ANTHONY AND THE INFANT CHRIST.	Murillo (1618-1682).	Spanish.	One of the best of a long series of such pictures painted by this distinguished Spaniard.

#### IV. In the Borghese Gallery, Rome

MADONNA.	Botticelli (1446-1510).	Florentine.	Botticelli was famous for his deep religious sentiment as expressed in his paintings and for exquisite finish.
LEDA AND THE SWAN.	Leonardo da Vinci (1452-1510).	Florentine.	It is fair to say that modern critics contest this attribution and in fact there are but few authentic works extant by Da Vinci.
SACRED AND PROFANE LOVE.	Titian (1477-1576).	Venetian.	An undisputed masterpiece, full of glorious coloring and of splendid conception and execution.
ENTOMBMENT.	Van Dyke (1590-1641).	Flemish.	A highly important example containing eleven figures.
ENTOMBMENT.	Raphael (1483-1520).	Umbrian.	Gracful arrangement of four nude figures.
DANAE.	Correggio (1494-1534).	Parmaese.	Nearly painted, and of deep religious feeling.
MADONNA.	Bellini (1428-1510).	Venetian.	

#### V. In the Brera Gallery, Milan

SAINT MARK.	Bellini (1428-1510).	Venetian.	A famous work depicting the marriage of the Virgin and Joseph by the high priest, in the court of the temple.
THE SPORALIZO.	Raphael (1483-1520).	Umbrian.	
PORTAIT OF A LADY.	Rembrandt (1607-1669).	Dutch.	A favorite theme with Van Dyke and his contemporaries.
VIRGIN, CHILD AND SAINT ANTHONY.	Van Dyke (1590-1641).	Flemish.	There are also others by Titoretto in this gallery.
SAINT HELEN.	Titoretto (1518-1594).	Venetian.	
HEAD OF CHRIST.	Da Vinci (1452-1510).	Florentine.	

#### VI. In the Brussels Museum

PORTRAIT OF THOMAS MORUA.	Holbein the Younger (1497-1533).	German.	One of his prized works, well known through reproduction.
ABRAHAM AND EVE.	Van Eyck (1390-1440).	Flemish.	Full of extraordinary detail and deep religious feeling.
PORTAIT.	Rembrandt (1607-1669).	Dutch.	
PIETA.	De Crayer (1582-1609).	Flemish.	
FOREST.	Hobbema (1638-1709).	Dutch.	Hobbema was famous for his rendering of wood interiors and this is particularly representative.
WIFE OF CHARLES DE CORDON.	Rubens (1577-1640).	Flemish.	Of unusual, rich color and free brush work.
FLEMISH FAIR.	Teniers (1610-1693).	Flemish.	Teniers' name is associated with such characteristic episodes in village life.
HIMSELF AND WIFE.	Gerard Dou (1613-1675).	Dutch.	A painter of great detail, which he yet kept broad to a degree.

#### VII. In the Dresden Gallery

THE SISTINE MADONNA.	Raphael (1483-1520).	Umbrian.	One of the most famous and popular of all the world's pictures. By many considered Raphael's masterpiece. It was painted for the monastery of San Sisto, at Piacenza, Italy, and is a shrine for admirers of this artist. It has been reproduced in many mediums.
LA NOTTE.	Correggio (1494-1534).	Parmaese.	This picture, <i>The Night</i> , is a representation of the Adoration of the Shepherds and was formerly known as <i>Madonna de Regio</i> .

## WORLD'S FAMOUS PAINTINGS—Continued

## VII. In the Dresden Gallery—Continued

TITLE OF PAINTING	PAINTER	SCHOOL	OBSERVATIONS
MARRIAGE AT CANA.	Veronese (1528-1588).	Venetian.	Painted many times by Veronese, the most important canvas being at the Louvre, Paris.
THIRTEEN MONKS.	Titian (1477-1576).	Venetian.	The last is a sumptuous work in rich, glowing color.
CUPID CROWNING VENUS.	Basoferatto (1605-1665).	Roman.	A fine canvas, for many years attributed to Titian.
SLEEPING VENUS.	Palma Vecchio (1480-1528).	Venetian.	
VENUS REPOSING.	Caravaggio (1560-1609).	Roman.	This artist painted many pictures of the same theme.
FORTUNE TELLER.	Ribera (1588-1656).	Spanish.	The artist, known as <i>Lo Spagnoletto</i> , painted much for churches and religious houses.
SAN MARTIN OF EGYPT KNEELING AT THE GRAVE.	Murillo (1618-1682).	Spanish.	
SAINT ROBERTOUE.	Murillo (1618-1682).	Spanish.	
VIRGIN AND CHILD.	Van Dyke (1599-1641).	Flemish.	Official portrait painter to the English court. Van Dyke limned all these people many times.
CHARLES I. OF ENGLAND.	Van Dyke (1599-1641).	Flemish.	
THE CHILDREN OF CHARLES I.	Van Dyke (1599-1641).	Flemish.	
HENRIETTA MARIA, WIFE OF CHARLES I.	Van Dyke (1599-1641).	Flemish.	
THE ARTIST'S WIFE.	Rembrandt (1607-1699).	Dutch.	This gallery contains a wonderful collection of Rembrandt's work.
THE ARTIST AND HIS WIFE.	Rembrandt (1607-1699).	Dutch.	
MANDARIN'S SACRIFICE.	Rubens (1577-1640).	Flemish.	One of the most important compositions by this master, containing no less than eight large figures.
JUDGMENT OF PARIS.	Holbein the Younger (1497-1533).	German.	One of the most popular and most reproduced religious pictures in the world, though of recent years its attribution has been questioned.
MADONNA.	Correggio (1494-1534).	Parmaese.	This work is familiar through many reproductions.
BRADING MADDALEN.	Guido Reni (1575-1642).	Italian.	Characterized by his usual detail and finish, a beautiful example.
CROWNED WITH THORNS.	Guido Reni (1575-1642).	Italian.	
LADY IN SATIN.	Terburg (1617-1691).	Dutch.	

## VIII. In the Academy of Fine Arts, Florence

ALLEGORY OF SPRING.	Botticelli (1446-1510).	Florentine.	World famous for its graceful arrangement of beautiful nudes.
COUPELION.	Botticelli (1446-1510).	Florentine.	This gallery is particularly rich in the pictures of its townsman, Botticelli.
CORONATION.	Botticelli (1446-1510).	Florentine.	
A FREDERICK.	Da Vinci (1452-1510).	Florentine.	This is in a painting by Verrocchio, and was painted when Da Vinci was his pupil.
MARY MADONNAS.	Ghirlandajo (1449-1494).	Italian.	
AN ANGEL.	Ghirlandajo (1449-1494).	Italian.	
THE NATIVITY.	Ghirlandajo (1449-1494).	Italian.	

## IX. In the Royal Museum, The Hague

THE YOUNG MOTHER.	Gerard Dou (1613-1675).	Dutch.	One of his very best examples.
THE ANATOMICAL LECTURE.	Rembrandt (1607-1699).	Dutch.	One of the great paintings of all time, containing many figures showing seven students listening to a lecture by the famous Dr. Nicolaas Tulp, who is dissecting a dead body. Rembrandt's fame dated from this picture. It was painted for the Guild of Surgeons, Amsterdam. Curiously enough, several famous painters have rendered the same theme, among them:—Aert Pieterman, Thomas de Keyser, Nicolas Elias, and Pieter van Miereck. There are several other important examples by Rembrandt in the Hague gallery, notably, <i>The Presentation in the Temple</i> and <i>The Fight Into Egypt</i> .
THE YOUNG BULL.	Paul Potter (1625-1654).	Dutch.	The most famous cattle picture in the world, painted when the artist was but twenty-seven. The animal is the size of life, another animal is lying near a tree by which are some sheep, and to one side is a peasant. Back of them there is a familiar Dutch landscape. Recent critics qualify the earlier profound admiration for this work.
PORTRAIT OF PAUL POTTER.	Van der Helst (1612-1670).	Dutch.	

## X. In the Museum of Haarlem

BANQUET OF OFFICERS OF ARCHBISHOPS OF SAINT GEORGE.	Frans Hals (1580-1666).	Dutch.	This large canvas contains twelve figures and is justly famous. The greatest claim this museum possesses is its superb collection of the work of its eminent townsmen.
BANQUET OF OFFICERS OF ARCHBISHOPS OF ST. ANDREW.	Frans Hals (1580-1666).	Dutch.	All of these works may be considered as masterpieces.
ASSEMBLY OF OFFICERS OF ARCHBISHOPS OF ST. ANDREW.	Frans Hals (1580-1666).	Dutch.	
OFFICERS AND SERGEANTS OF ARCHBISHOPS OF ST. GEORGE.	Frans Hals (1580-1666).	Dutch.	
GOVERNORS OF THE ELIZABETH HOSPITAL.	Frans Hals (1580-1666).	Dutch.	
GOVERNORS OF THE HOSPITAL FOR OLD MEN.	Frans Hals (1580-1666).	Dutch.	
LADY GOVERNORS OF THE HOSPITAL FOR OLD WOMEN.	Frans Hals (1580-1666).	Dutch.	

## XI. In the Hermitage, St. Petersburg

HOLY FAMILY.	Raphael (1483-1520).	Umbrian.	This gallery is wonderfully rich in examples of Rembrandt's work.
THE DESCENT FROM THE CROSS.	Rembrandt (1607-1699).	Dutch.	
PORTRAIT OF AN OLD JEW.	Rembrandt (1607-1699).	Dutch.	
BOLDERS.	Rembrandt (1607-1699).	Dutch.	
HIS MOTHER.	Rembrandt (1607-1699).	Dutch.	
THE FARM YARD.	Rembrandt (1607-1699).	Dutch.	

## XII. In the Louvre, Paris

MADONNA OF THE CRADLE.	Raphael (1483-1520).	Umbrian.	
ST. GEORGE AND THE DRAGON.	Raphael (1483-1520).	Umbrian.	
LA BELLE JARDINIÈRE.	Raphael (1483-1520).	Umbrian.	
PORTRAIT OF HIMSELF.	Rembrandt (1607-1699).	Dutch.	
PORTRAIT OF HIMSELF.	Rembrandt (1607-1699).	Dutch.	
EMMAUS.	Rembrandt (1607-1699).	Dutch.	
PHILOSOOPHERS.	Rembrandt (1607-1699).	Dutch.	
THE SAMARITAN.	Rembrandt (1607-1699).	Dutch.	

## WORLD'S FAMOUS PAINTINGS—Continued

## XII. In the Louvre, Paris—Continued

TITLE OF PAINTING	PAINTER	SCHOOL	OBSERVATIONS
ERASMUS.	Holbein, the Younger (1497-1543).	German.	One of the world's famous portraits of deep human interest.
SOLDIER AND MAIDEN.	Torbjurg (1617-1681).	Dutch.	A cabinet picture of great charm and delicacy of finish.
OFFICER ADDRESSING A LADY.	Metsu (1650-1667).	Dutch.	A graceful composition by a master of genre work.
THE DRACONIC WOMAN.	Gerard Dou (1613-1678).	Dutch.	Very famous as being of a somewhat repulsive theme which the painter has by sheer force of craftsmanship made most interesting.
THE IMMACULATE CONCEPTION.	Murillo (1618-1682).	Spanish.	This artist, as well as his contemporaries, painted this theme frequently, but this picture is the most famous of all and is a large canvas full of figures, exquisitely rendered.
THE BIRTH OF THE VIRGIN.			
LA MATHÈREUSE DU TITIAN.	Titian (1477-1576).	Venetian.	A world-famous picture of deep religious significance.
THE ENTOMBMENT.			Universally considered one of the greatest masterpieces of portraiture that the world has ever seen.
THE MAN WITH THE GLOVE.			The collection is particularly rich in the work of this masterly Venetian.
CROWNED WITH THORNS.			
THE HOLY FAMILY.			
MONA LISA.	Leonardo da Vinci (1452-1510).	Florentine.	Perhaps the greatest single figure piece ever painted. It is a portrait of the wife of Zanobi del Giocondo, and the canvas is sometimes referred to as "La Gioconda." Da Vinci is said to have spent four entire years on the picture, which he sold to Francis I. for the then extravagant price of four thousand gold florins, a terrific amount for those days. It has been the shrine for art worshippers and students for many years. Many copies of this work, some by pupils of Da Vinci are in the various galleries of Europe.
SAINT ANNE.			Among the few authentic pictures by this great artist.
SAINT JOHN, THE BAPTIST.	Paul Veronese (1528-1588).	Venetian.	The Louvre is full of masterpieces and this is one of its most famous, being an enormous canvas, of sumptuous coloring, containing portraits of Francis I. and his queen, Mary of England, the Emperor Charles V., and many painters, including the artist himself, Titian, Tintoretto and others.
THE MARRIAGE AT CANA.			
RETREAT OF SAINT CATHERINE.	Correggio (1494-1534).	Parmaese.	
ANTHOPE AND JOSEPH DISGUISED AS A SATYR.			
THE MUSIC LESSON.	Torbjurg (1617-1681).	Dutch.	One of the famous genre of painting executed in great detail.
SHOOTING MATCH.	Van der Heist (1612-1670).	Dutch.	
CHILDREN OF CHARLES I.	Van Dyke (1590-1641).	Flemish.	Van Dyke gave the greatest distinction to his portraits, of which, though he died at the early age of forty-two, he did many.
CHARLES I. AT FULL LENGTH, WITH HORSE AND SUTLE.			
ISABELLA OF SPAIN.			
THE DUKE OF RICHMOND.	Guido (1575-1642).	Italian.	A most representative collection of the work of this popular painter.
SAINT SEBASTIAN.			
MARY MAGDALEN.			
THE HOLY FAMILY.			
PORTRAIT OF THE INFANTA MARGARITA.	Velasquez (1590-1660).	Spanish.	A comprehensive representation of this great master's methods of work.
MARIA.			
THE INFANTA MARIA TERESA.			
PHILIP IV.			
MEETING OF GENTLEMEN.			
LAVERING GIRL.	Frans Hals (1584-1666).	Dutch.	All are excellent examples, but this Dutch master is seen at his best in the gallery of his native place, Haarlem.
PORTRAIT OF A LADY.			
PORTRAIT OF THE BERNSTEIN FAMILY.			
THE EMBARKATION FOR CYTHERA.	Antoine Watteau (1684-1721).	French.	Considered one of the most beautiful pictures in the world, of great charm, originality and poetic feeling.
CHILDREN OF THE COMEDIE ITALIENNE.			
L'INDIFFÉRENT.			
THE BROKEN PITCHER.	Greuse (1725-1805).	French.	A very popular work, well known through reproduction.
THE RAFT OF THE MEDUSA.	Germeau (1791-1834).	French.	An epoch-making picture, being a great departure in realism and a protest against the prevailing academic manner. The work when first shown created a great sensation.
PORTRAIT OF MRS. RECAMIER.	David (1748-1825).	French.	Very distinguished canvases and both well known by reproduction.
PORTRAIT OF HIMSELF.			
DATE OF THE HORATII.			
RAPE OF THE SABINE WOMEN.			
CECROPS EXPLAINING THE RIDDLE OF THE SPHEX.	Ingres (1780-1867).	French.	These are hard, academic compositions, the figures rigid and unsympathetic, but drawn with distinction, though the manner of painting is of a curiously artificial period in French art.
APOTHEOSIS OF HOMER.			The picture <i>La Source</i> was painted when the artist was seventy-five and is one of the great works of his time, while some of his portraits are of most distinguished excellence.
LA SOURCE.			
PORTRAIT OF HIMSELF.			

## XIII. In the National Gallery, London

MADONNA AND CHILD.	Cimabue (1240-1302).	Florentine.	Archaic and charmingly naive in its religious earnestness.
MADONNA AND CHILD.	Filippo Lippi (1457-1504).	Florentine.	Unusually fine landscape background to a well-balanced composition of deep religious feeling, characteristic of the times.
SAINT JEROME AND SAINT DOMINIC.	Botticelli (1446-1510).	Florentine.	Of distinguished treatment and original composition arrangement, rendered in alluring detail and with conviction.
MADONNA AND CHILD.			
ENGLINDING VIRGIN.	Raphael (1483-1520).	Umbrian.	Sometimes known as <i>The Bleeding Madonna</i> because it once belonged to the Duke of Marlborough. It is a noble composition, with the Virgin enthroned, St. John on one side and St. Nicholas of Bari on the other. There are other examples by Raphael in this gallery.
THE ANGELOI MADONNA.			
OUR LADY OF THE ROCKS.	Leonardo da Vinci (1452-1510).	Florentine.	This is a masterpiece pure and simple, one of the few authentic known works of Da Vinci, and there is a study for it at the Castle at Windsor.
THE FAMILY OF DARIUS AT THE FEET OF ALEXANDER.	Paul Veronese (1528-1588).	Venetian.	For finish, beauty of conception and profound skill of execution, it is unsurpassed in the world.
PORTRAIT OF THE DOGS LEONARDI LORENZANO.	Giovanni Bellini (1428-1516).	Venetian.	A grand sumptuous composition, eminently characteristic of the master colorist.
A TAILOR.			
BERNARDINI, VENUS AND CUPID.	Giovanni Moretti (1525-1578).	Bergamese.	One of the world's famous portraits, full of character.
PORTRAIT OF JEAN ARNOULT AND HIS WIFE.	Correggio (1494-1534).	Parmaese.	Extraordinary painting of the nude forms of a man, woman and child.
	Jan van Eyck (1390-1440).	Flemish.	A remarkably painted portrait of two hideously ugly Dutch people, almost ludicrously naive in its selection of arrangement, but masterly in its rendering of light, shade and detail.
PORTRAIT OF AN OLD LADY.	Rembrandt (1607-1669).	Dutch.	A famous canvas, showing a seated woman in white cap and ruff.
LA CHAPELLE DE PAUL.	Rubens (1577-1640).	Flemish.	The portrait of a beautiful young woman, thought to have been Mlle. Lunden, wearing a black Spanish beaver hat. The picture was once known as <i>The Spanish Girl</i> . Rubens obviously admired this work, for he never parted with it, and when he died it went to his widow, who also retained it during her life.

**WORLD'S FAMOUS PAINTINGS—Continued**

### XIII. In the National Gallery, London—Continued

TITLE OF PAINTING	PAINTER	SCHOOL	OBSERVATIONS
THE AMBASSADORS.	Hans Holbein (1497-1543).	German.	One of the world's masterpieces, showing two gnomes standing in handsome robes, by a table which is littered with various still-life minutely painted. The floor is of intricate design, and cast diagonally thereon is the object that has been the subject of much speculation. It is apparently a human skull elongated, though for what reason no one seems able to determine. The work is of superlative greatness, however.
CHARLES THE FIRST. PORTRAIT OF GEORGE IV.	Van Dyke (1599-1641).	Flemish.	A great portrait of the monarch on horseback, of rare excellence. A man with a pointed beard, wearing a ruff about his neck, very famous and popular in reproduction.
THE PRACE OF MONNETS. THE AVENUE-MIDDLEHARNAIR.	Terburg (1617-1681). Hobbema (1638-1709).	Dutch. Dutch.	Important composition, with many figures gathered about a table. One of the great landscapes of all time, by a man who received little appreciation during his life.
INTERIOR OF A DUTCH HOUSE. PIERCE OF SPAIN. MARRIAGE A LA MODE.	Pieter de Hooch (1630-1684). Velasquez (1590-1660). William Hogarth (1697-1764).	Dutch. Spanish. English.	Interesting arrangement of light, shade and dexterous rendering of textures. One of the Spanish master's famous portraits of his king. A series of six cartoons or pictures of the fashionable life of the artist's time, telling of the weakness, extravagance and dissipation of the nobility. These and other works here by Hogarth are world-famous. The famous actress seated in graceful pose, in large picture hat.
PORTRAIT OF MRS. SIDGONS.	Thomas Gainsborough (1727-1785).	English.	All of these portraits are human documents of the first order.
PORTRAIT OF TWO GENTLEMEN. DOCTOR JOHNSON. BOWELL. ADMIRAL KEPPEL. HINDSLEY. GEORGE IV. AS PRINCE OF WALES. THE AGE OF INNOCENCE. DREYER DAT.	Sir Joshua Reynolds (1723-1792).	English.	A popular picture full of infinite detail, representing England's famous race track on Epsom Downs, on its fete day.
THE VALLEY FARM.	W. P. Frith (1819-1909). John Constable (1776-1837).	English. English.	A famous landscape, which, with others by Constable, made a profound impression on the French artists who founded the Barbizon school, largely on the work of Constable.
THE FIGHTING TINKERAIRES.	J. W. M. Turner (1775-1831).	English.	An extraordinary colored painting of the famous battleship being towed by last boats, the French frigate being captured.

## XIV. In the Old Pinakothek, Munich

SAINTS JOHN AND PETER. SAINTS PAUL AND MARY. CARPENTIER.	Albrecht Dürer (1471-1528). Wolgemuth (1434-1519).	German. German.	Wonderfully drawn and painted and full of engaging detail.
SACRIFICE OF ISAAC. DESCENT FROM THE CROSS. MARY AND SAINTS. MADONNA CANTIGLIANI.	Rembrandt (1607-1669). Ghirlandajo (1449-1494). Raphael (1483-1520).	Dutch. Italian. Umbrian.	A marvelous composition, with many figures in the costumes of the artist's own time, with the dead Christ on the cross against a background of a medieval city, all rendered in infinite detail.
STREET BOY. THE PUTTICIAN. THE CRUCIFIX. THE SCOURGING.	Murillo (1618-1682). Miers (1635-1681). Gerard Dou (1613-1675).	Spanish. Dutch. Dutch.	A beautiful pyramidal composition that came originally as a part of the dowry of the Princess de Medici, to Elector Wilhelm, about 1807. There are in this gallery five other similar themes by Murillo. This gallery contains fifteen other examples by this artist.
DUTCH INTERIOR. BATTLE OF THE MARONS. ABRAHAM AND HIS ANGELS. THE ENTOMBMENT. THE SCOURGING. ECCE HOMO. THE CRUCIFIXION.	Pieter de Hooch (1632-1681). Rubens (1577-1640). Van der Werf (1659-1722).	Dutch. Dutch. Dutch.	The picture shows the artist at a window. In all there are twelve paintings in this gallery by Dou.

## XV. In the Prado, Madrid

LAS LANCAS (THE SURRENDER OF BRUDA).  THE SPINNERS.  THE ADOPTION OF THE MAGI. THE SUPPER AT EMMAUS. RAPE OF EUROPE. ADAM AND EVE. PORTRAIT OF MARIE DE MEDICI. THE TEMPTATION OF ST. ANTHONY. A VILLAGES FESTIVAL. THE NINETEEN PLAYERS. A SKEETICAL OPERATOR. THE MARTYRDOM OF ST. BARTHOLOMEW. JACOB'S LADDER. ST. JESOME PRATING. ST. FRANCIS IN A DRESS OF ECSTASY. WOMEN FIGHTING IN A CIRCUS. THE ADOPTION OF THE SHEPHERDS. THE PAINTER MAGNIFICENT. CHRIST AND ST. JOHN (NINOS DE LA CONCEPCION). IMMACULATE CONCEPTION (Four examples). VIRGO LISTENING TO MUSIC. THE ENTOMBMENT. VENUS AND ADONIS. THE FALL OF MAN. MATER DOLOSO. PORTRAIT OF CHARLES V. ON HORSEBACK. PORTRAIT OF CHARLES V. ON FOOT. KING PHILIP II. EMPEROR ISRAEL OF PORTUGAL. CHARLES V. AT THE BATTLE OF MURILLO.	Velasquez (1599-1660).    Rubens (1577-1640).  <

## WORLD'S FAMOUS PAINTINGS—Continued

## XVI. In the Pitti Gallery, Florence

TITLE OF PAINTING	PAINTER	SCHOOL	OBSERVATIONS
CONSEQUENCES OF WAR. TWO LANDSCAPES. PORTRAIT OF POPE LEO X. PORTRAIT OF POPE JULIUS II. MADONNA D'ORI. MADONNA DEL' INFANATA. MADONNA DEL' GRANDECA. MADONNA DELLA SODALITA. MAST MAGDALEN. PEPPER AT EMMAS. CHARLES I. OF ENGLAND AND HIS QUEEN, HENRIETTA MARIA. THREE AGES OF MAN.	Rubens (1577-1640). Raphael (1483-1520).  Titian (1528-1588). Palma Vecchio (1480-1528). Van Dyke (1599-1641). Lotto (1480-1556).  Giorgione (1476-1511). Fra Angelico (1387-1455). Albrecht Dürer (1471-1528).	Flemish. Umbrian.  Venetian. Venetian. Flemish. Venetian.  Italian. Italian. German.	The last in the <i>Madonna of the Chair</i> and has long enjoyed a great world-wide popularity, being perhaps the best known of the many Raphael <i>madonnas</i> . It has been reproduced in engraving and color, in every possible medium, and has had an enormous sale through Europe and America.  A theme that has always had a fascination for painters.  A very human composition, with age to the left and a handsome youth in the center, attending the reading of a man of middle age. The three figures are said to be a portrait of Calvin, Luther and Melancthon. Naïve in both conception and rendering.

## XVII. In the Uffizi Gallery, Florence

HOLY FAMILY. LA FORNAINA.  PORTRAIT OF POPE JULIUS II. VIRGIN AT THE WELLS. BIRTH OF VENUS. VENUS AND THE GRACES. VIRGIN AND CHILD. JESUS WITH THE HEAD OF HOLOFERNES. ADORATION OF THE MAGI. THE ANNUNCIATION. PORTRAIT OF SIR ROBERT SOUTHWELL. PORTRAIT OF THE ARTIST. PORTRAIT OF ELIZABETH BRANDT. HENRY IV. AT IVRY. ADORATION. ENTOMBMENT. MADONNA ENTOMBED. MAN PRAYING. MADONNA. CORONATION OF VIRGIN. NAMING OF JOHN THE BAPTIST. MARRIAGE OF THE VIRGIN. THE ASSUMPTION. VIRGIN AND CHILD. VENUS.	Del Sarto (1486-1531). Del Piombo (1485-1547). Raphael (1483-1520). Botticelli (1446-1510).  Holbein (1497-1543). Rubens (1577-1640). Van der Werf (1659-1722). Van der Weiden (1400-1464). Memling (1430-1492). Fra Angelico (1387-1455).  Titian (1477-1576).	Florentine. Venetian. Umbrian. Florentine.  German. Flemish. Dutch. Flemish. German. Italian.  Venetian.	The figures of St. Francis and St. John are contained within the composition. This is said to be Del Sarto's masterpiece. This is a portrait of a very beautiful woman and for years was thought to have been by Raphael. A work most spiritual in its conception.  Both are world-famous portraits, of the first order.  Very naïve and full of great sincerity, in the manner of the Van Eycks.  In all a very comprehensive showing of the work of this interesting painter.  The Uffizi gallery contains portraits of artists painted by themselves at the request of the directors of the gallery, a distinguished honor that is not limited to men of Italian birth but includes the world's greatest artists, among them Rubens, Masaccio, Perugino, Raphael, Michelangelo, Leonardo da Vinci, Titian, Dürer, and other modern Europeans and Americans.
---	---	--	--

## XVIII. In the Vatican Gallery, Rome

COMMUNION OF ST. JEROME. DEAD CHRIST AND MAGDALEN. FAITH, HOPE AND CHARITY. TRANSFIGURATION. CORONATION OF THE VIRGIN. ADORATION OF THE SHEPHERDS. CORONATION OF THE VIRGIN.  NATIVITY. MADONNA ENTOMBED WITH SAINTS.  VIRGIN OF ST. HELENA. MADONNA WITH ST. SEBASTIAN. ST. JEROME.	Domenichino (1581-1641). Raphael (1483-1520).  Murillo (1618-1682). Pisturicchio (1454-1513).  La Spagna (—1530). Perugino (1440-1524). Paul Veronese (1528-1588). Titian (1477-1576). Da Vinci (1452-1510).	Italian. Umbrian.  Spanish. Umbrian.  Umbrian. Umbrian. Venetian. Venetian. Florentine.	A famous work by a famous painter of altarpieces.  A very effective rendering of the theme. A fine painter who worked in "tempera," for he never mastered oils. His most famous work is a decoration for the library of the cathedral at Siena.  This artist was a pupil at the schools with Da Vinci, and was the master of Raphael, La Spagna and Pisturicchio.  Cardinal Feerch had only the head of the saint, which had been cut out of the wood panel, but the rest was found at a dealer's shop in Rome and joined together with the original.
---	--	---	--

## XIX. In the Venice Academy

VIRGIN IN THE TEMPLE.  ASSUMPTION OF THE VIRGIN. THE ENTOMBMENT.  VIRGIN AND CHILD AND SENATORS. HOLY FAMILY, WITH ST. JOHN. PROCESSION IN ST. MARK'S SQUARE.	Titian (1477-1576).  Tintoretto (1518-1594). Paul Veronese (1528-1588). Bellini (1428-1516).	Venetian.  Venetian. Venetian. Venetian.	An old woman in the picture, selling eggs, is said to be a portrait of the mother of the artist. A grand work containing many figures. This was the last work of this great artist, begun in his ninety-ninth year and completed by Palma Vecchio.  An astonishing piece of realistic flesh painting. Highly interesting historically as showing the square as it existed in 1496.
--	--	--	---

## XX. In the Vienna Academy

PORTRAIT OF MAXIMILIAN I. MADONNA AND SAINTS. HIMSELF AT FORTY-FIVE. HIMSELF IN AGE. YOUNG MAN IN ARMOR. CACCIGIONE. VIRGIN AND SAINTS. FAMILY OF VELLASQUEZ. A VENETIAN LADY.	Albrecht Dürer (1471-1528). Rembrandt (1607-1669).  Van Dyke (1599-1641). Van der Weiden (1400-1464). Paul Veronese (1528-1588). Velasquez (1599-1660). Titian (1477-1576).	German. Dutch.  Flemish. Flemish. Venetian. Spanish. Venetian.	Maximilian was a great patron of Dürer, though he did not invariably pay the artist's charges promptly. Rembrandt painted himself many times in various costumes.  Very sumptuous in the color and remarkable treatment of stuffs.
--	--	---	---

**How to Look at Pictures.**—It is a mistake to suppose that age is any indication of the value of a picture. This is an error into which many laymen fall with the result that discouragement ensues because the work under consideration does not appeal. Indifferent work is by no means a monopoly of the modern painter. There have been poorly equipped craftsmen since the world began. But, because a picture is not immediately understood, is by no means to say that it is lacking. Art, like the study of literature or music, is a profound study, requiring the most serious application, investigation, research and experience. The average person prefers rag-time to the symphonies, nocturnes and grand compositions of musical masters, just as trashy reading appeals to the minds of the uncultivated. This is not, however, for a moment to admit that the works of the great composers and authors are not of higher importance than the meretricious tunes of the hurdy-gurdy, or the ephemeral novels of the day. But one, by a systematic course of study, can no train the ear and mind that only the best will satisfy in the end. And so it is with pictures. It is the story of all great collectors that their collections are gradually weeded out as their tastes improve and a higher standard is demanded.

Intuitively some minds are attracted to the best in art, as in music and literature. They are, however, the exceptions, not the rule. Even such minds are improved and strengthened by study and experience. The average man can only hope to achieve reasonable discretion in the matter of art by serious investigation and much sober reading. Some one has said that a work of art means a combination of two people—he who did it and he who looks at it. A picture is one man's conception of nature, and though twenty painters render the same subject, each according to his endowment and altogether differently from his fellow, each will be right, according to his convictions and power of transferring his thought to

canvas. For it is a matter of seeing, no less in the layman than in the artist, and one may be taught to see, as one may be taught to do other things. A good picture must say something; not necessarily tell some trite anecdote, or record some trivial incident, but must strive to convey some truth, even it be but the truth of humanity, as for instance in Titian's *Man With the Glove*, in the Louvre, one of the grandest portraits ever painted, or in the *Mona Lisa*, the most successful single figure piece ever offered to the world. In both cases the artists gave an epitome of the man and the woman of their day, and did so in the last terms of craftsmanship. Veronese gave the glory of color and the sumptuousness of apparel in his *Marriage at Cana*, which, as a record of the biblical event, was utterly false; but his genius carried it beyond facts and made of it a superb composition. The extraordinary piety in many of the older men among the Primitives atoned for other shortcomings, while the absolute and convincing sincerity of the Little Dutchmen, and their technical skill, made up for many a stupid composition.

A masterpiece must be all things to all men. You may have it dark in key, like a Ribera; glorious in light and shade, like a Rembrandt; full of poetry and graceful beauty, like a Raphael; colorful, like a Titian; elegant, like a Van Dyke; faithful and analytical, like a Holbein; unctuous and rich, like a Rubens, a poem in tone, like a Turner; or full of the glories of light and air, as a Monet, for each of these men had a mission to convey and he conveyed it seriously, earnestly, and according to the best that was within him. So when you stand before a canvas, seek first to know what was the object of the creator. If his aim was color, try to analyze his accomplishments in that direction; to portray the glory of out of doors, follow him there; or, if the human form attracted him most, endeavor to put yourself in touch with such an ambition on his part. And if at first there is no appeal, engage in a little introspection

and possibly you may discover the fault is your own, not that of the artist. But above all, approach a work of art, one that has stood the test of time, with reverence and the genuine endeavor to get the good, not the bad out of it, to get the viewpoint of the painter, and so to try and enter with him into his general trend of thought.

They have an inscription above the doors of the picture gallery at the South Kensington museum, in London. It reads, "That which has pleased a long and many must have some merit." It is advice to be remembered. Da Vinci, Botticelli, Rembrandt, Velasquez and the whole nobility of art are not where they are because of the critical opinions of the few, subject to changes of fashion, but because their art was founded on the eternal truths. They were great craftsmen as well, and they had something worth the world's listening ear, each in his own way, and each according to his own light; but it was always truth, the truth of humanity, nature, beauty—always truth. The spectator may not understand them, but the fault is not theirs, and it is up to the spectator to reorganize his point of view, for no ignorance, no stupidity, no false arguments, can for one moment dislodge truth, which despite all efforts yet remains as firm as the rock of ages—as truth, eternal, unassailable, inviolate. So, read of art. Listen to what the best judges have said about pictures. Get from these writers their point of view, the point of view of men who by study and experience are better qualified than you to judge, and so, in a humble spirit, and with a child's openness of mind, approach the work of these great men whom heaven has endowed with beauty of thought, precision of hand, and splendor of imagination. Do this reverently and with the genuine desire to learn, and the reward will be yours. It will repay a thousand fold, for if we may not all be creators, at least we may get an intelligent satisfaction from the creation of those more gifted, alas, than are we.

TABLE 1—POTTERY AND EARTHENWARE

COUNTRY	DATE	NATURE OF PRODUCT	REMARKS	COUNTRY	DATE	NATURE OF PRODUCT	REMARKS
Egypt	B. C. circa 3000	Unglazed pottery.	Household vessels, mostly wheel made.	Rome	B. C. 60	Dark ware with white decoration. Called <i>Castor</i> from the English locality.	The beginning of "slip" painting. It is a tinging scenes and scrolls.
Egypt	1900	Glazed stoneware.	Rich blue glaze. Figures and designs molded.	Rome	400	Samian ware from the island of Samos; also called <i>Aretine</i> .	Bright red glazed pottery. Molded with decorative scenes and scrolls.
Assyria	800	Unglazed pottery.	Utensils both hand and wheel made.	India	900 et seq.	Pottery of natural clay with colored glazes.	Wheel made. Decorated with floral arabesques under the glaze.
Assyria	700	Inscribed tablets.	Cylinders and slabs with impressed letters.	Japan	A. D. 200	Common pottery glazed and unglazed.	The art introduced by Korean pottery.
Babylonia	700	Unglazed pottery.	Primitive style. Simple bands of dark color.	Perla	1300	Erybre or slip coated pottery.	A natural dark clay covered or veneered with a white coating, colored and glazed.
Greece	800	Pottery both rough and polished.	Urnlike. Primitive style. Interlaced lines in dark color.	Perla	1200	So-called "Gombroon ware," attributed by some to the Chinese.	A porcelaneous earthenware of fine quality. Perforated and filled in with semi-transparent glaze. Sometimes decorated in blue.
Greece	700	Polished pottery, also called Mycenaean.	Wheel made. Archaic style. Birds and animals in blue, white, and black, the tails scratched in.	Syria and Arabia	1400	Erybre ware of the same general type as the Perla.	Decorated under the glaze with fine arabesques in color.
Greece	600	Polished pottery, also called Mycenaean.	Wheel made. In human figures in black, faces in profile, eyes fronting.	Rhodes and Asia Minor	1500	Erybre ware of the same general type as the Perla.	Characterized by the use of a red earth as a pigment.
Greece	500	Polished pottery. Red figured ware. Finest period.	Wheel made. Background in black, figures in natural color of clay. Faces and eyes in profile; drapery in detail. Figures and embossments in color.	Spain	1320	Tin enamelled ware, known as <i>Malolica</i> .	A dark natural clay covered with an enamel supplied by tin oxide. Lustrous and decorated in color.
Greece	400	Polished and ornamental ware. Decadent period.	Wheel made. Lines polished. Black color produced by smoke in burning.				
Rome	100 to A. D. 40	Black and gray ware, called "Uppchurch" from the English locality where much is found. Found in France and Germany.

TABLE I. POTTERY AND EARTHENWARE.—Continued

COUNTRY	DATE	NATURE OF PRODUCT	REMARKS	COUNTRY	DATE	NATURE OF PRODUCT	REMARKS
Italy	1350	Tin enameled ware, known as Majolica. A most extensive and important product which emanated from many centers.	Elaborately decorated in color and embellished with rich paintings. Lustered and sometimes with a brilliant overglaze.	China	618-907	Pure white hard porcelain (liang di nanyi).	The early porcelains were rather dark in color.
Italy (Luca della Robbia)	1450	Architectural modeled work coated with the characteristic tin enamel.	Luca della Robbia is believed to have greatly improved the quality of the enamel.	China	954	The first "celadon" porcelain.	This tint was called "the sky after rain" and was produced from iron.
Italy (Giorgio Andreoli)	1520	Ruby pots, dishes and platters.	The Maestro Giorgio worked at Gubbio and his ruby lusters are unique.	China	1368	Ming dynasty. The finest period.	The works of this time constitute the crowning glory of Chinese porcelain.
France (Nevers)	1580	Tin enameled ware in Italian style.	The maker of these wares came from Faenza, hence the term "faience."	China	1661	"Famille vert." (Jacquemart).	The porcelain was finished and glazed in the usual way, then decorated in black and covered with a fusible green enamel.
France (Rouen)	1540	Tin enameled ware of superior quality.	The style is entirely French. Figures and conventional ornaments.	China	1723	"Famille rose" (Jacquemart).	Overglaze decoration in which a rose color made from gold is the characteristic feature.
France (Moustiers)	1680	Tin enameled ware of superior quality.	Painted with hunting and domestic scenes on a very pure enamel.	Italy (Florence)	1580	A semi-hard porcelain with blue decoration.	The famous and rare Medici porcelain. Only 20 pieces are known.
France (Haut Deux)	1520	Glazed cream-colored pottery, inlaid with dark clay.	Also called Faience d'Oron from the supposed place of origin. A very rare and valuable ware; only 53 pieces are known.	Italy	1743	Soft porcelain.	Modeled figures colored over the glaze.
France (Valley)	1560	Light colored earthenware with richly toned glaze.	Modeled embossments of natural objects glazed in proper colors. Also some modeled figures.	Spain (Buen Retiro)	1760	Soft porcelain.	Removed from Capo di Monte when King Charles III. of Spain.
Germany	1840	Salt glazed stoneware.	Brown, gray or cream glazes, embossed and sometimes decorated in blue.	France (St. Cloud)	1695	Soft porcelain.	The first French porcelain and the first distinctive soft porcelain.
Holland	1600	Tin enameled pottery decorated in blue.	The well-known Delft ware.	France (Vincennes)	1745	Soft porcelain.	Vincennes was the forerunner of Sevres. In 1753 the king of France purchased one-third of the stock and gave the title "Royal" to the factory.
England	B.C. 400	Primitive hand-formed pottery.	Found in burial mounds used in funeral ceremonies. Crude and unglazed.	France (Sevres)	1756	Soft porcelain (pâte tendre).	Removed from Vincennes. In 1759 Louis XV. became sole proprietor.
England (Maltres and other places)	1250	Ecclesiastic tiles. Part-colored slays.	Made for church use, by the monks.	France	1760	Hard porcelain (pâte dure)	Kaolin or porcelain clay was discovered at St. Yrieix in 1768 and the production of hard porcelain followed. The pâte tendre was finally discontinued in 1804.
England (Tulham, Mortlake and Staffordshire)	1550	Salt glazed ware.	The knowledge derived from Germany.	France (Limoges)	1779 et seq.	Hard porcelain	The famous works of Hard and St. Yrieix, Puyat and others now manufacture very large quantities of the well known French china.
England (Staffordshire)	1610	Lead glazed pottery on colored slays.	Primitive in character. Either wheel made or shaped by hand.	Germany (Munich or Dresden)	1709	Hard porcelain.	No porcelain was made in Germany until the discovery of kaolin. Böttger was the first man to make hard porcelain in Europe.
England (Wootton and Staffordshire)	1620	Slip decorated ware.	A characteristic English product. Decorated with ornamentation in light-colored slips.	Germany	1718	Hard porcelain	Nearly every German prince desired a porcelain works during this period. There is not much to choose between the wares as regards quality, but the Dresden, largely over the glaze, bore different characteristics. Few of these factories are now in existence.
England (Lambeth, Staffordshire, Liverpool)	1635	Tin enameled ware.	Introduced from Holland.	Germany (Völsau, Aaspach, Bayreuth, Höchst, Fürstenberg, Berlin, Frankenthal, Nymphenburg, Ludwigsburg, etc.)	1758		
England (Staffordshire)	1680	Combed and marbled wares in parti-colored slays.	A domestic pottery largely made in cottage homes.	Denmark (Copenhagen)	1760	Soft porcelain.	This factory was closed in 1768. The paste is good and the making of excellent quality.
England (Etruria)	1762-1776	Wadsworth ware, queenware and Jasper.	The beginnings of modern manufacture.	Denmark	1772	Hard porcelain.	Became a royal manufactory in 1772. It is now noted as one of the first in the world.
England (Leeds)	1770	White earthenware.	Perforated and glazed.	England (Bow)	1744	Soft porcelain.	Bow was at one time called "New Canton." It is believed that bone ash was here first used in English china. The factory was closed in 1776 when Duesbury removed the equipment to Derby.
England (Staffordshire)	1784	Willow pattern, introduced by Spode.	Spode was the forerunner of the house of Copeland.	England (Chelsea)	1745	Soft porcelain.	Patronized by the king and the duke of Cumberland. The style of treatment was French. Purchased in 1769 by Duesbury and the equipment removed to Derby.
England (Lambeth (Doulton))	1818 (still working)	Stoneware.	A salt glazed ware, decorated in sgraffito and otherwise commonly known as "Doulton ware."				
England (Staffordshire (Furzevale))	The date of origin of these factories is unknown.		A fine quality of earthenware for table use.				
England (Staffordshire (Meakin's))			An excellent earthenware, largely in demand for table services.				
England (Staffordshire (Johnson's))			One of the best of the English earthenwares.				
China	Circa B.C. 165	The first hard porcelain.	It is quite uncertain when porcelain was invented; the Chinese themselves admit a much earlier date.				
China	A. D. 583	Hard porcelain, decorated under the glaze in blue.	The blue of cobalt is quite indestructible by fire and has been universally employed as a pigment.				

TABLE I. POTTERY AND EARTHENWARE—Continued

COUNTRY	DATE	NATURE OF PRODUCT	REMARKS	COUNTRY	DATE	NATURE OF PRODUCT	REMARKS
England (Derby)	1750 (uncertain)	Soft porcelain.	Derby was concerned in the making of china probably as early as 1745. In 1769 Duesbury combined with the Derby trust the resources of Bow and Chelsea. Hence the term, Chelsea-Derby.	England (Bristol)	1768	Hard porcelain.	Champion began to make porcelain in Bristol and in 1771 purchased the Plymouth patent. The works still exist, but for the production of earthenware only.
England (Derby)	1877	Bone porcelain and other wares.	Mr. Edward Phillips of the Worcester factory built the new 'Derby works' and began the manufacture of 'Royal Crown, Derby' porcelain. The factory now stands among the foremost in England.	England (Burslem (Doulton))	1840 (still working)	Bone porcelain, and other wares.	The factory of Pinder, Bourne, etc., was purchased by the firm of Doulton, Lambeth, and the work produced now ranks with the first of English wares.
England (Worcester)	1781	Soft porcelain. Ivory porcelain. Bone porcelain.	Founded by Dr. Wall and for a time occupied chiefly in producing Chinese patterns. Consolidated with Chamberlaine in 1840. The present company formed in 1862 and now manufactures the famous Royal Worcester wares.	England (Stoke-on-Trent (Minton))	1793 (still working)	Bone porcelain, earthenware and pottery.	Began as a manufactory of earthenware, & b a house of Minton, under the patronage of Campbell and J. Minton, took the lead in the well known Staffordshire potteries. The wares are of the finest.
England (Coalport)	1814	Soft porcelain. Bone porcelain.	The successor of Jackfield and Caughley. This factory is still in existence and produces fine wares.	England (Stoke-on-Trent (Copeland))	1779 (still working)	Bone porcelain, ironstone china and other wares.	Copeland was the successor to Spode. Considerable success has been achieved in all kinds of table services. Ceramical wares have been made also.
England (Plymouth)	1768	Hard porcelain.	This, the first factory in England for the manufacture of hard porcelain, was established by Coalworthy as a consequence of the discovery of porcelain clay in Cornwall. Removed to Bristol in 1771.	England (Causton Place (Brown, Weathered, Moore, etc.))	1794 (still working)	Bone porcelain and earthenware.	The present house is the successor of Ridgway & Sons. They are famous for china dinner wares.
				England (Wedgwood)	1767 (still working)	Bone porcelain and earthenware.	The original house of Wedgwood has taken up and developed all the modern styles with much success.

TABLE II. GLASS

LOCALITY OR COUNTRY	DATE	NATURE OF PRODUCT	REMARKS	LOCALITY OR COUNTRY	DATE	NATURE OF PRODUCT	REMARKS
Egypt	Circa B.C. 2400	Dark blue glass. Semi-opaque.	The earliest dated specimen is a small jar in the British Museum.	France	1400 to 1600	Utensils of various sorts colored and decorated. Window glass.	Small manufactures of glass existed in many parts of France but most of the product was unimportant.
Egypt (Nineweh)	1450 712	Transparent green glass. Pale green transparent.	A small vase in the British Museum bears the name of Layon, king of Assyria.	Spain	Circa 500 to 800	Cups, vials and bottles.	As in the case of France, the Roman influence was felt in Spain.
Greece or Phenicia	Circa 400	Colored glass. Waved, striated and sometimes carved.	Numerous small bottles. Beads and ornaments.	Spain	1400 to 1600	Utensils and drinking cups.	Some Spanish glass bears evidence of Venetian influence. Colored and reticulated forms are found.
Rome	Circa 30 B.C. to 309 A.D.	Common green glass. Colored and ornamental glass, carved, cut and woven glass.	Enormous quantities of glass of every description, even including window glass, were produced. The statements regarding early glass in China are very uncertain. But few specimens remain.	Germany	Circa 700	Drinking cups.	The influence of Rome is apparent here also.
China	Circa B.C. 140	Small vase ornamented and embossed.	Classical models were followed, but the wares of the period caused much interchange of plunder, and theories of many specimens is doubtful.	Germany	1400 et seq.	Steins and goblets. Window glass.	The stein was even then a feature in Germany. A great variety of form and treatment is found. Some highly ornate pieces are preserved.
Constantinople (Byzantium)	A.D. 800 to 1200	Heavy molded glass in dark colors. Some window glass.	Classical models were followed, but the wares of the period caused much interchange of plunder, and theories of many specimens is doubtful.	Great Britain	Circa 600	Beads, crude cups, window glass.	Both Roman and Saxon specimens are found. The original 'tumblers' was a glass drinking horn which could not be set down until empty.
Damascus and the East	1200 to 1400	Vessels of clear glass often richly ornamented.	Many lamps and vessels for religious use are found in mosaic.	Great Britain	1300 to 1600	Cathedral glass. Vessels of many sorts.	English stained glass for church windows is of the finest. The vessels were generally plain and useful.
Italy (Venice and (Urbino))	1090	Every description of fancy glass.	Glass mosaics preceded the general manufacture of glass in Venice. The furnaces were removed to Murano probably about 1300. Venetian glass is the model for the world.	Venice and Murano			
Italy (Murano)	1490	Millefiori glass.	This had been made by the Romans. Cases of colored glass cut into short lengths and these, with the cut ends showing, were fused into the body of the vessel.	France			
Italy (Murano)	1600	Vetro di Trina (lace glass).	Transparent opaque white glass were fused in a geometric pattern into the clear glass of the vessel.	Bohemia			
France	A.D. Circa 800 to 800	Glass vessels.	Scarcely any specimens remain. The work was probably of Roman origin.	Germany (Jena)			
				England			
				America			

## MODERN PRODUCTIONS

The glass made is much on the old style. Every description of colored, blown, woven and reticulated glass is produced. The material is still of the lime-soda mixture.

A great deal of modern French glass is crystal of the lead-oxide compound. The molded glass is very fine. Some French craftsmen have produced wonderful effects in color. The glass is well known in the small and inexpensive variety-brass of the stores. A good deal of it is decorated in color and gold.

In optical and chemical glass the Jena works lead the world.

The English glassmakers are surpassed by none. Table glass of pure crystal, cut glass and ornamental pieces are made in great variety. The Stourbridge district is the most famous.

Much of the American glass is molded in the form of tumblers and household vessels. Fine cut glass is made at Cortez, Toledo and other places. Plate glass is an important part of the industry.

**RELIGION** is the feeling of reverence which men entertain toward a supreme being or to any order of beings conceived by them as demanding reverence from the possession of superhuman control over the destiny of man or the powers of nature; more especially the recognition of God as an object of worship, love, and obedience.

Religion, as distinguished from *morality*, denotes the influences and motives to human duty which are found in the character and will of the deity, while morality is concerned with man's duty to his fellows. As subjective from *theory*, religion is distinguished, inasmuch as it relates to the feelings; while *theory* is objective, as it denotes the system of beliefs, ideas or conceptions which man entertains respecting the God whom he worships.

Various estimates have been made of the diffusion of the different religious creeds over the world. These are necessarily very loose and often differ widely from one another. A recent estimate is the following:

CREEDS	No. of Followers
1 Christianity.....	477,080,158
2 Worship of ancestors and Confucianism.....	256,000,000
3 Hinduism.....	192,000,000
4 Mohammedanism.....	176,834,372
5 Buddhism.....	147,500,000
6 Taoism.....	43,000,000
7 Shintoism.....	14,000,000
8 Judaism.....	10,186,000
9 Polytheism.....	17,681,669

CHRISTIANITY	Total Followers
Catholic church.....	230,866,523
Protestant churches.....	143,237,625
Orthodox Greek church.....	98,016,000
Church of Abyssinia.....	3,000,000
Armenian church.....	1,890,000
Coptic church.....	120,000
Nestorian.....	100,000
Jacobites.....	70,000

**Christianity** is the religion instituted by Jesus Christ, and the Christian church consists of his followers. Its first great increase was at Pentecost, when three thousand were converted and shortly afterward five thousand were added to the church. Stephen was the first to suffer martyrdom. Paul made three great missionary tours, and the result was the unity of the church in its first period. **Ancient Period, A. D. 30-750.**—The first part of this period was distinguished by great simplicity of doctrine and life, and real in extending the kingdom of Christ. Important centers were established, and the gospel was largely confined to the middle and lower classes. Controversies arose between the gentile and Jewish Christians, but not to such an extent as to arrest steady progress. The heretical sects, with Saturninus, Basilides, and others at their head, were of no serious injury. The chief defenders of Christianity were Aristides, Justin Martyr, Melito, Tatian, and Hermas.

This was the time of great persecutions. There were ten in all; the most serious being under the emperors Nero, Decius, and Diocletian. The scriptures were collected into a canon, and the church made great advance in numbers and territory. The most important writers were Ignatius, Irenaeus, Origen, Tertullian, and Clement of Alexandria. The more serious schisms were produced through Pelagius, Novatus, and Miletus. The doctrinal controversies related chiefly to eschatology, human depravity, and the divinity of Christ.

**The Council of Nicea, in A. D. 325,** was a great triumph for orthodoxy. It declared the essential trinity of the godhead, and settled

for all time the divinity of Christ as a fundamental doctrine of Christian faith. The heresy of Arius was condemned. Persecution ceased, through the sympathy of the Emperor Constantine, who, in 313, removed all disabilities from Christians, and in 325 made Christianity the state religion of the Roman empire. Monasticism, a reaction against worldlyness, increased rapidly. Julian the Apostate endeavored to revive paganism, but without avail. Leo the Great, bishop of Rome, extended the authority of the western church in opposition to the claims of the patriarch of Constantinople.

**Mohammedanism** paralyzed the eastern church for a time. Its leaders conquered all northern Africa, western Asia, and gained a foothold in Spain, and the south of France; but it was finally arrested in western Europe by Charles Martel, by the victory of Tours, in 732.

**Gregory the Great, bishop of Rome, ruled from 590 to 604.** He greatly extended the power of the Roman church, organized monastic orders, elevated the church festivals, and reformed purgatory as a Roman church doctrine. He organized a mission among the Anglo-Saxons. The gospel spread rapidly through Britain and Germany. Christian art was patronized liberally by the Roman bishops. The close of the ancient period found the Latin, or western church, very vigorous and aggressive, but the eastern church in a stagnant condition.

**Medieval Period, A. D. 750-1517.**—This period falls into three great divisions—from Charlemagne to Gregory VII. (750-1073); from Gregory VII. to removal of papal see to France (1073-1305); from removal of papal see to Reformation (1305-1517). The middle ages were the transition from the ancient to the modern period.

The most important political events, all of which had a bearing on the church, were the end of the Greek exarchate in Italy, the destruction of the Lombard kingdom, the organization of the Frank empire under Pepin, rise of the new Germanic church, division of the Mohammedan caliphates, decline of the Greek empire, and development of the new Roman empire in the west.

**Charlemagne** was the greatest mediæval ruler. He was victorious over many northern tribes, and increased the territory of the church to vast proportions. He was a liberal patron of learning, and authorized a Latin version of the scriptures. Alfred the Great of England reigned from 871 to 901, and was distinguished for learning as for his power to rule. The Russian monarchy was founded by Rurik, in the middle of the ninth century. At this time, evangelization of heathen nations progressed rapidly. The Hungarians, Bulgarians, Bohemians, Moravians, Wends and Scandinavians accepted Christianity.

**Crusades.** The violent rule of the Mohammedans over Palestine excited the wrath of western Europe, and crusades were organized for the rescue of the country from the Moslems. There were seven crusades, extending from 1096 to 1272. Christian Europe failed, finally, to hold the country, but the general effect of the crusades was beneficial to Europe in the development of commerce, introduction of oriental thought, and the growth of liberty. **Reformatory Movements** were inaugurated through the Waldenses (1170), Wycliffe (1324), John Hus (1373), the Moravian Brethren (1417), the Mystics (Tauler, Suso, Ruysbroek, Groot, Thomas à Kempis), and Savonarola (1480-97). Mendicant orders were established. The Inquisition, established to arrest reform, was decreed in 1215.

**The Modern Period, 1517-1880.**—Martin Luther began the Reformation by publish-

ing ninety-five theses against Rome. He translated the scriptures into German, gained the cooperation of the German princes, and published sermons and other works against the errors of Romanism. Melancthon was the chief doctrinal writer of the Reformation. Erasmus labored in the department of New Testament criticism. The leading Swiss reformers were Zwingli in East Switzerland and Calvin in the west. Farel stood next to Calvin in Geneva.

**The English Reformation** had King Henry VIII. on its side, through no pious motives, but because the pope would not sanction his frequent marriages. This was the great opportunity for which the reformers of England had been waiting. Protestant sentiment grew rapidly. Ridley, Latimer, Cranmer, Hooper and Taylor fell victims to Queen Mary's religious seal. Under Elizabeth the Reformation was placed on a firm foundation.

**The Puritans** were a reaction against Romanism and sympathy with it in the church of England. They persevered, under Cromwell, the liberties of the English nation.

Arminius, in Holland, opposed the chief tenets of Calvinism. The spread of Dort resulted in the political triumph of the Calvinists, and the expulsion of the Remonstrants, until the death of Maurice (1630). The Thirty Years' war (1618-48) was confined to the continent, and established the territorial boundaries of the Protestant and Catholic nations. The Huguenots of France were persecuted. 1572, and 70,000 people were killed on St. Bartholomew's night. The Jesuits, organized by Ignatius Loyola, 1540, were established as an offset to the aggression of Protestantism.

**Deism** prevailed to an alarming extent in England, its chief promoters being Hobbes, Herbert, Shaftesbury, Tindal, Bolingbroke, Hume and Gibbon. They had strong antagonists in Baxter, Cudworth, Taylor, Waterland, Leland, Butler and Paley, but the general condition of the people was irreligious.

**Methodism**, which arose from John Wesley, was a fervent religious movement. Charles Wesley, Whitefield, John Fletcher, Joseph Benson and Adam Clarke were strong coadjutors.

**German Rationalism** arose in 1750, through the teachings of Wolf and Semler and the example of the Prussian court. It then declined, through the labors of Tholuck, Naender, Hengstenberg, Ullmann, and others.

**The Evangelical Alliance** has promoted the unity of orthodox Christians in all parts of the world, and, to a corresponding degree, the victory over skepticism. The Old Catholics, a Roman church reaction against the vatican council of 1869, were organized into a church in 1870, with Dollinger, Huber, and Friedrich at their head. They have made great progress in certain parts of Germany and in Switzerland.

**The American Church, A. D. 1807-1911.**—The colonization of North America sprang from religious motives. The colonists sought freedom here because of oppressions at home. **Periods of American Church History.**—1. From 1607-60, revival and progress. 2. 1660-1720, trial, disputes with Great Britain, religious decline. 3. From 1720-50, great revivals. 4. From 1750-83, political agitation, freedom from British rule. 5. From 1783-1911, extensive revivals, separation of church and state, abolition of slavery, evangelization.

The following tabulation, prepared by the joint effort of eminent authorities representing the various denominations, gives an exhibit of the present religious status of the United States.

## CHIEF RELIGIOUS BODIES OF THE

NAME OF DENOMINATION	WHEN AND WHERE FOUNDED AS AN ORGANIZED BODY	BY WHOM OR HOW	NUMBER OF CHURCHES
<b>Adventists</b>			
Evangelical	Albany, N. Y., 1845	Rev. William Miller	18
Advent Christians	Boston, Mass., 1861		550
Seventh-Day	Battle Creek, Mich., 1845		1,817
Church of God	Sanberry, Mo., 1865		30
Life and Advent Union	New York City, 1848		12
Churches of God	Philadelphia, 1888		62
<b>Baptist</b>	Outgrowth of long period and of widespread anti-pedobaptist, anti-Romanist movements. Name first used (apparently) in 1644. English Baptist history distinct after 1641.	No single founder	
Northern	In 1844	Due to anti-slavery agitation	9,239
Southern	New Hampshire, 1780	Separated from regular Baptists because of close communion.	21,587
Freewill	Newport, R. I., 1671	Nicholas Brood—Separated from the Baptists in England, and observed the seventh day.	1,926
Seventh-Day		Alexander Mack—Originated in Germany, 1708, in Westphalia, at Schwesau. Called by themselves Old School Baptists, having no missions, Sunday-schools, or educative institutions.	82
Dunkers, German Baptist	Pennsylvania, 1719	John Winebrenner—Winebrenner was previously a minister of the German Reformed church in Harrisburg.	1,188
Primitive			2,922
Church of God	Pennsylvania, 1830		48
Colored, regular			
Church of Christ, Scientist	Founded in Boston in 1879	Mrs. Mary Baker Eddy	17,429
			721
<b>Congregational</b>	The Congregational church was founded in Scroby, England; emigrated to Leyden, Holland; came across the Atlantic to the Mayflower, and began its life in America December 22, 1620. This was the beginning of Congregationalism in America.	"By the apostles in Jerusalem." Congregational (independent) church originated in England in 1555.	14,166
<b>Disciples of Christ or Christians</b> (Church of Christ or Christian Church)	First congregation at Brush Run, Pa., May 4, 1811. The movement was merged with the Baptists in 1813, but a separation occurred in 1830, and it has been an independent body since that time.	The movement was led by several men, the chief among whom were Thomas Campbell, Alexander Campbell, Barton W. Stone and Walter Scott.	11,490
<b>Friends</b>	North Carolina, 1672	George Fox—Fox began his work in England in 1647, and spent two years in America.	830
<b>Orthodox Hekata</b>			211
<b>Jewish Church</b>	At Ur, in Chaldea, about twenty-first century B. C. to America, by Synagag Teah Israel, Newport, R. I., 1658.	Abraham	1,770
<b>Latter Day Saints or Mormons</b>	Fayette, N. Y., 1830	Joseph Smith	1,380
<b>Lutherans in the United States</b>	Hagerstown, Md., 1820	From a number of scattered congregations traceable to the original society founded in New Amsterdam, by Jacob Fabricius, in 1609.	12,762
1. General Synod of the Evangelical Lutheran Church in the United States of America.	Hagerstown, Md., 1820		1,746
2. United Synod of the Evangelical Lutheran Church in North America.	Roanoke, Va., 1866		481
3. General Council of the Evangelical Lutheran Church in North America.	Pt. Wayne, Ind., 1867		2,393
4. Evangelical Lutheran Synodical Conference of America.	Milwaukee, Wis., 1872		3,278
5. United Norwegian Lutheran Church in America.	Miocepollis, Minn., 1890		1,415
6. Evangelical Lutheran Joint Synod of Ohio and other states.	Somerset, Ohio, 1818		760
7. Lutheran Synod of Buffalo.	Milwaukee, Wis., 1845		44
8. Hauge's Norwegian Evangelical Synod.	Jefferson Prairie, Wis., 1846		286
9. Evangelical Lutheran Church in America, Eielson's Synod.	Jefferson Prairie, Wis., 1846		26
10. German Evangelical Lutheran Synod of Texas.	—, Texas, 1851		25
11. Evangelical Lutheran Synod of Iowa and other states.	St. Sebald, Iowa, 1854		708
12. Synod for the Norwegian Evangelical Lutheran Church in America.	East Koahkonong, Wis., 1853		621
13. Evangelical Lutheran Synod of Michigan and other states.	—, Mich., 1897		55
14. Danish Evangelical Lutheran Church in America.	Neenah, Wis., 1872		122
15. Icelandic Evangelical Lutheran Synod in North America.	Mountain, N. D., 1885		14
16. Immature Synod of the Evangelical Lutheran Church of North America.	Wall Rose, Pa., 1885		11

## UNITED STATES, TABULATED

NUMBER OF ADHERENTS	NUMBER OF CLEBY	VALUE OF CHURCH PROPERTY	FORM OF GOVERNMENT	CENTRAL DOCTRINE BELIEF STATED
481	8		Congregational, excepting the Seventh-Day Adventists, who are Presbyterian; they are organized in local and general conferences and hold annual meetings, often in connection with camp-meetings.	The bible is their creed, which they accept as inspired; the second coming of Christ; observance of the seventh day of the week as Sabbath; all fundamental doctrines of the Christian system, except a millennial era prior to Christ's advent.
26,799	526			
61,427	519			
611	32			
509	12			
2,124	56	\$133,530,000	Democratic, local churches formed into associations, with general denominational conventions.	Supremacy of bible in faith and practice; churches independent; church membership dependent on regulation and immersion; anti-sacramentarian; generally Calvinistic; priesthood of individual believers; liberty of conscience and denial of all final religious authority except that of Jesus Christ.
1,176,380	8,095			
2,130,680	13,555			
114,114	1,598			
8,339	96			
122,847	3,412			
102,311	1,500			
1,823	75			
1,874,261	12,602			
Not tabulated, hence indefinitely known.	Each church has two readers in lieu of a pastor	Approximately 9,000,000	The existence of branch churches is provided by the rules and regulations of the mother church, and the mother church stipulates the form of service, but each branch church is independent of the mother church as regards its business affairs.	Christian Science plants itself unreservedly upon primitive Christianity as taught and exemplified by Christ Jesus. Its cornerstone is the scriptural teaching that God is Spirit and is the only power.
1,373,557			Democratic. The local church is autonomous; the fellowship of the churches brings them together for cooperation in Christian work.	Protestant evangelic
1,364,000	6,399	30,364,000	Congregational. The minister, elders and deacons usually constitute the official board, through which body the business of the congregation is often transacted, though matters of importance are sometimes brought before the congregation.	Sovereignty of God; divinity of Christ; the indwelling power of the Holy Spirit and its agency in conversion; Old and New Testament scriptures as the inspired word of God; the future punishment of the wicked and the future reward of the righteous; the institution of the Lord's supper for all the Lord's children; finally, the personal Christ as its only creed, and the bible as its only rule of faith and practice.
96,000	1,341		Independent Congregational.	Evangelical; the "inner light" or "grace of God" is the cardinal point of belief.
19,545	96			
145,000	1,100		Congregational	The unity of God. Rejects doctrine of original sin. Salvation for all through repentance and good works. Moral consecration and social righteousness. Rejects eternal punishment. Israel, God's chosen people.
400,650	2,483	3,500,000	Apostolic. Two orders of priesthood exist—the higher that of Melchisedek, the lower that of Aaron. To the former belong apostles, sevens, high priests, elders, patriarchs; to the latter, bishops, priests, teachers, deacons. The first presidency (i. e., the president of the church and two counselors) forms the highest authority, followed by the twelve apostles and sevens—a hundred councils of seventy each. These bodies supervise generally the church, which locally is organized into fifty stakes, further subdivided into wards. Each stake has a president and two counselors; each ward a bishop, teachers, and deacons.	The Book of Mormon and Doctrine and Covenants form the basis of a belief which looks for a continuance of revelation and miracles, an American Zion, a millennium, and the palingenesis of earth under Christ's rule. Other Mormon tenets are universal tolerance of other faiths, the literal resurrection of the body, baptism by immersion, and (by proxy) of the dead.
2,207,133	8,458	83,513,500	Modified Presbyterian	Justification by faith alone in the merit and righteousness of Christ; atonement; eternal rewards and punishments; Christ very God and very man. In the eschatist the belief of the Lutherans is known as consubstantiation.
284,808	1,320	18,344,453	1. Modified Presbyterian	The doctrinal system of the Lutheran church is contained in the Augsburg Confession and other documents, including the two catechisms of Luther.
49,374	240	1,714,140	2. Modified Presbyterian	
471,563	1,565	23,288,909	3. Modified Presbyterian	
735,866	2,620	22,000,000	4. Modified Congregational.	
100,845	525	3,658,588	5. Modified Presbyterian

5,370	27	130,000	7. Modified Presbyterian	
36,357	148	682,135	8. Modified Presbyterian	
1,043	6	15,900	9. Modified Presbyterian	
2,440	19	30,050	10. Modified Presbyterian	
110,360	500	3,713,944	11. Modified Presbyterian	
107,712	359	2,469,713	12. Modified Presbyterian	
9,997	37	184,700	13. Modified Congregational	
12,541	64	248,700	14. Modified Congregational	
4,656	13	126,252	15. Modified Presbyterian	
3,378	12	89,300	16. Modified Congregational	Cardinal doctrines of minor Lutheran denominations are practically the same.

## CHIEF RELIGIOUS BODIES OF THE

NAME OF DENOMINATION	WHEN AND WHERE FOUNDED AS AN ORGANIZED BODY	BY WHOM OR HOW	NUMBER OF CHURCHES
<b>Lutherans</b> —Continued			
17. Finnish Evangelical Lutheran Church of America, or Suomi Synod.	Columet, Mich., 1890		122
18. Norwegian Lutheran Free Church.	Minneapolis, Minn., 1893	The number of separate church organizations is due to difference of language rather than to difference of doctrine.	325
19. United Danish Evangelical Lutheran Church in America.	Minneapolis, Minn., 1896		198
20. Slovak Evangelical Lutheran Synod of America.	Braddock, Minn., 1902		59
21. Finnish Evangelical Lutheran National Church.	Ironwood, Mich., 1900		43
22. Apostolic Lutheran Church (Finnish).	—, 1872		68
23. Church of Lutheran Brethren of America (Norwegian).	Milwaukee, Wis., 1900		16
24. Evangelical Lutheran Jehovah Conference.	—		9
<b>Mennonites</b>	Lancaster Co., Pa., 1683	By invitation of Wm. Penn. Name derived from Menno Simon, who preached in Friesland.	606
<b>Methodist</b>	At Oxford, England, 1729; in America by Thomas Coke, under deputation by Wesley, Baltimore, 1784.	John Wesley and a group of Oxford students.	
Methodist Episcopal	Baltimore, 1784	John Wesley—Mr. Wesley deputed Dr. Thomas Coke as superintendent or first bishop to organize a separate church.	28,325
Methodist Episcopal South.	Louisville, Ky., 1845	By the separation of the church in the South under separate jurisdiction.	16,757
Methodist Protestant	Baltimore, 1830	By separation from M. E. church at a convention formally opened Nov. 2, 1830.	2,380
American Wesleyan	Utica, 1843	By separation from M. E. church, separate societies were organized in 1845.	255
African Methodist Episcopal	Philadelphia, 1816	Richard Allen—By withdrawal of colored members into separate organizations.	5,483
African Methodist Episcopal Zion	New York, 1816	Christopher Rush, first president—By withdrawal of Zion church congregation from M. E. church: first conference held 1821.	3,291
Colored Methodist Episcopal in America	—, 1874	By separation of most of the colored members from M. E. church South.	2,800
Evangelical Association	Pennsylvania, 1800	Jacob Albright—Composed of German Methodists and those who are followers of Albright.	2,678
Free Methodists	Western New York, 1860	Benjamin T. Roberts—By separation from Methodist Episcopal church.	1,132
<b>Moravians</b>	Near Savannah, Ga., 1736	Anthony Seiffert—Established by Count Nicholas de Zinsendorf, at Herrnhut, in Saxony, 1722.	142
<b>Presbyterian</b> Northern	Philadelphia, Pa., March, 1706	Seven ministers, the leader, Rev. Frances McKim.	9,907
Southern	Augusta, Ga., 1861	Cumberland Presbytery—By separation of the southern churches from the northern at the opening of the Civil war.	3,217
Cumberland Presbyterian	Tennessee, 1810	Chiefly because the old church refused to allow nongraduates to be ordained to the ministry.	1,465
Colored Cumberland Presbyterian	—	By peaceful separation of the colored church from the old body.	196
United Presbyterian	South Carolina, 1858	By union of the Associate and Associate Reformed churches.	980
Associate Reform Synod of the South	—, 1802	By those in the south who declined to unite with the new organization.	158
<b>Protestant Episcopal</b>	Became independent of the church of England in 1789.	On account of the change of government the church which came with the colony of Jamestown, 1607, adopted a constitution of its own.	8,017
<b>Reformed</b>		Reorganization of Anglican church, which became fragmentary and scattered.	
Reformed Episcopal Church	New York, 1873	Bishop G. D. Cummins—By separation from Protestant Episcopal church.	80
Reformed (Dutch) Church	New York City, 1619	By ministers sent from Holland by request of Governor Minuit.	684
German Reformed Church	Pennsylvania, 1727	Geo. Michael Weiss—The first church was composed of about 400 Palatines from Europe.	1,737
<b>Roman Catholic Church</b>	Pentecost day at Jerusalem	Jesus Christ	13,304
<b>Salvationists</b>	London, England, 1865; United States, 1881	William Booth	909
<b>Unitarians</b>	Boston, 1783	James Freeman—By self transfer from the Anglican church.	504
<b>United Brethren</b>	Pennsylvania, 1800	Philip W. Otterbein—Composed chiefly of Germans at first, Methodist in doctrine and policy.	4,311
<b>Universalists</b>	Gloucester, Mass., 1779	John Murray—Under name of "The Independent Christian church." Murray had been a Methodist in Ireland.	890

85,007	1,008		Independent Congregational	
		230,000,000	Episcopal. The general law-making bodies are: The General Conference; the Judicial Conference; the Annual Conference; the District Conference; the Quarterly Conference; and the Ladies and Stewards' Meeting.	Armenian or evangelical as distinguished from Calvinistic. Wesley thus defines the doctrine of the deamination: "The points we chiefly insisted upon were four: "First, that orthodoxy, or right opinions, is at least but a very slender part of religion, if it can be allowed to be any part of it at all; that neither does religion consist in negatives, in bare harmfulness of any kind, nor merely in externals, in doing good, or using the means of grace, in works of piety or of charity; that it is nothing short of or different from 'the mind that was in Christ,' the image of God stamped upon the heart, inward righteousness attended with the peace of God, and 'joy in the Holy Ghost.' "Secondly, that the only way under heaven to this religion is to 'repent and believe the gospel'—or (as the apostle words it), 'repentance toward God, and faith in our Lord Jesus Christ.' "Thirdly, that by this faith 'he that worketh not, but believeth on Him that justifieth the ungodly, is justified freely by His grace, through the redemption which is in Jesus Christ.' "And, lastly, that, 'being justified by faith,' we taste of the heaven to which we are going; we are holy and happy; we tread down sin and fear, and 'sit in heavenly places with Christ Jesus.'"
3,159,913	18,160		Wesleyan Methodist ministers change their circuit every three years, save under exceptional circumstances. Several unsuccessful attempts have been made to alter this rule, and there is a growing conviction that the term should be extended. Lay or local preachers fill an important place in Methodism, the pulpits in many villages being almost wholly occupied by them.

## GOVERNMENT AND LAW

### GOVERNMENT OF THE UNITED STATES

**Origin and Development.**—1. The fundamental fact about the government of the United States is that it forms a federal state, a union which has developed from separate colonies or territories. The colonies, from the geographical conditions of climate and soil and from varying circumstances under which they had been settled, differed greatly from one another both in type of government and in social conditions. In New England they had settled in villages with a church, and the form of government was popular, the town-meeting type, the meeting deciding policies and electing men to carry them into effect. In Virginia, owing to the ease of traffic by water courses and to the nature of their agricultural products, tobacco and others adapted to cultivation on a large scale, great estates had been formed, the government was not popular, but by the gentry speaking for all and in counties rather than in towns. Elsewhere either one of these or a later type combining the two was adopted.

In relation to the mother country the colonies differed, two (Connecticut and Rhode Island) having received charters which enabled them to choose their governors; others (Pennsylvania, Maryland, Delaware) having their governors appointed by the proprietor who had received the grant of land and power from the crown; while the governors of the other eight were appointed directly by the king and were responsible to him.

The pressure of danger from the Indians, the Dutch and the French, and later from the mother country, with the disadvantages of inharmonious action on commercial matters and the benefits and power to be derived from uniform regulations and united action, led by a series of steps to a firm united state, of which the form was adopted largely from the governments of Great Britain and of the different states that had been formed from the colonies in 1776 and the following years after the separation from Great Britain.

2. **Important Steps Toward Union.**—(a) From 1643 to 1684 Massachusetts Bay, New Plymouth, Connecticut and New Haven colonies formed the New England Federation to strengthen their defense against the Indians, Dutch and French, representatives being sent from each. After that in time of need intercolonial conferences were held from time to time.

(b) In 1754 a Congress of twenty-five members from seven colonies met at Albany to arrange a treaty with the Iroquois Indians and to consider other common interests. The Congress adopted Franklin's plan for a permanent federation, but it was rejected by all the colonies.

(c) In 1765, in consequence of the passage of the Stamp act in Great Britain, at the instance of the Massachusetts house of representatives nine colonies sent representatives to the Stamp Congress at New York, which issued a declaration that the rights of natural born English subjects

belonged to the colonists and framed petitions to the English government for relief.

(d) Further acts of England, especially the *Committees of Correspondence* among the colonists, who thus fostered unity of sentiment against England and for their common interests.

(e) *The First Continental Congress* was called by Massachusetts in 1774 when the English government passed the acts providing for the coercion of that colony. All the colonies except Georgia sent delegates to Philadelphia, who drafted the Declaration of Rights of the colonies, adopted articles of association, advised resistance, and provided in case of need for the meeting, May 1775, of the Second Continental Congress.

(f) *The Second Continental Congress.*—This met, delegates from all the colonies being present. In the meantime England had passed other measures of coercion, and in attempting to seize the war supplies of the colonists, had brought on the battle of Lexington. It therefore became necessary for the Congress to make provisions for continuing resistance. In fact it became a governing body, and with adjournments from time to time, until May 1, 1781, it directed the war of the Revolution, and really organized and managed a new state. It issued the Declaration of Independence, recommended the colonies to provide for themselves state governments, instituted relations with foreign countries and did other needed work.

(g) *The Articles of Confederation*, first sketched out and presented by Franklin July 21, 1775, after long delays and many amendments, were adopted by the last state, Maryland, March 1, 1781. The desire of each state to control its own affairs, the lack of experience of the difficulties of separate action and of the consequent need of a central body which had the powers necessary to secure harmony, resulted in leaving the government so weak and ineffective that only the overwhelming needs of war time at first secured harmony. Later, disputes and hostile interests, especially commercial, brought the country to the verge of civil war.

(h) A meeting of commissioners from Maryland and Virginia in 1785 to discuss a commercial dispute led Virginia to call a meeting of delegates of all the states at Annapolis in 1786 to consider commercial relations. Representatives of only five states came, but among them were several far-sighted statesmen, and before adjourning they adopted a resolution offered by Alexander Hamilton calling a convention to amend the Articles of Confederation.

(i) *This Constitutional Convention* met at Philadelphia May 25, 1787. Representatives of all the states except Rhode Island were present, among them the most noted and ablest men of the time. Different plans were proposed, important compromises, especially to settle controversies

between large and small states and those concerning slavery, were made, and at length the Constitution was adopted and signed September 17, 1787.

(j) It was then submitted to Congress and by it sent to the states to be ratified. On June 21, 1788, New Hampshire, the last of the nine states whose ratification was needed, adopted it. The last state, Rhode Island, ratified it May 29, 1790. Congress provided an act by which it went into operation in 1789.

(k) *Amendments.*—To satisfy the wishes of several of the states, a Declaration of Rights was provided in the first ten amendments, which were ratified by the state legislatures soon after the adoption of the Constitution. Amendments XI and XII were passed to settle practical difficulties in administration, while Amendments XIII, XIV, and XV were passed to clinch the results of the Civil war on the question of slavery.

**The Federal Government.**—I. **Congress; General Powers.**—The Congress which has been elected under the Constitution as the law-making body consists of the Senate and the House of Representatives and has several general powers granted it: To pass laws, to judge the elections and qualifications of its own members, to determine its own rules of procedure, to lay and collect taxes, duties, imports and excises, to pay the debts and provide for the common defense and general welfare, to borrow money on the credit of the United States, to regulate commerce with foreign nations and among the several states and with the Indian tribes, to coin money and provide for certain substitutes for coin, and make provisions for controlling the value and purity of both, to fix standards of weights and measures, to establish uniform rules of naturalization, and uniform laws of bankruptcy, to establish and maintain a postal system with all needed equipment for efficient service, to make provision for the encouragement of inventors and authors by patent and copyright laws, to define and punish piracies and felonies committed on the high seas and offenses against the law of nations, to declare war and make full provision for carrying on war by land and sea by regular army and navy or by militia, and to exercise exclusive jurisdiction over all districts that are acquired for the use of the federal government in its civil or military capacities. Besides these special powers, the right to make all regulations necessary to carry these into effect is granted and by decisions of the Supreme Court has been fully established.

Scarcely less important than the powers granted to Congress are the restrictions placed upon the government. It shall not suspend the writ of *habeas corpus* except in cases of rebellion or invasion if the public safety requires it; shall not pass bills of attainder or *ex post facto* laws. No money shall be drawn from the treasury but in consequence of appropriations made by law, and regular accounts thereof shall be published; no titles of nobility shall be granted by the United States, and presents and titles from foreign governments or rulers are forbidden to office holders without the consent of the Congress.

These prohibitions are all in the interest of the people as against possible encroachments by the government.

To give needed unity of action in matters of national import the several states are forbidden to enter into any relations with foreign states and are restricted closely in their actions regarding money, the law of

contracts, and some other important matters. Especially rigid are the provisions forbidding state interference with interstate or international commerce and relations with foreign powers.

Sessions of Congress begin the first Monday in December. In the years following a congressional election the term ends on March 3d; in other years it extends until it decides to adjourn, usually early in the summer. The President may call special sessions.

Bills are introduced by private members, referred to committees, appointed by the speaker of the House and elected in the Senate, that consider and amend at will and report with such recommendations as they see fit. The committees often suppress bills, and their report has great weight in determining the action of Congress.

**The Senate.**—(a) Consists of two members from each state chosen by the state legislatures, each senator to have one vote, which he is to cast independently.

(b) The term is six years, the senators being divided into three classes so that one-third retire every two years, securing thus a continuing body. In case of a vacancy the place may be filled by appointment of the executive of the state until the state legislature meets, when it elects a senator.

(c) A senator must be thirty years of age, have been nine years a citizen of the United States and an inhabitant of the state from which he is chosen.

(d) Senators receive a salary of \$7,500 a year, mileage of 20 cents a mile each way from their homes to attend sessions, stationery, \$1,600 a year for clerk hire, and certain uses of rooms and secretaries of committees.

(e) The Senate, over whom the Vice President is the regular presiding officer, chooses a president *pro tempore* to act in the absence of the Vice President, acts as a court for the trial of impeachment cases, a two-thirds vote of the members present being required for conviction. When the President of the United States is impeached the chief justice of the United States presides.

(f) The Senate must approve the appointment of the higher officials made by the President and must approve by a two-thirds vote treaties negotiated by him with foreign powers if they are to go into effect.

**The House of Representatives.**—(a) Consists of 391 members chosen by the voters of districts in the several states made up as nearly as practicable in proportion to the number of inhabitants.

(b) For a period of two years.

(c) A representative must be 25 years of age, have been seven years a citizen of the United States, and a resident of the state from which he is chosen. By custom the representative is usually a resident of his district, but this is not necessary; and sometimes, especially in the large cities, a representative resides beyond the boundaries of his district.

(d) The salary, mileage and emoluments of representatives are the same as those of senators except that senators from their smaller numbers have a more liberal use of rooms; the allowance for secretary is only \$1,500 to a representative.

(e) The House of Representatives elects its speaker, judges the elections and qualifications of its members, makes its own rules of procedure, and has the sole right of impeachment of executive and judicial officials before the Senate sitting as a court of impeachment. Bills for raising revenue

must originate in the House of Representatives; but, as the Senate has an unlimited right of amendment, the privilege is of little value.

Both representatives and senators are frequently consulted by the President and other executive officers in making appointments to office. Moreover, committees of either house if duly authorized, may, during times when Congress is not in session, make investigations at home or abroad in connection with legislative measures. In such cases, while expenses are paid, no additional salary is given to members.

#### SPEAKERS OF THE HOUSE OF REPRESENTATIVES

**II. The Executive.**—The chief executive is the president (a) chosen for a period of four years (b) by an electoral college elected by the voters of the several states usually on a general ticket, so that all electors from a state are generally from the same political party; the electors are in some states chosen by congressional districts. (c) The President must be 35 years of age and a natural-born citizen of the United States. (d) His salary is \$75,000 a year. In addition Congress has for some years voted \$25,000 for traveling expenses. He is given also secretaries, his residence, the White House, which is furnished at public expense, stables, vehicles, and other minor emoluments necessary for his position and work. (e) The President is commander-in-chief of the army and navy and of the militia when in actual military service of the United States; he grants reprieves and pardons; he makes treaties with the concurrence of two-thirds of the Senate; he nominates and by and with the advice and consent of the Senate appoints ambassadors and other foreign representatives, judges of the federal courts, and other high officials, some others being appointed by him alone or by heads of departments; he makes reports and recommendations to the Congress concerning the state of the nation and legislative action; he calls special sessions of Congress, receives ambassadors

and public ministers of foreign powers; and takes care that the laws are faithfully executed. The President approves bills passed by the Congress, or, in event of disapproval, returns them to the branch in which they originated. In case of such veto they must be repassed by a two-thirds vote of both houses to become effective. If he does not disapprove them within ten days (Sundays excepted) they become laws unless by adjournment in the meantime the Congress prevents their return, in which case they fail.

**The Vice President** has [the same qualifications and is chosen for the same term and in like manner as the President. Unless the President dies or is removed or incapacitated, his sole duty is to preside over the Senate. In case of the vacation of the President's office, he succeeds. If the Vice President dies, the members of the cabinet succeed in the order of the establishment of the departments, beginning with the Secretaries of State and the Treasury.

**The Cabinet** consists of the Secretaries of State, Treasury, War, Attorney-General, Postmaster-General, Secretary of the Navy, Secretary of the Interior, Secretary of Agriculture, Secretary of Commerce and Labor. They are (a) appointed by the President, confirmed by the Senate and (b) serve really at the pleasure of the President, usually for his term unless their resignation is sooner brought about. (c) Their salary is \$12,000 a year, and while their office expenses are covered, their personal emoluments are only incidental to the official work. (d) The members of the cabinet are the official advisers of the President in both administration work and political policy. In administrative matters each member exercises much discretion in the management of his department and usually really controls the selection of his subordinates who are not under civil service regulations. In matters of policy and making important decisions, his personal judgment is of prime importance. Routine business is frequently managed by subordinates whose tenure of office is practically during good behavior and efficiency.

**The Civil Service** is made up of (a) those officials appointed without competitive examination—generally higher officers, those whose services are personal or confidential in their nature, like private secretaries, unskilled laborers, or temporary employes, as employees of special commissions; and (b) the classified service, the members of which are appointed after a competitive examination. Such appointees are apportioned among the states in proportion to population so far as possible, and the positions are permanent during efficiency. The President may extend by order the classified service, which now includes some 200,000. Examinations are held regularly twice a year at various places throughout the country, as designated by the civil service commission, a board of three members appointed by the President to administer this law, free from the influence of partisan politics.

**III. The Judiciary** consists of the Supreme Court of the United States and such inferior courts as Congress may establish. All United States judges are appointed by the President, to hold their office during good behavior. Their salaries shall not be reduced during their term of office.

1. The Supreme Court consists of the chief justice, whose salary is \$13,000, and of eight associate justices with a salary of \$12,000 each.

## JUSTICES OF THE U. S. SUPREME COURT

NAME	SERVICE	TERM	BORN	DIED
John Jay, N. Y.	1789-1795	6	1745	1829

Joseph R. Lamar, Ga.	1910-1910	0	1857	1910

2. Nine circuit courts of appeal have been established which consist of three judges each. Eligible to sit in this court are the Supreme Court justice assigned to the circuit, the circuit judges (of which there are two to four in each circuit), and the district judges within the circuit. The salaries are \$7,000.

3. The territory of the United States has been divided into some 901 judicial districts, none of them crossing state lines. There is usually one in each district, though at times a judge is assigned to two districts. The salaries are \$6,000.

A judge who is 70 years of age and has served ten years may retire on full pay for life.

4. The United States courts have (also appointed by the President) district attorneys and marshals to prepare and prosecute cases in behalf of the government and to execute processes and other orders of the courts.

5. The jurisdiction of the federal courts pertains to matters concerning the federal government, such as the post-office, coinage laws, etc., and to cases which might involve the states in disputes with one another or with foreign countries.

6. Besides the courts mentioned for the disposal of controversies, there has been established (a) the court of claims, before which come claims of various kinds (excepting pensions) against the United States, and (b) the customs court, which settles controversies arising in connection with the collection of our customs duties.

**The States.** 1. The original thirteen states, at the suggestion of the Continental Congress, each in its own way and time adopted a state constitution. It is customary of late years for the Congress to pass an act admitting a state under prescribed conditions of boundaries, population, etc., with the provision that it shall frame and adopt a constitution satisfactory to the Congress. These are all modeled in part after the constitution of the United States and of the older states. Of late years there is a tendency to make them longer and to include in the constitution subjects usually left to the legislature.

2. (a) All the states have legislatures consisting of two houses. The members of the larger, or lower, house are elected from districts and meet in six states annually; in the others the legislature meets only biennially. Members of the upper house are usually chosen for a period of two or more years. (b) Salaries are paid to all but day from annual salaries to a per diem for days actually served. In several states the sessions are limited in time to sixty or ninety days. (c) In most of the states there are restrictions upon the powers of the legislature, such as prohibitions of special legislation, and limiting the borrowing power of cities. Provisions against corrupt lobbying, blackmail and other abuses are common. In the main, the laws that touch most closely our daily life, those regarding contracts, crimes, marriage and divorce, inheritance, etc., are left to the states. Of

late there is a movement in some of the states toward direct legislation by the people under the initiative and referendum.

3. The executive department of the state consists of a governor, lieutenant-governor, secretary of state, auditor or controller, treasurer, attorney-general and others needed to carry out the laws. The terms and compensation vary in the different states. The most important difference between the state and federal executive departments is that in the states the other officers are elected and not appointed by the governor, so that there is not the unity of action that comes from an appointive cabinet.

4. The judiciary department consists of a supreme court, and sometimes a court of appeals, and of such subordinate courts as the size of the state and the nature of its business and customs have made suitable. There are great similarities throughout the country. The judges are usually elected and for terms of two to fourteen years.

5. The county, town and city governments are all under the control of the state, but the forms vary widely, usually there being a tendency, as regards the rural districts especially, to follow models of some of the older states as indicated in the brief historical introduction. Each local subdivision has, of course, some body with minor legislative or ordinance powers, an executive and a judiciary.

**Territories and Dependencies.**—The territories and the insular dependencies of Hawaii, Porto Rico and the Philippine islands are under governments established by Congress and approved by the President and subject to change by regular legislative procedure.

All have governors and administrative and judicial officers appointed by the President. To them Congress has given a legislative body to make new laws under the powers granted. In Porto Rico and the Philippine islands the members of the upper house are appointed by the President and consist in part of the administrative officers mentioned. The lower house is elective. In event of a deadlock the revenue and appropriation laws of the preceding year continue in force. No new laws can be made without the assent of both houses. There seems to be an inclination to increase the powers of self-government of the territories and insular possessions as rapidly as the people, hitherto not accustomed to self-rule, shall show themselves fit to take it.

In all cases Congress retains under the constitution the right to modify to any extent the method of governing these territories and possessions.

**PARLIAMENTARY LAW** and practice consist of those rules, precedents, and usages which are generally accepted as the most convenient and practicable for the government of proceedings in deliberative assemblies or organizations. Most of the essential rules now accepted had their origin in the English parliament, although some of them have been changed to adapt them to the needs of our legislative bodies. The rules and usages of Congress have the greatest weight as correct parliamentary law in the United States generally, but the legislature of each state has a code of its own containing the general rules, and special ones not commonly accepted.

Besides the common parliamentary law, which is recognized by deliberative bodies in general, each body may make rules for its own government. When there are no special rules to the contrary the body is controlled by the principles of common parliamentary practice, and these principles govern if there are no rules enacted by the body itself.

**Uses.**—Parliamentary law is used in deliberative bodies in order that there may be a mutual understanding as to what may be done; that the rights of the body and of its individual members may be protected, and that business may be transacted with expedition and also deliberation.

A gathering does not become a deliberative body until it is duly organized. This implies officers and members. The number of the former may vary according to circumstances. There must be one to preside over the deliberations. Then there should be a clerk or secretary to keep a record of the transactions.

Parliamentary practice presumes that, ordinarily, matters for discussion and decision emanate from some member or members of the meeting, and that the discussing and deciding is done by the membership.

**Organization.—Temporary.**—At the time appointed, or a few moments later, some one steps forward and requests the meeting to come to order, and, having secured attention, he either makes a motion that a certain person, giving his name, act as chairman, or asks the assembly to nominate a chairman. And he puts motions or nominations to vote, until some one is elected to preside. The chairman then takes his place, and the organization is completed by the nomination and election of a secretary, and any other necessary officers.

**A Convention of Delegates.**—In the case of a convention of delegates, a temporary organization is first made by electing a chairman and secretary *pro tem.* Then, if the chairman is chosen, to ascertain who are duly authorized to take part in the deliberations and the voting. The committee on credentials is the body of persons who are found to have proper credentials; also doubtful or contested cases, with recommendations. No one without credentials is admitted to vote on the report of the committee, or on any question until he is duly accepted as a delegate. The organization is then completed by the nomination and election of permanent officers.

After a meeting is duly organized, it is customary for some member to state briefly the object of the meeting, and business may be introduced at once, or the time may be occupied by addressing the committee is sometimes appointed to prepare resolutions, while addresses are being given to fill up the time, and they repeat the same or they may be given more time, and bring in their resolutions after a recess, or at a subsequent meeting.

**Permanent.**—In organizing a permanent society a temporary organization is first effected, after which the chairman is elected upon some person who is taking a leading part in getting up the society to state the object of the proposed organization for resolution or resolution of the organization is next in order, and, if carrying out the committee is appointed to draft a constitution or by-laws or rules. The constitution should be in the form of articles at least, viz.: 1. Name and object of the society. 2. Qualifications of members. 3. Officers, their election and duties. 4. Powers of the society. 5. How to amend the constitution.

At the second meeting the constitution is adopted and after all have signed the constitution who wish to become members, by-laws are adopted if desired, and a committee is appointed to prepare permanent officers to be elected at this or an adjourned meeting. Each officer as elected takes the place of the temporary one, and when all are elected the organization is completed.

**Nominations and Elections.**—Generally the most prudent and expeditious way of making nominations is to place the matter in the hands of a committee created for the purpose, who, after due consideration, make the nominations and tender them to the assembly after which a vote is taken and seconded to adopt the report of the committee. Then the names of the nominees are read, and each member is given an opportunity for amendments. Any member who is not satisfied with a nomination may move to substitute another name, and if this motion receives a second and is carried the substituted name takes the place of the regular nominee.

The vote, if by acclamation, may be taken upon each name before passing to the next, but the more common way is to vote upon the names as a whole, and the entire list has to be elected at once.

Sometimes the chairman is authorized by the assembly to make the nominations, and in this case the names are treated the same as if brought in by a committee. Another way of nominating is as follows: Some member rises and says, "I nominate Mr. A. for the office of chairman, Mr. B. for the office of secretary, and Mr. C. for the office of treasurer." If the motion is seconded, the names are read, and a vote is taken. If the motion is not seconded, some member moves that the nominations close, and if this motion is seconded and carried, the chairman then reads the names, in the order in which the nominations were made, and continues until one is elected. If the chairman then one office has been filled, the same process must be gone through with in each individual case.

If the election is to be by ballot, and the names are on the ballots, each voter may cast his ballot as it is, or he may cross off names and write others as he wishes. If blank slips are used, each voter writes on his slip the names of the nominees, or substitutes other names according to his choice. A motion for all the votes cast is necessary to choose. In case the office or offices are not filled at the first ballot, the voting must be continued until the necessary officers are elected.

**Officers and Their Duties.**—**Chairman, President, or Moderator.**—The presiding officer is generally known by one of these titles. He should be addressed by his title, and in referring to himself he should always use his official title, thus: "I am the chairman of this assembly," etc.

It is his duty to take the chair and call the meeting to order at the proper time, to announce in its name the names of those who are to be proposed, to put them to vote, and to declare the result of the vote; to see that the rules of debate are followed; to order the assembly to come to order or course of proceeding, by request, or when he finds it necessary to do so; to receive all persons and other communications and announce them to the assembly, to act for the assembly in signing all papers, etc.

He may sit while stating a question, but he should rise to put a question to vote, or to speak to a question of order.

**Vice-President.**—The vice-president acts in place of the president in his absence.

**Clerk or Secretary.**—The recording officer, whether called clerk or secretary, keeps a correct record of all proceedings, and he reads the minutes made at the next meeting. In the absence of the chairman (if there is no vice-president present), it is his duty to call the meeting to order, to take the chair while the assembly proceeds to elect a chairman *pro tem.*, to read papers to be acted upon, to receive and to read questions to be referred to the assembly when necessary, to hand to the chairman of every committee appointed a list of the names of the members of the committee, and the matter committed to them; to make out in order, and hand to the chairman before each meeting, a list of the names of the members of the committee, of all papers and documents, to sign his name to the minutes, and to authenticate by his signature alone, or in connection with that of the chairman, the orders, and the proceedings of the assembly. In some assemblies the secretary also acts as treasurer.

**Treasurer.**—The treasurer has charge of the funds of the assembly and pays out the money as it is assembled signed by the secretary. His annual report should give the amount in the treasury at the beginning of the year, the amount received, the amount paid out, and the balance on hand. This report should be examined by an auditor or an auditing committee, and the accounts by the itemized accounts kept by the treasurer, and the receipts he has received for payments made; and if found correct it should be approved by a vote of the assembly.

**Committees.**—A committee for deliberation or investigation should be large, and should represent all classes and localities. A committee for action

should be small, and should consist of those only who are to carry out the proposed action.

A committee may be nominated and elected, or the chairman may be authorized by the constitution or by-laws to appoint the committee. The constitution or by-laws may also prescribe the number of members, and in some cases each shall be composed, or the number may be included in the motion if the appointment is ordered by the assembly.

Sometimes the assembly proposes different numbers, and in this case the number is decided by vote, or by-laws may be proposed, and then upon the next, and so on until a vote is carried deciding the number. A standing committee is one appointed for a particular occasion. A standing committee is one appointed beforehand, for all matters that may arise of the same nature.

The person first named on a committee calls the members together, and presides all through, or until the committee elects another chairman; which is seldom done. In the absence of the first member, the next in order who is present acts as chairman. The committee chooses one of its own number to act as secretary. It conducts its proceedings in the same manner as business is conducted in the assembly.

A committee must be allowed to do business, and a quorum must be present.

Any paper or amendment must not be altered, or rejected by them. The committee may present amendments written on another sheet, or they may recommend amendments to be adopted if any recommendation they see fit. The report of the committee is signed by all the members, or by the chairman alone, and makes the report to the assembly unless another has been chosen to tender it. Only that which has been agreed upon by the majority can be incorporated in the report, but the minority may also tender a report if they choose. The majority report may be substituted for the report, or the committee may vote of the assembly. When the committee has tendered its report in full and the report has been accepted, the committee is thereby discharged, but it may be revived by having the report of some part of it referred back to it.

Committee members are free from time to time until their work is completed, then the motion is to rise, which motion means the same as to adjourn, and is so acted upon.

**Committee of the Whole.**—The object of resolving the assembly into the "committee of the whole," is to do away with the distinction between the committee and the assembly, and to make the report of a subject that is allowed under ordinary circumstances, and the motion is, "That the assembly do now consider the report of the committee of the whole," etc., specifying the subject. If carried, the presiding officer at once calls another member to the chair, and the assembly becomes a committee of the whole. The only motions in order are "to amend," "to adopt," and "to rise and adjourn." The committee of the whole, the assembly may pass an order limiting debate, which order cannot be changed in the committee.

The chairman having resumed his seat, the member who presided in the committee rises and informs the chairman that he is ready to report. The report may then be received, or the time fixed when it shall be received.

The clerk keeps the minutes of the proceedings of the committee, if there is not an assistant clerk to keep them, but the only record he makes in the minutes of the assembly is the report as received from the committee. If at any time the committee becomes disorderly, the presiding officer may remove the disorderly member, or the committee be dissolved.

The quorum of the committee of the whole is the same as that of the assembly.

**Informal Action.**—Instead of going into a committee of the whole, the assembly may consider a question informally, with the chairman presiding, and the same restrictions apply as in the committee of the whole. In this case the chairman retains his seat, and there is no motion to rise and report. The chairman reads the subject that has been considered before the assembly, and it is treated of as if it were a formal action.

Any motion except "to amend" or "to adopt" puts an end to the informal action. A temporary memorandum of the same nature as the minutes of the whole, and the clerk enters the chairman's report only in the minutes.

**Quorum.**—A quorum of an assembly, or of a committee, is the number of members as it is composed to transact business; and unless the number is prescribed by the constitution or by-laws, or by an order of the assembly, it is the majority of the members. The number may be fixed at much less than a majority. When a quorum is not present, the only action that may be taken is to adjourn.

**Order of Business.**—In the absence of special rules upon any subject, the regular order of business is as follows:

1. Reading the minutes of the previous meeting. 2. Reports of standing committees, managers, trustees, etc., come under this head.

3. Reports of special committees, managers, trustees, etc., come under this head.

4. Reports of special committees, managers, trustees, etc., come under this head.

5. Reports of special committees, managers, trustees, etc., come under this head.

6. Reports of special committees, managers, trustees, etc., come under this head.

## Modifying or amending.

8. To amend or to substitute, or to divide the question.....

To refer to committee.....

7. To commit (or recommit).....

Deferring action.....

6. To postpone to a fixed time.....

4. To lay on the table.....

5. For the previous question.....

To limit, or raise, debate.....

To extend limits of debate.....

Suppressing the question.....

Objection to consideration of question.....

Appeal from chair's decision touch-  
ing indecorum.....

Appeal from chair's decision gener-  
ally.....

Question upon reading of papers.....

Withdrawal of a motion.....

Rule A.—Undebatable, but remarks may be tacitly allowed.

Rule B.—Undebatable if another question is before the assembly.

Rule C.—Limitable debate allowed on propriety of postponement only.

Rule D.—Opens the main question to debate.

Motion not so marked do not allow of reference to main question.

Rule E.—Cannot be amended. Motion to adjourn can be amended when there is no other business before the house.

Rule F.—Cannot be reconsidered.

Rule G.—An affirmative vote cannot be reconsidered.

Rule H.—In order when another has the floor.

Rule I.—A motion to reconsider may be moved and entered when another has the floor, but the business then before the house may not be set aside.

This motion can only be entertained when made by one who voted originally with the prevailing side. When called up it takes precedence of all others which may come up, excepting only motions relating to adjournment.

Rule K.—A motion to amend an amendment cannot be amended.

Rule L.—When an appeal from the chair's decision results in a tie vote, the chair is sustained.

Rule M.—Requires a two-thirds vote unless special rules have been enacted.

Rule N.—Does not require to be seconded.

General Rules.—No motion is open for discussion until it has been stated by the chair.

The maker of a motion cannot modify it or withdraw it after it has been stated by the chair, except by general consent.

Only one reconsideration of a question is permitted.

A motion to adjourn, to lay on the table, or to take from the table, cannot be renewed unless some other motion has been made in the interval.

On motion to strike out the words, "Shall the words stand or part of the motion?" unless majority sustains the words, they are struck out.

On motion for previous question, the form to be observed is, "Shall the main question now put?" This, if carried, ends debate.

On an appeal from the chair's decision, "Shall the decision be sustained as the ruling of the house?" the chair is generally sustained.

On motion for orders of the day, "If all the business now proposed be the order of the day?" This, if carried, supersedes intervening motions.

When an objection is raised to considering questions, "Shall the question be considered?" objections may be made by any member before debate has commenced, but not subsequently.

## COMPULSORY EDUCATION AND CHILD LABOR LAWS

Statutory provisions relating to compulsory attendance and child labor prepared by the United States Bureau of Education.

COMPULSORY EDUCATION				CHILD LABOR	
State	Age	Annual Period	Penalty on Parents for Neglect	Age Under Which Specified Employments Are Forbidden	Educational Restrictions on Child Labor
Alabama				12 years, in any mill, factory, or manufacturing establishment.	No child, 12 to 16, may work in any mill, etc., unless attends school 8 weeks each year employed.
Arizona	15-16	6 months; 20 weeks consecutive.	\$5 to \$25.	12 years, in all cases in manufacturing establishments, except canning industries in vacation; 14, unless to support a parent or self, as specified by law; 14, in mines; females not at all in mines.	No child, 14 to 18, unable to write, may be employed in a manufacturing establishment unless he has attended school 12 weeks the preceding year.
Arkansas	8-16	Not less than half the full term. Certain counties are exempt.	\$10 to \$25.	14 years, in any mercantile or manufacturing establishment, workshop, hotel, or as messenger, etc. Children 12 to 14, upon permit, may work if parents incapacitated, or during vacation.	No minor under 16 may work for gain in school hours, unless he can read and write English or attends night school.
California	8-14	Full term.	First, not over \$10 or 5 days' imprisonment; subsequent, \$10 to \$50, or 5 to 25 days, or both.	14 years in any underground works, mine, smelter, mill, or factory. No female may be employed in a coal mine.	Unlawful to employ children under 14 during school hours unless they have complied with the school-attendance law; under 16, unable to read and write, unless attending day or night school.
Colorado	18-16	Full term.	\$5 to \$25.	14 years, in any mechanical, mercantile, or manufacturing establishment.	Children under 14 may not be employed while school is in session. Children 14 to 16 can not leave school to be employed, unless their education is satisfactory to the local or state school board.
Connecticut	7-16	Full term.	Not exceeding \$5 each week of absence.	14 years, in any factory, workshop, or manufacturing establishment, except in canning industry, etc., or to support widowed mother.	No child 14 to 16 may be employed, unless he has attended day or night school 12 weeks the preceding year.
Delaware	7-14	8 months (may be reduced by districts to 3).	First, not over \$2; after, not over \$5. (On default imprisonment 2 to 5 days.)	14 years in any factory, workshop, or manufacturing establishment, except in canning industry, etc., or to support widowed mother.	Children under 14 may not do any work for wages during school hours, not under 16 in preceding employments, unless can read, write, and attended school 150 days preceding year.
District of Columbia	8-14	Full term.	Not exceeding \$20.	14 years in any factory, workshop, store, office, hotel, theater, as messenger, etc. Children 12 to 14 may get permit to work in certain cases.	After Jan. 1, 1908, no child under 14 may be employed in a preceding column (with the exception there noted) unless able to write and has attended school 12 weeks the preceding year; under 18, unless so attended school.
Florida				Children under 15 may not be employed more than 60 days without consent of legal guardian.	No child under 14 may be employed in any way during school hours. No minor under 16 may work in a coal mine unless he can read and write and has attended school 3 months in the year.
Georgia				10 years, in or about any manufacturing establishment; 12 years after Jan. 1, 1907, except for support of self or parents in specified cases.	Under 14 may not be employed in any way during school hours; nor from 14 to 16 in stated occupations unless can read and write, and attended school 100 days preceding year.
Idaho	18-16	Full term.	Not over \$300 or imprisonment not over 6 months, or both.	14 years, in any mine, factory, workshop, mercantile establishment, laundry, hotel, etc., except over 12 during vacation.	Children under 14 may not be employed in any way during school hours; nor from 14 to 16 in stated occupations unless can read and write, and attended school 100 days preceding year.
Illinois	7-16	Full term, to be not less than 6 months.	\$5 to \$20 and costs, and stand committed until paid.	14 years, in any mercantile institution, factory, office, theater, elevator, etc., or as messenger or driver; 16, in or about any mine. No female may work in or about a mine.	Children under 14 may not be employed in any way during school hours; nor from 14 to 16 in stated occupations unless can read and write, and attended school 100 days preceding year.
Indiana	7-14	Full term.	\$5 to \$25, and, in discretion of court, imprisonment 2 to 90 days.	14 years, in any manufacturing or mercantile establishment, mine, quarry, laundry, renovating works, bakery, or printing office. No female may work in a mine.	Children under 15 shall not be employed in any manufacturing or mechanical establishment, except during vacation, unless they have attended school 6 months in preceding year.
Iowa	7-14	16 consecutive weeks; first and second class city boards may require full term.	\$3 to \$20.	14 years, in any mine, factory, mill, shop, laundry, packing house, elevator, or store where more than 8 persons are employed.	Children under 14 may not be employed in any way during school hours; nor from 14 to 16 in stated occupations unless can read and write, and attended school 100 days preceding year.
Kansas	8-15	Full term.	\$5 to \$25.	14 years, in any factory, workshop, theater, packing house, or in or about any mine; 16, in any dangerous, etc., employment.	Children under 14 may not be employed in any way during school hours; nor from 14 to 16 in stated occupations unless can read and write, and attended school 100 days preceding year.
Kentucky	17-14	8 consecutive weeks; full term in cities; first, second, third, and fourth class.	First, \$5 to \$20; subsequent, \$10 to \$50.	14 years, in any mine, workshop, factory, store, office, hotel, as messenger, etc.	Children under 14 may not be employed in any way during school hours; nor from 14 to 16 in stated occupations unless can read and write, and attended school 100 days preceding year.
Louisiana				14 years, in any manufacturing or mercantile establishment, mine, laundry, carrying messages, etc.	Children under 14 may not be employed in any way during school hours; nor from 14 to 16 in stated occupations unless can read and write, and attended school 100 days preceding year.
Maine	7-15	Full term.	Not exceeding \$25, or imprisonment not exceeding 30 days.	14 years, in any manufacturing or mechanical establishment.	Children under 15 shall not be employed in any manufacturing or mechanical establishment, except during vacation, unless they have attended school 16 weeks during preceding year.
Maryland	18-12	Full term.	Not exceeding \$5.	14 years, in mills and factories (except canning establishments), unless self, widowed mother, or invalid father solely dependent upon such employment. 18 counties exempt from law. 14 years, day messenger service; 16 years, night messenger service; 21 years, messenger duty to house of ill repute.	No minor 12 to 16, unable to read and write English, may be employed where there is an evening school unless attending that or another school.

## COMPULSORY EDUCATION AND CHILD LABOR LAWS

COMPULSORY EDUCATION				CHILD LABOR	
State	Age	Annual Period	Penalty on Parents for Neglect	Age Under Which Specified Employments Are Forbidden	Educational Restrictions on Child Labor
Massachusetts...	(a)	Full term.....	Not exceeding \$20.....	14 years, in factories, workshops, or mercantile establishments; 21 years, dangerous occupations.	Children under 14 may not be employed at any work for wages during school hours; from 14 to 16 may not be so employed in any factory, workshop, or mercantile establishment if unable to read and write.
Michigan.....	7-16	Full term.....	Fine of \$5 to \$50, or imprisonment 2 to 90 days, or both.	14 years, in any manufacturing or mercantile establishment, workshop, laundry, store, office, hotel, messenger service, etc.	Children 14 to 16 may not be employed unless they have attended school 100 days preceding year, and can read and write and know the elements of arithmetic.
Minnesota.....	8-16	Full term.....	Not over \$50, or imprisonment not over 30 days.	14 years, in factories, mills, workshops, or mines.	Children under 14 years may not be employed in any service during school term; under school age (16 years), in any occupation during school term unless they have attended school the prescribed period; under 16, unable to read and write English, in any indoor occupation (except in vacation) unless attending day or evening school.
Mississippi.....				12 years, in any mill, factory, or manufacturing establishment.	
Missouri.....	m8-14	Not less than 1/4 of term. Full term in cities of over 500,000.	\$10 to \$25, or imprisonment 2 to 10 days, or both.	14 years, in any mine, manufacturing or mercantile establishment, laundry, etc., in cities of over 10,000; no females in mines.	No child 8 to 14 may be employed in any way in school hours unless he has complied with the attendance law. No boy under 16 may work in a mine unless he can read and write.
Montana.....	m8-14	Full term; in no case less than 16 weeks.	\$5 to \$20.....	16 years, in mines or underground works.	Children under 14 not to be employed during school seasons unless they have completed the studies required by law; from 14 to 16, if unable to read and write English.
Nebraska.....	m7-16	Two-thirds of school term; in no case less than 12 weeks. Full term in cities.	\$5 to \$25 (on truant officer)	14 years, in any manufacturing or mercantile establishment, office, hotel, etc.	No child under 14 may be employed in any service during school hours.
Nevada.....	8-14	16 weeks; 8 consecutive.....	First, \$50 to \$100; subsequent, \$100 to \$200; with costs.		
New Hampshire.....	p8-14	Full term.....	First, \$10; subsequent, \$20	12 years, in any manufacturing establishment.	No child under 14 may be employed during school seasons, nor under 16 if unable to read and write English. No minor unable to read and write English may be employed unless attending day or evening school, if any is held.
New Jersey.....	m7-17	Full term.....	Punishable as a disorderly person.	14 years, in factories, workshops, mills, or manufacturing establishments, also mines; 15 years until July 4, 1911, 16 years thereafter, in factories, etc., between 6 p. m. and 6 a. m.	Children under 15 must have attended school 12 weeks the preceding year as a condition of employment.
New Mexico.....	7-14	Full term.....	\$5 to \$25, or imprisonment not exceeding 10 days.		
New York.....	7-16	Full term (not less than 160 days) in districts of over 5,000 population having a superintendent, for children 7-16 r. elsewhere, for children 8-16, Oct. 1 to June 1, r.	First, not over \$5 or imprisonment 5 days; subsequent, not over \$50 or imprisonment 30 days, or both.	14 years, in factories; if 14 to 16, the child must have attended school 130 days the preceding year, and be able to read and write English, and either. Similar provisions apply, in places of over 3,000 population, to work in mercantile establishments, business offices, restaurants, hotels, express or messenger service, except for children over 12 in small places during vacation. For work in or about mines 16 years is the minimum. No female may work in a mine.	Unlawful to employ in any business or service child under 14 during school term; or one 14 to 16 in city of first or second class unless he has employment certificate (having certificate and not having completed elementary course, must attend evening or trade school); or one 14 to 16 elsewhere, in any factory, etc., unless has employment certificate, or in any service unless has certificate of school attendance, etc.
North Carolina.....	8-14	16 weeks.....	\$5 to \$25.....	12 years, in any factory or manufacturing establishment (does not apply to oyster canning and packing); 12 years, in mines employing over 10 men (boys); children 12 to 13 may be employed in factories only as apprentices.	Apprentices 12 to 13 years must have attended school 4 months in preceding 12.
North Dakota.....	8-14	Full term.....	\$5 to \$20 (on school official).	14 years, in mines, factories, workshops, mercantile establishments, etc.	Children under 14 may not be employed in any manner during school term, or those 14 to 16 unless they have attended school 120 days preceding year and know the elementary branches.
Ohio.....	m8-14	Full term; in no case less than 28 weeks.	\$5 to \$20; on default, imprisonment from 10 to 30 days.	14 years, in any factory, workshop, business office, mercantile establishment, hotel, or messenger, etc.; 16 years, messenger service between 9 p. m. and 6 a. m.	No child between 14 and 16 may be employed in foregoing occupations without a schooling certificate.
Oklahoma.....	8-16	3 to 6 months.....	\$10 to \$50.....	16 years, in mines (no girls in mines).	
Oregon.....	m8-14	Full term.....	\$5 to \$25 fine, or imprisonment 2 to 10 days, or both.	14 years, in any factory, store, workshop, in or about any mine, or in the telegraph, telephone, or public messenger service.	Foregoing employments forbidden to any child 14 to 16 unless attended school 100 days preceding year and can read English. No child under 14 may be employed in any work for compensation during school hours.

## COMPULSORY EDUCATION AND CHILD LABOR LAWS—Continued

COMPULSORY EDUCATION				CHILD LABOR	
State	Age	Annual Period	Penalty on Parents for Neglect	Age Under Which Specified Employments Are Forbidden	Educational Restrictions on Child Labor
Pennsylvania....	26-16	Full term; but the school board may reduce this to not less than 70 per cent of the term.	First, not exceeding \$2; subsequent, not exceeding \$5; on default, imprisonment; first, not over 5 days; subsequent, not over 5.	14 years, in any employment, except domestic or farm labor. Girls may not work in or about coal mines.	No child 14 to 16 may be employed unless he can read and write English and has complied with the school laws.
Rhode Island....	97-15	Full term.....	Not exceeding \$20.....	14 years, in any factory, manufacturing or business establishment.	Children under 13 may not be employed except during school vacations.
South Carolina.....				12 years, in any factory, mine or textile establishment, except that certain self-dependent children may work in the latter.	Children may work in textile establishments in June, July, and August if they have attended school 4 months during the year and can read and write.
South Dakota....	78-14	Full term; but districts may reduce it to 16 weeks, 12 consecutive.	\$10 to \$20 and costs; stand committed till paid.	14 years, in mines.....	No child 8 to 14 to be employed during school hours unless he has attended school 12 weeks during the year.
Tennessee.....	8-14	4 months or 80 days consecutively.	First offense, \$1 for each day of absence.	14 years, in workshops, factories, or mines.	Unlawful to employ children 12 to 14 who can not read and write English, in mills, factories, etc. certain self-dependent children excepted.
Texas.....				12 years, in mills, factories, manufacturing or other establishments using machinery; 16 years in mines, distilleries, or breweries.	
Utah.....	8-16	20 weeks, 10 consecutive; in cities of the 1st and 2d class 30 weeks, 10 consecutive.	First, not exceeding \$10; subsequent, not exceeding \$30, with costs.	14 years in mines (constitution of state).	
Vermont.....	25-15	Full term.....	\$5 to \$25.....	12 years, for any railroad company or in any mill, factory, quarry, or workshop, or carrying messages.	No child under 16 who has not completed the 9-year school course may be employed in any railroad, factory, mine, or quarry work, or in delivering messages, except out of school hours.
Virginia 25.....	8-12	12 weeks.....	First, \$2 to \$10; subsequent, \$5 to \$20.	13 years, after March 1, 1909; 14 after March 1, 1910, in any factory, workshop, mercantile establishment, or mine, except in certain cases of need over 12.	
Washington.....	8-16	Full term.....	Not over \$25.....	14 years, (boys), 16 years (girls), at any labor not connected with house or farm work; 16 years in mines (girls not at all).	Children under 15 may not be employed during school hours unless exempted by the school superintendent.
West Virginia....	8-14	20 weeks.....	First, \$2; subsequent, \$5..	12 years, in factories, workshops, mercantile or manufacturing establishments; 14 in mines (no girls may work in mines).	No child under 14 shall be so employed during school term if it hinders regular attendance.
Wisconsin.....	7-14	Full term in 1st class cities; in 2d class cities not less than 8, elsewhere not less than 6 school months.	\$5 to \$50 and costs, or imprisonment not over 3 months, or both.	12 years, in any occupation; 14, in factories, workshops, mines; 14 to 16, in any occupation without specified written permit.	Children 12 to 14 may not be employed in any occupation, except during school vacations by specified written permit, in stores, offices, hotels, mercantile establishments, laundries, or public messenger service, where they reside (does not apply to farming or other outdoor work).
Wyoming.....	77-14	Full term.....	Not exceeding \$25.....	14 years, in mines; females may not work in mines. (Constitution.)	
United States laws (for territories).				12 years, in the underground workings of any mine.	

a To 16, if unable to read and write English.

b Children 14 to 16 whose labor is necessary to their own or parents' support are excused.

c Not applicable to children over 14 lawfully employed to labor at home or elsewhere.

d Except children over 14 who have completed eighth grade, or have to support themselves or parents, or have other good cause to be exempt.

e Children 14 to 16 necessarily and lawfully employed are exempt.

f Inclusive.

g 8 weeks for children over 14 who can read and write English and are at work to support themselves or others.

h To 16 in cities of first, second, third, and fourth classes; holders of employment certificates excepted.

i The provisions tabulated for Maryland (except in 5th column) are of the act of 1902, whose operation is limited to Baltimore city and Allegany county.

j To 16 unless regularly employed to labor at home or elsewhere.

k To 16 if wandering about public places without lawful occupation, or if unable to read and write.

l Must be able to so read and write as is required to enter the second grade in 1906, third in 1907, and fourth in 1908 and after.

m To 16 years for children not lawfully, regularly, and usefully employed.

n To 16 if unemployed.

o To 16 years in cities.

p To 16 if unable to read and write English.

q Does not apply to children over 15 who have finished grammar-school course and are regularly employed; otherwise must attend grammar, or high, or manual-training school. Children over 14 may be employed in cases of necessity.

r Does not apply to children 14 to 16 lawfully employed.

s Other forbidden employment: under 16, on certain machines in box factories; under 21, night messenger service in certain cities; under 16, in bowling alleys and in places of amusement at night.

t Law does not take effect in any county until voted by the county; does not apply to children over 12 lawfully employed at home or elsewhere.

u To 16 if not legally employed or if unable to pass fifth grade test in required subjects. Children in cities who have not completed eighth grade may be required to attend until they are 16.

v In the discretion of school boards.

w To 16 if unemployed.

x Not applicable to children over 13 who can read and write English and are regularly employed in useful service.

y Not applicable to children over 12 who are lawfully employed.

z The compulsory attendance act applies to 18 counties, in addition to which 13 counties are under special laws.

aa Children over 15 or under 8, when once enrolled, must attend the full term they are enrolled for.

ab Compulsory attendance law optional with the voters of any county, city, or town.

ac Children under 17 may not be sent to immoral resorts.

# TRADE AND INDUSTRY

**AGRICULTURE** is the oldest and most important industry. It is an art of tilling the ground, the planting, cultivation and harvesting of crops, and includes fruit-growing or horticulture, animal husbandry, or the rearing, breeding, feeding and management of the domesticated breeds of live stock, as well as the manufacture or evolving from products of the soil articles for home consumption or purposes of commerce. By it humanity is fed and clothed, and it contributes in many other ways to the welfare and wealth of the world. Without agriculture man would be a barbarian and the earth a wilderness.

The knowledge that centuries of research and practice give, the light contributed by agricultural chemistry, supplemented by new and improved machinery and modern transportation facilities, have greatly enlarged the productions and possibilities of agriculture; and its problems, the mysteries of the soils, and of animal and plant life are engaging the best intellect.

**Acreage Yields.**—While in the aggregate of field productions the United States ranks first, America does not compare favorably with older countries in acre-yields. To compass this a more scientific farming, more educated farmers, more thorough tillage and cultivation, careful seed selection, proper fertilization, and rational crop rotation must be the agencies; in fact a more intimate knowledge and use of the underlying principles governing soil fertility, and crop and live stock production. What this would mean finds illustration in the examples afforded by England and Germany in wheat-growing, with averages of 32.2 and 26.1 bushels per acre, respectively, compared with the 14 bushels per acre in the United States, from a soil naturally as fertile and as well adapted as any.

**Home and Foreign Markets.**—In the settlement and development of America the millions of acres of fresh land brought into production yielded more than domestic consumption required, which caused the seeking of markets elsewhere for the surplus, and the resulting export trade has been a wellspring of prosperity. There are signs, however, that American farmers will not so largely depend for profits in the future upon foreign demands, as home requirements are annually increasing. A case in point is the constantly lessening difference between the production and home consumption of wheat.

In the five-year period of 1894-8 exports from the United States averaged 32 per cent of annual production, and in 1904-8 had fallen to 17 per cent, while the average annual production was 535,387,000 bushels for the first period, and 665,959,000 bushels in the latter. Deducting the average yearly exports for each period it is shown that the consumption of wheat at home increased 50 per cent. Also, for 1909, the value of agricultural exports was \$903,000,000, or \$151,000,000 below the highest record, made in 1907, and \$114,000,000 below the next highest, in 1908, while on the other hand the imports of agricultural products were never so high

in value, the amount being \$637,000,000, in 1909.

**Soils and Their Fertilization.**—Naturally the soil is and must be of primal importance. Plants obtain their food from the soil, and atmosphere, and the mineral elements in the soil are utilized only through the plant roots. If requisite elements are lacking yields are less, however much of a factor tillage may be. Without proper proportions of plant food available in the soil, tillage and good seed do not suffice to maintain it in a high state of productivity, and a supply of suitable plant food must be maintained if maximum yields are to be realized.

**Chemistry of Soil.**—Vegetation requires carbon and oxygen, taken into the plant leaves from the air as carbon dioxide; hydrogen, a constituent of water absorbed through the plant roots; nitrogen, taken from the soil by all plants and also from the air, especially by legumes; and potassium, phosphorus, magnesium, calcium, iron and sulphur, drawn only from the soil.

Of these, nitrogen, the most expensive element of plant food, although comprising four-fifths of the atmosphere, is perhaps the one becoming the most seriously deficient in the ordinary soils of the wheat and corn growing sections, due largely to continuous grain-growing, resulting in a loss of vitality and dwarfed growth.

Of these, nitrogen, the most expensive element of plant food, although comprising four-fifths of the atmosphere, is perhaps the one becoming the most seriously deficient in the ordinary soils of the wheat and corn growing sections, due largely to continuous grain-growing, resulting in a loss of vitality and dwarfed growth.

**Phosphate.**—One eminent soil expert says: "To increase the value of farm manure we should add phosphate to it. Thus we can balance manure, and when used on soils rich in potassium, in rotation with nitrogen-fixing legume crops, we can provide plant food in a balanced ratio to meet the needs of maximum yield. By these means we can check the progress of soil exhaustion, and even gradually increase the fertility and productive capacity of the land. Indeed, we can thus profitably enrich such land even beyond its virgin fertility," and, again "... land may be built up and be made richer than it ever was by a good system of strictly grain farming." The experiment stations are successfully solving these problems.

**Humus,** decaying vegetable or animal matter, is the great storehouse of nitrogen, and is also an indispensable element in soils, not so much because of its direct nourishment to plants but because it helps to render other materials available for the growing crops. It is humus that gives life and heart to the soil, improves its physical condition, its tilth and texture, augments its water-holding capacity, gives its dark color, modifies extremes in its temperature, facilitates the entrance of air, and is what most worst lands suffer for want of.

**Commercial Fertilizers,** by which are provided artificial plant food, are in common and extensive use where lands have been depleted and crop production decreased, as on the tobacco and cotton lands of the Southern States, acting as a sort of medicine or stimulant to the soil, but many of them have little or no further influence than is evidenced in the increase of a single season's crops or crop.

Composition of the Principal Commercial Fertilizing Materials

FERTILIZING MATERIAL	NITROGEN	PHOSPHORIC ACID			POTASH	CHLORINE
		Available	Insoluble	Total		
Supplying nitrogen:	Per Cent	Per Cent	Per Cent	Per Cent	Per Cent	Per Cent
Nitrate of soda	15.5-16.0					
Sulphate of ammonia	19.0-20.5					
Dried blood (high grade)	12.0-14.0					
Dried blood (low grade)	10.0-11.0			3.0-5.0		
Concentrated tankage	11.0-12.5			1.0-2.0		
Fish-lime (bone)	10.0-11.0			11.0-13.0		
Dried fish scrap	7.0-9.0			6.0-8.0		
Cotton-seed meal	6.5-7.5			1.5-2.0	2-3.0	
Castor pomace	5.0-6.0			1.0-1.5	1-1.5	
Supplying phosphoric acid:						
South Carolina rock phosphate			20-25	26.0-28.0		
South Carolina rock superphosphate (discolored South Carolina rock phosphate)		12-15	1-3	13.0-16.0		
Florida land rock phosphate			32	33.0-35.0		
Florida pebble phosphate			26-32	26.0-32.0		
Florida superphosphate (discolored Florida phosphate)		14-16	1-4	16.0-20.0		
Boneblack			32-36	32.0-36.0		
Boneblack superphosphate (discolored boneblack)		15-17	1-2	17.0-18.0		
Ground bone	2.5-4.5	5-8	13-17	20.0-25.0		
Steamed bone	1.5-2.5	6-9	16-20	22.0-29.0		
Dissolved bone	2.0-3.0	13-15		15.0-17.0		
Thomas slag				11.4-23.0		
Supplying potash:						
Muriate of potash					48-52.0	45.0-48.0
Sulphate of potash (high grade)					48-52.0	0.5-1.5
Sulphate of potash and magnesia					20-30.0	1.5-2.5
Kainit					12-12.5	30.0-32.0
Sylvinit					16-20.0	42.0-46.0
Cotton-bull ashes					7.0-9.0	20-30.0
Wood ashes (unleached)					1.0-2.0	2.0-2.5
Wood ashes (leached)					1.0-1.5	1-2.0
Tobacco stems	2.0-3.0			3.0-5.0	6-8.0	

The following table is given, showing the amount of fertilizing constituents in one ton of various agricultural products, if returned to the land in the form of manure:

FARM PRODUCTS	NITROGEN	PHOSPHORIC ACID	POTASH
Timothy hay.....	19.2	7.2	25.2
Clover hay.....	29.4	8.0	35.0
Alfalfa hay.....	53.2	10.8	49.2
Cowpea hay.....	79.6	13.2	47.2
Field corn fodder.....	17.2	7.2	21.4
Corn silage.....	8.4	2.4	6.6
Wheat straw.....	8.0	2.6	14.8
Rye straw.....	10.0	5.8	15.8
Oat straw.....	13.0	6.0	24.4
Wheat.....	34.6	19.2	7.0
Rye.....	32.4	16.2	10.4
Oats.....	36.2	15.4	11.4
Corn.....	29.0	32.2	7.2
Barley.....	29.0	35.4	9.0
Wheat bran.....	51.2	56.4	33.4
Linseed meal.....	108.6	37.6	26.2
Cotton seed meal.....	142.8	61.8	36.4
Potatoes.....	7.0	3.2	11.4
Milk.....	10.2	3.4	3.0

**Kinds of Soils.**—Generally a soil well drained, with a sandy or gravelly subsoil, is adapted to tree and fruit growing. The deep alluvial prairie lands are premier for corn, and the rather drier and more compact soils, containing liberal proportions of lime and clay, are especially prized for wheat. Soil alone, however, does not determine the kinds of crops that should be raised.

**Rainfall.**—Over a large portion of America the precipitation is ample for the requirements of agriculture, but owing to wide variation in the yearly rainfall some sections have too much and others too little. In some of the plains regions west of the Missouri river, and elsewhere as well, precipitation is comparatively scant, but over considerable of these the greatest proportion of the yearly rainfall comes in the crop-growing season.

All localities are subject to vagaries of the weather, but their harmful effects are minimized by the knowledge that experience and study have brought. Diversity of crops, scientific methods of preparation and tillage best adapted to the particular locality, drainage and irrigation are being utilized through a better understanding, and have large influence on the general welfare.

**Irrigation and Drainage.**—Irrigation is the artificial watering of land to increase production, or make available for agriculture lands that otherwise would be too dry. Artificial watering of the land has been practiced from earliest times in the older countries, and even by the prehistoric people of some portions of what are now the United States.

Mormons, beginning late in 1840, in Utah, were the first modern people to demonstrate the practicability of extensive irrigation in America, and from their modest beginnings farming and fruit-growing by irrigation have slowly but continuously been extended until the nation, states, municipalities, companies and individuals are all interested in irrigation enterprises in the regions of insufficient rainfall. Authorities state that in 1860 about 100,000 acres of land were under irrigation in the United States, while in 1910 there were being irrigated over 10,000,000 acres, and more than 15,000,000 acres capable of irrigation were under completed canals and reservoirs.

The National Reclamation Law of 1902 gave great impetus to such undertakings in the United States. By its provisions the proceeds from sales of public lands in fourteen states and two territories have been used in the construction of irrigation

systems. In each of these the reservoirs are essential parts, storehouses for the collected flood-waters thereby made usable when needed for lands otherwise barren. Most of the irrigated lands are supplied by gravity with water from reservoirs and surface streams, although the lands watered by artesian wells are not unimportant, and those irrigated by pumping from wells by wind-power and gasoline engines are increasing, especially where immeasurable quantities of water, popularly called the underflow, lie near the surface. The applying of water in the United States is quite generally by checks, flooding and furrows, and in all skill and judgment are required, the character and situation of the soil and the crops planted being governing factors.

**Drainage,** by either natural or artificial means, has for its principal object the removal of excess water from the land, to make it more productive. Many tracts already producing would be greatly enhanced in value if some practical system of soil drainage were installed. The most efficient method is by the use of porous tiles, buried at proper depths and distances apart in the ground. In times of too much water they quickly carry off the surplus, early leaving the surface in condition for cultivation, and in times of drought permit such action of the earth's vapors as to accumulate moisture in the soil.

**Underdrainage.**—The practice of underdrainage is old, but the use of specially made burnt clay tiles for the purpose is comparatively recent. Such lands, for instance, as are full of water for the first two or three feet below the surface, or those where water stands on the surface after heavy rains, are greatly improved by tile methods, and water which was formerly probably employed to carry off surface water. Properly drained fields obviously present many advantages. Even in lands under irrigation the circulation of water in the soils is quite necessary, to prevent injurious accumulation of soluble substances having unfavorable effects. Fortunately, most lands have natural underdrainage, but without this the removal of the excess water by tiles is to be commended.

Ground too wet is generally cold, often sour, and unfriendly to plant growth, whereas well drained land, containing the moisture held by capillarity, has appreciably more warmth and needed aeration. These conditions not only increase its powers for developing and yielding plant food, but the soil being warmer, promotes the germination of seeds and gives thrifter, healthier plants. In ordinary seasons it enables preparation, planting, cultivating and harvesting to be done at such times as experience has shown best.

**Tillage and Dry Farming.**—It is quite probable that low yields and failures of crops are more generally due to inadequate and improper tillage than to any other part of the farmer's work. Proper seed, a soil of average fertility, its timely and proper preparation and subsequent tillage, where crops are cultivated during their growth, very materially determine yields.

Good soils often fail of compensating returns because of poor tillage. It is through the processes aided by cultivation that plant food is available and utilized. Sowing or planting the staple crops on unbroken sod would be unprofitable. By tillage the soil is not only aerated and pulverized but moisture is conserved.

The action of air and moisture in the soil brings about such changes that the otherwise largely unavailable food elements are liberated for assimilation by plants through their roots. Hence, the importance of thorough and scientific tillage for all crops, for yields are materially influenced by the frequency and kind of cultivation given.

**Dry Farming.**—This is all the more imperative in those regions of scant rainfall, and in those in recent years have been adopted a system of culture that makes production more certain and more abundant. This is popularly called "dry farming," the principles of which have been practiced from the most ancient times.

Dry farming means simply proper tillage, an outstanding feature being suitable preparation of the soil for the reception and retention of the natural precipitation. By providing a loose, finely pulverized surface, or dust blanket, capillary attraction with the moisture beneath is broken, lessening evaporation and promoting proper percolation.

Where irrigation is impracticable for lack of water, as in the major portions of the semiarid regions, such methods prove advantageous, and by conservation the natural rainfall is made sufficient for yields that otherwise would have been impossible. Its general principles might be profitably adopted everywhere, and are absolutely essential to remunerative results in regions of scant rainfall.

**Agricultural Education.**—Recognizing agriculture as the country's chief industry, Americans early evinced interest in agricultural education, which took practical form in the organization of societies for its promotion. Washington, the first president of the United States, strongly urged upon Congress the wisdom of providing ways and means for agricultural research and dissemination of the useful knowledge acquired, and he was a member of the first society formed, in 1785, for the advancement of agriculture in America.

This was the nucleus from which has developed the comprehensive agricultural educational system of our day, reaching its highest efficiency in the present excellent colleges and schools maintained in the interest of husbandry, with their elaborate curricula, extensive equipment, and army of capable instructors. Now, also, nearly every farming community has an agricultural or similar association. State, county and district fairs have been educators; nearly, if not all, the states have their boards of agriculture or their equivalent, supported by public funds, and from these institutions are issued, free, a great variety of literature to those interested in rural pursuits.

**Agricultural Literature.**—In the same time there has been developed through private enterprise an extensive agricultural literature, of general and special work and periodicals, many of which are devoted wholly to some one branch of farming, as dairying, a single breed of live stock, orcharding, market gardening, and the like. Farmers' institutes, the agricultural college short courses and extension work, instruction by correspondence and home reading courses and other kindred methods, all aid in teaching the why and wherefore of the business of farming.

**Extension Education.**—A number of colleges, with the cooperation of interested railroads, carry the gospel of better farming direct to those who cannot attend the schools, by sending out train specialists,

known as seed, wheat, dairy, corn, alfalfa, or poultry trains, depending on the topic selected for presentation. These trains are properly equipped and manned with college specialists, who lecture at the different railroad stations visited, and answer such questions as may be propounded, illustrating their lectures and answers by examples, specimens, diagrams, charts and tables—a method of teaching found extremely popular.

#### United States Department of Agriculture.

The head of the agricultural educational forces in the United States is the National Department of Agriculture, which was established in 1862 as a bureau, under direction of a commissioner, and in 1889 by an act of Congress made an executive department of the government under a secretary, appointed by the President, and who is a member of his cabinet. The work of its extensive corps of scientists and experts is principally for the nation as a whole, while that of the colleges and experiment stations chiefly concern the advancement of agriculture in the states in which they are respectively located. The national department issues bulletins, reports and other literature from its specialized bureaus, some free and others for which only nominal charges are made. The most popular are the "Farmers' Bulletins" and the "Yearbooks," both free, the latter obtained generally by application to members of Congress.

**Agricultural Colleges.**—While there were a number of agricultural colleges and schools supported mostly by private funds and popular subscriptions previously, the Land Grant act of 1862, by which Congress donated public lands to states and territories providing agricultural colleges, laid the broad foundation upon which have been built institutions for teaching agriculture and the mechanic arts in every state and territory. Supplemental to this endowment the states make liberal appropriations for furthering the work.

To Michigan belongs the distinction of having the oldest agricultural college in the United States, it having been created by legislative enactment in 1855, and formally opened in 1857. Nearly one-half of such colleges are connected with their state universities, and the others are separate, or are parts of technical or industrial instituti.

**Curricula.**—Their curricula embody many distinct courses, pertain to nearly every conceivable phase of farm affairs, and provide for teaching the sciences related to the various industries of farm, shop and home. Chemistry, physics, bacteriology, botany, entomology, zoology, mechanics, and kindred studies, are prominent. Courses comprehend among others the study of soils, soil physics, crops and their production, farm mechanics and farm management; animal husbandry, or the origin and history of the various breeds of domesticated animals and their characteristics, care, feeding, breeding and management; dairying, horticulture, veterinary science, mechanical engineering, electrical engineering, and domestic science and art.

**Agricultural Experiment Stations,** as the term would imply, are for conducting agricultural experimental investigations. They are generally connected with the agricultural colleges, and the members of the faculties of the colleges usually comprise the staff of the station. The first of the regularly organized experiment stations was in Connecticut in 1875, followed by others elsewhere.

In 1887 Congress passed the Hatch act, which gave \$15,000 a year for the maintenance of each agricultural experiment station, for experimentation, investigation, and the compilation and reporting of results.

**Purpose and Work.**—The law specifically states that these stations shall "conduct original researches or verify experiments on the physiology of plants and animals, the diseases to which they are severally subject, with remedies for the same; the chemical composition of useful plants at their different stages of growth, the comparative advantages of rotative cropping as pursued under a varying series of crops; the capacity of new plants or trees for acclimation; the analysis of soils and manures; the chemical composition of manures; natural or artificial, with experiments designed to test their comparative effects on crops of different kinds; the adaptation and value of grasses for forage plants; the composition and digestibility of the different kinds of food for domestic animals; the scientific and economic questions involved in the production of butter and cheese, and such other researches or experiments bearing directly on the agricultural industry of the United States, as may in each case be deemed advisable."

In 1906 Congress passed the Adams act, having for its object extension and strengthening of the experimental work of stations by additional funds. By its provisions an initial appropriation of \$5,000 was to be increased each year until 1911, when it would amount to \$15,000, thereafter to be annually available. The aggregate \$30,000 of government funds for each station, under the Hatch and Adams acts. Several states have two stations, one being supported wholly with state funds, and several maintain branches of the government stations.

**Publication of Results.**—Results of the work of these stations are published in bulletins and circulars sent free to those who desire them. While the agricultural colleges and stations are in a sense separate institutions, their property and work are more or less closely interwoven, to their mutual advantage, the colleges profiting from the work of the stations, and the stations from the gratuitous use of the college farms, buildings, apparatus and equipments.

**Plant Breeding, and Seeds.**—A work of great importance carried on by experiment stations is that of improving crops in both yield and quality. Knowing that through the process of selection based on chemical analysis the sugar content of the sugar-beet has been increased from about 5 per cent to 16 per cent, the idea was advanced that the chemical composition of corn might be similarly changed. Experiments showed that it could be done at will, either to a high or low protein, oil content, or other constituent; that a corn rich in protein had an added value for feeding to growing animals; the corn with the larger oil content was of special worth in fattening animals, and the increase of carbohydrates rendered it more valuable for manufactures, as for starch, glucose, and other articles. Similarly, wheat had been improved for flour-making by increasing the gluten content, and such possibilities in plant-breeding seem well-nigh limitless.

**Value of Selected Seed.**—The wisdom of using seed selected according to approved standards has already been convincingly

demonstrated, through improved quality and increased yields. Several states, notably Minnesota, Illinois and Kansas, have by these methods materially enlarged their yields of wheat and corn. Experience has shown, too, the advisability of planting only such seeds as have been graded, and tested for germination, so that a given quantity may be planted uniformly on a given area, with reasonable assurance of definite results.

**Imperfect Viability of seeds** cannot be detected by mechanical examination alone, but the testing box tells in advance of the field planting. The importance of this is emphasized by the illustration that if seed corn, for instance, was only 90 per cent germinable, it would mean the vacant places in the field would aggregate 10 per cent of the area, or ten acres out of a hundred which would produce nothing, due to an uneven and imperfect stand because of the 10 per cent of worthless seed. Lacking good seed there can be no successful agriculture. (See also *Elementary Agriculture*, under Education.)

**Status of the United States in Agriculture.**—It aggregates of field production the United States is without a peer among the nations. Although the capabilities of some parts are as yet but poorly comprehended, the possibilities of others scarcely suspected, and developments superficial, owing to the large holdings by corporations as well as by individuals, and the variant conditions that had to be understood before they could be dealt with, the achievements of the past promise to be far surpassed by the enlightened husbandmen of the future.

**Rank Among Our Industries.**—The country's progress and development agriculturally is suggested by the fact that the aggregate of Indian corn raised in 1909 in the United States was considerably more than that in 1875. In 1875, with a yield of 308,103,000 bushels, it assumed first rank in wheat in 1875; in 1909 the yield was 737,189,000 bushels, or 139 per cent greater. The 1901 crop, however, of 748,460,000 bushels was the largest ever produced, the 1909 crop being next.

In quantity and value the agricultural products of the United States exceed those from any other source. In three-score years they have advanced from the point of not equalling home demands to that of making the United States the world's largest exporter of farm products. In the aggregate of products American agriculture rivals that of all Europe. The farms not only contribute abundantly for home needs, and provide export commodities overshadowing in value all others combined, but supply the manufacturers of the country with raw materials, although, as already stated, the ratio between production and consumption at home has been gradually narrowing.

**Exports.**—For the year ending June, 1909, the value of farm products exported from the United States was \$903,000,000, of which live stock and their products were an important part. Large amounts of domestic animals, especially cattle and sheep, and immense shipments of dressed meats go to foreign ports constantly. Cotton is the leading export crop, the quantity thus disposed of in 1909 amounting to 4,448,000 pounds, valued at \$147,300,665. In 1909 the live animals exported aggregated in value \$22,645,438, while that of packing house and dairy products reached nearly \$173,500,000.

TABULATIONS ON AGRICULTURE, HORTI-  
TABLE I.

CROP	SOIL	PLANTING DATE	SEED TO ACRE	AVERAGE YIELD PER ACRE	ORIGIN AND BRIEF HISTORY	USE
<b>Alfalfa.</b> <i>Medicago Sativa.</i> Linn. <i>Leguminosa.</i>	Deep, well-drained, nonacid, fertile, with deep, permeable subsoil.	May-July north March-May, Aug.-Oct. south.	20-25 pounds broadcast. 15-20 pounds drilled.	3 tons.	Is native to southwestern Asia and was in use centuries before Christian era. Spread from Media to Greece about 480 B. C. Italy first century A. D., Spain eighth century, Mexico and South America sixteenth century. Was introduced from Chili into California in 1854. Came from Mexico to Texas early part of nineteenth century.	Stock feeding. Pasture. Soil-improvement. Soil improvement.
<b>Barley.</b> <i>Hordeum sativum.</i> Linn. <i>Graminea.</i>	Old, well-subsoiled land, not soggy. Rich clay loam best.	April-May north March-April, September-March, south.	1.5 to 2.5 bushels.	25.5 bushels.	Supposed to be native of western Asia, and widely grown before Christian era. Use as a broadplant universal throughout Europe, Asia and Africa to close of fifteenth century.	Maiting purposes. Hay and grain. Food for domestic animals. Human diet. Malt-sprouts and brewers' grains are by-products.
<b>Buckwheat.</b> <i>Eragrostis esculentum.</i> Munich. <i>Polygonacea.</i>	Rather light, well-drained, and not overrich. Will grow in wide range, including poor land.	May-July 15.	3-5 pecks.	18.1 bushels.	Native of Europe and northern Asia. Has been cultivated for centuries in all grain-producing countries. Is found wild in China and Siberia, and has been grown in China for food from time immemorial.	Flour for human food. Honey plant. Grain for poultry. Middlings a by-product for stock feeding.
<b>Clover, Alsike.</b> <i>Trifolium hybridum.</i> Linn. <i>Leguminosa.</i>	Deep clay loam. Will do well on moist and cool land.	March-August.	8-15 pounds alone. 4-6 pounds on wheat or rye in spring.	1.5 tons hay. 4 bushels of seed.	Takes its name from parish in South Sweden. From there probably introduced into England. Is found in Europe, northern Africa, western Asia. Reached America from Great Britain of Scandinavia.	Hay. Pasture. Silage. Honey plant. Soil improvement.
<b>Clover, Red.</b> <i>Trifolium pratense.</i> Linn. <i>Leguminosa.</i>	Sweet medium clay loam, underlain with moderately porous clay subsoil. Moist and abundant humus.	March-August.	15 pounds alone. 8-14 pounds on small grain in spring.	1.5 tons hay. 3-6 bushels of seed.	Probably native to Europe. Introduced into England early in seventeenth century. Doubtless introduced into America by early colonists.	Hay. Pasture. Soiling. Silage. Soil improvement.
<b>Clover, White.</b> <i>Trifolium repens.</i> Linn. <i>Leguminosa.</i>	Light clay loam, sweet.	March-August.	10-12 pounds alone. 2-4 pounds in mixtures.	1.5 tons hay. 2.5 to 6 bushels of seed.	Indigenous to Europe, northern America and probably western Asia. Grows in every country in Europe and throughout America. Best in moderately cool, moist climate.	Lawn grass. Pasture. Honey plant. Short hay. Soil improvement.
<b>Corn.</b> <i>Zea mays.</i> Linn. <i>Graminea.</i>	Fertile, medium loam. New lands preferable.	May-June north. Late March, south.	6 quarts to 1 bushel. 9-11 quarts for silage.	25.4 bushels.	Originated in Mexico. Found in cultivation and principal food of Indians by first explorers of North America. Is related botanically to a native Mexican grass, <i>Euchloa mexicana</i> .	Human food. Stock feeding. Grain for poultry. For manufacture of glucose, dextrine, alcohol, starches, grits, hominy, oil, etc.
<b>Cotton.</b> <i>Gossypium hirsutum.</i> Linn. <i>Malvacea.</i>	Fertile clay or sandy loam, with a clay subsoil at a depth of about two feet.	April-May 15.	1/2 to 1 bushel.	0.5 bale.	Origin antedates recorded history. Supposed to have originated in India, or possibly China. Found in various countries of southern Asia and Africa, and Columbus and other explorers found it native in West India, South America and Mexico. First cultivated in United States in colony of Virginia, 1621.	Manufacture of cloth, thread and yarn. Cottonseed oil. Cottonseed meal, oil cake and hulls for stock feed.
<b>Cowpea.</b> <i>Vigna unguiculata.</i> Walp. <i>Leguminosa.</i>	Wide range, sandy and loamy soils preferred.	May-June north. May-July south.	1 to 1.5 bushels. 3 pecks for seed.	1.5 tons. 10 bushels of seed.	Native of India and region northward to southern part of trans-Caspian district. Has been cultivated more than 2,000 years. Reached West India later part of seventeenth century, and mainland of America later.	Soil improvement. Forage. Seed food for man and domestic animals. To fit land for sod.
<b>Mangel.</b> <i>Beta vulgaris.</i> Linn. <i>Chenopodiacea.</i>	Wide range, deep alkaline loam preferable. Good preparation of seed-bed essential.	April-May	5-8 pounds.	24 tons.	Considered direct descendant of chard, used as vegetable by Greeks 300 B. C. Use of root for rattle feeding recorded in sixteenth century. Beets introduced in America by early colonists.	Stock feed.
<b>Millet.</b> Many groups and varieties. <i>Graminea.</i>	Fertile, mellow clay loam.	April-July.	1-3 pecks drilled.	1.5 tons.	Cultivated in China since 2800 B. C. Still largely grown in oriental countries as food grain and forage. In America, usually grown as supplementary or catch-crop.	Hay. Forage. Soiling. Silage. Pasture. Seed for stock feed.
<b>Oats.</b> <i>Avena sativa.</i> Linn. <i>Graminea.</i>	Not specially fertile. Clay loam preferable.	April-May north. February-March, September-December south.	2-3 bushels.	30.1 bushels.	Probable nativity Tartary in western Asia, or possibly eastern Europe. Largely north temperate zone crop, but grown in Australia, Africa and South America. Has been cultivated in America since advent of first settlers.	Food for animals. Human food. Forage crop. Pasture.
<b>Rice.</b> <i>Oryza sativa.</i> Linn. <i>Graminea.</i>	Rich, moist, well-drained clay loam.	March 15-June 15.	1.3 bushels	25-30 bushels.	Existed in India in early historic times, and doubtless indigenous there. Introduced into America soon after settlement of Virginia. Introduced accidentally into lower Carolina in 1694.	Human food. Stock feed. Wine.

\*The bulletins herewith mentioned may be had upon application to the director of the respective agricultural experiment station or college publishing

CULTURE AND ANIMAL HUSBANDRY  
FIELD CROPS

FERTILISERS	PLANT DISEASES AND ENEMIES	REMEDIES	BULLETINS*
Line to correct acidity, well-rotted manure. Commercial fertilizer containing phosphoric acid and potash.	Dodder. Leaf spot. Anthracnose. Root rot. Web-worm, army worm.	Close cutting, removal of stalks, burning, close pasturing. Mowing. Watering and application of nitrate fertilizer. Plowing under. Mowing, fall disking.	Farmers' Bulletin Nos. 194, 215, 330, 373. Canada Central Experimental Farm Bulletin No. 46. Most experiment stations have issued bulletins.
Barnyard manure. 500 to 1,000 pounds of complete commercial fertilizer.	Rust and mildew. Closed smut.  Loose smut.	No effective remedy. Formaldehyde treatment: 1 pint formaldehyde into 20 gallons water in barrel. Submerge sacks of barley 10 minutes in solution, then empty on platform to dry. Preferably, cover drying seeds with blanket for two hours. Hot water treatment, which is effective also against closed smut: Grains in gunny sacks submerged 12 hours in cold water, to soften hull; then removed and drained 1 hour; then submerged in hot water at constant temperature of 130° F. for not over 6 minutes. Seed should be sown same or following day.	Wisconsin Experimental Station Reports Nos. 20, 21, 22, 23.  Year books of the U. S. Dept. Agr.
Fertilizer seldom needed. Light applications barnyard manure or moderate dressing of complete fertilizer on poor soil. 100 pounds of low-grade fertilizers, especially if sown late.  Crushed and unburned lime-stone. Carbonate of lime. Stable manures.	Relatively free from diseases and insects. Birds may cause loss.		Yearbooks of the U. S. Dept. Agr.  Cornell Bulletin No. 238.
See alsike clover.	Clover sickness, a soil condition, the result of overcropping to clover. Flower midges.  Seed fly. Root borer. See alsike clover.	Grow clover less frequently in the rotation. The addition of potash may aid.  Feed off or mow first crop just before timothy heads out. Pasturing or clipping back to delay blooming ten days useful. No practicable remedy known. Crop rotation. See alsike clover.	U. S. Dept. Agr. Plant Industry Bulletin Nos. 31, 59, 66, 123.  Farmers' Bulletin Nos. 123, 237, 260, 323.  See alsike clover.
See alsike clover.	See alsike clover.	[See alsike clover.	See alsike clover.
10-20 tons farm manure each year or two. Phosphoric acid, nitrogen and potash. Plow under large quantities of vegetable matter, preferably legumes and grasses.  Add phosphate kainit. Muriate of potash. Nitrate of soda. Cottonseed meal. Barnyard manure.	Root worm. Webworm. Cutworm.  Chinch bug. Grasshoppers. Crows. Smut. Webworm and cotton-square borer. Plant lice.  Cutworms. Cotton worm.  Cottonboll worm. Mexican cottonboll weevil. Wilt. Screw-worm or damping off. Root knot.	Crop rotation and fall plowing. Crop rotation and fall plowing. Early fall plowing. Sprinkling bran mixed with paris green and molasses in proportions of 30 pounds bran, 1 pound paris green, 2 quarts molasses, enough water to moisten the bran. Trap in dusty furrows. Destroy in furrows by kerosene. Strip of coal tar will prevent passage. Trap on wide catches drawn rapidly around field. Burn affected plants and rotate crops. Dust with paris green.  Plow under host plants in fall or winter, or spray with whaleoil soap, kerosene emulsion or tobacco solution. Haul about fields bunches of grass immersed in paris green; or destroy by winter cultivation. Apply paris green to plants. Mature crop early and destroy immediately all rubbish. Fumigate seed with carbon bisulphide before planting. Plant disease-resistant seed; burn infested plants; rotate crops. Lime and cultivate to keep surface much dry.  Bordeaux mixture. Iron variety practically immune.	U. S. Dept. Agr. Office of Experimental Station Bulletin No. 57. Farmers' Bulletin Nos. 32, 41, 81, 174, 199, 229, 253, 292, 298, 308, 312, 317.  U. S. Dept. Agr. Office of Experimental Station Bulletin No. 33. Bureau Plant Industry Bulletin No. 62. Division of Statistics Bulletin No. 16. Yearbooks 1902, 1904. Farmers' Bulletin Nos. 36, 48, 217, 302, 314, 326.  U. S. Dept. Agr. Bureau of Plant Industry Bulletin No. 25. U. S. Dept. Agr. Agronomy Bulletin No. 64, Circular No. 24. Yearbook for 1906. Most experiment stations have issued bulletins. New York (Cornell) Bulletin No. 243, 244.
Phosphoric acid 200 to 400 pounds and muriate of potash or kainit, 100 pounds per acre.	Wilt.		
10 to 12 tons manure in fall. 100 to 200 pounds muriate of potash in fall or early spring.	Mildew and leaf spot. Nematode worms.  See sugar beet.	Seldom extensive damage. Iron variety practically immune.  See sugar beet.	
Manure to be determined by local needs. Requires plant food near surface.	Smut.	Formaldehyde or hot water treatments. See under barley.	Farmers' Bulletin No. 168. Division of Botany Bulletin No. 23. Kentucky Experiment Station Bulletin No. 98. Kansas Bulletin No. 162.
Fertilizers must be used sparingly. Barnyard manure, 10 to 25 loads per acre on poor soils. Fertilizer containing 10 to 20 pounds each of ammonia and potash, and 30 to 60 pounds of phosphoric acid.  Rich soils generally used.	Chinch bug.  Closed and loose smut.  Orange leaf rust. Black stem rust. Chinch bugs. Army worms.	Crop rotation. See under oats.  Formaldehyde or hot water treatments of seed. See under barley.  Plant resistant and early maturing varieties.  Plow furrow to prevent spread. Scatter tar in furrow. In extreme cases burn one field to save another.	Farmers' Bulletin Nos. 250, 393, 420, 444. Ohio Experiment Station Bulletin No. 101, 108. Louisiana Experiment Station Bulletin No. 24, 50, 61, 77.
	Rice weevil. Rice worm. Rice grub. Chinch bug. White blight. Smut.	Carbon bisulphide. Draw off water and allow field to dry for few days. Water. Thorough flooding. Application of lime to soil. See under barley.	Farmers' Bulletin No. 110. Division of Botany Bulletin No. 22. U. S. Dept. Agr. Office of Experiment Station Bulletin No. 112. Louisiana Experiment Station Bulletin No. 24, 50, 61, 77.

the same, or to the United States Department of Agriculture. A list on each station follows the table.

TABLE I. FIELD

CROP	SOIL	PLANTING DATA	SEED TO ACRE	AVERAGE YIELD PER ACRE	ORIGIN AND BRIEF HISTORY	USE
<b>Rye.</b> <i>Secale cereale.</i> Linn. Gramineae.	Light, with little clay. Well drained, will grow on poor soil.	April-May or September-November.	3-4 pecks early, 6-8 pecks late.	15.7 bushels. 1 ton of straw.	Original home was between Austrian Alps and Caspian Sea. Culture more than 2,000 years old. Seems to be of decreasing importance.	Grain for animal and human food. Fall pasture. Cover-crop and green manure. Alcoholic liquors. Pasture for hogs. Hay. Fodder. Silage. Straw.
<b>Sorghum.</b> <i>Andropogon sorghum.</i> Linn. or <i>Sorghum vulgare.</i> Pers. Gramineae.	Rich, well drained, sandy or clay loam.	March-June.	1.5 to 2 bushels broadcast, 6 pounds to 0.5 bushel for silage drilled.	3-6 tons fodder, 8-20 tons green forage.	Originated in tropical or subtropical regions of old world, and in cultivation as human food for many centuries, long before Christian era. Tropical Africa generally considered birthplace.	Flour. Alcoholic liquors. Pasture for hogs. Hay. Fodder. Silage. Straw.
<b>Soybean.</b> <i>Glycine hispida.</i> Maxim. Leguminosae.	Well-drained sandy, loam or clay soil.	May-June.	2-3 pecks in drills, 1 to 1.5 bushels broadcast.	12-20 bushels.	Native of southeastern Asia. Thought to be derived from wild <i>Glycine soja</i> of Japan. Grown extensively in China and Japan.	Animal grain feed. Silage. Soybean oil. Hay. Cover-crop and soil improvement. Human food.
<b>Sugar Beet.</b> <i>Beta vulgaris.</i> Mout. Chenopodiaceae.	Clay loam, or not too light sandy loam.	May, north January-May south.	15-20 pounds.	11.5 tons.	Known at least three centuries before Christian era. Sugar first extracted about middle of eighteenth century by Margraff. First attempt to grow beets for sugar in U. S. in 1830, near Philadelphia.	Stock feeding. Sugar manufacture.
<b>Sugar Cane.</b> <i>Saccharum officinarum.</i> Linn. Gramineae.	Well-drained soil of good average character.	March 21-May 20.	4 tons of cane.	8-25 tons.	Origin lost in antiquity. Cultivation probably among first undertaken by tropical peoples. Early use almost exclusively for eating raw. As source of sugar it stood practically alone until beginning of last century.	Manufacture of sugar and molasses.
<b>Sweet Potato.</b> <i>Ipomoea batatas.</i> Poir. Convolvulaceae.	Warm, sandy, well-drained and aerated.	March 21-May.	1.5 to 4 bushels.	100 bushels.	Native unknown, probably tropical America. Was cultivated in tropics of both hemispheres when authentic records began. De Candolle inclines to an American origin.	Human food.
<b>Timothy.</b> <i>Phleum pratense.</i> Linn. Gramineae.	Deep, clay loam, moist and fertile.	March-October.	8-16 pounds; with clover 10 pounds.	1.5 tons.	Native of Europe and extensively cultivated in cooler parts of North America as a forage plant. Introduced to America from England in 1720.	Hay. Pasture.
<b>Tobacco.</b> <i>Nicotiana glauca.</i> Linn. Solanaceae.	Rich, friable sandy loam in seed-bed, well fertilized each spring with fertilizer containing 10 per cent ammonia, 8 per cent available phosphoric acid, 12 per cent soluble potash.	February 1 to March 1 in seed-bed, April-June in field.	1 table-spoonful to 100 square yards of seed-bed, to set out six acres.	800-1000 pounds.	Of American origin. Pipes and other means for smoking tobacco were found in prehistoric mounds of the United States, Mexico and Peru. Columbus found natives using tobacco for smoking, chewing and snuff. In 1558, Jean Nicot, French ambassador to Portugal, sent a supply of tobacco seed to Queen Catherine de' Medici, and to commemorate the service the generic name Nicotiana was given.	Disinfectant. Smoking and chewing purposes. Stalks for making of paper.
<b>Vetch.</b> <i>Vicia spp.</i> Leguminosae.	Wide range. Used on poor sandy or gravelly soils to improve them. Prefers moist clay loam.	April-June, September-December.	1 bushel.	1.5 to 3 tons.	Common spring vetch is native in Europe and western Asia. Was cultivated by Romans. Reached America 100 years ago.	Cover-crop. Stock feed. Soil improvement. Pasture.
<b>Wheat.</b> <i>Triticum sativum.</i> Lam. Gramineae.	Light clay and glacial drift soil.	September-October, April-May.	6-8 pecks.	13.8 bushels.	Wheat cultivation antedates recorded history. Monuments more ancient than Hebrew scriptures depict its cultivation established. Chinese grew wheat 2700 B. C. Cultivation in America prior to discovery by Columbus not known.	Flour for human food. Grain for stock feeding. Straw. Bran, shorts and middlings are by-products for stock-feeding.

TABLE II. ORCHARD

CROP	CLIMATE	SOIL	PLANTING TIME, PLANTS OF SEED PER ACRE	DISEASES	REMEDIES
<b>Apple.</b> <i>Pyrus malus.</i> Linn. Rosaceae	Temperate	Clay loam to sandy loam, with variety preferences.	Fall or spring, fall preferable.—27-33.	Scab.  Fire blight.  N. Y. apple tree canker.	Spray thoroughly with lime-sulphur, 1-40, or bordeaux, 3-3-50, 3 times: (1) Just before blossoms open, (2) just as blossoms fall, (3) 10 to 14 days after blossoms fall. Cut out and destroy diseased parts. Wash wound with corrosive sublimate 1 part to 1,000 of water. Paint wound with gas tar or lead paint. Spray before buds start with lime-sulphur, 1-12, or bordeaux, 10-10-50; soak body and limbs when making first application for scab. Cut out cankers and treat wound as for fire-blight.
<b>Asparagus.</b> <i>Asparagus officinalis.</i> Linn. Liliaceae	Temperate.	Warm, well-drained loam, deep rich, fertile and moist.	Early spring, April preferable for seed.—5,445-14,520. 1 os. of seed to 400 plants. Rows 3 ft. apart, plants 1 ft. in row; or rows 4 ft. apart, plants 2 ft. in row, 5,445. Rows 2 ft. apart, plants 15 inches in row, 14,520.	Rust.	During cutting season, permit no plants to mature. Fertilize liberally and cultivate thoroughly. Late in the fall burn all infected plants. Spray with bordeaux, 5-5-50, containing a tickler of resin, red soda, soap. Spray when shoots are 8 to 10 inches high after cutting, and repeat once or twice a week.

## CROPS—Continued

FERTILIZERS	PLANT DISEASES AND ENEMIES	REMEDIES	BULLETINS
350 pounds per acre of dissolved phosphate rock.	Black rust of stems. Orange rust of leaves. Smut. Ergot. Chinch bug. Hessian fly.	Burn infested stubble—rotate crops. Formaldehyde or hot water treatment. See under barley. Clean seed on clean land. Burn rubbish nearby. Rotate crops. Plow deep trenches and use tar strips. Resistant varieties, late seeding, burning stubble, sowing early wheat trap crop.	Pennsylvania Agr. Experiment Sta. Bulletin No. 52. U. S. Dept. Agr. Yearbooks.
Barleyard manure and leguminous fertilizers.	Grain smut. Whole-head smut. Chinch bugs and green aphids.	Rotation and seed selection. Hot water and formaldehyde treatments. See under barley. Seldom serious. Avoid continuous cropping on same area.	Farmers' Bulletin No. 37, 50, 90, 135, 174, 246, 288. Bureau of Chemistry Bulletin No. 14, 20, 26, 34.
200 to 300 pounds high-grade acid phosphate, 50 pounds muriate or sulphate of potash per acre.	Sclerotium. Nematode root worms. Rabbies. Grasshoppers. Reddish brown hairy caterpillar.	Fatal. No treatment. Not specially serious.	Farmers' Bulletin No. 58, 121, 372. Connecticut Experiment Station Bulletin No. 22. Delaware Bulletin No. 60, 61. Georgia Bulletin No. 17. Indiana Bulletin No. 108. Kansas Bulletin No. 16, 92, 100, 123. Many other station bulletins. Division of Entomology Bulletin No. 19, 23, 29, 31, 40, 43. Special Report No. 28. Bureau of Chemistry Bulletin No. 27, 96.
Green fertilizers, generally alfalfa. Stable manures. Complete commercial fertilizers.	Leaf spot. Curly top. About 160 insect enemies.	Bordeaux mixture and crop rotation. Seldom occurs in two successive seasons in same locality. See entomology bulletins in next column.	Farmers' Bulletin No. 52, 92. Bulletin of Hawaiian Sugar Planters Experiment Station, Louisiana, Cuba, and Porto Rico Experiment Stations.
Stable manure. Nitrogenous fertilizers, dried blood, fish refuse in small quantities. Lime extensively.	Root diseases, rind diseases, scorch, pineapple disease, red top, top rot, smut, rust. Mites. Borers. Innumerable insects. Parasitic nematodes on roots.	Burn over, use quicklime as soil fungicide. Plant in new soil. Burn over or poison. Mongongo will destroy. Hand pick, rotate crops, use trap crops, or rest land. Fought by introduction of parasites. Expose soil to air and sunlight.	Farmers' Bulletin No. 26, 129, 324. Arkansas Experiment Station Bulletin No. 72. South Carolina Bulletin No. 63.
Abundant humus. Light straw manure. Crimson clover and plowed under at half-growth. Stable manure put in furrow under the crop.	Black rot. Soft rot. Soft rot. Tortoise beetles. Sawflies. Flea beetles.	Use slip-seed. Thoroughly clean and disinfect storage house. Dry potatoes before storing. Destroy all infected potatoes. Crop rotation. Apply kainit and sulphur, 300 pounds per acre. Dry potatoes before storing. Destroy all infected potatoes. Dip plants before setting in solution of arsenate of lead, 1 pound to 25 gallons water. Paris green or the above arsenical spray. Arsenical sprays.	Farmers' Bulletin No. 111. Division of Agronomy, U. S. Dept. Agr., Bulletin No. 7, 14, 17, 20. N. Y. State College of Agr. Farmers' Reading-Course Bulletin No. 10.
Top dressing with barnyard manure and complete fertilizer.	Root rot. Sore skin. Wilt. Angular leaf spot. Folk burn. Flea beetle and horn-worm. Tobacco worm. Cutworms.	Sterilize soil with hot or formalin before seed sown. Lime. Plant disease-resistant seed; burn infested plants; crop rotation. Grow vigorous plants. Apply heat carefully and ventilate sheds to reduce humidity. Light spray of paris green, 1 pound paris green, 1 pound quicklime, 100 gallons water, stirred constantly while in use. Dust or spray with paris green, 1 pound to 160 gallons water. Sow along rows bran and paris green, 1 pound paris green, 50 pounds bran. Hand pick or dust or spray with paris green.	Farmers' Bulletin No. 60, 82, 83, 120, 343. Plant Industry Bulletin No. 18, 51, 91, 96. Report on the Culture of Tobacco, U. S. Census, 1883. Bulletins from experiment stations, particularly Connecticut, Maryland, North Carolina, Kentucky.
Seldom needed. On poor land, complete fertilizer, and especially phosphoric acid and potash, may be required.	Bud worm.		Farmers' Bulletin No. 18, 102, 147. Division of Agronomy Circular No. 6. Alabama Experiment Station Bulletin No. 87, 96, 105.
Barnyard manure. Complete commercial fertilizers. 200 to 400 pounds of a 4-12-4 fertilizer commonly used.	Hessian fly. Chinch bug. Rust. Loose smut. Stinking smut or bunt.	Late seeding, burning stubble. Clean tillage, crop rotation. Plant resistant varieties. No satisfactory treatment. Formalin, 1 pound to 50 gallons water. Sprinkle the wheat and cover with cloths soaked in the solution, or immerse the seeds 30 minutes; or blue stone, 1 pound to 5 gallons water. Immerse seeds 10 minutes, then drain and dry. Apply the solution to all utensils and machinery used.	Farmers' Bulletin No. 132, 250. U. S. Dept. Agr. Division of Physiology and Pathology No. 16, 24, 29. Plant Industry Bulletin No. 3, 47, 78, 79. Office of Experiment Station Bulletin No. 11.

## AND GARDEN CROPS

INSECT AND OTHER ENEMIES	INSECTICIDES AND REMEDIES	TIME TO BEAR	YIELD PER ACRE	BULLETINS ON CULTURE
Bud moth.	Applications of either 1 lb. paris green or 4 lbs. arsenate of lead in 100 gals. water (1) when leaf tips appear and (2) just before blossoms open.	3 to 6 years from planting. Good crop in 10 to 15 years.	Tree 30 years old 20-30 bus.	Cornell Bul. 272. California Buls. 103 and 185. Cornell Buls. 93, 124, 142. Geneva Buls. 262, 206, 306, 330. Geneva Circular 9.
Canker worms.	Spray once or twice before blossoms open with 1 lb. paris green, or 4 lbs. arsenate of lead in 100 gals. water. Keep after blossoms fall. Use sticky bands or wire-screen traps to prevent ascent of wingless females. Use burdock bags on trunk, and kill caterpillars under them every 10 days from July 1 to Aug. 1, and once later.			
Codling moth.	Spray with kerosene emulsion diluted with 6 parts of water or whale oil soap, 1 lb. to 4 or 6 gals. water, in May or June when young white leaf appear.			
Oyster shell scale.	Chickens and ducks will destroy. Close cutting of young shoots early in season. Use fresh air-slaked lime or arsenites dusted on dew-wet plants after cutting period.	Seed 3-4 years. Plants 1-3 years.	2000 bunches of 3½ in. diameter.	Geneva Buls. 75, 188. California Buls. 105 and 172. New Jersey Reports 1895, 1896. Farmers' Bul. 61. Massachusetts Bul. 61. Iowa Bul. 63.

TABLE II. ORCHARD AND

CROP	CLIMATE	SOIL	PLANTING TIME, PLANTS OR SEED PER ACRE	DISEASES	REMEDIES
<b>Beans</b> (bush), <i>Phaseolus vulgaris</i> , <i>Leguminosae</i>	Warm temperate.	Good warm loam.	May-June—1 qt. of seed to 100 feet of drill. In drills 2 ft. apart plants 15 inches in row, in hills, 18x20 inches, 1 plant per hill. Should be 3 plants per hill.	Anthraxnose or red spot.	Plant clean seed. Hand spray with Bordeaux mixture, 5-5-50, (1) when plants break through ground, (2) when first pair of leaves are expanded, (3) when pods have set.
<b>Beans</b> (pole), <i>Phaseolus vulgaris</i> , <i>Leguminosae</i>	Warm temperate.	Warm fertile soil.	Late spring, after danger of frost. After ground becomes warm—1 qt. seed to 200 hills. Hills 4x4 ft., one plant per hill. Should be at least 5 plants per pole.	Blight.	Spray with bordeaux as for anthraxnose.
<b>Beets</b> , <i>Beta vulgaris</i> , Linn., <i>Chenopodiaceae</i>	Temperate.	Loose, light, fresh, clean rich soil.	April-June—Seed 5-6 lbs. per acre. In drills 12x6 inches.	Scab, rust, rot, spot diseases.	Avoid following potatoes with beets. Practice clean culture and proper rotation. Spray with bordeaux mixture for leaf diseases.
<b>Blackberry</b> , <i>Rubus nigro-obscurus</i> , Bailey, <i>Rosaceae</i>	North temperate. Cool, northern exposure.	Strong loam, retentive of moisture and tending toward clay.	Spring preferably, or fall—900 to 1550.	Anthraxnose and leaf rust.	Cut out bearing canes as soon as they are through fruiting.
<b>Cabbage</b> , <i>Brassica oleracea</i> , Linn., <i>Cruciferae</i>	Cool, moist climate.	Well drained, rich, friable loam.	April-May to June-July—7,000-11,000. 1 oz. seed to 3,500 plants.	Club-root or club foot.	Practice crop rotation. Set only healthy plants. Do not use manure containing cabbage refuse. Lute the seed-bed at least as early as fall before.
<b>Cauliflower</b> , <i>Brassica oleracea</i> , Linn., var. <i>botrytis</i> , D. C., <i>Cruciferae</i>	Temperate, cool and moist.	Richest land, strong, moist, loam best.	April-May in seed-bed. July in field.—7,000 to 10,000. 1 oz. seed to 3,000 plants.	Black rot.	Practice crop rotation. Soak seed 15 minutes in solution made by dissolving one corrosive sublimate in 100 parts of water.
<b>Celery</b> , <i>Apium graveolens</i> , Linn., <i>Umbelliferae</i>	Temperate.	Moist peaty soil or highly fertilized land.	January-April in seed-bed. May-August in field—20,000 to 30,000. 1 oz. seed to 7,000 plants.	Same as cabbage.	See cabbage.
<b>Cherry</b> , <i>Prunus avium</i> and <i>Prunus cerasus</i> , Linn., <i>Rosaceae</i>	Secret, 35-45° latitude, 60-80° longitude. Sour, 35-45° latitude, 68-100° longitude.	Elevated, light, dry, loamy, retentive soil.	Spring or fall—Sweet 48, sour 154.	Cercospora leaf blight of early blight. Septoria leaf blight or late blight.	Spray with ammoniacal copper carbonate, 6-3-45, making 5 to 8 applications. Begin while still in seed-bed. Bordeaux 5-5-50, may be used for earlier application.
<b>Current</b> , <i>Ribes rubrum</i> , Linn., <i>Saxifragaceae</i>	Cool temperate climate.	Cool, moist and rich soil.	Fall or spring—2,178.	Black knot. Leaf spot; powdery mildew.	Plant resistant varieties. Prune trees to let in sunlight and air. Spray with well-leaked lime-sulphur, 5-5-50, to which add 2 lbs. arsenate of lead to 50 gals. Spray (1) about time young fruit sets, (2) 2 to 3 weeks later, (3) 1 month before fruit ripens, omitting the arsenate.
<b>Cowberry</b> , <i>Ribes ssp.</i> , <i>Saxifragaceae</i>	Cool and shady north temperate.	Moist, but not soggy, clay loam. Herb, root, bottom lands.	Fall or early spring—2,178.	Black knot. Leaf spot; powdery mildew.	Cut out and burn all knots before leaves appear. Spray with lime-sulphur or bordeaux. Dust with sulphur or spray with potassium sulphide, 1 oz. to 3 gals. water, or lime-sulphur as for leaf spot.
<b>Grape</b> , <i>Vitis ssp.</i> , 1 <i>Rosaceae</i> .	Warm. Along shores of water best. The location must provide frost drainage.	Gravelly or clay.	In spring. Completed by last of May—605.	Black rot.	Begin when plants are small, on over 3 or 4 times every summer and cut out and burn all diseased canes. Upon first appearance of current worms spray with bordeaux and Paris green, 1 lb. to 100 gals., or arsenate of lead, 4 lbs. to 100 gals. Repeat if second brood of worms appears.
<b>Lettuces</b> , <i>Lactuca sativa</i> , Linn., <i>Compositae</i>	Cool temperate.	Open, loose, rich loam.	April-June Aug-Sept.—1 oz. seed to 3,000 plants. Rows 2 ft. apart, plants 1 ft. in row equals 2,780 plants.	Downy mildew.	Cut away drooping branches. Keep ground free from weeds. Spray with potassium sulphide, 1 oz. to 2 gals. Commence when buds are breaking and repeat every 7 to 10 days until fruit is gathered.
<b>Muskmelon</b> , <i>Cucumis melo</i> , Linn., <i>Cucurbitaceae</i>	Hot, bright temperate climate.	Light and quick warm soil. Sandy loam.	May-June—1 oz. seed to 50 hills. Plants 6x6 ft. (preferable). Plants 5x3 ft.	Black rot.	Remove all mummies and diseased leaves. Rake all refuse into burrows and cover. Use surface cultivation and keep down weeds and grass. Keep vines well sprouted. Spray with bordeaux, 4-4-50, till middle of July, after that with ammoniacal copper carbonate. Spray first when third leaf shows. Foliage should be protected by shading of spray before early rain. Make 4 applications of bordeaux, 50 to 60 gals. of spray to acre. Apply bordeaux as for black rot.
<b>Onion</b> , <i>Allium cepa</i> , Linn., <i>Liliaceae</i>	Temperate.	A rich, moist, but not wet, loam with subsoil of clay.	April-May—1 oz. to 100 feet of drill. 4-5 lbs. per acre. In drills, 14 to 20 in. apart, seed 5 to 6 lbs.; sets 6 to 12 lbs.	Downy mildew. Wit.	Steam sterilization of soil to depth of 2 inches or more; or use fresh soil for every crop. Common in greenhouses.
<b>Pea</b> (garden), <i>Pisum sativum</i> , Linn., <i>Leguminosae</i>	Temperate.	Rich, friable soil, but overrich in nitrogen.	April-May or July-Aug.—1 quart of seed to 100 ft. of drill, or 2 lbs. per acre. Dwarf 12x1 in.; tall, double rows 3 ft. apart.	Mildew. Smut.	No effective method of control. Crop rotation. Drill into rows when planting seed, 100 lbs. sulphur and 50 lbs. air-slacked lime to acre.
				Powdery mildew.	Fungal spray.

## GARDEN CROPS—Continued

INSECT AND OTHER ENEMIES	INSECTICIDES AND REMEDIES	TIME TO BEAR	YIELD PER ACRE	BULLETIN ON CULTURE
Worm.	Use bisulphide of carbon as for pea bug.	45-65 days from seed.	75-120 bus.	Cornell Bul. 239. New Jersey Bul. 161. Geneva Bul. 48.
Worm.	Use bisulphide of carbon as for pea bug.	65-70 days from seed.	75-100 bus. dry beans.	Cornell Buls. 87, 118. New Hampshire Bul. 62.
Not often damaged by insects.		65-150 days.	400 to 700 bus.	Cornell Bul. 168.
Saw-fly. Cane borer.	Spray with paris green or arsenate of lead, or apply hellebore. In midsummer cut off and destroy the drooping tips.	1 year. Good crops in 2 and 3 years.	50 to 100 bus.	Cornell Bul. 99. Central Experimental Farm. Ottawa, Can., Bul. 86.
Cabbage worm.	If plants not heading, spray with kerosene emulsion or paris green to which sticker has been added. If heading, apply hellebore.	90-180 days.	7500 heads.	New Jersey Bul. 98. Geneva Buls. 232, 251, 302. Cornell Bul. 78.
Cabbage aphid.	Before plants begin to head spray with kerosene emulsion diluted with 6 parts water; whale-oil soap, 1 lb. in 6 gals. water; or one of tobacco extracts.	110 days from seed.	125-200 barrels, 18-30 heads per barrel.	See cabbage.
Same as cabbage.	See cabbage.			
No widespread or serious insect pests.		120-180 days.	120-160 crates.	Cornell Bul. 132. Michigan Bul. 102. Geneva Bul. 81.
Aphid.	Spray with kerosene emulsion diluted with 6 parts of water or with one of tobacco extracts.	3 years. Commercial crops 4-6 years according to variety.	2½ tons.	Cornell Buls. 81, 98, 238. Geneva Bul. 98. U. S. Dept. Agr. Bureau of Entomology Circular 120.
Plum curculio.	Spray just after blossoms fall with arsenate of lead, 6-8 lbs. in 100 gals. water, and repeat in about a week. After fruit has set, jar trees daily over sheet or curculio catcher.			
Curran worm.	When worms first appear, spray with 1 lb. paris green or 4 lbs. arsenate of lead in 100 gals. of water. Ordinarily the poison should be combined with bordeaux. After fruit is half grown use hellebore.	1 year. Good crops in 2 and 3 years.	100 bus.	Geneva Buls. 167, 169. Iowa Bul. 80.
Curran worm.	See curran.	1 year. Good crops in 2 and 3 years.	100 bus.	Geneva Buls. 114, 133, 161.
Steel beetle or flea beetle.	When buds begin to swell, cover with arsenate of lead, 8 lbs. in 100 gals. of water. To kill larvae add 1 lb. paris green or 4 lbs. arsenate of lead to every 100 gals. of bordeaux mixture.	Fair crop in 4 years.	3 to 5 tons.	Cornell Buls. 157, 208, 224, 238, 254, 266.
Root worm.	Spray latter part of June with 6 lbs. arsenate of lead in 100 gals. water. Repeat in 7 to 10 days. Cultivate thoroughly in June, close to vines, to kill pupae.			
Leaf hopper.	Spray underside of leaves with whale-oil soap, 1 lb. in 10 gals. water, about July 1. Repeat in a week or 10 days.			
Rose chaffer. Little troubled by insects.	Spray with 10 lbs. arsenate of lead in 100 gals. water.	65 days from seed.	400-800 half-bushel baskets. 600 baskets good average.	Massachusetts Bul. 99.
Striped cucumber beetle.	Plant early squashes as trap crop. Spray with bordeaux. Dust with tobacco dust or snuff, or laid plaster with a little kerosene or turpentine.	120-140 days from seed.	3,000-7,000 melons.	Cornell Bul. 95.
Aphid.	Spray with kerosene emulsion diluted with 6 parts water or use one of tobacco extracts. Burn vines after harvest, and keep down weeds.	135-150 days from seed.	500 bus.	Geneva Bul. 192. Michigan Bul. 51.
Onion fly or maggot. Thrips.	See cabbage-root maggot. Kerosene emulsion, diluted with 6 parts water; tobacco decoction; whale-oil soap, 1 lb. to 4 gals. water.			
Pea weevil or pea bug.	Fumigate seed stock with carbon bisulphide. Place seed in tight vessel or room and expose to fumes for 2 or 3 days. One pound of bisulphide for 100 bushels of peas.	50 to 80 days.	100 to 150 bus. green in pod.	Cornell Bul. 67. Farmers' Bul. 48. Florida Bul. 36. New Jersey Report 14. Delaware Bul. 49.
Pea moth or worm.	Early planting of early varieties.			
Pea aphid or louse.	Plant seed in drills and use cultivator to bury aphides after they have been brushed from vines.			

TABLE II. ORCHARD AND

CROP	CLIMATE	SOIL	PLANTING TIME. PLANTS ON SEED PER ACRE	DISEASES	REMARKS
<b>Peach.</b> <i>Prunus</i> <i>serotina</i> . Sieb. & Zucc. <i>Rosacea</i> .	Warm and sunny. In north near body of water.	Light and sandy loam.	Spring preferable—134.	The yellow. Leaf curl. Brown rot.	Dig out and burn diseased trees as soon as discovered. Spray trees once before buds swell with bordeaux, 5-5-50, or lime-sulphur mixtures used for San Jose scale. Plant resistant varieties. Prune trees to let in air and sunlight. Thin fruit well. Spray with self-boiled lime-sulphur, 8-8-50, and arsenate of lead 2 lbs. to 50 gals. water. Spray (1) when shuck is abedding from young fruit, (2) 2 to 3 weeks later, (3) 1 month before fruit ripens, omitting the arsenate.
<b>Pear.</b> <i>Pyrus</i> <i>communis</i> . Linn. <i>Rosacea</i> .	Temperate. Best near large bodies of water.	Strong loam of moderate depth overlying a porous subsoil.	Spring or fall—48 to 108 standard plants. 193 dwarf plants.	Fire blight. Scab.	Prune out blighted branches, cutting 6 to 8 inches below diseased part. Disinfect with corrosive sublimate solution, 1 to 1,000. Clean out limb and body cankers. Disinfect all large wounds and cover with coat of paint or gas tar. Plant resistant varieties. Spray three times with lime-sulphur, 1-50, or bordeaux, 3-3-50, as for apple scab.
<b>Plum.</b> <i>Prunus</i> <i>domestica</i> . Linn. <i>Rosacea</i> .	Temperate.	Clay loam. Some varieties on light moist soils.	Spring or fall—108-134.	Black knot. Brown rot. Leaf spot.	Cut out and burn all knots before leaves appear in spring. See peach. Two or three applications of self-boiled lime-sulphur or bordeaux, 3-3-50. First application about 10 days after blossoms fall. Japan plums should not be sprayed with bordeaux. Spray with bordeaux, 5-5-50. Commence when plants are 8 to 8 in. high and repeat every 10 to 14 days during season. Use 40 to 100 gals. per acre each application.
<b>Potato.</b> <i>Solanum</i> <i>tuberosum</i> . Linn. <i>Solanaceae</i> .	Moist, cloudy climate. Sensitive to frost.	Warm, rich, sandy or loamy soil.	March to May—8 to 10 bu. seed. Early, rows 18 in. apart; late, 3 ft. x 18 in. or 3 ft. x 3 ft.	Blight and rot. Scab.	Treat tubers before cutting by soaking in formalin solution, 1 pint to 30 gals. water, for 2 hours, or in corrosive sublimate, 1 oz. to 7 gals. for 1½ hours. Plant in clean soil. Spray three times with bordeaux as for apple and pear scab.
<b>Quince.</b> <i>Cydonia</i> <i>cydonia</i> . Pers. <i>Rosacea</i> .	Temperate.	Heavy, moist, retentive clay loam, well drained.	Spring or fall—200.	Leaf and fruit spot.	
<b>Radiish.</b> <i>Raphanus</i> <i>sativus</i> . Linn.	North temperate.	Rich, light, loose; one that drains rapidly.	March-Sept.—1 oz. seed to 100 ft. of drill. Rows in garden, 12 to 18 in. apart.	Relatively free from diseases.	
<b>Raspberr.</b> <i>Rubus</i> <i>strigosus</i> . Michx. (red). <i>R. occidentalis</i> . Linn. (black).	Cool temperate.	Deep, moist soil. Lighter loams for red, heavier loams for black.	Fall or spring, the latter preferable for black caps—Black 2,420; red 2,904.	Anthracnose.	Remove all old canes and diseased new ones as soon as fruit is gathered. Spray with bordeaux, 5-5-50, when new canes are 6 to 8 inches high and follow with two more at intervals of 10 to 14 days. No successful treatment known. For new settings use only plants from healthy plantations. Dig up and destroy infected plants.
<b>Spinach.</b> <i>Spinacia</i> <i>oleracea</i> . Linn. <i>Chenopodiaceae</i> .	Cool season plant. Grown in fall and spring.	Abundance of available plant-food, particularly nitrogen. Any good garden or field soil.	March and Aug.-Sept.—1 oz. seed to 100 ft. of drill or 10 to 12 lbs. per acre; rows 12 to 15 in. apart.	Cane blight or wilt. Red rust. Mildew, anthracnose, leaf blight.	Burn all affected parts. Practice crop rotation. Treat soil with mixture of flowers of sulphur and air-slacked lime.
<b>Squash.</b> <i>Cucurbita</i> <i>pepo</i> , var. <i>Cucurbita</i> . Linn.	Temperate.	Warm and quick soil. Sandy, var. Cucurbita. Sandy or sandy loams best.	Summer, April-May; winter, May-June 1 oz. seed for 25 hills, or 4 lbs. per acre. Summer, hills 4x4 ft.; winter, hills 8x10 ft.	Mildews.	Bordeaux mixture or ammoniacal carbonate of copper.
<b>Strawberry.</b> <i>Fragaria</i> <i>chiloensis</i> , var. <i>androsaema</i> .	Cool season plant.	Rich, rather moist, sandy soil.	Aug. or spring—10,000 to 14,000.	Leaf-spot, rust, or leaf-blight.	In setting new plantations, remove all diseased leaves before plants are taken to field. Spray newly set plants with bordeaux, 5-5-50, as soon as growth begins. Repeat three or four times during season. The following spring, spray just before blossoming and again 10 to 14 days later. Plant resistant varieties.
<b>Tomato.</b> <i>Lycopersicon</i> <i>esculentum</i> , var. <i>esculentum</i> , var. <i>esculentum</i> .	Warm climate, long season, sunny, open position.	Warm soil, light, porous and well drained.	Start plants in hot bed Feb. or March; transplant May to June—1 oz. to 3,000 plants.	Septoria, leaf-spot. Mildew. Black rot. Bacterial blight. Club rot. Bolt rot.	Spray with bordeaux, 5-5-50, as soon as plants are set out. Spray underside of leaves. Repeat every week or ten days. Crop rotation. Crop rotation, destruction of affected vines and contiguous vegetable matter. See cabbage. Plant on soils free from disease. Plant resistant varieties.
<b>Turnip.</b> <i>Brassica</i> <i>capitata</i> . Linn. <i>Cruciferae</i> .	Cold weather plants. North temperate.	Loose, moist soil.	April, or July-Aug.—1 oz. seed to 100 ft. of drill. Rows 18 in. apart, or broadcast. Rutabaga, rows 2 ft., plants 10 inches in row.		
<b>Watermelon.</b> <i>Citrullus</i> <i>citrullus</i> . Schrad. <i>Cucurbitaceae</i> .	Warm and sunny climates. Southern temperate.	Light, quick, sandy soil, with strong clay subsoil.	May-June—1 oz. seed for 30 hills, or 4 to 5 lbs. per acre. Hills 8x10 ft.	Free from any viral disease.	

TABLE III. HORSES, CATTLE,

BREED BREEDER	CHARACTERISTICS	USES	BRIEF BREEDING RULES
<b>HORSES</b> <b>American Saddle Horse</b>	Head rather small and clean cut. Eyes wide apart, full, clear and prominent. Ears pointed. Long upright neck, sloping shoulders. Deep chest, short, strong back. Barrel ribbed with back. Strong coupling, quarters level, strongly muscled. Pasterns long and sloping. Bones of leg broad and flat, strong tendons. Height about 15 hands 2 inches. Weight about 1,000 pounds.	Saddle horse for pleasure, as a gaited horse, hunter, cavalry or commercial purposes. A light harness horse also.	1. Age of puberty 12 to 24 months. 2. Best age for breeding, 2 to 3 years. 3. Period of heat, 9 days after delivery and each 2 or 3 weeks thereafter; duration of heat, 2 to 3 days.

## GARDEN CROPS—Continued

INSECT AND OTHER ENEMIES	INSECTICIDES AND REMEDIES	TIME TO BEAT	YIELD PER ACRE	BULLETINS OF CULTURE
Peach borer.	Dig out borers in June and mound up trees. Apply gas tar or coal tar to trunk from roots up to a foot or more above surface of ground.	2 years. Good crop in 4 to 5 years.	5-10 bus. per tree in full bearing.	Cornell Bula. 176, 192, 276.
Curculio.	Spray just after blossoms fall with arsenate of lead, 6 to 8 lbs. in 100 gals. water, and repeat in a week. After fruit has set, jar tree daily over a sheet and destroy beetles.			
San Jose scale.	See apple.			
Pear psylla.	After blossoms fall, spray with kerosene emulsion diluted with 6 parts water or whale-oil soap, 1 lb. in 4 or 5 gals. water, or one of tobacco extract. Repeat every 3 to 7 days.	3 or 4 years. Fair crop in 5 to 12 years. Dwarf in 5 to 7 years.	A tree 20-25 years old from 6-15 bus.	Cornell Bula. 145, 198, 142, 272. Geneva Bula. 67, 64.
Leaf blistermite.	Spray with lime-sulphur wash in fall or spring, or with concentrated lime-sulphur solutions. 1 gal. in 10 gals. water.			
Pear slug.	Spray with 1 lb. paris green or 4 lbs. arsenate of lead in 100 gals. of water.			
Plum curculio.	Spray just after blossoms fall with arsenate of lead, 6 to 8 lbs. in 100 gals. water, and repeat in about a week. After fruit has set, jar trees daily over sheet and destroy the beetles.	3 years. Good crop in 5 or 6 years.	3 to 8 bus. per tree.	Cornell Bula. 28, 81, 131, 238. Geneva Bula. 96, 117.
Colorado potato beetle.	Spray with paris green, 2 lbs., or arsenate of lead, 4 lbs., in 100 gals. water, or arsenite of soda combined with bordeaux mixture.	80 to 140 days.	100-300 bus.	Geneva Bula. 101, 123, 221, 241, 294, 267, 279, 290, 311. Vermont 53. Maine 141.
Flea beetles.	Bordeaux mixture as applied for potato blight.			
Quince curculio.	When adults appear, jar them from tree onto sheets or curculin catchers and destroy them.	2 years. Good crop in 4 years.	100 to 300 bus.	Cornell Bula. 80, 145, 148.
San Jose scale.	See apple.			
Round-headed apple-tree borer.	See apple.			
Maggots.	Cover soil just after planting with a heavy dressing of un-leached wood ashes. Inject bisulphide of carbon into earth about plants.	30-45 days from seed.	2,800-3,500 bunches.	
Rawfly.	See blackberry.	1 year. Good crop in 2 and 3 years.	50-100 bus.	Geneva Bula. 134, 236.
Cane borer.	See blackberry.			
Leaf miner.		30 to 60 days.	200 barrels.	Rhode Island Bul. 41. Geneva Bula. 70, 96.
Striped cucumber beetle.	See muskmelon.	Summer, 60-80 days; winter, 120-160 days.	10 to 15 tons, winter.	N. Y. State Exp. Station Report 6th. New Jersey Bul. 94. Geneva Bula. 75, 112, 156, 158. Ohio Bul. 165. Cornell Bul. 31.
Squash-vine borer.	Plant a few early squashes between rows of late varieties as trap crop. As soon as early crop is harvested, remove and burn vines.			
Aphis.	Spray with kerosene emulsion diluted with 6 parts water or use one part of tobacco extract. Burn vines after fruit harvest and keep down weeds.			
Squash stinkbug.	Trap adults under boards in spring. Kill nymphs with kerosene emulsion.			
White grubs.	Dig out grubs from beneath infested plants. Destroy pupae by early fall cultivation of land.	1 year. Heavier crop usually in 2 years.	75-250 bus.	Cornell Bul. 79.
Boll worm.	Hand picking. Use of corn as a trap crop. Destruction of wormy fruit.	150 days from seed.	8 to 16 tons.	Cornell Bula. 32, 61. Michigan Bula. 19, 31. Florida Bul. 48. Kentucky Bul. 66. Connecticut Bul. 115.
Tobacco worm.	Hand picking.			
Nematode galls.	Crop rotation and preventing contiguity of host plants, notably cowpeas.			
Root maggots.	Inject bisulphide of carbon into soil about roots before grubs have burrowed deeply into tissues. Crop rotation.	60-70 days from seed.	600 to 1,000 bus.	Geneva Report 6th.
Flea beetle.	Spray with bordeaux or sprinkle with paris green diluted with lead plaster (1 part by bulk of paris green to 50 of plaster).			
Melon worm.	Spray with paris green, 4 ounces to 50 gals. water. Two or three sprayings a week apart.	120-150 days.	400-500 melons.	Georgia Bul. 38.
Melon louse.	Spray with a 1 to 20 mixture of kerosene and water, or kerosene emulsion, or whale-oil soap, 1 lb. to 1 gal. See muskmelon.			
Striped cucumber beetle.	See muskmelon.			
Flea beetle.	Hand picking and thorough spraying with bordeaux mixture and paris green.			

## SHEEP AND SWINE

BEST FOODS	DISEASES AND SYMPTOMS	TREATMENT	BULLETINS
<i>For the trotter.</i> When not in training, feed should be reduced at least one-half. Good oats and clean sweet timothy should constitute bulk of ration. Also a few carrots and a bran mash occasionally. In spring, when shedding, bran mash may be given more often to keep bowels open.	<i>Big-head.</i> —Symptoms: Loss of vitality, irregular appetite or other digestive disturbance. Tendency to stumble. Then intermittence or migratory lameness. Swelling of bones of face and jaw. Animal becomes thin, coat rough, skin tight and	Place animal under new conditions. Give lime, one peck slacked in a sack of water, more water being added from time to time. Give a table-spoonful of powdered bone meal in each feed, with free access to a large piece of rock salt. Feeds containing mineral salts, such as leas, cowpeas, oats and cottonseed meal are good. Animal should not work during active stage or be used for breeding.	Best references to breeds in study-books issued by breed societies.

TABLE III. HORSES, CATTLE,

BEST BREEDS	CHARACTERISTICS	Uses	BRIEF BREEDING RULES
<b>HORSES—Cont'd.</b>			
<b>Belgian Draft</b>	Short body set on short legs. Tendons of legs large. Head good size. Eyes small, neck short, thick and well crested. Shoulders heavily muscled, deep and wide, good barrel. Back short, broad and inclined to sag. Loins wide, short and very thick. Flank low and full. Hindquarters short, very wide, muscular. Lower thighs very wide, well muscled. Hocks round and meaty. Colors, chestnut, roan, brown and bay.	Draft and crossing, especially on grade draft mares.	4. Period of gestation 11 to 12 months. 5. Proper rations and sufficient exercise important during pregnancy. 6. Fecundity favored by: (a) Warm climate. (b) Abundance of exercise. (c) Generous supply of nutritious food, regularly given. (d) Crossing. (e) Heredity. (f) Full maturity of animal.
<b>Clydesdale</b>	Weight 1700 to 2000 pounds for stallions, 1500 to 1800 pounds for mares. Height, 16 to 16½ hands. Colors, bay, brown, black or chestnut, with white markings on face and legs. Head intelligent. Shoulder good, which gives a free, easy, long stride. High withers. Arm well muscled. Feathering on leg is fine, silky and long. Quarters and croup muscular. Sprang, strong pastern. Front action free and snappy.	Draft and crossing on native draft mares.	7. Variation in type caused by: (a) Changed conditions of life. (b) Heredity—union of two animals with diverse qualities. (c) Habit or use or disuse of parts. (d) Food.
<b>French Coach</b>	Height 16 hands. Weight 1000 to 1400 pounds. Rather upstanding. Smooth and symmetrical, fine quality, clean cut, intelligent head, long graceful neck, closely ribbed body, muscular quarters. Legs well set and fine. High free knee action, regular uplifting back action. Colors, bay, brown or black.	Coach and carriage horse, cavalry and fast saddle purposes. Crossing on common brood mares for production of grade coach horses for general city purposes.	8. Selection is of two kinds— (a) Natural. Survival of those possessing greatest ability to live and get food under particular conditions. (b) Methodical. Favoring and fixing of characters especially useful to mankind.
<b>German Coach</b>	Colors, bay, brown or black. Height 16 to 16½ hands. Weight 1350 to 1450 pounds. Deep round body, well proportioned, close ribs, neck long and high set on shoulders, neat head, intelligent face. Back short and strong, smooth at coupling, plump rounded quarters, strongly muscled limbs, strong hock good feet.	Saddle, carriage and draft. The horse-drawn work.	9. Heredity—like produces like. Offspring resembles parents in stature, form and feature. Normal and abnormal characters are inherited. Diseases are subject to laws of heredity. Characters that have appeared regularly through many generations transmit with greatest force. Variations also transmitted.
<b>Hackney</b>	Considerable substance, very smooth, gracefully curved outlines, rather short legs, head well proportioned, full bright eye, well-developed neck, shoulders long, sloping, well muscled. Body deep and round-ribbed. Muscular loins and quarters, strong backs, excellent action. Colors, brown, bay or chestnut, with white markings. Height 15 2 to 16 hands.	Heavy-harness horse. A desirable cross on common mares of much quality.	10. Correlation of parts. Whole organism so closely interwoven that change in one organ or set of organs almost certain to result in disturbance of the balance of other qualities and produce a change of other organs. Certain characters are normally correlated.
<b>Percheron</b>	Height 15 25 to 16 5 hands. Weight 1500 to 2000 pounds. Colors, gray and black. Active temperamental, intelligent head, deep body, wide muscular croup, clean-cut legs, joints clean and hard; legs show abundance of quality. Good action.	Draft and crossing to produce grade draft mares.	11. Atavism, or reversion to characteristics of remote ancestors, may occur. Leading causes are change of environment and crossing.
<b>Shetland Pony</b>	Height 10 hands 2 inches. Weight 325 to 375 pounds. Compact build, deep body, heavy muscular quarters, short legs, short broad chest, deep full neck, small head and ears, prominent eyes, docile disposition. Colors, brown, black and bay. Long shaggy coats, heavy, long mane.	Child's pony and light driving.	12. Inheritance of acquired characters. Acquired character is gained as result of action, sensation, or reaction from environment. Such characters may be inherited.
<b>Shire</b>	Conformation low, broad and stout. Heavy in build, slow in movement. Large girth, deep and strongly coupled with broad back, quarters heavily muscled, legs strong, feet large. Feathering on leg below knees and hocks. Weight 2200 pounds. Height 17 hands. Colors, brown, bay or black with white markings on face and legs.	Draft and crossing to produce grade draft horses.	13. Determination of sex. Many theories have been advanced, but in the present state of our knowledge it is not practicable to attempt to control the sex among the mammalian animals.
<b>Standard-Bred Trotter</b>	Head well proportioned, clean cut, neck long and muscular, crested in stallions. Shoulders well muscled, chest low, foreleg long from elbow to knee, short from knee to fetlock. Pasterns sloping, feet moderate in size, only in appearance. Hock and loin well muscled, hindquarters and croup well muscled and smooth. No fixed colors. Height 16 hands. Weight for mares 900 pounds, stallions 1150 pounds.	Racing, driving as a roadster, and breeding. Also heavy harness horse. Much used in breeding "cow ponies."	14. Prenatal influences of doubtful consequence. Pregnant animals should be kept quiet and free from causes which might produce extreme nervous shock.
<b>Suffolk Punch</b>	Low-set, short legs, deep body, muscular, durable feet. Head clean cut, with full forehead and Roman nose, neck full, with strong crest, chest deep and wide. Barrel deep, round-ribbed, and well let down on hind flank. Legs and hindquarters muscular. Height 16½ hands. Weight 2000 pounds. Color, chestnut.	Heavy draft and crossing on range mares.	15. Four methods of breeding: (a) Cross-breeding. A union of different breeds or races or breeding together of different strains of families within the same breed. Increases fertility, size and restores constitution, vigor and thrift. Breaks up established types, and destroys prepotency of the breed. Not certain to produce improvement. (b) Grading. Breeding of unimproved females to males of well-established breeds will invariably improve stock. (c) Inbreeding. Breeding together of close relations. Will fix desirable qualities. Inbreeding, however, weakens constitution, impairs fecundity. (d) Line-breeding. Union of animals more or less closely related. Favors fixation of characters, but may result in too great refinement and weakness of constitution.
<b>Thoroughbred</b>	Very deep, narrow chest, long legs. Refinement and clear definition of feature. Large nostrils, full, clear eyes, broad forehead, neck long and straight, sloping shoulder, muscular hindquarters, sharp withers, well marked superficial blood vessels, silky skin and hair. Colors, bay, brown, or chestnut, more or less white on face and limbs. Height 15 to 16 hands. Weight 900 to 1050 pounds.	Racing, sporting, breeding. Influence felt in all but draft breeds.	16. Pedigree and individual excellence should both enter into choice of breeding animals. Neither alone sufficient.
<b>Welsh Pony</b>	Good shoulders, strong back, neat head, best of legs and feet. Height 12 to 13 hands. Colors, bay or brown, gray or black. Great strength and endurance.	Child's pony and for hack and tradesmen's purposes.	

## SHEEP AND SWINE—Continued

FEED FOODS	DISEASES AND SYMPTOMS	TREATMENT	BULLETINS
<p>When horse goes into training, strength of food should be gradually increased. At first may have all hay he will consume. Later it may be necessary to limit it. No carrots. Bran mash once or twice a week if constipated. Oats gradually increased.</p> <p><i>For the driving horse.</i>—Oats lead among the grains. Bran mash for constipation. When horse is not taken from stable during day, the concentrates should be reduced by one-third. Laxative foods, such as clover or alfalfa hay or bran, in too large quantities should be guarded against.</p> <p><i>For the work horse.</i>—In general, horse should have over 2 pounds of provender daily for each 100 pounds of weight. Of this about two-thirds should be grain, depending on heaviness of work. Morning meal should be rather light, mostly of grain. Midday ration should not be large. Heavy feeding at night. In cold weather a more carbonaceous ration may be used. Equal parts of corn and oats better than larger proportion of oats.</p> <p><i>For the brood mare.</i>—Much the same as for work horse with the addition of more protein foods, as bran and oilmeal. If constipated, give bran mash. After foaling, a hot bran mash fed once a day has a cooling and laxative effect. To stimulate milk flow, good pasture grass best, but oats or wheat bran with equal weight of corn-and-cob meal is good.</p> <p><i>For the foal.</i>—Should begin to nibble grain from mother's box at 2 months, and at 3 to 4 months be eating well. Should have more protein than work horse. Oats, shorts, peas and perhaps corn, may constitute the grain. Alfalfa, clover and mixed hays may constitute the roughage. Abundant exercise important.</p> <p><i>For the stallion.</i>—During breeding season, grain ration should be mainly of good sound oats, varied by ration of corn, corn-and-cob meal, or barley. Wheat bran is valuable. The roughage should be clean, sweet hay, timothy or timothy and clover mixed.</p>	<p><i>Hives.</i>—Symptoms: Eruption of swellings from one-half to two inches in diameter on skin. The edges of swellings often cut sharply from surrounding tissue.</p> <p><i>Heat stroke.</i>—Symptoms: Horse stops sweating, appears droopy in harness, drows along, soon falls and becomes unconscious. Breathing rapid and shallow, pulse rapid and weak, body temperature excessively high.</p> <p><i>Moon blindness.</i>—Symptoms: Great irritation in eyeball, excessive flow of tears; eye kept closed and drawn back into socket; mucous membrane on inside of eyelid red, swollen and may protrude between closed lids; eyeball enlarged and cloudy, very sensitive to light.</p> <p><i>Lameness.</i>—Symptoms: Mucous membrane of mouth becomes congested with blood and protrudes below incisor teeth.</p> <p><i>Rheumatism.</i>—Symptoms: Animal becomes stiff and lame, followed by rise of temperature (104 degrees Fahr.). A swelling appears around joints of legs which is very painful to the touch. Location may change from day to day, and attacks be intermittent.</p> <p><i>Colic.</i>—Symptoms: Animal lags or stops in harness or walks around stall restlessly. Looks around at side, kicks at belly, may grit teeth. Tail goes a peculiar curl and is held extended. May lie down, roll, kick, or make violent movements, as clamping head against floor or hitting at self or manger. Attacks may be intermittent.</p> <p><i>Hæmorrhage.</i>—Symptoms: Distressing dry cough which often occurs in paroxysms. A double respiration present. Expired air comes from nose in jets, with pause between them.</p> <p><i>Bots.</i>—Symptoms: Cause irritation of walls of stomach and intestines and obstruction of passage between stomach and intestines.</p> <p><i>Worms.</i>—Symptoms: Presence of worms in feces the only sure sign.</p> <p><i>Curb.</i>—Symptoms: A rupture of the ligament on posterior surface of hock with swelling and heat, often lameness. Leg shows bulging backward below point of hock.</p> <p><i>Founder.</i>—Symptoms: Onset sudden with fever from 102.5 to 106 degrees Fahr., rapid respiration, increased pulse, intense pain in feet. Animal stands with hind feet well under body.</p> <p><i>Bone spavin.</i>—Symptoms: Onset gradual. Prominent bony growth most marked when horse is first brought out of stable and disappears on warming up. Bony enlargement on hock joint.</p> <p><i>Ringbone.</i>—Symptoms: Onset gradual with lameness. Local heat, swelling and pain in joint. Pre-tre of bony enlargement about joint.</p> <p><i>Spind.</i>—Symptoms: Lameness. Pressure over splint will cause gradual increase of temperature and there may be some redness. New bony growth may be seen or felt on front of internal splint bone.</p>	<p>Withheld feed for 24 hours. Then give bran mashes and small quantities of hay. Cleanse digestive tract by quart of linseed oil or 1½ pounds epsom salts. To relieve itching, apply alkaline solutions, 1 tablespoonful sodium bicarbonate to 1 quart of water, or a weak solution of ammonia.</p> <p>Treatment energetic. Apply ice bags to head and pour cold water over body to reduce temperature immediately. Give ½ pint whisky, followed by tincture of digitalis in 1 dram doses by mouth or ½ dram doses subcutaneously to stimulate heart. Continue cold water until temperature is reduced to 102 or 103 degrees Fahr. Rub limbs briskly with straw or the hands. Recovery is gradual, over week or two.</p> <p>Keep animal in the dark and wash off eyes several times daily with a 4 per cent solution of boric acid. A few drops may be dropped in eyes. Ice position may be used 3 or 4 days, after which warmth should be applied by covering eyes with cotton soaked in warm water. One or two drams of potassium iodide daily have been recommended.</p> <p>May be relieved by making a few shallow punctures in mucous membrane with a sharp knife that has been thoroughly sterilized. Such treatment demands expert care.</p> <p>Administer a cathartic, aloes balls containing 7 drams of aloes. Thoroughly rub affected joints with a stimulating liniment, as camphor or chloroform liniment. Follow cathartic with salicylates given in 1 dram doses, 3 or 4 times a day. 6 to 8 drams may be given 2 or 3 times daily in food. Keep horse in dry place and give plenty of fresh air.</p> <p>Give animal plenty of room. To allay pain, cannabis indica, 1 to 2 ounces, may be given, or morphine sulphate, 5 to 7 grains, given subcutaneously. Larger doses of either dangerous. An excellent prescription is fluid extract cannabis indica, 4 drams; tincture opium, 6 drams; sulphur ether, 1 ounce; sweet spirit of niter, 1 ounce. Give in 1 dose and repeat if necessary in an hour. To stimulate intestines, 8 drams of aloes or 4 pint of linseed oil. Injections of lukewarm water into rectum good. In fermentation colic tapping is quickest and surest method. This requires expert surgery.</p> <p>Condition incurable. Greatest benefit from regulation of diet. All duty hay should be withheld and small quantities of best timothy given sprinkled with linseed meal. Nutritious concentrated foods best: corn, oats and bran with carrots and turnips or apples suet in.</p> <p>Best treatment preventive. Eggs should be removed from hair before tenth day. If occasional bots noticed in manure, animal should be starved for 12 hours, allowing only water, after which give 2 teaspoonfuls of tartar emetic in water as a drench. Repeat in 4 hours; 8 or 12 hours later give a drench of 1 pint of 1 quart of linseed oil.</p> <p>Starve animal 12 to 15 hours. Then give tartar emetic in two-dram doses every 4 hours until 3 doses are given. Follow in 3 or 4 hours with 1½ pints of linseed oil.</p> <p>In acute inflammation cold water should be applied for 10 to 12 hours daily in constant stream. If lameness persists after a week, a blister of biniodide of mercury (part to vasoline 5 parts) should be applied and animal should rest for 2 to 4 weeks.</p> <p>Give tincture of acetone in 10-drop doses every 2 hours during first day. Allow animal to stand with affected feet in a soaking tub of cold water, or in puddle of soft clay, water to be kept cold by addition of ice. Give 2 ounce doses of saltpeter in a pint of water 3 times daily for 1 week. Case may require expert attention.</p> <p>Proper shoeing will assist in removing lameness. 4 to 6 weeks rest with repeated blisters will give temporary relief. Most successful treatment requires assistance of a veterinarian.</p> <p>Feet should be properly dressed and shod. If lameness is marked, prolonged rest and repeated mercurial blisters (1 part biniodide of mercury to 8 of vasoline) should be applied. If this is not successful, call veterinarian.</p> <p>For acute inflammation, let cold water run over part for several hours each day for a week. Hair should be clipped, then apply blister of one dram benzoin of mercury to one ounce of petrolatum. Animal should rest 3 to 4 weeks. In severe cases, call veterinarian.</p>	<p>Report of Kansas State Board of Agriculture, 1899.</p> <p>Farmers' Bulletin No. 170.</p> <p>North Carolina Bulletin No. 189.</p> <p>Florida Bulletin No. 72.</p> <p>Iowa Bulletin No. 118.</p> <p>New Jersey Bulletin No. 92.</p> <p>Special Report on Diseases of the Horse, Bureau of Animal Industry, U. TABLE IV. HORSES, CATTLE,

BEST BREEDS	CHARACTERISTICS	Uses	BEST FOODS
<b>CATTLE</b>			
<b>Aberdeen-Angus</b>	Black color, polled heads, round compact type, conformation, short legs, evenness of flesh when fat, deep, full hindquarters. Beef breed.	Beef. Very valuable in crossing and grading. Little value for milk.	<i>For dairy cattle</i> 1. The dairy calf—Avoid fattening feeds. Choose such as tend to develop a vigorous muscular system. Gradually substitute skimmed milk for full milk after first few days. A small quantity of some concentrated feed, as shorts, linseed meal or dressed meal, mixed into a jelly with water (1 part meal to 6 of water) is fed daily with the skimmed milk. Milk should be at blood heat, and the milk is considered to cold milk. At 6 or 8 weeks other feeds are given, preferably oats or wheat middlings, or a mixture of both. For older calves, milk feeds containing bran, barley, malt sprouts, etc., are desirable. Keep fine quality of early-curt milk after calves.
<b>Ayrshire</b>	Medium size, standard weight for cows 1000 pounds, bulls 1500 pounds or more. A little smoother than Jersey or Holstein but from behind wedge shape is evident. Tip of ears notched, horns white with black tips and curve outward and upward. Body large and deep, ribs well sprung, hindquarters often heavy. Udder shows high development of form and setting. Color variable through red, white, and brown in patches. Mild but active disposition. Dairy breed.	Milk and butter, so much for cheese. Crossing to improve grade herd.	2. Dairy heifer—As time of parturition approaches, feeding should be plain, good clean hay from clover or mixed grasses, corn fodder, corn silage (not to exceed 25 to 30 pounds a day) or roots. Both dry and suckling roughage is fed, and small amounts of bran, ground oats, shorts, gluten feed and perhaps corn. Shortly before calving, feeding of all grains except about 2 pounds of bran, is discontinued and dry roughage and roots are fed till cow freshens. Directly after calving the calf is fed of oatmeal, bran or shorts is given or warm water only. Utmost danger of fever is over, food should be very light and gradually increased for 2 or 3 weeks until cow is on full feed. Corn meal good for a heavy milking heifer.
<b>Brown-Swiss</b>	Weight for cows 1200 pounds and bulls 1800 pounds. Colors shade from light to dark chestnut brown. Light tuft of hair between horns, on inside of ears, and a narrow line along back. Nose black, mouth surrounded with meal-colored band. Horns with black tips, medium size. Face dishlike, large, full eye, ribs well sprung. Hoofs and tongue black, udder large, extending well up in front and rear. Teats large, well placed. Short legs. Dairy breed.	Milk for condensing and butter and cheese making.	3. Dairy cow— (a) Summer—Ample pasturage. Later in the season add cooling crops such as corn, alfalfa, peas and oats, ryegrass, etc. Summer silage, corn, red or other clover and alfalfa. 30 pounds of cooling crop or silage average allowance for dairy cows on poor pastures, to be increased as conditions demand. In case of heavy milking or very short pasture, add 10 to 15 pounds of wheat bran or wheat bran and oats, throughout season. (b) Winter—Succulent feeds should be provided during entire lactation period. Silage and roots are main available feeds. Best results from not over 40 pounds silage fed daily, and fed with some dry roughage, hay or corn fodder. Protein feeds, as clover hay, wheat bran or oil-meal, should be fed with corn silage. Clover hay or hay of other legumes stands first for dairy cows. Pure timothy, especially if late cut, is a poor feed. Other kinds of hay are millets, oat, sorghum, alfalfa and pea. Commercial concentrates are the cereals and mill refuse, starch or glucose factory refuse, brewery and distillery feeds and oil-meal. Good rule is to feed as many pounds of grain feeds a day as cow produces milk. Corn silage is a poor feed and to feed as much roughage as cow will eat up alone. Should give variety of feeds containing liberal amount of highly digestible substances. Feeding must be regular.
<b>Galloway</b>	Low, black animal, with long, soft, shaggy coat of black hair, hornless, well sprung in the ribs, resembling harrier in shape, which is evenly covered with juicy lean flesh. Head short and wide, forehead broad, face clean, nostrils large. Eye large and prominent. Neck short, clean. Shoulders broad, joining body smoothly. Hindquarters long, wide, well filled. Rump straight, wide, carrying width of body out uniformly, well filled with flesh. Thighs broad and thick. Legs short and clean. Beef breed.	Beef, hides and tanning. Very prepotent.	4. Dairy bull—Ground oats, wheat bran, gluten meal, oil-meal, grain and roots. 6 or 8 pounds per day for 1000-pound animal. Keep animal vigorous, not fat and lazy.
<b>Guernsey</b>	Clean-cut, lean face, long, thin neck, backline rising well between shoulder blades, pelvis arching and wide, rump long, shoulders large and deep, udder full in front, of large size and capacity. Teats well apart, and of good even size. Hair a shade of fawn with white markings, cream-colored nose, horns amber, small, curved and not coarse. Mature cows about 1050 pounds. Dairy breed.	Milk, cream and butter. Crossing.	<i>For beef cattle</i> Baby calves (10 to 12 months)—Require heavy grain feeding. Corn depended on largely, fed with a food rich in protein, as oil-meal or gluten feed. Oats and bran may be added if not too expensive. Good ration is 5 pounds corn, 2 pounds oats, 14 pound oil-meal, plenty of good clover or alfalfa hay. Corn silage is valuable. Daily ration must be increased as fast as calves can handle it. Long yearlings (18 to 23 months)—When calves are born in spring they are given little or no grain before or after weaning. Through summer and fall depend on grass. In winter, one-half of that weight of oil-meal. In the second fall feed close grown corn fodder, shelled corn, alfalfa, clover or cowpea hay. If non-legume roughage used, milk grain ration of one-half a day one-fourth oil-meal, gluten or cottonseed meal. Short two-year-olds—Finish by feeding grain in connection with spring dry summer pasture. With this system a light grain ration is fed the first winter and less than half feed of grain second winter. Shaded shell corn is effective for spring and autumn weaners. Fall feeding two-year-olds—Corn fodder on pasture. May begin about September 15 and continue in field for 3 months. Feed corn with 3 pounds of corn a day and increase till cow's capacity is reached. 3 pounds bran and 1 pound oil-meal or cottonseed meal per steer per day slowly increase gains. Winter feeding range two-year-olds—Cattle which have had no grain during summer and fall. Shaded corn most used for winter feeding. Alfalfa, clover or cowpea hay. Field-cured stalks with alfalfa equally good. After 6 to 8 weeks begin shelled corn gradually to replace alfalfa, clover or cowpea hay. Use only supplement corn with about 2 pounds per day of shelled corn, oil-meal, gluten or cottonseed meal. Total feed will take 20 to 25 pounds grain per day, plus all roughage desired. Range three-year-olds—Require smaller proportion of protein foods than above, but consume a larger proportion of grain to hay.
<b>Holstein-Friesian</b>	Clean-cut, lean face, long, thin neck, backline rising well between shoulder blades, pelvis arching and wide, rump long, shoulders large and deep, udder full in front, of large size and capacity. Teats well apart, and of good even size. Hair a shade of fawn with white markings, cream-colored nose, horns amber, small, curved and not coarse. Mature cows about 1050 pounds. Dairy breed.	Beef, especially early or "baby" beef.	
<b>Jersey</b>	Color, red and white. Head, including jaws and throat, white, with some neck down, dark brown, under belly, and on legs. Bush of tail white, white strip on top of neck to top of shoulders, remainder of body red. Head short, broad, broad, eyes full, horns rather strong and of whitish yellow color, free from black tips, more or less drooping, neck short and thin. Hides heavy and loose and covered with dense soft coat of hair. Breast broad and full, free from loose drapery. Nipples broad on top. Ribs well sprung and extending well backward. Rump bones wide apart. Legs short, straight and set well apart. Line of back straight and level. Quarters full and well rounded. Beef breed.	Milk, butter and cheese. Fair beef qualities.	
<b>Jersey</b>	Small head, muzzle black or dark in color surrounded by light or nearly strip of light skin and hair. Eyes prominent, bright and wide apart. Horns crumpled, small, often black, tipped. Neck fine, clean and small. Legs short, fine boned and small. Body well rounded, large and deep. Skin medium loose, yellow, with top fine milky hair. Udder large, not pendulous. Teats medium size, placed far apart. Back straight from shoulder to tail. Movement light and graceful. Cows 800 to 1000 pounds, bulls 1200 to 1500 pounds. Dairy breed.	Milk and butter.	
<b>Red Polled</b>	Weight for bulls 1800 to 2000 pounds, cows 1300 to 1500 pounds. Color red. Nose flesh color. Switch of tail and under white. Head medium length, side between ears, full well forward and prominent, neck of medium length, clean cut, straight from head to top of shoulder. Neck broad and deep, back long, straight and level, hips wide and well covered, legs short and straight. Udder full and flexible. Teats well placed and wide apart. Hides loose, mellow with full coat of soft hair. Dual purpose breed.	Beef, milk and butter.	
<b>Southdown</b>	Head wide between eyes, short from eyes to nostrils. Horns short, curved forward, waxy white with dark tips. Neck short and fine. Back straight, level and broad and deeply covered with fine flesh. Thighs wide and deep, well filled down to the twist. Body deep, squarely built. Flanks well let down, underline nearly straight. Legs medium length. Colors, pure red, pure white, a mixture of these colors, or roan. Beef breed.	Beef, crossing, grading. Fair results for milk, butter and cheese.	

**SHEEP AND SWINE—Continued**

BRIEF BREEDING RULES	DISEASES AND SYMPTOMS	TREATMENT	BULLETIN
<p>1. Age of puberty 4 to 18 months.</p>	<p><b>Caked bag.</b>—A part or all of udder becomes enlarged and firm. Cow is depressed and there may be a slight rise of temperature. Gland is sensitive to pressure and flow of milk is lessened. Milk is watery and may be tinged with blood.</p>	<p>Give sparingly of milk producing food. Massage udder with hand and rub in emporated oil or tincture of iodine 1 part, alcohol 8 parts. Then severe warmth should be applied by sponges wrung out of hot water and held against udder. In case of development of abscess or gangrene expert assistance will be needed.</p>	<p>Handbooks of all breeding and registration societies. Special Report on Diseases of Cattle and Cattle Feeding, U. S. Department of Agriculture, Bureau of Animal Industry, 1892. Revised 1904.</p>
<p>2. Best age for breeding best cattle, 20 to 25 months, dairy cattle 18 to 24 months.</p>	<p><b>Clapped Teats.</b>—Symptoms: Apparent on milking. May cause great difficulty in milking.</p>	<p>In fresh cows wean calf as soon as possible. See that teats are dry before cow goes out into the cold or wet weather. Bland antiseptic ointment, as a 10 per cent ointment of calomel in petrolatum should be applied after milking. Yellow oxide of mercury in a 5 per cent ointment is also good. Care must be taken to prevent milk becoming contaminated. In very bad cases milk should be withdrawn for few milkings with tube and udder massage. End of teat and milking tube must be sterilized before inserting. Astringent applications, as lead water with laudanum or tannic acid ointment, are good when there is considerable discharge from the sore.</p>	<p>Bureau Animal Industry Circular No. 51.</p>
<p>3. Period of heat, 40 to 60 days after delivery, if suckling the calf and 30 to 50 days if calf is taken away at birth. Period recurs each 3 weeks thereafter. Duration 12 to 24 hours.</p>	<p><b>Milk fever.</b>—Symptoms: Attack usually comes on within two days after calving. Cow is restless, staggering east, especially in hind legs, weakening of knees and fetlocks in front. This increases until paralysis becomes general and animal goes down. Cow takes very characteristic head-tucked round neck to side, usually left, rots against chest, causing peculiar arching of neck. If head drawn out straight, immediately flops back to above position. Animal quiet and insensible.</p>	<p>Because of paralysis of the throat, great care should be taken in administration of medicines by the mouth. Patient should be kept in an upright position on the breastbone, and not on her side. Only successful treatment is the injection into the udder of atmospheric air, which requires the assistance of a surgeon.</p>	<p>Same Bulletin No. 108.</p>
<p>4. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Sore tongue.</b>—Inability to eat, frequent movement of lips with formation of froth on their margin, driving of saliva. Ulcers occur on gums around teeth, inside lips and on tip of tongue. Mucosa dry and parched, and crusts and scabs form over the parts. The thin skin in clefts between jaws may become fissured and eroded, causing a slight swelling with pain. Animal takes position with back arched and feet propped under body.</p>	<p>Remove herd from pasture to barn or corral and feed on soft nutritious food, such as bran mash, ground feed and greens. Keep cool water in manger. Dose 2 heaping tablespoonfuls of borax or one tablespoonful potassium chlorate in each of first 2 buckets of water taken during day. Astringents, such as 1/4 tablespoonful alum, borax or chlorate of potash, should be placed on tongue. Teat may be treated with a 2 per cent solution of carbolic acid or of creolin. Fissures or cracks in skin benefited by carbolic vaseline or zinc ointment.</p>	<p>Connecticut Reports, 1895-1901.</p>
<p>5. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Indigestion.</b>—Symptoms: When stomach and small intestine affected, loss of appetite and rumination, coated tongue and emaciation. Constipation is usual, although diarrhea may be present. Fecal matter contains imperfectly digested food and more or less mucus. When large intestine is involved, appetite may not be affected. Diarrhea marked, droppings coated with mucus. No undigested food present. Animal will lose flesh and become hidebound.</p>	<p>In constipation, 1 quart of castor oil should be given. Easily digested and nutritious food should be given in small quantities. Green food best or hot bran mash, with small amount of good sweet hay. In diarrhea and fermentation a mixture of bismuth subnitrate 1 dram and creosote 1/2 dram shaken up with milk or given as a creosote 1/2 dram daily for 2 or 3 days is beneficial. For a tonic, powder, 1 dram, reduced to 1/2 dram, powdered gentian root 1 ounce, should be given in the feed 2 or 3 times daily for a few weeks.</p>	<p>Illinois Bulletin No. 142.</p>
<p>6. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Choking.</b>—Symptoms: Champing of jaws, driving of saliva, ceasing to chew and choking movements, head extended, eyes bulging, inability to swallow.</p>	<p>When obstruction is in pharynx, a block of wood should be placed in mouth between back teeth and object removed with hand. If in gullet, small amount of olive oil should be given at frequent intervals to lubricate the esophagus and allow object to pass into stomach. If this fails, the probing, a long, hollow, flexible tube, may be used. It is slid. By means of probing, foreign body gradually forced into stomach.</p>	<p>Indiana Bulletin Nos. 129, 130, 136, 137; Circulars Nos. 12, 14.</p>
<p>7. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Cough.</b>—Symptoms: Chilly sensations or a chill followed by rise of temperature to 103 to 108 degrees Fahr., loss of appetite and rumination, dry mucus, constipation, rapidity of pulse and respiration. Cough at first dry, harsh and painful. Later cough becomes moist and there is nasal discharge.</p>	<p>Animal should be placed in light, comfortable stall and given plenty of clear water. Keep bowls open with 1 pound of Glauber's salt. Feed green succulent materials if possible or bran mash and moistened hay. An electuary consisting of extract of belladonna leaves 5 grains, morphine sulphate 3 grains, powdered ipecacuan root 4 drams and sufficient syrup to make an electuary, should be given on tongue 4 times daily. If cough persists after the above treatment a mixture of ammonium chloride 1 dram in 1/4 ounce of brown mixture should be given 4 or 5 times daily.</p>	<p>Kansas Bulletin No. 81.</p>
<p>8. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Warts.</b>—Symptoms: Appear as grayish or grayish red projections of skin or mucous membrane. Favorite location is under the head and inside of head and neck, on lips and belly.</p>	<p>May be removed with scissors or fingers, or ligatured by rubber band or horsehair. Roots should be cauterized with tincture of iron, glacial acetic or lactic acid. Acids should not be used around eyes or mouth. When warts are found in large numbers, arsenic in form of Fowler's solution should be given in 1 teaspoonful doses twice a day for a 6-months calf.</p>	<p>Louisiana Bulletin No. 104, 115.</p>
<p>9. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Mange.</b>—Symptoms: Contagious disease. Points of redness, pimples, vesicles and formation of scabs. Intense itching which becomes unbearable at night in hot stables or when exposed to sun. Animals scratch, rub, and bite themselves. Hair falls out and skin is bloody. In worst stage skin moist and bloody, ulcerated, scabby, thickened and wrinkled.</p>	<p>A good combination of drugs for killing parasites is flowers of sulphur 1 ounce, vasoline (or lard) 10 ounces. Best method is to dip animal in a vat containing flowers of sulphur 24 hours, or make a time 12 pounds of vasoline 100 grains. This should be repeated in 10 days to 2 weeks.</p>	<p>Maryland Bulletin No. 84.</p>
<p>10. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Rings.</b>—Symptoms: Formation of circular patches on skin, which soon becomes devoid of hair. Outer layer of skin is inflamed and vesicles form which exude a gummy liquid. Scaly crusts are formed, usually on head and neck.</p>	<p>Remove crusts by washing with soap and water, then apply acetic acid, 10 to 20 per cent solution of iodine, or nitrate of mercury ointment once daily. Cleanse and wash with stable to destroy spores scattered by crusts.</p>	<p>Massachusetts Report, 1908.</p>
<p>11. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Scald.</b>—Symptoms: Inflammation of skin, usually on head and neck, caused by scalding with hot water or steam.</p>	<p>Remove crusts by washing with soap and water, then apply acetic acid, 10 to 20 per cent solution of iodine, or nitrate of mercury ointment once daily. Cleanse and wash with stable to destroy spores scattered by crusts.</p>	<p>Michigan Bulletin No. 149, 257; Circular No. 4.</p>
<p>12. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Scald.</b>—Symptoms: Inflammation of skin, usually on head and neck, caused by scalding with hot water or steam.</p>	<p>Remove crusts by washing with soap and water, then apply acetic acid, 10 to 20 per cent solution of iodine, or nitrate of mercury ointment once daily. Cleanse and wash with stable to destroy spores scattered by crusts.</p>	<p>Mississippi Bulletin No. 70, 121.</p>
<p>13. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Scald.</b>—Symptoms: Inflammation of skin, usually on head and neck, caused by scalding with hot water or steam.</p>	<p>Remove crusts by washing with soap and water, then apply acetic acid, 10 to 20 per cent solution of iodine, or nitrate of mercury ointment once daily. Cleanse and wash with stable to destroy spores scattered by crusts.</p>	<p>Missouri Bulletin Nos. 53, 58.</p>
<p>14. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Scald.</b>—Symptoms: Inflammation of skin, usually on head and neck, caused by scalding with hot water or steam.</p>	<p>Remove crusts by washing with soap and water, then apply acetic acid, 10 to 20 per cent solution of iodine, or nitrate of mercury ointment once daily. Cleanse and wash with stable to destroy spores scattered by crusts.</p>	<p>New York (Genova) Bulletin No. 317.</p>
<p>15. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Scald.</b>—Symptoms: Inflammation of skin, usually on head and neck, caused by scalding with hot water or steam.</p>	<p>Remove crusts by washing with soap and water, then apply acetic acid, 10 to 20 per cent solution of iodine, or nitrate of mercury ointment once daily. Cleanse and wash with stable to destroy spores scattered by crusts.</p>	<p>Ohio Bulletin No. 193.</p>
<p>16. Period of gestation 9 to 9 1/2 months (285 days).</p>	<p><b>Scald.</b>—Symptoms: Inflammation of skin, usually on head and neck, caused by scalding with hot water or steam.</p>	<p>Remove crusts by washing with soap and water, then apply acetic acid, 10 to 20 per cent solution of iodine, or nitrate of mercury ointment once daily. Cleanse and wash with stable to destroy spores scattered by crusts.</p>	<p>Oregon Bulletin No. 102.</p>

TABLE III. HORSES, CATTLE,

BEST BREEDS	CHARACTERISTICS	USES	BEST FOODS
<b>SHEEP</b> <b>Cheriot</b>	Medium size, hornless, face and legs white, body closely covered with wool of bold fiber bright and pure. Fleece forms almost a ruff about face. Deep and large in breast, back wide and straight. Short legs well set apart, hoofs black. Mature rams 200 pounds, ewes 150 pounds.	Mutton. Not superior as a wool producer. Wool of good quality, but light.	A clean and dry feeding place is essential. Rations should be feeding inoperative. Ordinarily best to feed sheep twice a day. Sheep need to have access to salt and water at all times.
<b>Cotswold</b>	Large, long-standing breed with heavy fleece of long white, lustrous wool. Angle between neck and body is small, head upright carriage. Head moderately small, face white or mixed with gray, eyes prominent, neck short, thick and strong, shoulders broad and full, back broad, breast broad and well forward, quarters long and full, mutton quite down to hock. Weight of ram 250 pounds, ewe 200 pounds.	Mutton and wool, the latter especially. Crossing on native and merino sheep.	Feeding lambs.—When ewe has a succulent feed, it is best to feed any grain until near weaning time. When a ewe has a weak lamb, she should get some grain. If lambs are to be sold before weaning, grain feeding must begin as early as possible. A mixture of three-fourths corn meal and one-fourth bran is satisfactory. Right after weaning it is well to have fresh pasture, or rape or other succulent feed. In addition, lambs should be fed liberally on grain.
<b>Dorset-Horn</b>	Face and legs pure white, flesh-colored nose. Both sexes have horns. Eyes prominent, neck short and symmetrical, shoulders broad and full. Chest full and deep, quarters well and full with mutton extending down to hock. Fleece medium grade, of even quality, extending over belly and well down on legs. Short stout legs. Weight for rams 200 pounds, ewe 160 pounds.	Mutton breed. Early breeder, valuable for production of hot-house or winter lambs. Fleece light.	For fattening lambs in corn is best, combined with peas and bran. Grain feeding must come gradually. For fattening mature lambs during fall, good grass pasture and rape or rutabagas, with a mixture of corn and oats, is most satisfactory.
<b>Hampshire Down</b>	Black face, head large, well covered with wool on forehead and cheeks, nostrils wide. Ears large and drooping, eyes prominent and lustrous, legs well under outside of body, straight, almost black. Chest deep and full with breast prominent and full, back straight, quarters long and deep in thigh. E-wee prolific and heavy milkers. Weight for rams 250 pounds, ewes 185 to 195 pounds.	Mutton and production of early market lambs. Fleece inferior.	To fatten lambs in a short period give preparatory feeding on rape or roots for about six weeks. Should have pasture before going on rape, which must be restricted in quantity. For grain feed, for grain, corn, oats, bran and oil-meal or cottonseed meal.
<b>Leicester</b>	Hornless, large size, rectangular form of body on clean legs, harn faces or carrying a very stout topknot. Head long, tapering toward muzzle, face wedge-shaped, covered with fine white hairs, eyes large and prominent, neck strong and moderately short. Breast deep, broad and full. Back broad and well finished. Legs of moderate length. Fleece fine, uniform, curly, with bright luster.	Crossing purposes to get early lambs for market. For wool especially, and mutton.	To fatten lambs in a short period give preparatory feeding on rape or roots for about six weeks. Should have pasture before going on rape, which must be restricted in quantity. For grain feed, for grain, corn, oats, bran and oil-meal or cottonseed meal.
<b>Lincoln</b>	Large size with heavy fleece of long wavy or curly wool and moderate tuft of wool on face. Color white, head large, without horns, body deep, back wide and straight. Legs broad and set well apart. Weight for rams 250 pounds, ewes 200 pounds.	Wool. Crossing, especially on merino stock.	To fatten lambs in a short period give preparatory feeding on rape or roots for about six weeks. Should have pasture before going on rape, which must be restricted in quantity. For grain feed, for grain, corn, oats, bran and oil-meal or cottonseed meal.
<b>Merino</b>	Distinguished by its very fine wool, usually delicately crimped. Wool generally short and dense. Grows to tips of ears and hocks of feet. Form, when shorn, angular, shoulders narrow, back not usually so straight or strong as English breeds, legs less straight and neck more slender. Ram usually has horns. Very enduring and resistant. The American merino has 3 to 5 heavy folds on neck, and folds on arm and sides and across hips. Fleece covers entire sheep except tip of nose and hocks. Ewes hidden by wool. Outside of fleece a dirty brown, but inside white. Ewes 80 to 100 pounds, rams 100 to 175 pounds. <i>Delaine merinos</i> have smoother bodies than the American, and is over folds and wrinkles. Mature ewes 100 to 150 pounds, rams 140 to 200 pounds. <i>Rambouillet merinos</i> have large bodies, usually smooth and free from wrinkles, except perhaps on neck. Fleece fine and white. Rams usually have large spirally curved horns, ewes hornless. Legs long. Rams 175 to 165 pounds, ewes 140 to 160 pounds.	Wool. Fleece especially fine, strong and heavy. Used for crumming to increase wool production. Delaine merino mutton of fair quality.	To fatten lambs in a short period give preparatory feeding on rape or roots for about six weeks. Should have pasture before going on rape, which must be restricted in quantity. For grain feed, for grain, corn, oats, bran and oil-meal or cottonseed meal.
<b>Oxford Down</b>	Largest of down breeds. Nearly straight on underline. Long and coarse fleece. Very stately appearance. Color of face and legs brown, which is often flecked with gray. Ewes very prolific and heavy milkers. Not hardy under American climatic conditions. Rams 250 to 350 pounds, ewes 180 to 275 pounds.	Representative mutton breed. Fleece long and coarse.	To fatten lambs in a short period give preparatory feeding on rape or roots for about six weeks. Should have pasture before going on rape, which must be restricted in quantity. For grain feed, for grain, corn, oats, bran and oil-meal or cottonseed meal.
<b>Shropshire Down</b>	Dark brown face and legs. Broad head, short face, thick muscular neck, body somewhat barrel shaped, except that it is straight on back. Body, head and legs to knees covered with fleece of even length and quality. Weight for rams 245 pounds, ewes 175 pounds.	Mutton and wool.	To fatten lambs in a short period give preparatory feeding on rape or roots for about six weeks. Should have pasture before going on rape, which must be restricted in quantity. For grain feed, for grain, corn, oats, bran and oil-meal or cottonseed meal.
<b>South Down</b>	Smallest of down breeds, but the model in form. Short straight legs, wide apart; broad level back thickly fleshed; long broad hips; neck short, thick at shoulder; head small, forehead full, face short, eyes prominent, ears small, face and legs uniform reddish brown. Fluidquarters carry down a very heavy; breast broad and prominent. Fleece compact, long and slow wool, white and carrying some yolk. Best weight for rams 200 pounds, ewes 150 pounds.	Mutton breed; used for growing to produce early lambs. Wool of good quality.	To fatten lambs in a short period give preparatory feeding on rape or roots for about six weeks. Should have pasture before going on rape, which must be restricted in quantity. For grain feed, for grain, corn, oats, bran and oil-meal or cottonseed meal.
<b>Suffolk Down</b>	Large, rangy sheep, black-headed, hornless, with long clean, black legs. Wool is of good quality and mutton is excellent. A good feeder and very prolific.	Mutton breed; used also for crossing. Wool is short.	To fatten lambs in a short period give preparatory feeding on rape or roots for about six weeks. Should have pasture before going on rape, which must be restricted in quantity. For grain feed, for grain, corn, oats, bran and oil-meal or cottonseed meal.
BEST BREEDS	CHARACTERISTICS	USES	BEST FOODS
<b>SWINE</b> <b>Berkshire</b>	Rather more than medium size. Boast of medium length, face dished. Ears nearly erect, well carried, lusty heavy. Neck short with considerable crest. Shoulder, back and rump of good width. Body deep. Ham thickly meated, strong constitution. Color black, with a white mark on face. White on each foot and on tip of tail.	Lard and pork. Meat best end of high quality.	Feeding boar.—Should not be overfed, but given just what he will eat up clean. Ration needs to be very liberal. Corn and pasture contain a succulent food. Young boars should be fed more concentrated foods than older animals. Corn should be fed liberally during breeding season, than remainder of year. Food should consist of grain (loam ground oats) to corn (loam ground) or wheat middlings or wheat bran, skimmed milk, succulent food (roots, finely cut), and a little salt.
<b>Cheshire</b>	Medium size. Body has good length. Shoulders and hams well developed. Face slightly dished. Ear small and erect. Hine fine and of fair quality. Color white. Black spots often occur on skin.	Lard and pork.	Feeding sows and young.—Good pasture (bluegrass, clover, fescue, alfalfa, cowpeas, soybeans, etc.) and a little grain. Sows need little except good pasture in August and September. In October about 2 pounds per head of corn should be given. Sows are bred they should have pasture and some grain, preferably equal parts of corn and oats at the rate of 3 or 4 pounds to 300
<b>Chester-White</b>	Medium size, face straight or very slightly dished. Ear droops and is somewhat loosely attached to head. Color white, hair in many specimens wavy or curly. Neck wide, deep, and short. Jaw smooth, neat and firm. Shoulders broad, deep and full. Chest large, deep, full in girth. Sides full, smooth, deep, ham broad, full, long, wide and deep. Back broad on top, straight or slightly arched, legs short and straight. Coat fine. Weight of boars 2 years old 500 pounds, ewes 450 pounds.	Lard and pork. Crossing, especially with Poland-China.	Feeding sows and young.—Good pasture (bluegrass, clover, fescue, alfalfa, cowpeas, soybeans, etc.) and a little grain. Sows need little except good pasture in August and September. In October about 2 pounds per head of corn should be given. Sows are bred they should have pasture and some grain, preferably equal parts of corn and oats at the rate of 3 or 4 pounds to 300

## SHEEP AND SWINE—Continued

BRIEF BREEDING RULES	DISEASES AND SYMPTOMS	TREATMENT	BULLETINS
<p><b>Age of puberty</b> 6 to 10 months.</p> <p><b>Best age for breeding</b> 18 to 20 months.</p> <p><b>Period of heat, regularly</b> during spring and autumn months. At other seasons period is irregular and often absent. Duration 5 to 3 days.</p> <p><b>Period of gestation</b> 5 months (21 weeks).</p> <p><b>One ram to 30 to 50 ewes.</b> Ram may be allowed to run with flock at any time. In north, breed in October to December; to get lambs in March-May; in South breed in August or September. Ewes have passed greatest usefulness at 7 to 8 years.</p> <p><b>Lambs</b> may be allowed to run with mother 3 to 4 months. Should be weaned by 4 months. To get house lambs, have rams and ewes in good physical condition, not overfat. Use a young ram and keep him well fed while in service. Give ewes abundance of succulent food and some corn. If ewe was not alone in fall, shear as early as safe. Have ram with ewe not earlier than March 15 nor later than May 15.</p> <p><b>For additional breeding rules see horse.</b></p>	<p><b>Sheep worm.—Symptoms:</b> Sheep become unthrifty, diarrhea, loss flesh and strength. A soft non-inflammatory swelling appears under the jaw. Diarrhea appears.</p> <p><b>Tapeeworms.—Symptoms:</b> Slow development. Weakness and emaciation. Flanks are drawn up or distended with gas. Unterside on feet. Excessive diarrhea may develop.</p> <p><b>Bloating.—Symptoms:</b> Abdomen becomes bloated and distended, filling with gas. Feeding falls off, animal shows stupidity, and respiration is difficult.</p> <p><b>Liver rot or fluke disease.—Symptoms</b> do not appear until disease is far advanced. Rapid loss of condition and weakness. Ewes become dry and may drop off. Eyes and lips become bloodless. Appetite falls off. Bowels irregular.</p> <p><b>Gid, staggers or steady.—Symptoms:</b> Animal moving in a circle, yawning, reeling, running forward with head elevated, turning about sharply, showing lack of control. Animal may be stupor. Eyes become staring, sight lost.</p> <p><b>Scab.—Symptoms:</b> Sheep scratch, rub and bite infected places. Little blisters form which rupture and exude a yellowish liquid which dries on skin and forms scab. Mites may be found in margin of scab. Wool mats and falls out. Should be shorn, sides and rump most affected.</p> <p><b>Sheep Ticks.—Symptoms:</b> Animals show itching and pain caused by ticks, and bite and scratch themselves.</p> <p><b>Foot rot.—Symptoms:</b> Lameness is apparent. Swelling reveals red raw spot in cleft just above the horny part. A sticky offensive discharge from hole in horn of hoof. Swelling just above hoof is swelling, accompanied by heat and sensitiveness.</p> <p><b>Paper skin or lung worm disease.—Symptoms:</b> A fatal or epidemic disease leaving animal almost suffocated. Discharge accompanies cough. In final stages skin becomes dry and papery. Appetite falls off, resulting in weakness and decline.</p> <p><b>Sore feet and sore mouth.—Symptoms:</b> Lameness and difficulty in eating. Ulcers appear on skin of feet above hoof and in membrane lining the lips.</p> <p><b>Garget.—Symptoms:</b> Udder is swollen and hot. Milk contains streaks of blood or clumps of pus.</p> <p><b>Grass staggers.—Symptoms:</b> Fainting apoplexy, constipation, abdominal pain, fever, restlessness, untenderness, delirium, running against objects aimlessly.</p> <p><b>Sewer.—Symptoms:</b> Offensive diarrhea, loss of appetite, distended abdomen, abdominal pain. Depression and weakness.</p>	<p>Change flock to high, well-drained land which has not been occupied by sheep for some time. Feed generously and provide plenty of salt. Mix 10 drams of coal-tar cresote in a gallon of water and give to lambs 4 to 6 tablespoonfuls and older sheep 8 to 10 tablespoonfuls every other day until 3 doses have been given. Feed should be withheld for 12 hours before and 3 hours after medicine.</p> <p>Fringed paper corn difficult to control by medicine. For broad tapeeworm give every sheep in flock 1/2 dram of extract of male fern in 2 to 4 ounces of castor oil, or 1 to 1 1/2 drams of kalmis. Withhold feed night before and in the morning of the day in which the medicine is given and give no water for 8 or 6 hours after medicine.</p> <p>Surgical treatment is necessary.</p> <p>Remove sheep to high, dry pastures and separate the sick from the well. Give nourishing food and plenty of salt. Infected pastures and pools should be drained and should be used for other purposes until clean. Snails should be destroyed. Drugs have little effect.</p> <p>Animals in advanced stage should be slaughtered. Carcasses of intested sheep should be completely disposed of so that dogs cannot get at them. As precaution, give dogs that have run of place 1 or 2 teaspoonfuls of castor-oil, followed 12 to 24 hours later by 25 minims of extract of male fern, followed with another dose of castor-oil in 2 hours. Keep dog tied and burn all discharges.</p> <p>Shear all sheep and confine for 2 to 4 weeks. Then dip in a mixture that will kill the mange mites. Lime and sulphur dip is very good. Repeat 7 to 10 days later. Each sheep must be kept in dip 2 minutes and head dipped at least once.</p> <p>Dip flock in lime and sulphur mixture or in a kerosene emulsion. Dip twice with an interval of two weeks. Ewes and nursing places must be thoroughly cleaned before animals are returned.</p> <p>Treat feet of healthy sheep with a solution of 1 pound chloride of lime to 12 quarts water or 1 pound carbolic acid crystals to 4 gallons water. Remove sheep to clean fields. To treat diseased sheep, cut away all loose or undetermined horn and all proud flesh, and stand sheep for 10 minutes in solution containing 4 pounds copper sulphate in 5 gallons water. When disease has reached deeper, area should be washed with a solution containing 1 ounce carbolic acid crystals in 20 ounces water, then doused with a powder of equal parts horse and man and again of stin and covered with soft bandages.</p> <p>Mark infested animals or separate from flock. Remove flock to clean inclosures and give nourishing feed, plenty of salt and pure water. Famine is best, using a mixture of flowers of sulphur and alcohol in a deep vessel floating in pan of water. Place in tight room and ignite. Attendant should remain to see that none suffocate. A mixture of 1 part salt to 25 parts of copperas should be kept constantly before sheep.</p> <p>Remove ewes and wash twice daily with solution of 1 tablespoonful creolin in 1 quart of water. Then paint infected parts only with Lugol's solution of iodine.</p> <p>Give 5 ounces of epsom salts dissolved in a pint of water, as purgative. Bathe udder often with warm water and rub with camphorated oil, and keep udder milked out clean.</p> <p>Affected animals should receive a strong laxative. Then give 2 tablespoonfuls, twice a day, of following mixture in a half pint of lined tea: Aromatic spirits of ammonia 1 1/2 ounces, alcohol 1 1/2 ounces, fluid extract of sassafras 1/2 dram.</p> <p>2 teaspoonfuls castor-oil containing 2 or 3 drops of creolin should be given at intervals followed by a tea made up of following mixture 3 times daily: Pepsin 1 dram, substrate of henneth 2 drams, cherry wine 3 drams, acid 1/2 dram, mucilage of acacia 5 ounces.</p>	<p>Best breed information found in booklets published by the various breed societies. Experiment station records will reveal innumerable experimental station bulletins.</p> <p>Arizona Bulletin No. 60, Report, 1908.</p> <p>Illinois Bulletin No. 120, Circular No. 125.</p> <p>Michigan Bulletin No. 178.</p> <p>Missouri Board of Agriculture, Missouri Bulletin 7 (1909), No. 2.</p> <p>Missouri Station, Circular Information No. 25.</p> <p>Nevada Bulletin No. 63.</p> <p>New York (Cornell) Bulletin No. 285.</p> <p>Oklahoma Report, 1908.</p> <p>Tennessee Bulletin No. 84.</p> <p>Wisconsin 23d Report.</p> <p>Virginia Bulletin No. 178.</p> <p>Wisconsin Report, 1907.</p> <p>Wyoming Bulletin No. 79, 81, Report 1908.</p> <p>Best breed information found in herbbooks published by various breed associations.</p> <p>Bureau of Animal Industry Bulletin No. 48.</p> <p>Farmers' Bulletin No. 331, Colorado Bulletin No. 146, Report 1907.</p> <p>Illinois Circulars Nos. 126, 133.</p> <p>Indiana Bulletins Nos. 100, 126.</p> <p>Iowa Bulletin No. 166.</p> <p>Mississippi Bulletin No. 107.</p>
BRIEF BREEDING RULES	DISEASES AND SYMPTOMS	TREATMENT	BULLETINS
<p><b>1. Age of puberty</b> 3 to 7 months.</p> <p><b>2. Best age to breed</b> 8 to 12 months.</p> <p><b>3. Period of heat, 3 days</b> after weaning the pig and every 9 to 12 days thereafter. Duration 1 to 3 days.</p> <p><b>4. Period of gestation</b> 112 to 115 days.</p>	<p><b>Mange.—Symptoms:</b> The crusts about eyes and ears are often the first evidence of disease. Disease spreads until it may cover entire body. Hairs fall itching. Sometimes loss of flesh and decline.</p> <p><b>Verminous bronchitis.—Symptoms:</b> Bronchial tubes inflamed, very severe coughing. Growth stunted. Caused by a small round worm in bronchial tubes.</p> <p><b>Forcible distemper.—Symptoms:</b> First, gradually extending over entire body.</p> <p><b>Rickets or rachitis.—Symptoms:</b> Animals stunted and poorly nourished. Lameness appears and bones about joints swell. Bones may become very weak and body fall over.</p>	<p>Crusts may be removed by scrubbing with soap and water followed by application of a 3 per cent solution of creolin or an ointment made of sulphur 2 drams, creosote 1 dram and vasoline to make an ounce. Crusts are daily until all parasites are killed. When large numbers are affected, dipping in lime and sulphur dip (described under mange) is necessary. Dipping should be repeated after 6 days.</p> <p>Kill adult pigs for food in first stages. Give young pig a teaspoonful of turpentine in swill food 3 times daily.</p> <p>Surgical treatment requiring extreme care is necessary.</p> <p>Feed concentrated and nutritious food rich in proteins. Milk, muddings, best ground bone turn are good. Lime water should be given. Sunlight, fresh air, clean quarters and exercise must be provided. Precipitated phosphate of calcium 1 to 3 dram doses 2 or 3 times daily in the feed, with oil of phosphorus in 1 drop doses is helpful.</p>	<p>Best breed information found in herbbooks published by various breed associations.</p> <p>Bureau of Animal Industry Bulletin No. 48.</p> <p>Farmers' Bulletin No. 331, Colorado Bulletin No. 146, Report 1907.</p> <p>Illinois Circulars Nos. 126, 133.</p> <p>Indiana Bulletins Nos. 100, 126.</p> <p>Iowa Bulletin No. 166.</p> <p>Mississippi Bulletin No. 107.</p>

TABLE III. HORSES, CATTLE,

BEST BREEDS	CHARACTERISTICS	Uses	BEST FOODS
<b>SWINE—Cont'd</b> <b>Duro-Jersey</b>	Medium size, fine bone. Snout medium length, face slightly droop. Ears drooped, level heavy body weight and dark on short legs. Ham heavily fleshed. Cherry red the popular color, but yellowish red and chestnut are often seen. Weight of boars 2 years old 600 pounds, sows 500 pounds.	Lard and pork. Crossing, especially with Berkshire and Poland-China.	or 400 pound sows, until late December. Then substitute daily 5 or 6 pounds of ration, ground oats 2 parts, ground corn 3 parts and bran 1 part. Skimmed milk is especially recommended for nursing grain ration. In winter give liberally of clover, alfalfa, or peas.
<b>Hampshire or Thin-kind Swine</b>	Medium size, face straight, ear inclined forward, but does not droop. Jaw light, as is also shoulder and ham. Black of medium width. Legs of medium length and bone of good quality. Color, black extremities with a white belt 4 to 12 inches wide encircling body and including fore-legs, which should also be white. Weight, boars 2 years old 450 pounds, sows 400 pounds.	Bacon and pork. Almost general purpose.	For first 24 hours after pigs are born, give sow no food. Then give light ration of 34 ground corn, 15 shorts, 14 ground oats mixed with 3 to 5 pounds skimmed milk to one of grain. Pigs should be given a little feed at 3 weeks, using same ration as for sow. Feed liberally to 3 months of age.
<b>Large Yorkshire or Large White Swine</b>	One of the largest breeds. Snout of medium length, with little or no dish. Moderate dish in face. Jaw of good width and muscular. Ears rather large, firmly attached, fringe with fine hair. Shoulders and back of medium width. Side long. Ham lighter than that of lard type with flesh carried well round inside of thigh. Legs medium length. Bone fairly heavy, clean and finny. Color, white.	Bacon. Valuable for crossing on Poland-China, Berkshire and Chester-White.	The bacon Avg.—Best foods are mixed peas, barley, oats, shorts and skimmed milk. Barley, ground or soaked over night is feed most used. Oil-meal or tankage may be added advantageously. Summer feeding on pasture of clover, alfalfa or rape.
<b>Poland-China</b>	Medium size. Face slightly dishd. Jaw full and heavy. Ears fine, firmly attached; about one-third of ear droops. Neck short, thick and heavily arched on top. Shoulder heavy. Side short. Back wide. Ham very wide and deep. Legs short, bone fine. Black with 6 white points on face, feet and tip of tail. Weight of boars 2 years old 600 pounds, sows 500 pounds.	Lard and pork. Valuable in crossing.	For first 24 hours after pigs are born, give sow no food. Then give light ration of 34 ground corn, 15 shorts, 14 ground oats mixed with 3 to 5 pounds skimmed milk to one-third pound of tankage daily. For the last 4 or 5 weeks of fattening they should be removed from the sow and fed as much corn as they will consume. Method will vary according to method of feeding the steers. Pigs that do not follow steers are fattened on pasture, clover or alfalfa or run-jam being best. Corn alone or abundant clover pasture is excellent ration.
<b>Tamworth</b>	Should have golden-red hair on a flesh-colored skin, free from black. Snout long and straight. Ear large. Jaw strong and light. Neck and shoulder are light; back and loin of medium width, side of good length, moderately deep. Rather deficient in ham. Legs long and strong.	Bacon. Crossing, especially with Berkshire.	

TABLE IV. CHICKENS, TURKEYS,

BEST BREEDS	CHARACTERISTICS	Uses	BEST FOODS
<b>CHICKENS</b> <b>Plymouth Rock</b>	Three varieties, the barred, white and buff. Back and body rather long, hence the name. Single combs, yellow shanks. Cocks weigh 9½ pounds and hens 7½ pounds.	General purpose, for both meat and eggs. Brown egg.	A good ration must contain sufficient digestible nutrients to meet needs of animal. Animal's appetite is safest guide as to amount of food needed.
<b>Wyandotte</b>	Eight standard varieties, white, buff, black, silver, golden, silver penciled, partridge and Columbian. A bird of curves, back short and broad, body deep and round, breast broad and deep, with a low-set tail. Shanks short and carried well apart. Colors silver, white, black, buff and mixtures. Close-fitting rose comb. Abundant fluffy, close-fitting plumage. Weight 8½ pounds for cocks, 6½ pounds for hens.	General purpose. Brown egg.	For raising young chickens, 1 pound protein to 4 pounds carbohydrates. The ration should consist of foods which the fowl likes. The following grains are preferred by fowls in order named: wheat, corn, oats, peas, barley, buckwheat, rice. The ration should provide a good variety and sufficient bulk to aid digestion. Wheat, bran, clover and alfalfa meal provide bulk in ration. The ration should contain easily digested foods, as whole grain and part ground feed. Feed at least one-third ground grain, as wheat or bran middlings, ground oats, corn meal and very small quantities of gluten meal. Wheat is most desirable of grains. Corn is used largely because it is cheaper. Hay oats raise best. Meat in some form, as beef scrap or green cut bone or skimmed milk should be included in every ration. It should form at least 10 to 15 per cent of total food consumed each day. Green food in form of cabbage, roots or cut clover should be given each day. Grit in form of crushed oyster shells or mortar is indispensable. Because of the expense of the latter, it is better to use meal and buckwheat middlings may be much used. Chickens should be fed on a ration that will keep them in good health and produce the most active breeds in winter. The lighter and more active breeds can be a great deal better than the heavy and more sluggish breeds.
<b>Rhode Island Red</b>	Three varieties, single comb, rose-combs and pea-combs (or buck-eyes). Tail color black. Rhode Island red has a red surface of body plumage, with a red or mahogany color, free from slate. Buckeye surface color is dark, rich carot, and under-color allows a bar of slate-color next to surface. Body of both 1 long. Rhode Island red level body, Rhode Island red slight elevation in front. Weight of Rhode Island red cocks 8½ pounds, hens 6½ pounds, buckeye cocks 9 pounds, hens 6 pounds.	Meat breed. Brown egg.	
<b>Brahma</b>	Two varieties, light and dark. Shy w hen long and toe feathering, thick, close plumage. General color of light Brahma, white, with black tail and black erect stripes in both hackle and saddle feathers. In dark Brahma, wings of cock encased by heavy black bar, and entire breast, body, leg and toes black. Back, wings, body and breast of female have a basis of gray on which are distinct dark pencillings. Weight for dark cocks 11 pounds, hens 8½ pounds; for light cocks 12 pounds, hens 9½ pounds.	Meat breed. Brown egg.	
<b>Cochin</b>	Four varieties, buff, partridge, white, black. Peculiarity is an appearance of massiveness and bulkiness. Heavy, short feathering is piled high on back and extends wide at sides. Extensive thigh and shank feathering. Comb single, low, close on head and evenly serrated with five distinct points. Cocks weigh 11 pounds, hens 8½ pounds.	Meat breed. Brown egg.	
<b>Leghorn</b>	Eight varieties, single-comb, rose-comb, single-comb and rose-comb white, single-comb and rose-comb buff, single-comb black and single-comb silver duckwing. Characterized by early maturity and great activity. Large, pendulous comb.	Egg production. White egg.	
<b>Minorca</b>	Three varieties, single-comb black, rose-comb black, single-comb white. Long body, carried rather upright, deep at breast with back tapering sharply toward tail, which is long and carried rather low. Comb large and erect, pure white. Cocks of rose-comb weigh 8 pounds, hens 6½ pounds. Single-comb cocks weigh 1 pound heavier.	Egg breed. White egg.	
<b>Dorking</b>	Three varieties, colored, white and silver-gray. Body long and deep. Carries abundance of flesh. Skin white. Colored largest cocks weigh 9 pounds and hens 7 pounds. White cocks weigh 7½ pounds, hens 6 pounds. Silver-gray variety is between these two. All have a fifth toe.	General purpose, meat especially. Egg of medium color.	
<b>Orpington</b>	Three varieties, buff, black and white. Long body, abundant plumage, white skin. Short heavy shanks. Tendency to feathering on shanks. Cock weighs 10 pounds, hens 8 pounds.	General purpose. Egg tinted.	
<b>Houan</b>	Color black and white evenly broken in alternate spots throughout entire plumage. Head ornaments of crest and beard. White skin. Carry flesh on each foot. Cocks weigh 7 pounds, hens 6 pounds.	Egg breed. White egg.	
<b>Hamburg</b>	Six varieties, golden spangled, silver spangled, golden penciled, silver penciled, white and black. About size of the Leghorn.	Egg and fancy breed. White egg.	
<b>Indian</b>	Two varieties, Cornish and white. Beaks and shanks yellow. Bird of strong proportions. Back and wings of cock mixture of red and black, tail and breast black. Hen's back, wings, breast and body a rich buff penciled with black. Cocks weigh 9 pounds, hens 8½ pounds.	Meat breed. Tinted egg.	

## SHEEP AND SWINE—Continued

BRIEF BREEDING RULES	DISEASES AND SYMPTOMS	TREATMENT	BULLETINS
Boars do not show best form before 4 or 5 months old, and should not begin service under 10 months. Give best service at 8 years old. Sows should be prolific and good milkers. For pork, breed sows any time after 8 months of age, but for pure-bred breeding stock 12 months of age better. Sows should breed twice a year, to get 1 litter in early spring (April to May), the second in September or October. Pigs may run with sows 8 to 10 weeks.	<b>Sore mouth.</b> —Symptoms: Aversion to food and saliva dripping from mouth. Gums become congested and later necrotic patches develop, especially about front teeth and tusks. Offensive odor to mouth. Jaws are swollen, lips and mouth often cracked and covered with scabs. Rapid decline and prostration. <b>Cottontail poisoning.</b> —Symptoms: Loss of appetite accompanied by thumps. Animal drops over, hicks and squeals for a few minutes and dies. <b>Catarrhal rhinitis or snuffles.</b> —Symptoms: Animal more quiet than usual and may experience slight chills. Eyes are red, appetite lessened and constipation is present. Watery discharge from nostrils, which later thickens and makes breathing difficult. <b>Thumps.</b> —Symptoms: Sets in suddenly with a jerking or twitching movement of flanks, which may become excessive, producing a thumping. Animal keeps up with and has a poor appetite. May fall off in weight. <b>Hog cholera.</b> —Symptoms: Continuous fever and discoloration of skin. Animals lack spirit and lie huddled together. Refuse to move when disturbed. <b>Swine plague.</b> —Symptoms: Aversion to food. Much coughing, back arched, grunts broken, eyes reddened and skin in front takes reddish tinge.	Affected animals should be separated from well animals and pens thoroughly disinfected. Wash mouth with 2 per cent warm creolin solution to remove patches. Then a 10 per cent ointment of salicylic acid may be applied in severe cases. Treat daily until almost is cured.  Complete elimination of cottonseed meal from ration is the only positive preventive. Given in proper quantities it is normally safe, but its use demands special precautions.  Keep animal warm and provide clean, well-lighted pen. Liquid foods should be warmed, 1½ ounces of castor oil should be given. Fumigation by burning tar in close room may help. To loosen nasal discharge, tincture of belladonna leaves in ½-teaspoonful doses twice daily may be added to feed.  If caused by worms, give dried sulphate of iron in will once a day for 7 or 8 doses. ¼ pound sulphate for 40 pigs. If caused by indigestion, give less food and allow access to charcoal and wood ashes. Exercise should be allowed also on free pasture. To first stage give every 4 hours a physic of 2 ounces raw linseed oil followed with 2 to 10 drops of tincture of opium in a little oil. Demands expert and immediate care.	Ohio Bulletin Nos. 208, 212. Oklahoma Bulletin No. 90 Pennsylvania Bulletin No. 95 South Dakota Bulletin No. 165 Wisconsin Bulletin No. 184; Report 1907.
For additional breeding rules see horses.		Demands expert and immediate attention.	

## DUCKS AND GEES

BRIEF BREEDING RULES	DISEASES AND SYMPTOMS	TREATMENT	BULLETINS
Very close inbreeding tends to produce chicks that are weak or fall on easy prey to disease or are infertile. Line breeding is better. Mate offspring of a pair with father and mother rather than brother with sister.  Grandchildren of original father may be mated to those of original mother.  Selection involves the careful inspection of the individuals of any generation and preservation for breeding of only the best.  Hybridization involves the crossing of two strains, varieties, or races in order to combine the favorable qualities of the two. Sex control means at present beyond human power.  Period of incubation is 19 to 24 days, average 21.  To get early market poultry mate late in fall. Brahmas and Cochins pullets begin to lay at 9 to 9 months. Leghorns and other small breeds 4 to 6 months. Plymouth Rock and Wadsworths, 5 to 7 months. Mate breeding pen 6 weeks before earliest date for hatching. Hens should lay a few weeks rest before breeding season, for high-class stock. Breeding stock should have free range or, if confined, be not crowded and fed green feed and meat scrap in addition to that upon which they rest. Hold eggs for hatching in cool, dry place, at temperature of 40 to 45 degrees Fahrenheit for setting should be in fair condition, should feel hot to hand when handled, and should allow herself to be handled freely.	<b>Simple canker.</b> —Symptoms: Appears as yellowish or whitish patches in mouth and on skin about feather roots, on abdomen, back, neck and head. <b>Lice.</b> —Symptoms: May be found under wings and on skin about feather roots, on abdomen, back, neck and head. <b>Mite.</b> —Symptoms: Red, black and grey. Bred in cracks and crevices of building or under droppings.  <b>Diphtheria.</b> —Symptoms: Fowl becomes suddenly ill and loses appetite; legs are hot, comb hot and deep red. Difficult breathing and sharp cough. Inflammation of throat. Legs and wings may become paralyzed. <b>Snail leg.</b> —Symptoms: Rough grayish or whitish scales and crusts on shanks and feet.  <b>Colds.</b> —Symptoms: Sneezing, watery eyes, discharge from nostrils and swollen face. Bubbles or drope form in corners of eyes.  <b>Catarrh (contagious) or roup.</b> —Symptoms: Peculiar, strong offensive odor. A glairy water-white or yellowish discharge from nostrils and under eyelids. Legs hot. Comb and wattles hot and deep red. Characteristic roup smell always present.  <b>Worms.</b> —Symptoms: Will appear in the excrement.  <b>Gapes.</b> —Symptoms: Difficult breathing and characteristic gaping attitude. Caused by a parasitic worm which attaches itself to mucous lining of windpipe.  <b>Diarrhea.</b> —Symptoms: Looseness of bowels. Discharges yellowish, greenish, dark or watery.  <b>Contagious diarrhea.</b> —Symptoms: Thirst, little appetite, stupidity, bowel discharge loose and watery, often dark or bluish green, sometimes blood streaked. Comb and wattles dark red or purplish, and legs hot.	Dust powdered boracic acid on sores or apply pure creolin with soft cotton cloth. Fifteen grains boracic acid in 1 ounce water may be used freely as a wash.  Dust thoroughly with pure fresh Perisan insect powder. Work well down to skin. Repeat in 10 days.  Keep roost clean. Use abundance of mixture of 1 quart kerosene, 1 quart creolin and 1 quart liquid lice killer for painting roosts and droppings-board.  Segregate sick fowl and preferably kill and burn. May give fowl four times daily a 0.01 grain tablet of biniodide of mercury. Cleanse mouth and throat with strong perfume of hydrogen, or 1 tablespoonful creolin in 4 fluid ounces of water.  Apply ointment made by mixing 1 teaspoonful creolin to 1 cupful melted lard. Stir until cool and apply daily until scales and crusts drop off.  Sleeping quarters should be well ventilated. Give condition powders or tonic in food or drinking water, or season mash with ginger and red pepper. Following mixture will usually cure if taken at start: 20 to 30 drops spirit of camphor with a tablespoonful granulated sugar. Dissolve in pint of drinking water and allow birds access to no other drink.  Kill and burn all very sick birds. Segregate in an open shed all that show symptoms. Use creolin dip—1 teaspoonful pure creolin in 1 pint water and dip heads in solution, using fresh solution for each bird—and make fowl inhale creolin vapor by spraying over with the same solution. Thoroughly cleanse head, mouth, eyes, nostrils and throat with this disinfectant, and keep fowls in wide open, fresh pens.  Allow no food for 12 hours. Then give in 1 dose a mixture of 3 teaspoonfuls oil of turpentine and 1 tablespoonful sweet oil. Administer directly into crop through rubber tube passed down throat. May be necessary to repeat in 12 to 24 hours.  Remove worms by a loop of horsehair or a wire gape-worm extractor dipped in kerosene. Soaked milk, thickened with well-boiled flour and seasoned with ginger, makes a desirable food and remedy.  Segregate affected birds and remove to clean place. Give calomel in 0.01 of a grain dose 3 times daily. For difficult cases dissolve 12 tablets of mercury bichloride, 0.001 of a grain drug strength each, in 1 quart of drinking water and allow no other drink. This medicine should be given less frequently as soon as improvement appears.	Ontario Department of Agriculture Bulletin No. 151.  Farmers' Bulletin No. 41, 51, 64, 177, 182, 200, 234, 257, 255, 267. TABLE IV. CHICKENS, TURKEYS,

BEST BREEDS	CHARACTERISTICS	Uses	BEST FOODS
<b>CHICKENS</b> —Cont'd <b>Bantam</b>	Ornamental birds of many varieties: Sebright, rose-comb, booted white, Hrahma, Cochon, Japanese, Polish, game, black-breasted red Malay.	Fancy and ornamental varieties of many foregoing breeds.	See page 408.
BEST BREEDS	CHARACTERISTICS	Uses	BEST FOODS
<b>TURKEYS</b> <b>Bronze</b>	Largest and hardiest of all varieties for the market. Adult cock 36 pounds, hen 20 pounds.	Meat.	The young must be fed with care at first, allowing only bread and milk mixed with $\frac{1}{4}$ pot cheese and a little chopped onion, given 2 or 3 times a day. Once or twice a day feed finely cracked corn, wheat and oatmeal mixed in equal parts. After second week, bread and milk should be decreased and grains and pot cheese increased. Fine grit and charcoal should be available. Water should be provided in such a way that young turkeys cannot become wet. When turkeys graze in fields during day they should be fed grain at night, corn, wheat, oats or peas.
<b>Narraganset</b>	Plumage bronze and black with a mixture of white. Second in size to bronze. Cock 30 pounds, hen 18 pounds. General color gray.	Meat.	
<b>Buff</b>	Feathers a reddish buff, the wing flights being white.	Meat.	
<b>Slate</b>	Plumage of a bluish slate shade. Cock 27 pounds, hen 18 pounds.	Meat.	
<b>Black</b>	Plumage pure black. Otherwise same as above.	Meat.	
<b>White Holland</b>	Plumage pure white throughout; has pinkish white shanks. Cocks 26 pounds, hens 16 pounds.	Meat.	
<b>Bourbon Red</b>	A kindred variety to the buff, having deep reddish-buff plumage.	Meat.	During breeding season, one feeding a day of mixture of equal parts by weight of wheat middlings, wheat bran, corn meal, ground oats and meat scrap, stirred up with skimmed milk, should be given. In fattening turkeys for market they should be fed all the whole corn they will eat at night. In morning a mixture of 6 parts corn meal, 3 parts wheat middlings, 1 part beef scrap, mixed as thick paste with sour skimmed milk may be given. Turkeys do best on free range.
BEST BREEDS	CHARACTERISTICS	Uses	
<b>DUCKS</b> <b>Boucon</b>	Largest and most popular of all colored market varieties. Weight 9 pounds for drakes, 8 pounds for ducks.	Meat.	
<b>Black Cayuga</b>	Largest solid black duck known. Mature pair weighs 15 pounds. Body of good length.	Meat.	A fair layer.
<b>Pekin</b>	Largest white duck in existence. Specimens weigh as high as 10 or 12 pounds. Head and beak long and of good size, beak orange-yellow, back, breast and body long, broad and deep, with deep keel. Creamy white.	Meat.	A good layer.
<b>Crested White</b>	Medium-sized white duck with large white crest or topknot, about two-thirds the size of Pekin, which it resembles in color and shape of body, except crest.	Meat.	A fair layer.
<b>Indian Runner</b>	Head long and flat, light fawn in color, cap and cheek markings light fawn, bill straight, green with black band at tip, eyes basal, neck white from head to beginning of breast markings, back light fawn or gray, breast light fawn, body light fawn, rear half white. Shanks and feet orange-yellow. Carriage very erect. Small size.	Meat.	The best layer.
<b>Colored Muscovy</b>	Good size, black and white in color, black predominating. Side of head and region around eye are without feathers and are carunculated or corrugated and scarlet. Builds her nest and never scatters her eggs. Never quacks. Active on wing.	Meat.	
<b>White Muscovy</b>	Same as colored muscovy except that it is pure white.	Meat.	
BEST BREEDS	CHARACTERISTICS	Uses	
<b>GOOSE</b> <b>African</b>	Large head with pronounced black knot and heavy gray dewlap under throat. Neck long, back broad and flat, breast full and round, body large and upright, thighs short and plump. Shanks medium length and dark orange color. Wings of good size, close fitting. General color, gray. Mature gander 20 pounds, goose 18 pounds.	Meat and feathers.	
<b>Emden</b>	Color white. Square, compact body. Neck long and massive appearing, large head. Medium-size orange-colored bill. Back slightly arched, breast round, deep and full. Shanks short, stout, deep, orange color, thighs strong, wings large, tail short. Eyes bright blue. Mature gander 20 pounds, goose 15 pounds.	Meat and feathers.	
<b>Toulouse</b>	Blue-gray in color, marked with brown. Head large but short, bill short and stout, neck medium long, body compact, medium length, deep, belly almost touching ground, back broad, slightly arched, breast broad and deep, wings large, strong, close fitting, tail short. Adult gander 20 pounds, goose 18 pounds.	Meat and feathers.	
<b>White and Brown Chinese</b>	Bodies plump and round, covered with coat of soft feathers and fine down. Medium size, mature specimens weighing 10 to 14 pounds. Long arch necks, with large round knob at base of beak. Short erect body and carriage.	Meat and feathers. Much in demand for ornamental purposes.	

## DUCKS AND GEESSE—Continued

BRIEF BREEDING RULES	DISEASES AND SYMPTOMS	TREATMENT	BULLETINS
Set from eggs from vigorous stock having the qualities particularly desired. Eggs should not be more than 1 week old, and must be fresh. For Asiatic breeds, mate 1 male to 10 females; for Americans, 1 male to 8 to 12 females; for Mediterranean, 1 male to 10 to 15 females. In selecting breeding stock, pedigree, appearance, condition and permanence are of first importance in the parents. Strong, constitutional vigor and early maturity essential.	<b>Fowl cholera</b> .—Symptoms: A yellowish discoloration of part of droppings usually white. Fowl becomes unsteady on legs, feathers ruffled, wings droop, head drawn down, comb and wattles pale, legs hot. Food repulsive. <b>Pip</b> .—Symptoms: Mucous membrane of mouth dried and a hard horny scale is formed on end of tongue. The hard scale or "pip" will in time fall off of its own accord. <b>Brood sickness</b> .—Rattling in throat and difficult food breathing.	Use mercury bichloride as on page 409 (contagious diarrhoea). 1 per cent solution carbolic acid in drinking water and cayenne pepper in food are recommended. Treatment seldom satisfactory.  Apply equal parts of glycerine and water freely or wash mouth frequently with a solution of 16 grains boracic acid in 1 ounce of water.  Remove fowl to comfortable fresh-air pen, protected from drafts. Give nourishing, bracing food. Use 12 tablets arsenite of antimony, 0.001 of a grain each, to each pint of drinking water and allow bird no other drink.	See page 409.

BRIEF BREEDING RULES	DISEASES AND SYMPTOMS	TREATMENT	BULLETINS
Select big, strong, vigorous, healthy, well-matured stock, not closely related. Constitutional vigor of first importance. Introduce new blood into flock. Males should be unpaired to females, as inbreeding weakens stock. Medium-sized male with good, fair-sized females of strong constitutional vigor and mature age will give best results. Have 4 or 8 females to 1 male. Hen lays 20 to 40 eggs in a season, beginning March or April. 1 mating sufficient to fertilize entire batch of eggs. Hen will lay 18 to 20 eggs before becoming broody, and if broken up will lay another batch.  Period of incubation 26 to 30 days. Old birds in good condition, not overfat, best breeders. Birds of either sex may be used for breeding until 8 or 10 years old. Laying generally begins in March or April.	<b>Blackhead</b> .—Symptoms: Turkey look pinched, shrunken and purple about head. Feathers rough. Diarrhoea present with bright yellow excrement. Birds have little life and drag about. <b>Colds</b> .—See under chickens. <b>Roup</b> .—See under chickens. <b>Gapes</b> .—See under chickens.  <b>Tapeeworms</b> .—Symptoms: Presence of worms in faeces. <b>Diarrhoea</b> .	Kill and burn affected birds, and thoroughly disinfect coops, buildings, feeding and drinking troughs, etc. Pepper, ginger and something sour in food aid in prevention.  Freshly powdered kumaso, tansy and pumpkins seeds are recommended. Turpentine in small doses has given success.  Mix 3 ounces sulphuric acid and 14 pound copperas in 2 gallons water, and give 1 teaspoonful of mixture in each quart of drinking water.	See chicken references. Farmers' Bulletin No. 200.

BRIEF BREEDING RULES	BEST FOODS	DISEASES AND SYMPTOMS	BULLETINS
Mate only standard specimens. Select meaty birds, deep bodied and strong in bone. Attention must be given to pedigree, appearance, condition and performance. Quick growth is important. Better ducklings result from eggs from old ducks, but young ducks lay a month earlier than old ones, and their eggs may be used for early hatching. Laying period December to June. Usually 1 male to 5 females till June, then 10 females. Birds are kept in flocks of 25 to 40 of both sexes. Laying season extends from January to August.  Period of incubation 25 to 32 days.  Ducks are poor sitters and eggs generally hatched by hen or incubator.  For general breeding notes see chickens.	When breeding birds have free range and water-run, they may be fed either whole corn, wheat, oats or barley, or a mixture. If eggs are desired, supply good beef scrap. The birds may be allowed to help themselves. When confined and heavy egg production desired, soft food should be fed morning and night and a light feed of hard grains in middle of day. Corn meal, low-grade flour, wheat bran, meat scrap and some green food, as turnips, cabbage, oat clover or alfalfa, make a valuable mixture. Drinking water should always be within reach. Begin to feed ducklings when 40 to 48 hours old. Start with mixture of two-thirds wheat bran and one-third corn meal, moistened with water or milk; a raw egg stirred in with each quart of grain is good addition, as is also a little sand or prepared grit. Keep before ducklings for 2 days if it remains sweet. Otherwise reserve. When ducklings 1 week old, they may take 0.05 beef scrap, 3 parts wheat bran, 2 parts corn meal, 4 feedings a day. Gradually increase proportion of corn meal so that at 6 weeks the meal and bran are equal, and the beef scrap 0.15 is of the whole. At 6 weeks feed 3 times daily. If this feed too laxative, reduce the beef scrap. Excess green food likely to make skin yellow. Abundance of grit and fresh water must be constantly available.	Ducks are remarkably free from disease and there are no diseases peculiar to them. Ducks running with other fowls may contract diseases, which should be treated as for other fowls. Lameness may result from damp quarters. Ducks having colic, as shown by frothy scum over eyes, should have eyes washed with warm water containing a little carbolic acid. Treat as for cold.	See chicken references.  Farmers' Bulletin No. 64.

BRIEF BREEDING RULES	BEST FOODS	DISEASES AND SYMPTOMS	BULLETINS
Choose bright, active goose and gander of good parentage, 2 to 3 years old. Mate in fall or early winter. Gander and goose to 4 in number, should be put together and isolated till they become accustomed. Young ganders often take but 1 goose. Hens may be placed on the eggs. Goosess usually lay 2 to 3 eggs. Wild ganders do not mate until 2 to 3 years old, and frequently will not mate first year in captivity. Period of incubation 27 to 33 days.  Laying season is very short, beginning about February 1. Will lay 20 to 50 eggs per year.  Goosess not fully mature until 1 year old, and first year eggs frequently infertile. Best laying is from second year on. Ganders are most valuable at 3 to 7 years. Goosess becomes broody after laying about 18 to 20 eggs. If these taken away and goose shut up for few days she will then lay another batch, and with similar treatment a third batch. Eggs for hatching should be held at 50 to 60 degrees and turned each day. For general breeding notes, see chickens.	Goosess graze freely and in this way pick up much of their food. In winter, supply a little grain and liberal allowance of succulent food, as roots and cabbage. At laying time the feed should be increased. A liberal ration, as prepared for ducks, containing considerable animal food, should be given twice a day.  Water and grit should always be accessible. In finishing grass-fed geese for market, feed corn meal with 10 per cent of beef scrap, scalded or wet with cold water. Once a day give whole corn.  Keep geosings in warm place, and first 2 or 3 days feed little soaked bread and water. Gradually let them out, and in a week they may go free. Will need nothing but a little stale bread first 5 weeks, if on good free range. After 5 weeks mash of one-third corn meal, two-thirds bran should be given. After 6 weeks give equal parts of corn and bran, to fatten.	Goosess are almost wholly free from disease, and the gander is seldom troubled in this respect.	See chicken references.  Farmers' Bulletin No. 64.

## THE AGRICULTURAL EXPERIMENT STATIONS

The most prolific source of agricultural literature is the United States Department of Agriculture, Washington, D. C. This department maintains various bureaus and laboratories, in charge of eminent specialists, who investigate and report upon almost every phase of agriculture, horticulture and animal husbandry. For location of Agricultural Colleges and State Universities, see page 76.

**HORTICULTURE** is the growing and cultivating of fruits, vegetables, flowers and ornamental plants, as shrubs and others. It is divided under four general heads by authorities, viz.:

*Pomology*, or fruit growing.  
*Olericulture*, or vegetable growing.  
*Floriculture*, or the growing of flowers and plants for various purposes.

**Landscape gardening.**

The first two have the wider economic importance. Improved transportation facilities, fast freight lines with refrigerator cars, organized systems of gathering, shipping and marketing, and a better general and specific knowledge of climates and soils best adapted to each particular product have stimulated horticulture in all its branches.

According to the census of 1900 fruits in the United States aggregated in value nearly \$131,500,000, of which those of the orchards proper contributed \$83,752,000, grapes over \$14,000,000, small fruits \$25,000,000, and subtropical fruits \$5,550,000. Of this total California was credited with 21.5 per cent, New York 12.1 per cent, Pennsylvania 7.5 per cent, Ohio 6.8 per cent, and Michigan 4.5 per cent, the aggregate for these five states amounting to over 52 per cent of the total for the United States.

Many other states include favored localities where fruits of the finest quality are grown.

Spraying as a means of protecting fruits and fruit trees, shrubs and vines from injury by insects and fungi, is generally regarded as essential, not only in preventing loss of fruit but in aiding its more perfect development. Also, it has been demonstrated in some districts noted for the excellence of their fruits that damage by unseasonable frosts may be successfully guarded against by use of smudge pots, or heaters, in which oil or some other material is burned, and by which atmos-

pheric conditions are made such as to prevent destruction of the fruit buds by cold. Bee-keeping goes hand in hand with fruit-raising, and the bees are helpful in promoting perfect pollination in the blossoms which they visit.

**ANIMAL HUSBANDRY**, or the rearing of livestock, is important, if not indispensable to a prosperous and permanent agriculture. Farm animals not only provide meat and milk, which constitute leading industries in themselves, but, through the wise use of their manures, vitally aid in maintaining the fertility of the land. As agriculture grows in intensity the values of manures increase; in Germany, for instance, it is a common custom to measure the peasant's prosperity by the size of his manure heap. Under right management, it should be infinitely more profitable, too, to market the bulk of the farm crops in the form of beef, mutton, pork, products of the cow and poultry, than to sell the crops direct. In the latter case all the fertility they contain goes with them, resulting in a net loss to the land of just that much plant food. Persevered in, such a system leads to impoverished soils and poverty. Besides, stock-keeping affords continuous employment for labor.

**Select Breeding.**—All domesticated animals have been greatly improved by judicious selection, mating and feeding, and the better sorts are always found where civilization is most advanced. In America, the pure-bred and high-grade are gradually taking the place of the "scrub" or mongrel. The former are not only kept more economically, but mature earlier, and can be reliably depended upon to return largest profits. The selection of a breed should depend upon the individual, his needs, environments and location, and by all means, for any purpose, be of improved stock and superior individuals.

**Dairying.**—No other form of husbandry

is more highly profitable, or contributes more to maintaining or building up soils than dairying. In recent years its progress and growth throughout the United States and Canada have been most marked, resulting incidentally in many immense butter factories, called creameries, some of which gather their milk and cream from a wide territory, and for which special milk trains are run. Butter and cheese making away from the farms have become special industries representing large capital, under the management of trained specialists.

**Important Aids.**—Inventive genius has been of incalculable aid to dairying. In comparatively recent years have come the Babcock test, and the cream separator. The test is used in ascertaining the per cent of fat in milk, and, with the scales, enables the detection of profitable and unprofitable cows. The separators extract the fat from milk by centrifugal force, as soon as drawn from the cow, obtaining a larger percentage of the butter-fat or cream than is possible by gravity, and leaving the milk at once available and sweet as a much esteemed food for young farm animals.

The many well-to-do communities where dairying is a leading industry prove that, wisely conducted, it yields a higher prosperity than general farming.

**Veterinary Science** has kept pace with and contributed to the general advance in animal husbandry. The tuberculin test, for detecting tuberculosis in cattle, is one of the valuable late discoveries, and another is the successful treatment of milk fever in cows. By inoculation and disinfection it is had from "Spanish" or "Texas" fever in cattle, and the latest discovery, and one promising incalculable value to the swine industry, is that by which hogs may be made immune from "cholera" through inoculation, which annually destroys vast numbers.

Copyright, 1916 by The W. E. Richardson Company

**MANUFACTURES.**—At the time the American colonies were founded the industries of the world were largely conducted under the domestic system of labor. The colonists were without capital and there was very little opportunity for specialization in manufacture. Each family was largely dependent upon its own exertions for the production of food and clothing, as well as for the ordinary domestic utensils and implements of agriculture. Building materials were unknown, except as they were obtained from the forest or the quarry.

**Early Basic Industries.**—The basic industries of the country, nevertheless, had an early start and naturally continued to develop with the increase in population.

**Textile Industries.**—Until after the Revolution, and even as late as 1840, hand spinning and weaving and the domestic manufacture of coarse cloths was largely practiced throughout the country. The tendency was constantly toward the factory method of manufacture, and a little fulling-mill was built at Rowley, Mass., in 1643, which was probably the first textile mill erected in this country. The first cotton factory for the employment of English methods was built in 1790 at Pawtucket, R. I. A cotton mill operated by horsepower was built on James Island near Charleston, S. C., in 1787. About the same time other textile mills were put into operation in Philadelphia and in the Southern States.

**Shipbuilding.**—The unlimited forests were an inducement to shipbuilding, and this was the first industry in which cooperative labor was employed. The *Restless*, built in 1614, was probably the first vessel with a deck built in this country. The industry developed with the increase in population, and by 1700 extended from the northward to the southern colonies. In 1769 the annual product amounted to not less than 389 vessels, with an aggregate of 20,000 tons burden.

**Lumber.**—The first sawmill in the New England States was built in 1633 or 1634. Saw and grist mills were located on streams wherever there was sufficient population to support them. They were the first industries to utilize the water power of the country.

**Building Materials.**—The first brick were made in Virginia in 1629. Rough logs and hewn timber were the universal building materials outside of the larger settlements, but the product of the sawmills was used for building at an early date. As early as 1770 considerable quantities of lumber were exported.

**Metal Industries.**—Iron was the only base metal produced in the early history of the colonies. The precious metals were found in small quantities, but never enough to be of commercial importance. The first forge was set up in Massachusetts, probably at Lynn or Braintree, in 1643 or 1644. Iron works, bloomeries and forges, and mills for the manufacture of articles from the metal were erected at various points where the ore was discovered. In 1619 there was an attempt made in Virginia to manufacture iron. Later the iron deposits were discovered in Pennsylvania, where forges and furnaces were built as early as 1700. In 1731, when the returns of the manufacturers were made by the governor in pursuance of an order of the House of Commons, New England was reported to have six furnaces, eighteen forges, one slitting mill, and a nail factory. The industry was insignificant as compared with the great blast furnaces and rolling mills and steel

works in operation 200 years later (1904), when more than 250,000 persons were employed, and the annual products were valued at \$906,000,000.

**Leather.**—Tanning, as one of the simplest of the arts and a support of the stock husbandry, was commenced almost with the first settlement. The tanning of leather and the manufacture of boots and shoes were of commercial importance at Lynn, Mass., as early as 1650. In 1640 laws were enacted providing for the preservation of the hides of animals to be tanned for leather, and evidently the shoe industry was of considerable importance then. Eastern Massachusetts has continued to be the principal boot and shoe producing district of the country. The products of the factories in the two cities of Brockton and Lynn during 1904 were valued at more than \$55,000,000 and formed about 17 per cent of the total for the United States, which was reported as \$320,000,000.

**Causes of Development.**—The various Indian wars of the colonial period, the war of the Revolution, as well as all subsequent wars, have stimulated the industrial development. Those in the early history of the country forced the planting of the mechanical arts, and an unprecedented development commenced immediately after the Civil War.

The ingenuity of the people, unlimited natural resources, the system of laws, free intercourse between the States, and improved methods of transportation have, combined with the various other conditions, caused a rapid and unprecedented increase in the manufactures of the United States. No other nation has such a record of development.

**Materials.**—The raw materials used in manufacture are obtained either from the farm, the forest, the mine, or the sea. During 1904 those obtained from the farm were reported as costing \$2,492,836,646; those from the forest, \$163,464,577; those from the mine \$471,118,181; and those from the sea, lakes and rivers, \$13,715,086.

**Principal Industries.**—The manufacture of food products, structural and building materials, and clothing and kindred products are by far the most important industries of the country.

**Animal and Fish Products.**—The manufacture of canned goods was comparatively unimportant prior to 1890. Since then it has had a wonderful development, and a great variety of foods preserved in metal or glass receptacles are now manufactured from animal and fish products. In 1904 there were 10,647 establishments with an annual product of \$1,139,557,178. This includes the slaughtering industry and the manufacture of the various animal products, cheese, butter, condensed milk, and the canning and preserving of sea foods. It also includes the by-products, such as fertilizers, containers, etc., which are of great importance in some establishments. Measured by the gross annual value of products (\$913,914,624), slaughtering and meat packing is the most important single industry of the United States. This is the product of the wholesale establishments only. The retail butchers and farmers slaughter an enormous number of which no record is preserved.

**Butter and Cheese.**—These products are manufactured on farms even more extensively than in independent establishments. In 1900 the production of butter on farms amounted to 1,071,745,127 pounds and in factories to 531,478,141 pounds. But this enormous total of 1,603,223,268 pounds

does not represent the total production, as it is estimated that 40,000 pounds of butter was made by persons having one or two cows, but who were not classed as farmers.

**Vegetable Products.**—The different varieties of food products are now practically unlimited, new forms of tasty preparations constantly appearing in the market. Including the flour mills and the bakeries there were 38,055 establishments reported as engaged in the manufacture of these commodities from vegetable products during 1904, and their annual product was valued at \$217,693,177. This value includes by-products, such as cattle feed, fertilizers, etc., which are not used for food. Flour mills, breweries, sugar refineries, bread and other bakery products are, in the order named, the four most important industries using vegetables or cereals.

**Flour Mills.**—Flour is the most important product for human consumption as a raw material. The annual production of wheat flour exceeds 110,000,000 barrels.

**Bakeries.**—Such a large quantity of flour is consumed annually in domestic use that the operations of the 18,227 establishments reported as engaged in the manufacture of bread and bakery products during 1904 is no indication of the actual consumption. The products of these establishments amounted to \$269,609,061.

**Sugar.**—Sugar cane was first brought to Louisiana in 1751 and the first sugar was manufactured in 1791. The industry has had a wonderful development, but the domestic production has never been sufficient to supply the consumption in the United States. The products of the refineries for 1904 amounted to \$277,285,449, which includes a considerable amount of by-products. The production has increased from 274,724,000 pounds in 1860-1 to \$28,800,000 in 1908-9.

**Beet Sugar.**—The manufacture of sugar from beets assumed considerable proportions prior to 1870. The production for that year was about 896,000 pounds. There has been a steady increase from year to year, the product for 1909 amounting to 851,768,000 pounds.

**Liquors.**—A considerable proportion of the revenue of the federal government is derived from a tax on the production and sale of distilled and fermented liquors. The production is carefully gauged. The production of distilled liquors, exclusive of fruit brandies, increased from 109,275,928 tax gallons in 1890 to 133,450,755 gallons in 1909. The production of fruit brandies increased from 1,825,810 gallons in 1890 to 6,440,858 gallons in 1909, and of fermented liquors from 27,561,944 barrels in 1890 to 56,364,360 barrels in 1909.

**Confectionery.**—Candy making as an art did not obtain a firm footing in this country until about the middle of the last century, but as early as 1816 there were twenty confectioneries manufacturing candy in Philadelphia. The products are made so largely in small shops, bakeries, and restaurants that no correct figures can be compiled. During 1904, however, there were 1,348 establishments with an annual product of \$87,087,253 which made a specialty of these products.

**Glucose.**—This product is used largely in the manufacture of confectionery as a substitute or adulterant for sugar. Prior to 1870 there was very little, if any, manufactured in this country, but during 1904 the product was valued at \$12,207,197.

**Manufactured Ice.**—In 1880 there were about thirty-five establishments in the country

manufacturing ice for sale. Since 1890 the industry has increased very rapidly, especially in the Southern states, where it is difficult, or impossible, to obtain the natural product. There were 1,320 establishments in operation during 1904 and their annual product was valued at \$23,790,045. In addition, enormous quantities are manufactured by brewers, markets, and cold storage companies and consumed in the establishment where produced.

**Textiles.**—These industries include the manufacture of fabric from either vegetable or animal fibers. The processes of manufacture are complicated and require large investments in machinery. A larger quantity of cotton is consumed than of all the other fibers combined. The consumption for the entire world in 1908 shows that about 54 per cent of the quantity was cotton, 14.5 per cent wool, 14 per cent jute, 10 per cent flax, 7 per cent hemp, and 0.5 per cent silk.

**Cotton Mills.**—In 1850 there were 1,094 establishments with an annual product of \$4,734,424. In 1904 there were 1,154 establishments manufacturing cotton goods, and cotton small wares and their products for the year were valued at \$450,467,704.

**Wool Manufactures.**—The product of the 675 establishments reported for this industry in 1850 amounted to \$48,608,770. There were 1,213 establishments in 1904 engaged in the manufacture of woolen and worsted goods, carpets and rugs, felt goods, wool hats and, similar products in which wool in some form was the chief component material. The annual product of these mills was valued at \$380,934,003.

**Hosiery and Knit Goods.**—The variety of products has increased with the application of new inventions, and since 1850 the industry has advanced more than five fold. There were 1,079 establishments in operation during 1904 and their products were valued at \$136,558,139.

**Spindles and Looms.**—The spindle is used in the majority of the textile mills irrespective of the character of the fiber consumed. In 1870 there were 9,344,418 spindles and 204,954 looms in operation. By 1904 the number of spindles had increased to 30,351,703 and the number of power and hand looms to 697,789.

**Clothing and Kindred Products.**—The manufacture of men's and boy's wearing apparel for sale, ready made, is a branch of industry established during the decade ending 1860. Since then it has been greatly expanded and specialized. It now covers practically every article of clothing worn by the old and young of both sexes. Considering the industry in this broad sense, there were 15,952 establishments engaged in it during 1904 and their products were valued at \$1,496,133,850. Of the various classes of manufacture included in this aggregate the most important are men's and women's exterior clothing, hosiery and knit goods, and boots and shoes.

**Iron and Steel Products.**—The manufacture of pig iron is the foundation of all industries in this group. The production has increased from 563,755 long tons in 1850 to 25,795,471 tons in 1909.

**Rolling Mills and Steel Works.**—The larger portion of the products of the blast furnaces was consumed as material in these works and their products were in turn consumed in part by the foundries and machine shops of the country. There were 415 steel works and rolling mills in operation during 1904 and their products were valued at \$673,965,026. In the early days of the industry these works made only the heavier

partially manufactured products, such as nail and boiler plate, rods, ingots, etc. Finished products, such as wire, wire nails, bolts, nuts, rivets, pipe, tubes, horseshoes, springs, stamped ware, structural iron, rails, etc., are now frequently manufactured in the establishment where the metal is produced. The annual production of steel ingots and castings increased from 4,412,032 gross tons in 1894 to 14,023,247 in 1908.

**Wood Industries.**—The sawmill is the basic industry for these products. There were 31,231 mills in operation during 1908 producing rough lumber, lath or shingles and kindred products. The production of lumber amounted to 33,224,396,000 feet board measure and there were 2,986,054,000 lath and 22,106,483,000 shingles manufactured. Wood is used as material, either alone or associated with other products, in such a great number of industries that it is impossible to measure its relative importance. Those industries in which it was the principal material reported a gross product for 1904 amounting to \$1,223,730,336. The New England states were originally the principal lumber producing section. With the depletion of the forests the center of the industry shifted to the north Central states, then to the Pacific coast and the Southern states. Washington and Louisiana are now the two principal lumber producing states, the production for 1908 amounting to 2,915,928,000 and 2,722,421,000 feet board measure respectively.

**Power and Machinery.**—The almost universal adaptation of machinery to all lines of manufacture has been one of the most important factors in the industrial development of the United States. The use of machinery was greatly stimulated by the invention of cotton spinning machinery in 1870, the power loom in 1785, the cotton gin in 1794, Bessemer process of steel making in 1856, the sewing machine in 1845, the gas engine, which was first used about 1800. Machines for the manufacture of brick were also invented in 1800.

**Steam Power.**—The invention of the steam engine in 1773 diverted attention from water power, which at that time was in universal use. Mills could be built in cities where operatives could be supplied. By 1870 steam power employed in the manufacturing establishments had increased to 1,215,711 horsepower. In 1904 there was 11,117,625 horsepower reported for the steam engines, including gas and internal combustion engines, employed in manufactures. The largest increase occurred during the decade ending with 1900.

**Water Power.**—In 1870 the water wheels in manufacturing establishments were capable of developing 1,130,431 horsepower, or almost half of the power used in such establishments. The quantity has not increased as rapidly as steam power. By 1904 it amounted to 1,647,969 horsepower, and formed only 11 per cent of the total power employed. Water power is now used largely to develop electric power, and the water wheels used for that purpose during 1907 were reported as having 1,441,000 horsepower.

**Electric Power.**—This kind of power was first employed in manufacturing establishments during the decade ending with 1890. By 1900 the electric motors used for this purpose had 310,661 horsepower and by 1904 it had increased to 1,150,891 horsepower, forming about 11 per cent of the total power. The establishment of large hydro-electric plants which furnish electricity for every conceivable purpose, is stimulating its use in manufactures, where it is now of greater importance than the direct application of water power.

**Manufacturing Zones.**—In 1850 the center of manufacturing was in western Pennsylvania. From decade to decade it has moved steadily westward on about the same degree of latitude and is now about the center of Ohio. The manufactures of the large cities of the middle west have increased rapidly and their importance has tended to pull the center away from the Eastern states, where industries were first developed.

**Most Important Area.**—The heaviest area of manufactures is in the southern New England states, southern New York, New Jersey, and eastern Pennsylvania. Manufactures are extensive and fairly heavy over a much larger area, namely, that north of the Potomac and the Ohio and east of the Mississippi rivers; in this section they have increased very rapidly during the past twenty years.

**Principal Centers.**—New York, Philadelphia, and Boston were for many years the principal manufacturing cities. Chicago now outranks Philadelphia, and St. Louis outranks Boston. During recent years manufactures have developed so rapidly in the suburbs of the cities that the establishments located within the corporate limits of the cities are no longer a true indication of the importance of the industrial community. The establishments in the immediate neighborhood of the city should be considered as forming a part of its industries. The following table gives the statistics for ten of the principal industrial districts of the United States.

THE TEN PRINCIPAL INDUSTRIAL DISTRICTS

DISTRICT	NUMBER OF ESTABLISHMENTS	NUMBER OF EMPLOYEES	SALARIES AND WAGES FOR YEAR	GROSS VALUE OF PRODUCTS	AREA (sq. mi.)
New York . . .	25,257	735,460	\$430,238,272	\$2,144,488,093	702
Chicago . . . .	8,382	288,809	180,673,672	970,974,280	500
Philadelphia . .	7,780	286,944	151,923,857	677,781,117	501
Boston . . . . .	4,870	177,157	102,501,692	457,254,360	502
Pittsburgh . . .	1,859	119,839	77,339,055	383,490,468	198
St. Louis . . . .	2,603	104,097	61,913,138	319,709,899	206
Baltimore . . .	2,243	78,729	36,651,368	202,659,272	246
Cincinnati . . .	2,600	82,590	44,862,069	203,095,605	151
Cleveland . . . .	1,720	75,142	44,216,685	179,184,277	201
Buffalo . . . . .	1,631	54,648	31,072,320	108,111,658	200

**Large Establishments.**—Large industrial enterprises have developed very rapidly during the past twenty years. One of the

most effective methods of forming these enterprises is to consolidate independent establishments. During 1904 there

were 1900 establishments that reported an annual product in excess of \$1,000,000 and many of these were operated under the same ownership. Their combined product formed 38 per cent of the total product reported for all establishments. There were 34,181 establishments that had an annual product in excess of \$100,000, and their combined product formed 79 per cent of the total for all.

The large establishments are of greatest importance in petroleum refining, slaughtering and meat packing, iron and steel works, tobacco manufacture, and also in the manufacture of electrical machinery and of cotton goods.

**United States Compared With Other Nations.**—In 1880 the United States was given fourth place in respect to the value of manufactures produced, and was conceded the first place in 1894. By some authorities it was given the first place as early as 1885. The United Kingdom is given the second place, Germany the third, and France the fourth. Germany has made greater relative progress during the

past twenty-five years than has either England or France.

The supremacy of the United States as a manufacturing nation may be attributed to several causes, but none has a more stimulating effect than the possession of a home market, untrammelled by local conditions and protected from foreign competitors. American manufacturers practically supply the needs of a population double that of the United Kingdom, more than double that of France, and nearly a third again as numerous as the population of the German empire, and in addition export domestic manufactures valued at more than a billion and a half of dollars.

**Iron and Steel in Other Nations.**—The manufacture of iron and steel is the most significant indication of a nation's progress.

The United States is by far the greatest iron and steel producing nation. Textiles in Other Nations.—The United Kingdom is the greatest producer of textiles, but it does not have the undisputed control that it enjoyed during the first half of the nineteenth century. Both the

United States and Germany are active and often successful competitors. In 1909 there were 53,312,000 cotton spindles in the United Kingdom as compared with 28,018,000 in the United States and 10,163,000 in Germany.

**MINES AND MINING.**—The two basal industries upon which all others depend are agriculture and mining. Manufactures of every kind, trade, transportation—all industry—must cease when the farms and the mines fail to bring forth their increase. When the two basal industries are measured by the value of their annual products that of mining appears of comparative insignificance. In 1908, for instance, the gross value of the agricultural products is estimated at \$7,871,000,000, while in 1907, the year of maximum activity in the mining industry, the value of the mineral products exceeded \$2,000,000,000 for the first and only time in our history.

**Principal Mining Countries.**—The United States leads the world in the production of most of the important mineral substances.

TABLE 1. PRODUCTION OF THE PRINCIPAL MINERALS AND METALS BY THE LEADING COUNTRIES OF THE WORLD

1906	COAL Short Tons	IRON ORES Long Tons	GOLD Value	SILVER Value	COPPER Pounds	LEAD Short Tons	ZINC Short Tons	PETROLEUM Barrels	CEMENT Barrels	SALT Barrels
United States.....	415,842,698	35,963,336	\$4,640,000	\$28,050,000	942,570,721	310,762	190,749	179,572,479	52,910,923	28,382,062

Note.—Germany, Austria-Hungary, Russia, and other European countries are manufacturers of Portland cement but statistics are not available.

The accompanying table I. shows the principal mineral products of the leading producing countries for the latest years that statistics are available. The United States produces nearly 40 per cent of the world's supply of coal, 63 per cent of the petroleum, 40 per cent of the iron ore, nearly 60 per cent of the copper, 30 per cent of the lead and zinc, 21 per cent of the gold and 25 per cent of the silver.

**Fuel.**—Coal is not only the principal mineral product, but it furnishes 60 per cent of the tonnage hauled by the transportation companies and nearly all the power. There are six grand divisions or provinces into which the coal-producing areas are divided, as follows:

**The Eastern Province,** which includes all of the bituminous area of the Appalachian region; the Atlantic coast region, which includes the Triassic fields near Richmond and the Deep and Dan river fields of North Carolina, and also the anthracite region of Pennsylvania.

**The Gulf Province,** which includes the lignite fields of Alabama, Mississippi, Louisiana, Arkansas and Texas.

**The Interior Province,** which includes all the bituminous areas of the Mississippi valley region and the coal fields of Michigan. This province is subdivided into the eastern region, which embraces the coal fields of Illinois, Indiana and western Kentucky; the western region, which includes the fields of Iowa, Missouri, Nebraska, Kansas, Arkansas and Oklahoma; and the southwestern region, which includes the coal fields of Texas. The Michigan fields

are designated as the northern region of the interior province.

**The Northern (or Great Plains) Province,** which includes the lignite areas of North and South Dakota and the bituminous and subbituminous areas of north-eastern Wyoming and of northern and eastern Montana.

**The Rocky Mountain Province,** which includes the coal fields of the portions of Montana and Wyoming which are in the mountainous districts of those states, and all the coal fields of Utah, Colorado and New Mexico.

**The Pacific Coast Province,** which includes all of the coal fields of California, Oregon and Washington.

**Production and Quality.**—In point of production and in the quality of the coals the Appalachian region of the eastern province is by far the most important.

It extends from Pennsylvania on the north to Alabama on the south and includes, besides the anthracite region of Pennsylvania, the high-grade coking coals of the Connellsville district of Pennsylvania, the Pocahontas and New river districts of West Virginia, and the Warrior district of Alabama; the famous steam and gas coals of the Pittsburgh district in Pennsylvania and of Fairmont and other districts in northern West Virginia; the unrivaled smithing coal of the George's creek region in Maryland and Elk Garden in West Virginia, the Kanawha (W. Va.) gas coals and the Jellico steam and domestic coal of eastern Kentucky and Tennessee.

The coals of the interior province are for the most part noncoking, but possess good steaming qualities and are good domestic fuels.

Those of the great plains and Rocky mountains range from lignite to bituminous, with small areas of anthracite. Some of the bituminous coals in the Rocky mountain areas possess good coking quality.

The principal coal deposits of the Pacific coast are in Washington and Alaska, though the latter have not been developed. **Pennsylvania** is by far the most important contributor to the coal supply, its combined production of anthracite and bituminous coal being equal to that of all the other states taken together, and in the possession of its supply of anthracite Pennsylvania stands alone. Small areas of anthracite are found in the Rocky mountains, but the production is and always will be insignificant as compared with the Pennsylvania product.

**Illinois** ranks second, closely followed by West Virginia.

**Ohio** is the fourth in rank, followed in order by Alabama, Indiana, Colorado and Kentucky. No other state produced as much as 10,000,000 tons, and it will be noted that all of these with one exception, Colorado, are east of the Mississippi river.

**Petroleum and Natural Gas.**—The Appalachian region was formerly the center of the petroleum industry, and Pennsylvania, Ohio and West Virginia were the leading producers. These fields are now on the decline and the development has followed the star of empire to the west.

The contestants for first place in the production of petroleum are Oklahoma and California. Illinois ranks third. All of these developments in California and in Oklahoma have been in the last six years, neither state prior to 1904 having a production of any importance. Illinois has no importance as a petroleum producer prior to 1906. The Gulf states of Louisiana and Texas have also become important producers in the last decade and the possibilities of future development are exceptionally good.

The principal gas-producing states are Pennsylvania, West Virginia, Ohio, Kansas, Indiana and New York in the order named.

**Metals.—Gold.**—From the time of Solomon, "the accursed thirst for gold" has led the adventurous portion of the human race into the wilderness and the desert, has made them brave the frozen north and the heat of the tropics. The search for gold more than anything else led to the "winning of the west" and the development of the Rocky mountain and Pacific coast states. It is now conquering the territory of Alaska.

The states east of the Mississippi river lead in the production of coal and of iron and in the manufacturing industries. The states west of that dividing stream are the leading producers of the precious and semiprecious metals. The eastern states that produce gold are Alabama, Georgia, New Hampshire, North Carolina, South Carolina, Tennessee and Virginia, but none of them yields as much as \$100,000 a year.

The distinction of leader in the production of gold belongs to Colorado. Alaska comes second, with California a close rival. Nevada, whose prominence fell with the exhaustion of the Comstock lode, has again come to the front with the developments at Bullfrog, Goldfield, Ely and Tonopah and now ranks fourth. The other important producing states are South Dakota, Utah, Montana, Arizona, Idaho and Oregon.

**Silver.**—The same states are for the most part, also, the principal producers of silver, though not occupying the same relative positions. A notable exception to the rule is Alaska, whose silver output is inconsiderable. The leading states in the production of the white metal are Montana, Colorado, Nevada, Utah, Idaho, Arizona and California.

**Copper.**—Only two of the eastern states have any prominence as producers of copper. Michigan, which ranks third among the copper-producing states, owes its importance to the deposits of ore containing copper as a native metal and commonly known as "lake" copper. It is considered superior in quality to all other grades and usually commands a premium of  $\frac{1}{4}$ ¢ per pound. Tennessee ranks sixth among the copper producers, but yields less than 10 per cent of the output of Michigan. The production of Tennessee is principally from Ducktown, in the southeastern part of the state.

Three states produce 80 per cent of the entire yield of copper—Arizona, from four principal districts, Bisbee, Globe, Jerome, Clifton-Morenci; Montana from the Butte district; and Michigan from the "lake" or Houghton district. The other important producers are Utah, California, Tennessee, Colorado and Nevada.

**Lead.**—The production of lead comes from two principal sources:

1. The Mississippi valley region, where it is largely associated with zinc, but the character of the ore is such that it can be separated mechanically before smelting.

2. The Rocky mountain region, where the lead is in combination with silver and has to be separated by refining after smelting into base bullion.

Missouri is the principal producer of lead, the product coming partly from the Joplin lead-zinc district in the southwestern part of the state and partly from what is known as the "disseminated" lead district in the southeastern part of the state. Missouri produced in 1908 about 40 per cent of the total output. Wisconsin, Kansas and Illinois are also producers of lead-zinc ores.

The lead produced in the Mississippi valley states is known as "soft lead"; that which is obtained from the smelting and refining and silver-lead ores is known as "desilverized lead." The principal producer of the latter is the *Cœur d'Alene* district of Idaho. Utah, the third in importance, obtains its lead chiefly from the Park City, Tintic and Bingham districts. Colorado ranks fourth. No other state produced as much as 10,000 tons.

**Zinc.**—Missouri, in zinc production, as in that of lead, ranks first, the output being from the Joplin-Webb City district. The production for the state in 1908 was practically two-thirds of the total output.

Colorado is second in rank with a production of 20 per cent of that of Missouri, most of which was from Lake county. Then come Wisconsin, Kansas and New Jersey, in the order named. The New Jersey product is from a complicated ore found at Franklin, in Sussex county, and known as Franklinite. Virginia was at one time an important producer of a peculiarly pure zinc from carbonate and silicate ores at Bertha, but the deposits have been exhausted.

**Quicksilver.**—The principal sources of quicksilver in the United States are California and Texas. The industry is on the decline, the introduction of the chlorination and cyaniding process for the treatment of gold ores having largely reduced the demand for quicksilver for amalgamation, its principal use.

**Aluminum.**—Quite the reverse from quicksilver, the uses for and production of aluminum, "the new metal," are growing rapidly, one of the most recent applications being in the construction of automobiles, for which its lightness and strength give it special desirability. The production is controlled in the United States by one company, which owns the principal patents, and exact statistics are not available.

All clays are ores of aluminum, being silicates of the metal, but its extraction from them is an expensive chemical process and not practical for industrial purposes. The ore from which the metal is obtained by electrolytic reduction is bauxite, an oxide of the metal. The known workable deposits are in Alabama, Georgia and Arkansas.

**Iron Ores.**—Iron ores are abundantly distributed, but vary widely in the size of the ore bodies and the quality of the ores. The deposits may be divided into three great districts—the eastern, central, and western.

The *Eastern District* comprises all the Appalachian states from New York to Alabama.

The *Central District* includes the great deposits of the Lake Superior region,

Michigan, Minnesota and Wisconsin, and less important areas in Illinois, Iowa, Missouri and Texas.

The *Western District* includes the Rocky mountain and Pacific coast states.

The principal source of supply at the present time is the Lake Superior region, the three states of Minnesota, Michigan and Wisconsin contributing 80 per cent of the ores that feed the blast furnaces of the United States. Minnesota alone produces over 50 per cent of the total.

**Platinum, Nickel and Cobalt.**—The deposits of these metals are not of economic importance in the United States. Some platinum is recovered in the refining of placer gold and a small quantity is obtained from the black sands of the Pacific coast.

The principal source of supply is the Ural mountains in Russia. Small quantities of nickel and cobalt (the two metals being usually associated) were formerly produced at Lancaster Gap, Pa., Mine La Motte, Mo., and Riddles, Ore., but the United States depends for its present supply on the deposits of Sudbury, Ont.

**Structural Materials.**—The most generally distributed of the mineral substances are those used chiefly for the construction of buildings, the clays and the building stones. Some kind of clay is produced in every state and territory, and there is no state or territory in which stone suitable for building purposes is not available.

The development of these industries, and particularly the manufacture of common brick, while not contributing so largely to the value of the mineral product, indicate the healthful growth of the social fabric in the building up of desirable and permanent communities.

**Clay.**—New York, Illinois, Pennsylvania and Ohio are the leading states in the manufacture of common brick, though because of the development of potteries and other clay-working arts Ohio ranks first in total value of clay products, with Pennsylvania second, Illinois third and New York fourth.

**Stone.**—The principal varieties of stone used for building purposes are granite, sandstone, limestone and marble. The first three are of general distribution, though the quarrying industry has not been by any means equally developed in the different sections.

**Granite.**—The principal development of the granite quarrying industry has been in New England, Vermont, Maine and Massachusetts being the three leading states. From New England a jump is made to California for the fourth in rank, and then for the fifth another jump is made to Wisconsin. Other important producing states are, in order, Georgia, Washington, New Hampshire, North Carolina, Maryland, Minnesota, Connecticut and Rhode Island, three of these being in New England.

**Sandstone.**—The principal producers of sandstone are New York, Pennsylvania and Ohio, the two former including a peculiar variety, known as bluestones, used for curbing and flagging.

**Marble.**—New England is the principal home of the marble industry, Vermont producing more than half of the total output of the United States. The only other important producing states are New York, Georgia and Tennessee.

**Limestone** suitable for building purposes is found in nearly every state. The principal production is in a belt of states extending from New York and Pennsylvania on the east to Missouri on the west,

and includes, besides these states, Ohio, Indiana and Illinois. These six states contribute more than two-thirds of the total production.

**Cement.**—No one branch of the mining industry has shown such a notable growth in recent years as that of the production of cement materials and the manufacture of Portland cement. In 1888 the production of Portland cement in the United States was barely a quarter of a million barrels; in 1908 it was 51,072,612 barrels. Ten years ago the seat of the industry was in the Lehigh district of eastern Pennsylvania, that region turning out three-fourths of the total production. The Lehigh district is still the chief producer, contributing from 40 to 50 per cent of the total output, but the industry has become more generally distributed over the country, as the fireproof construction of large hotels, office buildings and apartment houses has been required to meet the demands of urban population, and railroad freights have acted as a protective tariff to local establishments.

**Gypsum.**—Gypsum, like cement, owes its rapid growth in recent years to the construction of large office, hotel, and apartment buildings. Its principal use is in the manufacture of wall plasters, and because of the hardness, durability and attractiveness of gypsum plasters, they have to a large extent superseded ordinary lime plasters. The utilization of gypsum for this purpose had its real beginning in the manufacture of "stiff" for exposition buildings.

Since the World's Columbian exposition at Chicago the increase in the use of gypsum plasters has been rapid. The higher grades of calcined gypsum, or plaster of paris, are used for making statuary and by dentists for making casts. Some crude gypsum of lower quality is ground and used for fertilizer.

**Chemical Minerals.**—Salt.—If we exclude water from consideration as a mineral product, salt is the one mineral substance whose chief use is as an article of food. Water, it is true, is a mineral, but with the exception of a comparatively small quantity taken from springs and sold as pure potable water or for medicinal purposes, water is not considered as a commercial mineral product.

**Distribution.**—Common salt is widely distributed. It is held in solution in sea water, and in the waters of land-locked lakes, as Great Salt Lake, the Dead Sea, etc. It occurs as brine springs and as rock salt and it is recovered from all of these sources. Probably the largest production at the present time is obtained from wells through which surface water is conducted to the salt beds, allowed to become saturated, pumped again to the surface and evaporated to dryness. Rock salt is mined in New York, Louisiana, Kansas and California.

**Production.**—Michigan is the largest producer of salt, all of the product being obtained by evaporation of brine from deep wells around Bay City and Saginaw. New York is second, most of its product also being brine salt from the western part of the state in Genesee, Livingston and Wyoming counties and from the old state reservation around Syracuse. Salt is also produced from brine wells in Pennsylvania, Ohio, West Virginia, Illinois, Kansas, Louisiana, Texas, Oklahoma, Utah and California. In Utah the source is the water of Great Salt Lake; in Cali-

fornia it is principally the sea water from Alameda bay.

**Phosphate Rock.**—The United States has to depend for its potash fertilizer upon the potash salt deposits of Stassfurt in Germany, and for its nitrates upon Chili. Other countries, however, send to the United States for their supplies of phosphate, and since the discovery of the land and river deposits of phosphate rock in South Carolina, just after the close of the Civil war, the mining and marketing of this valuable soil food has been a steadily growing industry.

During late years the industry in South Carolina has been declining, but this has been more than made up by greatly increased production in Florida, where it began something over twenty years ago, and in Tennessee, where it began fifteen years ago. Recently phosphate rock has been discovered in Arkansas and large areas have been located on government lands in Idaho, Utah and Wyoming.

**Sulphur and Pyrite.**—Sulphur is obtained from two classes of ore. In one the sulphur occurs native, intermixed with limestone, recovery being accomplished by the application of sufficient heat to melt the sulphur. The other source is metallic sulphide ores, principally iron pyrite, in which the ores are roasted and the sulphur fumes recovered as sulphuric acid. This is used chiefly in the manufacture of superphosphates.

Iron pyrite is mined for this purpose in Massachusetts, New York, Virginia, Alabama, Georgia, and California. In Illinois, Indiana and Ohio it is obtained as a by-product in the mining of coal. Only recently efforts have been made to recover the sulphur by the smelters of copper and lead sulphide ores. Sulphur is produced in only four states—Louisiana, Nevada, Utah and Wyoming. With the exception of Louisiana the production is small.

The method of recovery in Louisiana is of particular interest. The deposits lie at considerable depth and can be reached only by passing through an immense bed of quicksand. The sulphur is obtained by forcing superheated water through iron pipes, melting the sulphur and forcing it to the surface by compressed air.

**Borax.**—The entire production of borax is from three counties in California—San Bernardino, Inyo and Ventura. The desert marshes of Nevada were at one time important producers and the "twenty mule team" that hauled the product 200 miles across the desert was a spectacular advertisement. These deposits are of little productive value.

**Miscellaneous.**—**Asphalt and Related Bitumens.**—A variety of hydrocarbons is included under the general head of asphalt. They are used for the manufacture of street paving, road dressing, waterproofing metals, papers and fabrics, roofing, electrical insulation, varnishes, reservoir and foundation linings, coal briquetting, etc. Bituminous lime and sandstone are used chiefly for paving. The production is from five states—California, Utah, Texas, Oklahoma and Kentucky.

**Mineral Paints.**—These include metallic paints, mortar colors, ochers, umbers, siennas, ground slate and shale, though many other minerals or mineral products are also used in the paint trade for mixing with these basic pigments.

Among these substances are asbestos, amphot, clay, graphite, gypsum, magnesite, pyrite, talc and chalk. Zinc oxide and a mixture of zinc oxide and lead oxide

made direct from the ores are also basic pigments. The lead pigments, such as white lead, litharge, orange mineral, etc., are made by the chemical decomposition of pig lead, and Venetian red is made from the roasting of iron sulphate.

Of the natural mineral pigments (the ones first mentioned), metallic paint and mortar colors are produced principally in New York, Pennsylvania, Maryland, Ohio and Tennessee; small quantities in New Jersey, Virginia, Wisconsin and California.

The principal producers of ochers, umbers, and siennas are Pennsylvania and Georgia; with smaller amounts from Vermont, Virginia, Kentucky, Iowa and California. The slate and shale ground for pigments is for the purpose of producing a deep black color, and this material is usually retained as a by-product in coal-mining. These materials are ground for pigments in Pennsylvania, New Jersey, New York, Iowa and Tennessee.

**Asbestos.**—The United States leads all other countries in the manufacture of asbestos products, but obtains its chief supply of raw material from Canada.

The chief characteristics of asbestos are its incombuability by fire and its low heat conductivity which render it valuable for fireproofing and for insulation. It is of fibrous structure and one variety, known as chrysotile, possesses strength and toughness sufficient to weave into fabrics, and is used for making fireproof theater curtains, etc.

Canada is the principal producer of this variety. Asbestos is used for boiler and safe packing, in the manufacture of paint, and as an electric insulator. Asbestos boards, shingles and other forms for fireproof construction are now quite common. Vermont and Georgia are the only two states in which it is produced in this country, and the output compared with the imports from Canada is small.

**Other Minerals.**—There are some forty other minerals among those mined for economic use. There are, for instance, corundum and emery grains and feldspar granite, grindstones, infusorial earth, tripoli, millstones, oilstones and pumice, which are included among the products used for abrasive purposes.

**Bromine,** a by-product of salt evaporation, is useful in the chemical industry.

**Fluor spar,** mined principally in Illinois and Kentucky, is used as a blast furnace flux, for the manufacture of hydrochloric acid and for the manufacture of opalescent glass.

**Feldspar and quartz** are used in pottery works. **Talc** is used as a lubricant for making pencils and in the manufacture of complexion powder, and a fibrous variety is used as a make-weight in paper manufacture.

**Mica** is used for windows in fireplaces and "base-burner" stoves, for the manufacture of insulators, and lamp chimneys for decorative purposes, and as a lubricant. It is mined principally in North Carolina.

**Graphite,** which is mined principally at Ticonderoga, N. Y., is used in the manufacture of lead pencils, crucibles, and as a lubricant.

**Monazite,** mined in North Carolina, is used for the manufacture of the mantles used in the Welsbach lights.

**Tungsten and cerium** are used in the manufacture of special steels.

**Sand** is used for the manufacture of mortar, for molding and other purposes.

**Manganese and mangiferous iron ores** are used in the manufacture of steel.

**PRODUCTION OF THE PRINCIPAL MINERALS AND METALS, AND THE TOTAL VALUE OF ALL MINERAL PRODUCTS IN THE UNITED STATES, BY STATES**

Figures in bold-face indicate the ranking states.

**PRODUCTION OF THE PRINCIPAL MINERALS AND METALS, AND THE TOTAL VALUE OF ALL MINERAL PRODUCTS IN THE UNITED STATES, BY STATES—Continued**

- a. Includes Alaska.  
b. Includes Texas.  
c. Includes Massachusetts.  
d. Includes Maryland and West Virginia.  
e. Includes Nevada, New Mexico, Utah and Wyoming.  
f. Includes unexported copper.

- g. Includes Alabama, Maryland, South Carolina and South Dakota.  
h. Includes Missouri.  
i. Includes Wyoming.  
k. Includes Georgia.  
l. Includes Washington.  
m. Includes South Dakota.

- n. Includes Kentucky and Tennessee.  
o. Includes Oklahoma.  
p. Includes Arizona.  
q. Includes Maryland and Massachusetts.  
r. Includes Illinois, Pennsylvania and Virginia.  
s. Includes Alabama and Texas.

**THE FISHERIES OF THE WORLD.**

The fisheries of the world constitute one of its most important industries, and at the same time furnish a very important part of the material used for human food. The aggregate value of the catch for a single year cannot be closely estimated, but it must exceed the sum of \$100,000,000, a sum, let us say, equal to the cost of half a dozen battleships.

**Capture of Fishes.**—Fishes are taken on every shore of every country, some species in nets in sandy bays, some with hook and line or other devices from among rocks, some in great schools in the open sea while migrating to and from their spawning grounds, some as they enter rivers for the purpose of spawning in fresh waters.

To the first class, those taken in sandy bays, the great majority of the different species belong, notably the tribes of the croakers and drums, the sea bass, the sardines, the barracudas, the mullets, the flounders and soles and the great array of scaly fish of the sea.

About rocks are found the hosts of rock cod, of wrasse fishes, of groupers, and, in tropical regions, of parrot fish and a multitude of forms which swarm about the coral reefs.

The codfish and halibut, with their relatives, are mostly taken with hand lines in water relatively deep.

In schools in the open sea are the mackerel and nearly all of its many relatives, from the mighty swordfish and the giant tuna, to the little chub mackerels that swarm on the coasts of all northern regions.

**The Salmon Fisheries.**—As important as any of these groups is that composed of anadromous fishes—that is, of fishes which ascend the rivers to spawn.

**Red Salmon.**—Easily first among these is the red salmon of the northwestern waters, which runs in the rivers at the age of four years, every individual of either sex dying after spawning. This species runs only in streams having lakes in their course. It spawns in gravelly streams at the head of the lake. The young spends the first year in the lake, then passes down to the sea, where it feeds on young crabs, small herring and the like, returning when four years old to cast its spawn, for the most part, in the same river in which it was hatched. This species reaches a weight of about six pounds. It is chiefly used for canning. Its flesh is very red, but inferior in flavor to that of the king salmon.

**The King Salmon,** or quinnat, of the Pacific ranks next in value among anadromous fishes. It is much larger than the red salmon, averaging twenty-two pounds and sometimes reaching 100. Its flesh is more delicate, but the aggregate value of the species is less, as it is far less abundant in Alaska, although it is the dominant species in the Columbia, the Sacramento and the Amur. It, too, ascends streams to their fountain heads, but it is not restricted to those with lakes. Both

species ascend the Yukon river as far as Lake Labarge, upward of 2,000 miles, and both follow the Fraser and the Columbia to the uttermost waters.

**Other Species.**—Four other salmon of the Pacific are of value—the Atlantic salmon, the steel-head of the Pacific, the sturgeon of many species, fishes of great value for their steak-like flesh and for their eggs used as caviare; the shad, the alewife, the striped bass, the smelt, the caluchon and numerous less known fishes of the tropical and south temperate zones.

**The Lake Fishes.**—There are also fishes in enormous variety in the rivers of the world, and especially in the lakes. First among bodies of fresh water come the Great Lakes of North America, and among these Lake Erie ranks highest as having for its size the most valuable fresh water fisheries of the world. Of the fresh water fishes the whitefish of the lakes ranks first in value, though some other species less esteemed, as the lake herring and the pike perch, sometimes yield a larger output.

**Cod Fisheries.**—The cod and halibut, with the haddock, pollack and other lesser fish, swarm off the rocky coast of Iceland, British Columbia, Newfoundland, Alaska and eastern Siberia. The cod especially furnishes a fishery of the greatest importance.

**Tropical Fisheries.**—In the tropical seas the number of species is vastly greater, but none of them is so abundant in individuals. A single haul of a small net at Key West, Fla., yielded seventy-five species of fishes, almost as many as all that frequent the shallow of the British Isles. There are 500 species of fishes found at Samoa, the majority edible. This is as many as are found in the whole of Europe. North America has upward of 2,500 species, in fresh and salt waters, and about 12,000 are known over the whole world. There are many species in deep waters. Some of these are valuable for food when the proper gear for taking them can be used.

**Deep Sea Fishes.**—Fishes are found to the depth of nearly five miles. Those in great depths are black in color, flabby in substance, and either blind or else provided with very large eyes and luminous spots, like lanterns. In some cases these luminous spots are on the end of the nose, like the headlight of an engine. In moderate depths, as one-eighth of a mile, most species are bright red. These red fishes are often of great value as food. They are now sought for in many regions by means of long hand lines or the beam trawl.

In temperate regions, as in the United States, in England and in Australia, only a few of the many sorts of fishes are utilized as food. The others meet no sale, even though in many cases they may furnish good food. But in tropical markets, as in Italy, Cuba, Hawaii and Japan, nothing is thrown away. All kinds of sea-fish not actually harmful is preserved, and in these markets a most interesting variety of sea animals may be seen.

**Artificial Hatching.**—The process of the artificial hatching of fishes has now risen to great prominence. In nature the eggs of fishes are usually scattered about in the water to be fertilized by the similarly scattered milt, or germ cells of the male. In some cases, as the black bass, the male builds a rough nest and guards the eggs and the young. But this is not the usual rule. In general, the eggs are at the mercy of other fishes, crabs, and even of multitudes of bacteria. Not one in a thousand usually matures, often not one in a hundred thousand. By taking the eggs, and washing them with the milt artificially, a vastly larger number can be made to hatch. By caring for the young and by depositing them in suitable places, as many as one in a hundred or even one in twenty can be brought to maturity. This work has been especially successful with whitefish, lake herring, the various kinds of trout and salmon, and the pike perch.

In case of a few species, as the black bass and sturgeon, artificial fertilization of the eggs has been found impossible. In the great majority of cases, however, the process is very successful.

**Output of Artificial Fish Hatcheries.**—Numbers of young fish planted by the United States fish hatcheries and private hatcheries:

Salmon.....	164,648,179
Trout.....	75,829,439
Whitefish.....	419,884,000
Shad.....	6,374,000
Striped bass.....	1,599,195
Pike perch.....	644,900,000
Yellow perch.....	225,000,000
White perch.....	343,263,850
Cod.....	184,428,000
Flounders.....	786,628,000
Other fish.....	40,617,180
Lobsters.....	104,509,000

Total.....3,107,131,910

**Fishing Nations.**—Among the fishing nations, the United States, Great Britain, Norway, France, Canada, Italy and Japan rank first. In northern regions there are relatively few species, but these few run in enormous numbers. The herring schools on every northern shore, above the latitude of Boston and as far as the Arctic circle. Björnson says that wherever the herring schools took the shores of Norway a town springs up, like driftwood cast up by the sea; so it is in Ireland, Scotland, Canada and Japan, and so it will be some time in Alaska. Huxley estimates that there are more herring in existence than individuals of any other kind of fish.

In the Atlantic the mackerel has also its vast predatory schools, but the true mackerel is not in the Pacific.

**FORESTS.**—Reliable data regarding the forested area of many countries are difficult to obtain, owing to imperfect surveys, lack of statistical facilities, etc. For Europe and the United States the reports are more complete.

The percentage of land under forest in Bessonia and Herzegovina is reported as being about 53 per cent, 45 per cent in Bulgaria, 44 per cent in Sweden, 40 per cent in Russia, 30 per cent in Austria-Hungary and Luxemburg, 26 per cent in

in Germany, and 21 per cent in Norway; the remaining countries of Europe have less than 20 per cent forest land.

The forests of India embrace about 13 per cent of the area of that country, of Japan 59 per cent, of Canada 40 per cent, and of the United States about 36 per cent.

In Europe a large portion of the forests belong to the state, and from them important revenues are obtained. The percentage of domain forests amounts to 84 per cent in Spain, 80 per cent in Greece, 70 per cent in Bosnia and Herzegovina, 61 per cent in Russia, 47 per cent in Roumania, 33 per cent in Germany, and 27 per cent in Sweden.

**Lumbering.**—Comprises the felling, and preparing of wood for building purposes, shipbuilding, furniture manufacture, paper making, and a variety of other uses. It forms one of the most important industries

of the United States, Canada, and of some European countries. The industry, especially in America, is well organized, and is subdivided into:

1. Logging, which includes the felling, cutting in lengths, and transporting to the mill.

2. Sawmilling of the logs into rough timber, beams, joists, boards, and laths.

3. The planing of these.

In the Northern states and in Canada lumbering is chiefly carried on in winter, and the logs are transported on sleds over the icy roads to rivers and lakes, where they are floated either singly or in rafts to the mills.

The chief wood-exporting countries are the United States, Canada, Austria, Norway, Sweden, and Russia; Great Britain and Germany being the largest importers.

**Extractive**, under which heading are considered mining, agriculture, forestry, fishing, and hunting;

**Manufacturing**, whether by the handicraft or the factory system;

**Distributive**, or those concerned solely with the marketing of products.

Auxiliary to these are the pursuits of transportation, lending, insurance, and warehousing, which because of the division and the specialization of occupations have become distinct enterprises.

**The Business Unit.**—The extractive industries is comparatively small, seldom reaching the size of modern manufacturing, merchandising, or transportation concerns; having smaller capitalization per unit and employing fewer laborers, it is simpler in structure.

With the breaking up of plantations and large estates, with the ever-increasing demand for intensive cultivation of small areas, farming particularly is lacking in the complex and extensive organizations so characteristic of the factory system.

**Natural Conditions.**—One of the essentials of the extractive industries is their great dependence upon natural conditions for their success or failure. Unless natural supplies are present and accessible, no amount of capital, administrative skill, or labor, and no combination of these factors will produce a profitable mine, quarry, or lumbering camp, and no farm will pay unless climatic conditions are favorable and the soil is good or can be made so. Efficiency of labor and of equipment, proximity to the market and good transportation facilities are important, but it is nature, with its deposits of mineral wealth, its sunshine and rainfall, its fertile soil, its rivers filled with fish, its world of animal and vegetable life—it is nature which gives the chief value to each extractive industry.

Correct judgment as to the extent to which each extractive enterprise may be capitalized is therefore necessarily based upon exact knowledge of natural conditions. The public so eager to join "get-rich-quick schemes" must in most instances blame no one but itself for its losses.

All the assertions of a fraudulent or of an overenthusiastic promoter cannot create a rich gold mine or a petroleum gusher. If these exist, their presence as well as their commercial worth can be ascertained beyond reasonable doubt by modern methods of careful scientific investigation.

**Organization.**—It was in the manufacturing industry that the new type of business organization arose. The highest expression of this industry—the factory system, with its modern steam and electrically driven machinery—has increased a thousand fold the efficiency of men; it has given an opportunity to exercise the highest strategic ability in the massing and grouping of laboring forces, and in the direction of these forces toward the common goal—the production of finished commodities. Out of materials most of which in their raw state are useless the mill and the factory produce a bewildering variety of goods, capable of sustaining us, of supplying our needs and wants, of giving us joy and comfort.

**Factory System.**—The work in the factory necessitated the cooperation of individuals on a scale unknown in any other type of industrial activity. The process of production was divided into many component parts, each part dependent upon the other and the whole calling for a systematic

## BUSINESS AND COMMERCE

### BUSINESS ORGANIZATION, ADMINISTRATION AND ECONOMICS

**BUSINESS ECONOMICS.**—All industries are conducted for purposes of profit. Their size, their organization and management are subordinate to this main consideration of yielding returns on the investment.

The investor in a modern enterprise, unless he has the majority of stock and thus the controlling interest, does not shape the business policy of the undertaking.

**Classes of Industrial Enterprises.**—All enterprises may be divided into two categories:

**Non-Speculative Industries**, or those attended with ordinary business risks; and

**Speculative**, or those in which the risks are unusually large.

In order to induce investments in the latter class of industries the allurements of exceptionally high profits is necessary. It may be noted here that some profits of this kind are at their best doubtful, and that many illegitimate schemes have been launched by unscrupulous promoters under the guise of an industry.

**Methods of Financing.**—The owner may have sufficient means to carry on and develop his business, but this is not the usual method of financing. When more or less large amounts of capital are required, three alternatives are open to the owner: (1) Borrowing money; (2) taking in moneyed partners; (3) incorporating and offering stock for sale.

The first two methods are not always feasible and have many disadvantages, such as the necessity to meet loan and interest obligations frequently at most inconvenient times, the partner's interference with the management, etc. The third plan may be considered the best, and it is the one most often used.

**Selling "Stock."**—There are two ways of offering shares to capitalists: one, by personally presenting the case to friends or strangers by means of interviews or correspondence; the other, by appealing to the public through circular letters, newspaper and magazine advertisements, etc. In either case, a prospectus, describ-

ing the nature of the enterprise, its scope and its special advantages, is usually prepared.

**The Prospectus** should be a document containing neither exaggerations nor misrepresentations, but at the same time putting the proposition in a most favorable light. It should be carefully arranged, and while giving details (would-be investors are naturally inquisitive), it should not be overloaded with immaterial facts which might obscure the main issue. The writer of a prospectus must know what to omit as well as what to include in his paper.

**Essential Facts.**—To substantiate facts contained in the prospectus, reports, certificates, analyses, abstracts of title, etc., must be on hand, so that any one desiring to investigate the proposition may be immediately shown all the data proving the accuracy of the promoter's assertions. An investigation before investment, unless the offer is of gilt-edged stock or bonds of national reputation, is imperative. When the prospectus is distributed, a personal or a facsimile letter generally accompanies it. In this letter are set forth the strongest features of the project.

**A Financial Statement**, indicating definitely how much money is needed, for what purposes, and how much stock is offered to secure the amount, is sent only to those parties who are sufficiently interested to justify the beginning of negotiations.

**Importance of Efficient Management.**—The nature of the enterprise is of comparatively little importance to the average investor as long as his capital is protected and his income assured; but he cannot be sure of either unless the undertaking is sound, well organized and efficiently managed. Some enterprises have failed because of lack of adequate capital, but immeasurably larger is the number of those which have come to grief either because of poor foundation or because of mismanagement.

**Classification of Industries.**—Legitimate industries may be divided into the following classes:

coordination of effort. Unless there was one ruling spirit dominating the part-activities of the mammoth factory, all its capable workmen, all its powerful engines, all its delicate and intricate mechanism, all its rapidity of motion would have been of comparatively little value.

**Specialization.**—From the operating rooms of the factory, the principles of specialization were transferred to the offices and to the counting-houses, to the banks and to the department stores. Every branch of human endeavor where the scope and the importance of the difference of a differentiation of functions, a strict fixing and enforcing of responsibilities, and an assumption of central supervision and control learned the value of subdividing into departments and of combining the related parts into a harmonious working unit.

**The Essentials** in the organization of each business are more or less alike. The departments must correspond to those natural divisions into which a concern resolves itself and thus fit the peculiar conditions of a specific enterprise, but the guiding principles of organization are the same, whether we deal with a factory, a transportation company, or a jobbing house.

**The Problems** which business organization must solve are problems of uniting a body of individuals in such a way that, grouped for the performance of certain transactions, they may work without waste and friction, adding to the precision of a machine the intellectuality of men.

**Departments.**—A large business concern is divided into departments because of the fact that the different kinds of work which must be performed in such a concern demand special training, both on the part of the authorities who govern the work and on the part of the subordinates.

Different methods of procedure characterize the purchasing, the advertising, the manufacturing, the accounting and other activities of a business unit. In order to secure successful results, each activity is placed under the immediate supervision of specialists, who act as heads of departments and direct the labor placed under their control. The sphere of action and the responsibility of departmental heads is clearly defined. This insures the greatest accuracy, economy, and dispatch.

The primary divisions of a business enterprise, regardless of its size or nature, are as follows:

1. *The Executive (managerial) division.*
2. *The Commercial (and office) division.*
3. *The Productive (factory, mine) or the Handling (transportation service, store) division.*

The subdivisions and the departments vary, groupings being effected and systems evolved which lead to the most effective operation of business.

In a factory the number and the character of the departments is determined by the demands of a standardized machine production which moves materials with an automatic regularity from one stage of manufacture to another until they reach as finished commodities the selling end of the organization.

The more general departments of a factory are the receiving room, the storing room, designing, drawing and experimenting rooms, tool-rooms, power, fuel and lighting plants and the shipping room; to these are added different workshops, such as foundry, assembling and erecting rooms, etc.

The commercial division consists of accounting, correspondence, advertising, selling, and credit and collections departments. A legal department is usually connected with credit and collections.

**Management.**—Most of our modern large undertakings are organized as corporations and the same initial executive authorities may be found in each concern.

**Directors.**—The proprietors or stockholders elect a board of directors, the latter selecting the executive officers—president, vice president, secretary and treasurer. If the board of directors is too numerous for an expeditious handling of affairs it either elects or appoints an executive committee. Some of the very large firms have also an advisory committee and a number of subcommittees to supervise special branches of their activity, such as finance, improvements, sales, etc.

**General Manager.**—Under the board of directors and responsible to it is the general manager, who has direct control over all the departments. He must possess constructive ability, his qualifications including wisdom and skill in selecting the right kind of men for various positions and of cultivating a spirit of fellowship and good-will in the staff.

The general manager formulates (in conjunction with the president and the board of directors or the executive committee) the business policy of the enterprise; he must therefore be familiar both with the technical and the commercial side of the business; he must understand the workings of every department, not only the details which should be left to the chief force, the factory workmen, the foreman, the salespeople, but the main principles governing the relation between the man and the tool, the effort and the result.

A successful manager combines with a determination to carry out plans once formulated an adaptability to changing conditions and a willingness to accept suggestions. Such a manager inspires confidence in his superiors and commands the obedience and respect of his subordinates.

In a manufacturing concern his immediate assistants are a superintendent, at the head of the manufacturing division, and a comptroller or auditor, under whose direction is the commercial branch.

Under the superintendent are the chief engineer, the chief draftsman and foremen who supervise the work in the shops; under the comptroller are the chief accountant, the head of the correspondence division, the sales manager, the advertising manager and the credit man.

**Accounting.**—The accounting department, although not engaged in the active forwarding of business, is of supreme importance. In this department the bookkeeper and his assistants keep records of every transaction, from the largest, to the smallest, thus furnishing data for an insight into the workings of every branch of the business. There are two main systems of bookkeeping—the single entry and the double entry. The difference in the methods is indicated in their names; the first method consists in a single, the second in a double recording of commercial facts in the account books of the concern (the journal, the ledger, the cash book, the stock book, etc.).

A single entry only registers the personal relations of the firm with its creditors and debtors and the variations in stock and cash on hand; the double entry, by having for each credit a countervailing debit and vice versa, indicates also the

gains and losses; it shows the interdependence existing between the various factors which make up a business enterprise and it permits a rapid detection of mistakes in posting. The double entry system is the one most generally adopted, single entry being confined to small enterprises or to those very few of the somewhat larger concerns which are blind to the evident superiority of the double entry.

**The Auditor** is the officer of the accounting department who evolves systems of accounting, passes on the correct posting of data and sees to it that every item is charged to its proper entry. The auditor also prepares comparative statements and other reports, such as inventories, pay rolls, etc.; these are submitted to the general manager, thus enabling the latter to know always the firm's standing.

The highest officer in the department is the chief accountant. He dissects and analyzes the facts of the business as they are revealed by the accounts; he estimates the cost of production and traces to their sources all profits and losses. He must be able to look far beyond the books of the company; the general principles of similar businesses and their relation to the commercial and financial world at large must be known to him. Without this he cannot have an intelligent appreciation of the statistical business facts in a particular enterprise and cannot make suggestions as to improvements.

The keenness of present day competition does not allow haphazard methods; the whole drift of modern industry is toward a systematic decrease of production-costs and an increase of business efficiency. This explains the great value of the chief accountant's work.

**Distributive Industries.**—Raw materials, particularly agricultural products, are marketed through the medium of boards of trade or exchanges. Such goods are bought by either domestic manufacturers or exporters; in both cases the transaction involves a comparatively large quantity of a commodity and the buyers demand a certain definite grade or quality. The supply comes from widely separated sources, from small farms and large estates, from every rural community which produces in excess of its home consumption. The problem of concentrating the supply is solved by the existence of a special class of traders who have established themselves at those strategic points which, because of their geographic position, have become primary markets for the sale of such goods as wheat, raw cotton, provisions, tobacco, live stock, etc.

**Exchange.**—To facilitate the handling of business, the traders have formed associations known as produce exchanges or boards of trade. An exchange is a corporation controlled by the law of the state in which it is located. Its charter sets forth the object of the association, which usually is to provide rooms where the members may meet, to establish and maintain uniformity in commercial usage of the place, to acquire and disseminate business information, and to adjust controversies between the members.

**How Constituted.**—Each exchange frames its own constitution and by-laws. The latter indicate who may be admitted to membership as well as the conditions on which the members are allowed to transact business. Violations of the rules meet with prompt punishment ranging from a few dollars'

fine to expulsion from the exchange. The number of members is invariably limited. Like all other corporations, exchanges are governed by a board of directors or managers elected by and from the members of the exchange. The board appoints various standing committees (a law committee, a floor committee, a finance committee, a trade committee, etc.), as well as all the employees and agents, such as secretary, attorneys, inspectors, weighers, gaugers, etc.; it enforces the rules of the exchange and it supervises the financial and other affairs, as well as the property of the organization. In order to defray the expenses of the exchange an annual assessment is made upon each certificate of membership.

The contracts concluded on the exchanges may be divided into *spot*, or *cash*, *dealings* and *futures*.

**Spot, or Cash.** Transactions represent the purchase and sale of goods available for immediate delivery. These goods are either in cars on railroad tracks or in warehouses, and they are offered for sale by means of samples. Each sample is provided with a certificate of grade. In most states the inspection of great staples and their grading as to freedom from impurities, soundness, color, etc., is conducted by public officials, the state thus guaranteeing the grade; this is particularly true of grain.

**Warehousing.**—Exchanges have evolved a carefully devised system for regulating the trade in each commodity. If the goods are not unloaded, the samples are accompanied by a ticket indicating the name of the railway company over which line the products have come and the number of the car which holds them; if they are unloaded and stored in a *regular warehouse* (by "regular" is meant a warehouse recognized and supervised by the exchange), then a *warehouse receipt* is issued to the prospective buyer. The receipt shows that a certain quantity of goods of a certain quality has been accepted by the warehouseman and is ready for delivery. When a sale takes place the receipt is indorsed by the seller and given to the buyer.

Warehouse receipts are unquestioningly accepted by dealers because they are confident that each receipt represents goods actually in the possession of the warehouseman, and that these goods will be delivered to them on the presentation of the document.

**Futures.**—The concentration of distribution in a few central markets, the character of the commodities dealt in (staples), the readiness with which the price of these commodities responds to world-wide influences of supply and demand, have created a tendency for speculation on the floors of the exchanges. Speculative transactions are generally known as *futures*.

Futures have developed from ordinary time dealings and they are not necessarily speculative in their character; among buyers of futures may be found millers, spinners, distillers, and other manufacturers who buy in order to cover their future needs for raw materials; among sellers are many farmers who dispose of their products before harvesting at a current price which they consider advantageous.

**Nature of Contract.**—A necessary condition for the existence of futures is a well-regulated market for classified standard commodities. The contractual stipulations of futures conform to the requirements of the exchanges as to grades, units of amount and terms of delivery. Each

exchange has an accepted form of contract which leaves open to the contracting parties the determination of the price, the month of delivery, and the total of the amount (always in the accepted unit or its multiples).

In the majority of instances both buyers and sellers of futures are speculators. The buyers purchase because they anticipate a rise in price, and the sellers assume obligations because they believe the price will drop.

**Bulls and Bears.**—Those speculators who have bought with the intention of reselling before the date of delivery are known as *bulls*. They naturally take advantage of every opportunity to influence the market in the direction of higher prices.

Those who have made sales without possessing the goods are known as *bears*. Their efforts are directed toward depressing the market, as they must buy before they are called upon to meet their obligations.

**Margins.**—Many outsiders speculate on the exchanges; to do so they resort to the services of *exchange brokers*; the trading is usually done on *margins*, the margin being a deposit of so many cents per bushel, bale, or other unit of product. The amount is given the broker to protect him in case the market goes against his customer. It must be understood that the broker, as a member of the exchange, is held responsible for the fulfillment of all the contracts concluded by him. Should unfavorable price fluctuations exceed the deposited amount, an additional margin is demanded by the broker, and if the demand is not met, then the transaction is wound up and the sum originally deposited is forfeited. For his services the broker is entitled to a commission, the rate of which is established by the exchange.

**Delivery.**—The majority of futures do not involve an actual delivery of goods; the purchase and sale contracts are compared, and a payment of the difference between the two prices liquidates the transaction.

**Privileges** are a form of speculative contracts officially recognized by the exchanges; they are concluded either before or after the regular trading hours. Privileges are *puts*, *calls*, and *straddles*.

The *put* is a contract by which a person acquires the right either to deliver or not to deliver a certain amount of goods at a stipulated price; the taker of a *put* receives a fixed consideration for which he agrees to accept the goods if they are offered for delivery.

A *call* contract the right is acquired to request or not to request the delivery of goods at a specific price.

A *straddle* is a combination of a *put* and a *call*. It permits the purchaser of such a contract either to call for goods or to deliver them.

The takers of privileges accept the risks because they expect the market conditions to be such as not to warrant their being asked to fulfill their part of the contract. Privileges are often used by bears and by bulls as means for speculative insurance. A bear, for instance, buys calls; this enables him, if the price rises, to meet his obligations by requesting the taker of the call to deliver the goods in his stead.

**The Sale of Manufactured Goods.**—In the marketing of agricultural products the problem confronting distributors is that of concentrating the supply; in the sale of manufactured goods their task is that of dividing the supply into small units

in order to reach the numerous final consumers. The methods used are necessarily different from those employed in the first case. Dealers in finished commodities do not belong to closed market organizations demanding certificates of membership and regulating the trade.

**Direct Selling.**—Any one may at any time operate in any market as a wholesaler or a retailer, and the selling organization of any factory may eliminate both, and enter into direct relations with the consumer. The latter system, that of *direct selling*, has been gaining ground recently, factories establishing their own retail stores, sending out canvassers, or conducting a mail-order business. In each case the producer seeks to gain control over the market, to create and to maintain a demand for his particular goods.

Illustrations of the *factory retail store method* may be seen in the Regal, Douglas and Walk-Over shoe stores, in the Huyler's or Gunther's candy stores, in the United Cigar stores, and in a number of stores established by typewriter and camera manufacturers. Each store is responsible to the main office, with which it must keep in close touch.

The *canvassing method* is used especially by the publishers of books and magazines. The *mail-order system* is used by the makers of furniture, of ready-made clothing, of novelties, etc.

Many manufacturers, for the purpose of regulating the sale of their output, have established *exclusive agencies*, which are modifications of the retail store plan; this method relieves the manufacturers of the necessity for entering into the retail sales business, at the same time permitting them to assign territories, determine prices, observe the market conditions, and push sales. The agent is usually selected from among reputable retail dealers best fitted to handle the goods.

The *Mail-Order Business* has grown to large proportions within the past two decades. It has been adopted not only by manufacturers but also by a number of retail firms, which from some central distributing point reach every town, every village, and every farm in the United States. They send out elaborate catalogues and other advertising literature, describing their goods and offering them at prices which usually cannot be met by the local general store.

Montgomery Ward & Company, and Sears, Roebuck & Company, both of Chicago, are the two most important concerns of this class; their yearly sales amount into many millions of dollars. Most department stores maintain mail-order branches.

**Wholesalers and Jobbers** are intermediaries between producers and retailers; in some instances their activity has been superseded by direct dealings between the factory and the consumer, or the factory and the large retailer, but as yet they are a very important factor in the campaign of distribution. They control the trade of such storekeepers as do not buy in sufficiently large quantities to enable them to deal directly with manufacturers, thereby securing wholesalers' discounts.

Many retailers prefer the services of the *jobber*, because buying from the factories necessitates the placing of orders many months in advance, and because dealing with the jobbers permits them to carry a more diversified stock; the jobbers gather the outputs of many mills, from which their customers may make selections and take the desired quantity.

Most wholesale houses specialize in one line of goods, such as clothing, groceries, drugs, dry goods, hardware, etc.; however, there are a number of general jobbing houses. The retailers are reached by means of traveling salesmen or catalogues; frequently a combination of the two methods is adopted.

**Department Stores.**—A most interesting phenomenon in the retail business has been the rise of the *department stores*. These stores have acquired a large share of city trade. Their business policy may be summed up as follows: Small profits on each sale, provided this leads to a quick turnover of capital; one price plainly marked; exchange of goods or refunding of money in case of dissatisfaction; cash payments, the granting of credit being an exception.

**Organization and Advantages.**—The buying division of a department store, alert as to where, when, and how to buy most advantageously, is connected with many sources of supply; department stores can secure better purchasing terms than small dealers because they buy in large quantities; their expense of handling goods is also proportionately smaller than the expense of those stores where there are only a few articles of each kind. This enables such stores to ask lower prices. Department stores offer to patrons many shopping comforts not to be found elsewhere; the stores are characterized by spaciousness; they are well lighted and ventilated, have reading and retiring rooms, etc. The possibility of doing practically all the shopping under one roof is another great advantage.

The main strength of *special single line stores* (they hold their own in cities) is in their higher grade of articles they carry and in the placing of personal service above all other considerations. Their patronage comes largely from the well-to-do who seek quality and style, for which they are willing to pay. In certain lines of retail business special stores predominate; this is true of drugs, groceries, musical instruments, etc.

**The Foreign Market.**—The foreign markets of the United States are usually considered from the point of view of export business, the fact being overlooked that in these markets our country is buying annually over a billion and a quarter dollars' worth of goods, and that there are many problems to solve in connection with importations from abroad.

**Importing.**—Goods coming from foreign countries are admitted into the United States only at some *port of entry*, which is usually also a *port of delivery*, or a place where the importer may, upon the payment of customs duties and other charges, receive the merchandise. For the convenience of importers a number of inland points have been designated by the government as ports of delivery.

**Bonded Warehouses.**—All imported merchandise may be entered either for *consumption* or *in bond*. In the first case, the duty must be paid immediately and the goods may be withdrawn to any place to suit the convenience of the consignee; in the second instance, the *collector of the port*, who is the chief executive officer of the customs district, requires a bond double the amount of the estimated duties; the goods must be either placed in a *bonded warehouse* at the port of arrival or entered for transshipment via a *bonded route* to some interior port of delivery. The importer is thus relieved of the necessity

of paying more or less large sums of money to the government before he actually needs the goods.

All *bonded warehouses* are placed under the control of specially designated customs-house officials, and they must comply with certain regulations regarding the receipt and the custody of goods; the storage charges are usually somewhat higher than in ordinary warehouses.

**Customs Regulations.**—Goods are admitted into the United States by filing a *declaration*, the form of which is prescribed by law. When the value of imports exceeds \$100 a *certified consular invoice* must be presented by the consignee to the customs-house through which the articles are to pass. This invoice contains a detailed statement of the consignment, indicating the quantity, the nature and the price of the things imported, as well as all the costs incidental to their shipment to the United States.

The name consular is given to the invoice because its accuracy is guaranteed under oath before an American consul in the district in which the merchandise is exported; the consul certifies to this fact by affixing his seal and signature to the document. In case a certified invoice cannot be produced at the time of making the entry, a *pro-forma invoice* must be presented and a bond be given to the government for the subsequent production of a certified invoice.

It is of great importance that the goods when entered should be designated according to their classification in the tariff, and that they should be assigned to their proper class, as the class regulates the rate of duty. For the purpose of avoiding sometimes costly mistakes importers resort to the services of *customhouse brokers*, who make entries for them and see to it that all the customs administrative formalities are complied with.

**The Appraiser.**—When goods arrive, one package out of each ten is sent to the appraiser's store; the appraiser examines it, and decides whether its contents correspond to the invoice and whether the declared price is correct. Should the appraiser's findings warrant an advance in the price of over 10 per cent, a penalty fine is levied, and in case the advance is over 40 per cent, the goods may be confiscated. A *protest* against the decisions of a local appraiser may be submitted by the importer to the board of general appraisers.

**Exporting.**—Large manufacturing concerns doing export business have their *agents abroad*, who work in territories assigned to them. This is the most satisfactory way of meeting foreign competition, of gaining new and keeping old customers. However, this method is too expensive for smaller firms. These latter deal with possible purchasers either directly by means of *correspondence*, or indirectly by intrusting their interests to the care of *export commission houses*.

Export commission houses may be regarded as resident buyers for foreign merchants; they receive orders from abroad, finance the payment of bills, and direct the shipment of goods; they are paid for their services a commission of about 2½ per cent.

**Methods.**—The sending out of *traveling salesmen* and *advertising* in foreign countries are both increasing in importance as methods of developing export business.

**Export Syndicates.**—In some countries merchants carrying on an export and import

business form *export syndicates* whose objects are to keep its members posted concerning the conditions in foreign markets, the financial standing of buyers, trade opportunities, tariff changes, etc.

**Commercial Museums.**—A very important institution for the promotion of foreign trade is a commercial museum. It is usually of a quasi-public character and is established and maintained either entirely by state and municipal authorities or with their assistance.

Commercial museums exhibit *sample products* from various parts of the world thus showing what these places offer in the way of return trade; they also show samples of articles which are in demand in these localities and which are sold there by foreign competitors. These displays, arranged both geographically, by countries, and monographically, by products, offer an effective and rapid method for gauging foreign markets. The exhibits are supplemented by information as to origin, industrial value, use and price of each article displayed.

Commercial museums promote private enterprises only by acting as disseminators of mercantile knowledge.

**Special Knowledge Required.**—An essential condition for success in foreign markets is a knowledge of the customs, tastes and peculiarities of the people whom the exporter wishes to reach. If catalogues, circulars or price lists are sent out, they should be written in the language of the country for which they are intended, and the indications of weights and measures, as well as the quotations of prices, should conform to those used abroad.

**Packing.**—In packing goods the exporter should closely follow the instructions sent him, remembering that goods are liable to damage on long sea voyages, as well as because of rough handling in many localities where proper facilities for loading, unloading and transshipment do not exist.

**Marking.**—If there are many packages in a consignment, it is advisable to adopt a *distinctive mark*, placing this mark and a consecutive running number on each package; this permits a quick reassembling of goods should they become separated.

**Invoicing** should be very carefully done, because invoices must be presented to the customs-house officials abroad. A carelessly or improperly prepared invoice may prevent the entry of goods, thus creating delay.

All goods shipped abroad must be *cleared* at a customs-house, the owners, shippers, or consignors delivering to the collector of the port from which the goods are shipped *manifests* specifying the kinds, quantities, values and destination of the merchandise.

When the steamer is loaded the captain files with the collector a full and complete manifest, which contains a detailed list of each consignment composing the ship's cargo. This manifest, after it has been certified by the customs officer, is returned to the captain together with *clearance papers*.

**Tariff Legislation.**—The act of July 4, 1789, was the first tariff law enacted by Congress. Since then thirty-five principal tariff laws have been in force for various periods. The last law was approved August 4, 1909. The raising of revenue and the encouragement and protection of domestic manufactures has been the object of all these laws.

## DUTIES UNDER THE TARIFF LAW OF 1909 AND OF 1897 COMPARED

The following table covers only the articles of principal importance imported into the United States. ad val.—ad valorem; n. a. p. f.—not specially provided for; n. a.—not enumerated. All weights avoirdupois standard. Ton, 2,240 pounds.

ARTICLES	RATES OF DUTY UNDER		ARTICLES	RATES OF DUTY UNDER

LIST OF DUTIES UNDER THE TARIFF LAW OF 1900—Continued

In the entire silk schedule the classification was so changed in the new law as to make tabulated comparison with the classifications under the Dingley law impracticable. In general, increases were made.

**NOTE**—After the tariff law of 1900 was passed, but before it was signed by the President, the following concurrent resolution regarding hides was adopted:

Hides of cattle, raw or unskinned, whether dry, salted, or pickled, shall be admitted free of duty; provided, that on and after Oct. 1, 1909, grain, haff or split leather shall pay a duty of 7½ per cent ad valorem; that all boots and shoes made wholly or in chief value from cattle hides and cattle skins of whatever weight, of cattle of the bovine species, including calfskins, shall pay a duty of 10 per cent ad valorem; that harness, saddles, and saddlery, in sets or in parts, finished or unfinished, composed wholly or in chief value of leather, shall pay a duty of 20 per cent ad valorem.

**HAWAII AND PORTO RICO.**—Articles of merchandise entering the United States from Hawaii and Porto Rico and entering those possessions from the United States are exempt from duty.

**PHILIPPINE ISLANDS.**—The act of Congress, approved August 5, 1906, provided (Sec. 3): "That there shall be levied, collected, and paid upon all articles coming into the United States from the Philippine Islands the rates of duty which are required to be levied, collected, and paid upon like articles imported from foreign countries, except all articles the growth or product of or manufactured in the Philippine Islands from materials the growth or product of the Philippine Islands or of the United States, or of both, or which do not consist of Philippine materials to the value of more than 50 per cent of the total value, upon which no drawback of customs duties has been allowed therein, coming into the United States from the Philippine Islands shall hereafter be admitted free of duty, except rice, and except, in the case of cigars, of 300,000 gross tons, wrapper tobacco and filler tobacco when mixed or packed with more than 15 per centum of wrapper tobacco in excess of 300,000 pounds, and except cigars of 1,000,000 pounds, and cigars in excess of 1,000,000 cigars; and that there shall be levied, collected, and paid, in the United States, upon articles, goods, wares, or merchandise coming into the United States, from the Philippine Islands, a tax equal to the internal-revenue tax imposed in the United States upon like articles, goods, wares, or merchandise of domestic manufacture."

Exports of Manufactured Products.

Materials for use in manufacturing and crude foodstuffs were for many years the principal articles of export, but their relative importance has been steadily diminishing, while the importance of finished and

partially finished product of manufacture has increased. Each year since 1891 the exports of manufactured products has fallen more than half the value of the total exports. In 1905 and 1906 they formed 60 per cent of the total. From

1907 to 1909 they have constituted 58 to 59 per cent. While the amounts exported are very large, the form a very small proportion of the total manufacture of the United States, being not more than 5 or 6 per cent.

**Business Correspondence.**—Modern industrial and commercial activities are impossible without extensive correspondence. Millions of letters are daily exchanged; some of these do not leave the confines of a single factory or store, being used in interdepartmental relations; others cross continents and seas in order to bring together prospective buyers and sellers.

**Diversity of Letters.**—Letters of application for positions and letters of introduction, letters of inquiry and letters of information, letters ordering goods and those recinding orders, letters of complaint and letters adjusting differences, letters demanding payments and those accompanying remittances; these and an infinite variety of other kinds of communications are used in the daily routine of business.

The increasing complexity of business life, the ever growing dependence upon the goods and the services of others, have made correspondence one of the cornerstones of our civilization, and upon this art depends in many instances the success or the failure of a commercial enterprise.

**Distribution of Mail.**—In large business organizations the incoming mail is generally opened by the *receiving clerk*, who distributes it to the various departments. Many firms request that all communications should be sent to the company and not to any number or official thereof; in this case, all letters must go to some central point, the nature of the letter alone revealing for whom it is intended.

Letters must be answered promptly, then filed away for future reference. (See *Business Letters* under *Practical English*.)

**Mail Contracts.**—With regard to *contracts by mail*, it is necessary to remember that an offer may be withdrawn at any time before it has been accepted, but legally the offer is not withdrawn until a notice of the withdrawal reaches the other party. On the other hand, the mailing of a letter of acceptance completes the transaction; in this case the law considers that the post office is the common agent of both the seller and the buyer, and that as soon as the letter is mailed the contract of sale is complete.

**Telegrams.**—A telegram, being a quicker medium of communication, may be used advantageously to withdraw an offer made by mail. If a telegram is sent accepting a mail offer, there is no binding contract until the telegram reaches its destination.

**Advertising.**—The object of advertising is to attract the attention of the public to saleable commodities or to services, and to create a demand for these.

The forms which advertising assumes and the media which it uses vary with the character of the goods advertised and with the amount of money available for publicity purposes.

**The Advertised Article.**—Certain commodities are excluded from general advertising

either because they cannot be so advertised or do not need this kind of publicity. Most raw materials are included in this group. These materials are subdivided into comparatively few grades, and they are usually sold according to certain fixed standards to buyers whose chief consideration is the adaptability of the article to productive purposes. The number of these buyers is limited and they know definitely what they want. The owner of a sugar refinery or of a textile mill is governed in his purchases by the necessities of his establishment, and no amount of competitive advertising will sway him in his decision, which is based upon experience and business judgment.

**Implements and Machinery** are usually advertised in trade and technical journals or by means of circulars and catalogues. In most instances, the announcements merely state the character and the quality of the product and give the name of the selling firm.

**Finished Commodities** are the most widely, most persistently and most ingeniously advertised. The average final consumer seeks the greatest amount of physical or spiritual satisfaction with the least expenditure of money; he is undecided, open to suggestions, and it is in order to get his patronage that the bulk of advertising is carried on. This advertising uses every device known to the psychologist and to the printer, and its subtleness and aggressiveness grow from year to year.

**Advertising Media.**—The periodical press is the most important medium of modern advertising.

**The Daily Papers** are used extensively by local merchants, bankers, real estate agents, professional men, theater owners, etc.; however, they print also an ever increasing number of announcements of transportation companies and of manufacturers of certain goods, such as bread, fast foods, tobacco, automobiles, ready-to-wear clothing, etc.

**Magazines.**—The latter advertise more frequently in magazines of general circulation because their object is the creation of a national reputation and of a national demand, and this object can be more economically obtained by using weekly and monthly journals instead of advertising simultaneously in various local papers throughout the country.

Another advantage of magazine advertisements over those in newspapers lies in the fact that the first may be made more striking, more attractive, because they have at their disposal a better grade of paper and superior printing facilities.

**Occasional Literature.**—The distribution of occasional literature includes the sending out of typewritten or printed letters, of circulars, catalogues, calendars, handbills, booklets, and almanacs. In this connection, special firms furnish lists of addresses which they compile from local trade

directories, clipping bureau reports, mercantile agency books, etc.

**Outdoor Advertising.**—The most important forms of outdoor advertising are signboards, posters, billboards and street-cards. The greater part of this form of publicity is controlled by *bill posting* and *street-car agencies* which are organized into a national union and which prescribe certain definite rules for such advertising.

**By Sample.**—An effective though expensive publicity method is a house-to-house distribution of samples; this is of particular advantage when a new article of superior quality is placed on the market.

**Demonstrators.**—Somewhat similar in character is the work of demonstrators, who travel from town to town in order to show the patrons of the shops handling their articles the advantages of their goods.

**Advertising Managers.**—Some business men write their own announcements, but most of the present-day advertising is done by men trained for the work. All large firms have advertising managers who control this side of the business, subject to limitations imposed by the financial head of the concern.

**Advertising Agencies.**—The great number of advertising media, the difficulty of ascertaining which are the best for specific purposes, has called into existence advertising agencies. These agencies collect and systematize information concerning publicity channels and place this information at the disposal of those concerns which intrust them with the management of their publicity campaigns. They relieve their patrons of all the details of the work, writing advertising copy, making illustrations, selecting type and borders, drawing contracts with papers and magazines, etc.

**Advertising Rates.**—The price paid for advertisements in the periodical press is determined by the circulation of the periodical, as well as by the size and the position of the announcement. The rate charged for one page of magazine advertisement approximates \$1 per thousand circulation, higher class publications demanding a somewhat larger sum.

**Keying.**—Various methods are used in order to determine the results of advertising in different periodicals. This is called *keying*. Announcements are keyed by lightly modifying the given address, by employing department letters, or by requesting the reader to fill out a coupon and mail it to the advertiser.

**Salesmanship.**—The success of a business enterprise largely depends upon the efficiency of its *selling force*.

The main classes of salesmen are:

1. Clerks in retail stores.
2. Commercial travelers.
3. Correspondents intrusted with the writing of sales letters.
4. Itinerant specialty salesmen.
5. Peddlers and bucketmen.

**Personal Elements.**—A successful salesman should be a keen observer of human nature; in addition to a pleasing personality he should possess tact and perseverance. As he must often contend with exasperating circumstances, it is very important that he should be self-controlled. A salesman should be straightforward and not overcautious, remembering that it is not the quantity but the quality of talk which counts. He should dress neatly; the matter of personal appearance is of greater importance to a business promoter than to a huckster, but even for the latter a shabby or a ragged attire is not good stock in trade.

The present-day salesman is a product of schooling and of self-training. Many factories and department stores give their salespeople instructions in the principles of salesmanship and in the methods of applying their general knowledge to specific conditions.

**Special Requirements.**—A salesman should know the articles he handles, not alone their selling price, but their purpose, their superiority over other similar articles, durability, workmanship, finish, as well as all other facts which might interest the probable buyer. The well-informed clerk inspires his customers with confidence, and this is an important element in making sales.

People buy for various reasons; sometimes in response to dictates of judgment, sometimes of feelings and of emotions. The wide-awake salesman reads his customer and makes his appeal accordingly. **Commercial Travelers** represent either manufacturers or wholesalers; they usually operate from a central office, the sales manager being their directing force.

A sales manager should be one who has had extensive selling experience and who has "made good" while doing actual saleswork. He should know his salespeople and the territories which they cover; he should be able to advise them and to cooperate with them in all possible ways.

**Territory.**—In dividing the territory the most important considerations are the condition of transportation facilities, the number of commercial centers and the line of goods handled.

**Necessity of Judgment.**—Roadmen should exercise judgment in taking orders; they must understand the needs of their customers as well as the interests of the house they represent. A buyer who has been overstocked is not likely to forget the fact, nor to forgive the salesman responsible for it. The financial standing of the buyer must also be carefully considered, as extensive sales to undesirable customers lead to the canceling of orders by the credit department of the firm, thus causing many annoyances and frequently creating ill-feeling.

**Communication.**—The firm should always be advised where they may find its representatives, and it is the duty of the commercial traveler to keep his house informed of his whereabouts. It frequently happens that fluctuations in price take place, or the stock may be considerably reduced; these and other important data must be immediately communicated to the roadmen.

**Compensation.**—The compensation of the commercial traveler consists of a fixed salary or of a commission on sales; often a combination of salary and commission is used.

**Credit and Collections.**—Credit is the means which makes possible transactions

involving the transfer of commodities, services, or money for a future equivalent. It is estimated that over 90 per cent of modern business is conducted on a credit basis, the credit granted being in the form of either deferred payments or of loans.

**Deferred Payments.**—In merchandising deferred payments are exemplified by the shipment of goods on time terms by the manufacturer to the wholesaler, and by the wholesaler to the retailer, as well as by the "charge accounts" of the customer in the retail store.

**Bank Credit.**—Such credit is usually book credit, neither notes nor collaterals being demanded by the credit giver from the credit seeker.

The basis of such credit is the confidence which those who grant it have in the ability and the willingness of the debtors to meet their obligations at a stipulated future date. This confidence is derived from a more or less exact knowledge of the tangible and intangible assets of the credit seekers.

Capital, in its various forms, calculated at marketable value, represents the tangible assets, while the intangible assets include honesty and business efficiency of the debtor, as well as any patents, trademarks, franchises, etc., which may protect his enterprise from competition, thus giving it greater earning power and greater stability. However important the tangible assets may be, it is the intangible ones which are most carefully scrutinized by the credit man when he passes upon credit risks.

Most deferred payments represent short-time credit, which seldom exceeds three months. Inasmuch as a considerable discount is generally offered for cash, it is of great advantage to the merchant to be able to utilize as far as possible his own capital or his bank credit.

**Bank Loans** may be obtained at a smaller rate of interest than that which is charged for deferred payments. The bank loans either on the personal note of the borrower or on the pledge of collateral securities, such as stocks, bonds, etc. The note is signed either by the borrower alone, if his financial standing in the community warrants the bank to accept his "single-name paper," or it is indorsed by a second party, a business associate or a friend of the borrower (two-name paper). The bank loans also by discounting bills of exchange and other negotiable documents arising from ordinary business transactions.

**Credit Department.**—Every large concern has a credit department whose work is placed under the supervision of a credit man. In this department are gathered and classified all data pertaining to the financial standing of the firm's present and prospective customers.

The data are obtained from the following sources: Written and signed statements of those who apply for deferred payments; references given by them; reports sent by the commercial travelers of the house; bank references; personal interviews of the credit man with the credit seekers; rating books and special reports of the mercantile agencies; information supplied by the credit cooperative organizations.

**Credit Man.**—A good credit man should not only be able to analyze credit statements and balance sheets, but he should also possess the power of discrimination and of selection, the ability to read character as it is revealed by the customer's manner

of answering questions, by his past history, by his associates, by his methods of conducting business, etc.

It is easy to deny credit, but it should be remembered that denial of credit in most instances means loss of business, and the best credit man is not the one who is overcautious, but the one who knows how to bring to his house the greatest number of credit patrons with the least probability of incurring bad debts.

**Collections.**—In connection with sales on credit, accounts should be watched carefully and collections made regularly. Many accounts never reach a past maturity stage, for they are promptly paid by the debtors when due; others become delinquent, thus necessitating the services of the collection department.

In dealing with bad accounts one should carefully distinguish between those customers who are unmethodical or slow and those who are willfully negligent or insolvent. If letters reminding the debtor of his obligations fail, drafts are sent for collection to a bank or to an agency. Should this method of enforcing payment also fail, there remains but legal procedure. When this has been decided upon it should be pushed without delay. It presupposes the breaking off of all friendly relations with the debtor, and nothing is to be gained from dilatory measures.

**Transportation by Land and by Sea.**—Commerce measures distances not so much by miles as by what it costs to transport freight from one locality to another. The cost of transportation depends upon the condition of the roadbed, the effectiveness of the motive power and the serviceability of the vehicle.

Primitive methods for overcoming distances by means of beasts of burden or draft animals over unimproved highways are not only slow, insecure and irregular, but are also expensive, thus limiting the commercial intercourse between communities to the exchange of more or less valuable objects of an imperishable character.

At present wagon roads do not play an important rôle in long distance traffic, but as feeders of railways and as local lines of communication their economic significance is very great. The cost of wagon transportation is prohibitive on sand surfaces at some seasons, but even on the best macadamized road it is seldom less than 10 cents per ton mile, the average being about double this amount. The average railway rate in the United States is between eight and ten cents per ton mile, and the rate on the Erie canal about three mills.

**Railway Rates** are based upon the expenses incurred in transporting goods as well as upon the value of the service to the shipper and the nature of the article transported.

**Rate-Fixing.**—For the purposes of rate-fixing, commodities are grouped into a small number of classes, the rate being based upon class and not upon individual articles. Our interstate railway rates are governed by three classifications—the official, applying in the territory north of the Ohio river and east of the Mississippi river; the southern, being in force south of the Ohio and east of the Mississippi; and the western, governing the freight traffic west of the Mississippi river.

The Classifications are issued by committees composed of representatives from all the railroads operating in the territory covered by the classification; supplementing these are freight tariffs which specify the rates for the various classes of commodities and

which are published by each railroad independent of all others for its own use.

Many products which are invariably handled in carload lots, such as coal, grain, cement, etc., are not included in the classifications, but are given a special or a so-called *commodity rate*.

**Shipping.**—Common carriers require that goods delivered to them for shipment should be accompanied by a *shipping bill*, containing a list of the articles to be transported as well as directions concerning where and to whom the goods are consigned. Shipping clerks should be familiar with railroad routes, classifications and tariffs; inefficiency in the organization of the *shipping department* has cost many a firm large sums of money through errors in routing and through overcharges.

**Receipt and Bill of Lading.**—When goods are delivered to the railroad company a *receipt* is given the shipper. The receipt is usually exchanged for a *bill of lading*, issued by the railway freight agent. The bill of lading is forwarded by the shipper to the consignee. It is not only a railway receipt for the goods and a contract for their carriage, but it is also an evidence of ownership and a means for transferring the title to the goods. On the bills of lading are printed certain stipulations limiting the liability of the carrier; to illustrate, in case of freight being lost, the carrier is not liable but for losses due to its own negligence, and even in the latter case not unless the claim is made within a certain time limit.

**Way Bill.**—One of the most important shipping papers is the *way bill*. It is not given the shipper, but it accompanies his shipment usually in the possession of the conductor who has charge of the freight train. The way bill is used by the agent at destination as a guide in collecting charges and by the central office in checking agents' reports.

**Notice on Freight Bill.**—As soon as the freight arrives at its terminal a notice is sent to the consignee. Upon the payment of the freight charges the railroad surrenders the goods and delivers a receipted *freight bill*, the transaction thus being brought to an end.

**Water Transportation.**—The ocean affords unrivaled opportunities for the use of large vehicles and powerful motors; it therefore permits the utmost utilization of both carrying space and propelling force; this results in a comparative cheapness of *ocean freight rates*. These rates are considerably less than railway charges, not only because it costs less to give the service but also because of the fact that rate agreements and combinations are more easily effected by railway organizations than by steamship companies.

An important fact to be considered is that in water transportation the vehicle is the carrier's chief item of expense, the roadway being provided by nature and the terminal facilities by municipalities, states or independent corporations.

**Ocean Commerce** is carried on by means of *steamers* and of *sailing vessels*. The respective position of each may be judged from the following figures: In 1904-5 the gross tonnage of sea-going steamers was 27,900,000 tons, that of sea-going sailing ships 7,512,000 tons. These data do not show the exact proportion of the work done by the two carriers, the steamer traveling and delivering cargoes with greater rapidity than the sailing vessel, whose movements are dependent upon winds and other natural conditions.

The comparative efficiency of the two is usually placed as four for steam and one for sail. Only about 5 per cent of the world's shipping is carried by sailing vessels.

Steamship transportation is divided into regular (line) traffic and irregular (charter) traffic.

**Line Traffic** implies a prearranged schedule of fixed sailings to definite ports and is made possible only by a large and continuous volume of trade. Line traffic is maintained by three kinds of vessels: by fast express steamers which carry only passengers, mail and parcels; by steamers of more moderate speed transporting both passengers and freight, and by boats which handle only freight. The equipment and the maintenance of line traffic is expensive and only the large commercial ports of the world can command such a service.

**Charter Traffic.**—Much of the heavy and bulky freight of commerce is carried by cargo boats operated as individual units, these boats being chartered as the occasion warrants; the traffic carried on by such vessels is known as *charter traffic*. Ports whose shipments are irregular depend almost entirely upon this kind of transportation.

Negotiations for the hire of single vessels, often called *tramps*, are usually made through *ship-brokers*, whose function is to provide cargoes for ships and ships for cargoes. These brokers may be found in most parts of the world.

Boats are chartered either for a single trip or for a certain length of time, *voyage charters* being much more numerous than *time charters*.

The contract whereby the merchant hires the vessel is known as the *charter party*, and in case of a trip charter it contains various agreed-upon conditions as to voyage, cargo, freight rate, time allowed for loading and unloading, etc. If the cargo is kept in the port longer than the *lay days* permit, the owner is entitled to an indemnity, usually provided for in the charter party and called *demurrage*. A charter party is supplemented by *bills of lading* acknowledging that the goods for the carriage of which the vessel was hired were received on board ship; bills of lading give effect to the various provisions of the charter.

**Corporation Economies.**—Of the three forms of business organization, individual ownership, partnership and corporation, the last is best suited for conducting large industrial and commercial enterprises.

**Individual Ownership** limits the amount of capital and credit a business unit may command; it also makes the single owner liable to the full extent of his possessions for the failure of the venture; because of this, individual ownership at present is confined almost exclusively to retail trade, to repairing industries and to farming.

**A Partnership**, through combination of capital and labor, makes larger enterprises possible but it greatly increases the individual liability of those who are associated in this way; each partner becomes personally liable not only for his own acts, but also for the acts of all other members of the firm. A partnership possesses another disadvantage which prevents it from meeting many important requirements of modern business; it is dissolved by the death or by the withdrawal of one of its members as well as by the addition of a new partner. Each

dissolution necessitates a readjustment of all titles, rights, assets and liabilities.

**A Corporation** has none of the aforementioned disadvantages; its existence is continuous and distinct from the persons forming it; its capital is divided into shares and the liability of the stockholders is limited to the amounts they have actually invested in the business. The control of the corporation is vested in the directors and other officers, who alone can act for the concern; this leads to greater efficiency through concentration of power and does away with complications and uncertainties which might arise should individual stockholders be permitted to involve the organization. The division of corporation capital into shares affords opportunities to both small and large investors, and the transferability of the securities makes it possible for the stockholders to join or to leave the undertaking at any time.

In the public mind, corporations are frequently associated with the idea of monopoly, but it should be remembered that not every incorporated business of large magnitude is a monopoly. Huge department stores working as corporations must continually face competition, and this is true of most of the steamship companies and of many manufacturing establishments.

**Monopoly** means a control over the supply of goods or services, not necessarily an absolute control, but one sufficiently powerful to permit the fixing of prices.

Excessive competition among industrial and railway companies caused many of them to enter into temporary agreements regulating prices, dividing territory, etc. These agreements were known as *pools*.

**Pools.**—In railway transportation, pooling consisted in apportioning either the competitive traffic or the receipts from this traffic; divisions were made according to stipulated ratios. In manufacturing agreements usually entered into were those limiting the annual output to a certain percentage of the producing capacity of the various establishments; if a factory produced and sold in excess of the stipulated amount, its owner was obligated to contribute a part of his earnings to the pool, the money to be distributed among those who made less than their share of production.

The successful management of a pool is very difficult, as its agreements can not be enforced. In the United States pools were declared illegal, being "in restraint of trade." They were succeeded by trusts.

**Trusts** are combinations by means of which the stockholders of competing corporations assigned their shares in trust to a committee (a board of trustees), receiving trust certificates instead. The earnings of the various companies are combined and each company receives its proportionate share of profits in accordance with the number of certificates it owns. At present the term "trust" is often erroneously applied to any combination which is capable of dominating a given branch of industry.

**Holding Company.**—The hostile attitude of our courts toward pools, as well as toward consolidations in the form of trusts, has led various competing companies into forming single large corporations; thus corporations have been established not only for the purpose of securing the economies of large scale production, but also in order to obtain a monopolistic control over the market. In many instances this result has been accomplished by forming a hold-

**ing company.** A holding company requires a controlling interest in several corporations by purchasing the majority of their stock. Identical in structure with ordinary corporations, it differs from them in that it is organized for the express purpose of holding stock, and by this means shaping the business policy of subsidiary concerns.

**Stock.**—The stock of a corporation is usually divided into *preferred* stock and *common*

stock. The holders of preferred stock are entitled to a certain percentage of the profits (ordinarily from 6 to 7 per cent) prior to the distribution of dividends among the holders of common stock. There are two kinds of preferred stock, *cumulative* and *noncumulative*. The advantage of the cumulative stock is suggested by its name. Should the annual profits of a corporation be insufficient

to pay the stipulated interest to the holders of the cumulative stock, the deficiency must be made good by the corporation out of future earnings, if any.

**Bonds.**—A distinctly different class of corporation securities are *bonds*, which are issued as certificates of indebtedness and may be regarded as promissory notes of a corporation, usually payable in from twenty to thirty years.

### THE RAW MATERIALS OF COMMERCE

The most important commercial products are summarized in the following pages. The materials are grouped according to their source: thus all the many products of the cotton plant are treated under one head; and since cotton fiber is the most important product of this plant, it is placed under the general heading of vegetable fibers, even though it supplies oil, cattle food and other articles.

Countries of production are mentioned in the order of their relative importance. This changes from year to year, due to many causes; thus a lessened production may be occasioned by unfavorable seasons, insect ravages, wars, or other influences, while production may increase on account of better transportation facilities, the opening up of new areas or the development of new demands for certain products.

In determining the relative importance of the different countries of production the average has been taken for a number of years, since 1900.

### FOODSTUFFS

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Wheat</b> is the seed of a grass ( <i>Triticum sativum</i> ). Fr., <i>Froment</i> ; Blt.; Ger., <i>Weizen</i> ; Sp., <i>Trigo</i> .	Its commercial varieties, hard, soft, red, white, etc., differ in percentage of starch and gluten. The whole grain is ground into <i>grains flour</i> , made into <i>breakfast foods</i> and used in brewing. From parts of the grain are prepared <i>whole wheat flour</i> , <i>white flour</i> , <i>middlings</i> , <i>bran</i> , <i>wheat grits</i> , <i>wheat starch</i> , <i>macaroni</i> , <i>spaghetti</i> , etc. Wheat straw is plaited into braids (leghorns, etc.) for hat making, and is used like the straw from other grains for packing material and as bedding for animals.	Grows in temperate climates, the largest crops being raised in United States (especially in Minnesota, North Dakota, Ohio, South Dakota, and Kansas); Central Europe (Russia, France, Austria-Hungary and Italy); India, Argentina, Canada and Australia. The area of wheat production is steadily increasing and wheat raising has become an important industry in newly developed countries, such as parts of British America, West Australia and Manchuria. The United States is the chief exporter of flour.	Wheat flour may be said to be the standard foodstuff of modern civilized man. In the modern flour mill, heavy rollers of steel or porcelain have replaced the old-style millstones. The bran, middlings and flour are separated by sieves, the finest being of silk bolting cloth. Macaroni is made from special varieties of hard, glutinous wheat. The principal countries exporting wheat are United States, Russia, Argentina, Canada, Roumania, and Australia. Straw braids come largely from Italy, China and Japan.
<b>Barley</b> is the seed of a grass ( <i>Hordeum sativum</i> , variety <i>vulgare</i> , etc.). Fr., <i>Orge</i> ; Ger., <i>Gerste</i> ; Sp., <i>Cebada</i> .	It is used chiefly in brewing and for horse feed; also in soups. Pearl barley, <i>barley flour</i> , malt, <i>beer</i> and <i>alcohol</i> are its chief products.	Cultivated chiefly in north and central Europe, the colder parts of Asia and North America.	Malt is made by moistening barley and allowing it to sprout in a dark room. The principal commercial starch is derived into dextrine and maltose. On fermentation, maltose produces alcohol. Pearl barley is prepared by removing the hard outer coats of the grain.
<b>Rye</b> is the seed of a grass ( <i>Secale cereale</i> ). Fr., <i>Seigle</i> ; Ger., <i>Roggen</i> ; Sp., <i>Ceneno</i> .	It is used in the form of <i>rye flour</i> and for distilling whisky and vodka. Rye straw is plaited into hat braids.	Cultivated in the cold climates of northern Europe, especially in Russia. Only small amounts are grown in the United States.	Rye flour is the chief breadstuff in parts of Russia, Scandinavia and Germany. Whisky is distilled from fermented rye and corn.
<b>Oats</b> is the seed of a grass ( <i>Avena sativa</i> ). Fr., <i>Avoines</i> ; Ger., <i>Hafer</i> ; Sp., <i>Avenas</i> .	Used chiefly for horse feed, and in lesser amounts for making oatmeal and breakfast foods.	Grown in largest amounts in Russia and the United States (especially Illinois and Iowa). Cultivated throughout the temperate parts of the civilized world.	The manufacture of oatmeal is of relatively small importance since the more nourishing products of wheat are increasingly used.
<b>Corn, Maize or Indian Corn</b> ( <i>Zea mays</i> ) belongs to the grass family. Flint, dent, sugar, soft and pop corn differ in percentage of starch and gluten, and the grain may be white, yellow, red or black in color. Fr., <i>Blé</i> ; Grain; Ger., <i>Getreide</i> , <i>Korn</i> ; Sp., <i>Grano</i> .	Among the dozens of useful products made from corn are <i>corn meal</i> , <i>corn grits</i> , <i>hominy</i> , <i>breakfast foods</i> , <i>beer</i> , <i>whisky</i> , <i>alcohol</i> , <i>condensed apricots</i> , <i>corn starch</i> , <i>dextrine</i> , <i>glucose</i> , <i>grape sugar</i> , <i>corn sirup</i> , <i>corn oil</i> , <i>soup</i> , <i>rubber substitute</i> and <i>cattle foods</i> . A special variety of corn is raised to make <i>cob pipes</i> . Compressed <i>corn pulp</i> is packed between the double hulls of wraps. Corn husks are used in <i>mattresses</i> and <i>paper</i> is made in very limited amount from the leaves and stalks. Large amounts of <i>popcorn</i> , corn plant and candied, are eaten in the United States.	Corn is the most valuable farm crop of the United States. The chief corn growing states are Illinois, Iowa, Kansas, Nebraska and Missouri. The bulk of the world's production of maize is grown in this country, although it is an important crop in Hungary, Italy, Egypt, South Africa, and other parts of the world.	Corn is of primary importance as a food for live stock; enormous quantities being used to fatten cattle and swine. The manufacture of starch and other products from corn is an industry of increasing magnitude. The chief starch derivatives are <i>dextrine</i> and <i>glucose</i> or <i>grape sugar</i> (used in brewing and as a substitute for rice sugar). Corn oil may be called a by-product in starch manufacture, yet the actual value of corn oil is greater than that of cornstarch produced in the United States. It is used in soap and paints. Vulcanized by heating with sulphur, it forms a widely used adulterant and substitute for rubber. It is estimated that one-third of the people of the world live principally on rice.
<b>Rice</b> is the seed of a grass ( <i>Oryza sativa</i> ). Fr., <i>Riz</i> ; Ger., <i>Reis</i> ; Sp., <i>Arroz</i> .	<i>Rough rice</i> and <i>clean rice</i> are the common commercial articles. <i>Rice polish</i> , <i>said</i> or <i>rice wine</i> , <i>rice straw</i> and <i>rice paper</i> are of lesser importance. Rice, steamed and swailed, is now extensively used as a breakfast food.	It is usually grown in swampy land or else on irrigated fields. In most countries, rice is grown in the most primitive fashion. Immense irrigating plants and modern agricultural machinery make possible the large production in parts of the United States. It is the chief crop in southeastern Asia, from India through Indo-China, a great part of China, southern Japan and many islands of the Pacific. Rice of excellent quality is raised in Texas, Louisiana and South Carolina, and an amount about equal to the production of this country is imported from eastern Asia.	<i>Rough rice</i> or <i>paddy</i> (rice in the hull) is first boiled by machinery and then the grains are polished or whitened. The <i>rice polish</i> , which consists of the powdered outer coats, is an important cattle food. <i>Said</i> , the national drink of Japan, is a weak alcoholic liquor brewed from rice. Rice straw is of enormous use in Asia, being employed for hundreds of purposes, some of them as in used equal to that in the making of bags, ropes and sails.
<b>Millet and Sorghum</b> are cultivated grasses of many varieties ( <i>Panicum</i> , <i>Setaria</i> , <i>Andropogon</i> , etc.). Fr., <i>Millet</i> ; Ger., <i>Hirse</i> ; Sp., <i>Mijo</i> .	Guinea corn, <i>kaffir</i> corn, <i>broom corn</i> and other names are employed to distinguish the different kinds.	These grains are grown in practically all parts of the world. In Europe and America they are important chiefly as fodder plants, although in many other parts of the world the seeds are used as human food.	In some places the juice of sorghum is boiled down to make <i>sirup</i> or <i>sugar</i> . Common brooms are made of the tops of certain varieties of sorghum ( <i>broom corn</i> ). These grains are mainly of local importance.

## FOODSTUFFS—Continued

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Buckwheat</b> ( <i>Fagopyrum esculentum</i> ) is regarded as a cereal because its seeds are used like those of wheat, rye and other grains. Fr., <i>Sarrasin</i> ; Ger., <i>Buchweizen</i> ; Sp., <i>Trigo sarraceno</i> .	The seeds are ground into buckwheat flour. Buckwheat fields are especially attractive to bees and a fairly important source of honey.	Buckwheat cultivation has decreased in recent years. New York and Pennsylvania produce the greater part of a crop in the United States. Abroad it is raised chiefly in Russia, France and Japan.	Buckwheat flour is less used than formerly. Very little of this grain enters into foreign trade.
<b>Hay</b> is made from many grains and leguminous plants. Fr., <i>Foin</i> ; Ger., <i>Heu</i> ; Sp., <i>Heno</i> .	Timothy, clover and alfalfa are the chief sources of hay in the United States.	It is produced almost exclusively in temperate climates. Its yearly value in the United States is almost equal to that of the wheat crop.	Hay is most important in the cattle raising sections of the world. Some dried hay is exported to Europe and a little is sent to the tropics.
<b>Starch</b> is prepared from many seeds and roots. The common starches are from corn, wheat, rice, potatoes ( <i>Solanum tuberosum</i> ), cassava ( <i>Manihot utilissima</i> ), arrowroot ( <i>Maranta arundinacea</i> ) and the pith of the sago palm tree ( <i>Metroxylon</i> sp.). Fr., <i>Amidon</i> ; Ger., <i>Stärke</i> ; Sp., <i>Almidón</i> .	Starches appear on the market in powder, lump, flake and pearl forms. Starch grains differ in size and shape according to their source so that it is not difficult under a microscope to identify the various kinds. Glucose, dextrine and alcohol are made from starch.	For industrial purposes starch is prepared chiefly from potatoes in Europe and from corn and potatoes in the United States. Cassava is a very important foodstuff in almost all parts of the tropics. Many starches are of great local importance, such, for example, as taro in Hawaii. Comparatively few enter into general commerce.	In general, starches are separated from roots or seeds by grating them and washing with water. The starch grains are carried off in suspension and later separated from the water. Starch and starched foods are of the greatest importance to men and animals. Aside from the manufacture of glucose, dextrine and alcohol, starch is used for making yarn, cloth and paper, for making paste and laundry purposes. Tapioca comes on the market chiefly from Brazil and Straits Settlements. Arrowroot starch is produced in Bermuda, St. Vincent and Jamaica. Sago is exported from Straits Settlements.
<b>Vegetables</b> of an almost infinite variety are used in all parts of the world. Many of these are roots, some seeds, some leaves or other parts of plants.	The bulk of the crop is consumed fresh, although beans, peas, etc., are dried and increasing amounts of vegetables are canned or otherwise preserved.	The largest cultivation of fresh vegetables is as a rule near great cities.	Vegetables are so heavy in proportion to value that they are not normally shipped long distances. Potatoes and onions, being least perishable, are most important in general commerce. Better transportation facilities naturally increase the trade in both fresh and canned vegetables.
<b>Fruits</b> , like vegetables, are used in great variety. Those deserving special mention are: <b>Apple</b> ( <i>Pyrus malus</i> ).—Fr., <i>Pomme</i> ; Ger., <i>Apfel</i> ; Sp., <i>Manzana</i> . <b>Plum</b> ( <i>Prunus domestica</i> ).—Fr., <i>Prune</i> ; Ger., <i>Pflaume</i> ; Sp., <i>Ciruela</i> . <b>Grape</b> ( <i>Vitis</i> sp.).—Fr., <i>Raisin</i> ; Ger., <i>Weinbeere</i> ; Sp., <i>Uva</i> . <b>Orange</b> ( <i>Citrus aurantium</i> ).—Fr., <i>Orange</i> ; Ger., <i>Orange</i> ; Sp., <i>Naranja</i> . <b>Banana</b> ( <i>Musa sapientum</i> ).—Fr., <i>Banane</i> ; Ger., <i>Banana</i> ; Sp., <i>Banana</i> , <i>Guineo</i> . <b>Date</b> ( <i>Phoenix dactylifera</i> ).—Fr., <i>Datté</i> ; Ger., <i>Dattel</i> ; Sp., <i>Dátil</i> . Many others are of almost as great value.	Large quantities of dried and evaporated fruits are produced, among which are apples, apricots, plums (prunes) and grapes (raisins). Canned fruits, jellies, syrups, wines, liquors and vinegars are manufactured.	Different fruits thrive in different climates. Apples are mostly raised in temperate regions, the largest production being in the northern United States and parts of Canada, France, Italy and Spain, the greatest grape-growing countries, are the largest producers of wine.	Refrigerator cars and special steamers make possible the shipment of fresh fruits to parts of the world distant from the region of production. Apples are picked when ripe and dried apples from the United States and Canada to England and the Continent. Australia and South Africa are increasing their export of dried fruit. Prunes, raisins and other dried fruits are shipped to all parts of the world from California and Mediterranean countries. Bananas, oranges and pineapples are the chief tropical fruits in general commerce. Florida and southern California, with the West India, Central America and northern South America, supply the markets of the United States. Those used in England and northern Europe come from the Canary Islands and the West Indies. Dates come chiefly from northern Africa and western Asia.
<b>Sugar</b> is obtained from the juice of the sugar cane ( <i>Saccharum officinale</i> ) and from the juice of the sugar beet ( <i>Beta vulgaris</i> ). Fr., <i>Sucre</i> ; Ger., <i>Zucker</i> ; Sp., <i>Azúcar</i> . Maple sugar is from the juice of the sugar maple tree ( <i>Acer saccharinum</i> ). Sugar and sirup are made also from the juice of several palm trees.	Pure cane and beet sugar are in every way identical. Raw cane sugar, brown to yellowish in color, produced by evaporation of the juice in open pans (muscovados), and crystals from vacuum pans are both important commercially. The price of raw sugar is determined by its purity as shown on chemical analysis. A fairly good indication of purity is found in color, and raw sugars are graded according to an accepted standard which is set by the Dutch government. White sugar, granulated, loaf and pulverized, as commonly sold, is more nearly chemically pure than most other articles of commerce. Molasses, from cane juice boiled in open pans, is palatable for human food, and, like all cane molasses, is fermented and distilled to make rum. Molasses from vacuum pans (whether from cane or beet juice) is not pleasant in taste, but is an important food for cattle and is distilled to make alcohol.	Sugar cane is grown in India, Cuba, Hawaii, Java, Brazil, Mauritius, Louisiana and other parts of tropics and sub-tropics. India's large production is consumed locally and enters little into export trade. Sugar beets are grown most extensively in Germany, Austria, Russia, France and United States. More than half of the world's supply of sugar (exclusive of India) now comes from the sugar beet. Sugar cane is harvested by hand, no satisfactory machinery having been devised for cutting the canes in the field. Economic modern processes necessitate the building of enormous mills and the manufacture of sugar on a very large scale. A factor of great importance in this has also been the production of sugar from beets, grown on the farms of the temperate zone, close to the point of consumption. Here the refuse or pulp from the beets, along with the molasses, is promptly used for stock food.	After harvesting, sugar cane is carried (usually by rail) promptly to the mill, where the juice is pressed out. Modern mills have nine rollers, arranged in three sets. The trash, or bagasse, is almost dry when it leaves the last rollers and is used as fuel to run the mill. The juice is boiled down, generally in vacuum pans heated by steam, and the sugar crystals which form are separated from the molasses in centrifugals. Sugar beets are sometimes stored for several months before being used. The juice is commonly attracted by diffusion; that is, the beets are sliced and soaked in warm water. The sweet liquid is then treated in practically the same way as raw juice. Raw sugar is refined or purified by dissolving in water, treating it with lime and the serum of blood, filtering through animal charcoal and recrystallizing. The large sugar refineries are located in the United States and Europe. Sugars from the maple and the palm are produced only in small amounts and are of only local value. Sugar of milk is of some importance medicinally and industrially.

## FOODSTUFFS—Continued

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<p><b>Alcohol</b> is formed as a result of the fermentation of sugar and is therefore obtainable from practically any fruit or from any starchy matter through conversion of the starch into sugar.</p> <p>Alcohol is also a product of wood distillation.</p> <p>Fr., <i>Alcool</i>; Ger., <i>Weingeist</i>; Sp., <i>Alcohol</i>.</p>	<p>Alcohols differ in chemical composition according to the source. Grain alcohol, denatured alcohol and wood alcohol are the chief commercial types.</p>	<p>All parts of the world make and use alcoholic liquors. Distilled liquors contain more alcohol than fermented drinks. Wood alcohol and denatured alcohol are finding an increasing use for many industrial purposes in Europe and America, largely because of the lessened tax on their production.</p>	<p>Grain alcohol is distilled from fermented grain, chiefly Indian corn, in the United States.</p> <p>Potatoes are the most important source of alcohol in Germany. For industrial purposes it is denatured, or rendered unfit for use as beverage, by the addition of substances which give it an objectionable taste, odor or color. Alcohol finds a large use for heating and lighting and the development of power in alcohol motors. In these uses Europe leads. It is employed also in the manufacture of artificial silk, other, paints, varnishes and hundreds of other products.</p>
<p><b>Tea</b>, as it appears in commerce, is the prepared leaves of a bush or small tree (<i>Thea chinensis</i>). Fr., <i>Thé</i>; Ger., <i>Thee</i>; Sp., <i>Te</i>.</p>	<p>Tea is classed commercially according to the district of production as China, Ceylon, India, Assam, Japan, Formosa, Java, according to the method of preparation giving sun-dried, pan-fired, basket-fired; (a) green—Gunpowder, Imperial, Hyson, Caper, etc.; (b) black—Pekoe, Oolong, Pouchong, Congou, etc., and according to the quality, depending chiefly on the age of the leaf.</p> <p>Black tea is commonly of low grade and not salable in the United States. It is made from tea dust and sweepings or from large leaves and trash. It has a large sale in Tibet and Russia.</p> <p>Soluble tea, or tea extract, and soluble tea are not of great commercial importance.</p> <p>The commercial varieties of coffee are named according to the districts of production, and to a very considerable extent these names when so applied indicate flavor (Mocha, Java, La Guayra, Santos, Rio, etc.). Such names as Mocha and Java, indicating high-grade coffees, have in the past been applied to beans from other localities, but this practice has been stopped in the United States by recent pure food laws.</p> <p>Coffee extract is prepared for sale to only a small amount.</p> <p>The popularity of coffee is due to the fact that, like tea and chocolate, it contains caffeine, a mild stimulant.</p>	<p>Tea is grown chiefly in hilly country throughout eastern and southern Asia, China, Ceylon, India, Japan and Java are the chief producing countries. The cultivation of the tea plant requires great care to produce leaves of perfect quality, young, tender and fragrant. The very youngest leaves and leaf buds, when properly prepared, sell for the highest price. In some places tea is picked only once or twice a year, while in other countries, where the climate is favorable to rapid growth of tea shoots, the pickings are very frequent.</p>	<p>Green and black teas are made from leaves of the same species of plant. For black tea the leaves are allowed to wither and ferment slightly before being dried, usually over a charcoal fire. Green teas are prepared by drying the leaves more quickly and not allowing them to ferment.</p> <p>Tea is popular because of its pleasant taste and stimulating quality (due to the thein, or caffeine, which it contains). Outside of tea producing countries, the chief consumers are English-speaking people. The United Kingdom buys about half of all export tea, chiefly from Ceylon, India, Formosa and China. The United States uses more green tea than any other country, much of our supply coming from Japan, Formosa and China. Much Chinese tea is exported overland to Russia.</p>
<p><b>Coffee</b> is the seed of a small tree. The world's supply of coffee is produced chiefly by the species of tree which was originally native in Abyssinia and cultivated in Arabia (<i>Coffea arabica</i>). The Liberian coffee tree (<i>C. liberica</i>) is cultivated to a limited extent. Fr., <i>Café</i>; Ger., <i>Kaffee</i>; Sp., <i>Café</i>.</p>	<p>Cacao beans are classified commercially according to the place of origin as San Thomé, Bahia, Esmeralda, Guayaquil, Mexican, etc., and according to the method of drying (as fermented (rotted) or unfermented).</p> <p>Cocoa and chocolate in its many forms, bitter, sweet, milk, candy, etc., are increasingly used for food and drink. They are in some respects superior to both tea and coffee in supplying nutrient (oil, starch and albumen) in addition to the same stimulant principle.</p> <p>Cocoa butter is added to some of the finest candies and enters into the manufacture of cosmetics, pomades and soaps.</p> <p>Cocoa shells are of scarcely any importance.</p>	<p>Coffee is cultivated in many parts of the tropics. Brazil is by far the greatest producer, the coffee district being mainly in the states of São Paulo, Rio de Janeiro, Minas Geraes and Espírito Santo. Much coffee is grown in the mountains of northwestern South America, Central America and the West Indies. Coffee is grown in Java and other parts of the East Indies, as well as in smaller quantities in Arabia, Africa and Australia.</p>	<p>Two beans are usually contained in each red coffee berry. The berries are sometimes dried in the sun and then cleaned by machinery to separate the beans from the several coats which cover them. In the wet method the berries are first crushed and washed to free them from the pulp, after which the beans are dried in the sun and cleaned by machinery. The United States uses and people in some parts of the world prefer a much darker roast than others. Coffee is but little adulterated at the present time, but there are various substitutes on the market, such as malted barley, roasted malted barley, etc.</p> <p>The United States uses more coffee than any other part of the world both in total amount and per capita.</p>
<p><b>Cacao Beans</b> are the seeds of a rather small tree (<i>Theobroma cacao</i>). Fr., <i>Cacao</i>; Ger., <i>Cacao</i>; Sp., <i>Cacao</i>.</p> <p>(This species is absolutely distinct from the cocoanut palm and from coca, the leaves of which yield cocaine.)</p>	<p>Cocoa and chocolate in its many forms, bitter, sweet, milk, candy, etc., are increasingly used for food and drink. They are in some respects superior to both tea and coffee in supplying nutrient (oil, starch and albumen) in addition to the same stimulant principle.</p> <p>Cocoa butter is added to some of the finest candies and enters into the manufacture of cosmetics, pomades and soaps.</p> <p>Cocoa shells are of scarcely any importance.</p>	<p>Cacao trees are grown in warm moist climates, usually in the shade of larger trees. Brazil, Ecuador and the island of São Thomé in the gulf of Guinea, Venezuela, Trinidad, Mexico, Central America, Ceylon and the East Indies produce cacao. The beans grow in pods six to ten inches long, each of which contains, perhaps, fifty seeds. These, after removal from the rind, are dried, generally in the sun, on especially prepared floors. It is customary to allow them to ferment slightly before drying, to develop the flavor.</p>	<p>Chocolate is made by grinding cacao beans which have first been cleaned, roasted, crushed and separated from the thin skin or shell which covers each. Sugar, vanilla or other ingredients are added to make sweet chocolate, etc.</p> <p>Cocoa or cocoa powder is made by pressing the ground-up beans in a powerful machine to remove some of the oil, and then pulverizing the remainder. Because it contains less fat than chocolate some people find it easier of digestion.</p> <p>Cocoa butter is the solid oil or fat removed in making cocoa.</p>
<p><b>Yerba Mate</b> or (Paraguay tea), the dried leaves of a tree (<i>Ilex paraguayensis</i>). Fr., <i>Maté</i>; Ger., <i>Maté</i>; Sp., <i>Maté</i>.</p>	<p>These leaves contain caffeine and are used like tea.</p>	<p>The tree grows wild in Paraguay and adjoining regions of Argentina and Brazil. The leaves are not selected but entire branches are taken,</p>	<p>Great factories in the United States, Holland, France, Switzerland, England and Germany use the bulk of the crop of cacao beans. The United States imports beans from the producing countries and prepared chocolate and cocoa from Europe.</p>
<p><b>Mustard</b> is the seed of plants of the genera <i>Brassica</i> and <i>Sinapis</i>. Fr., <i>Moutarde</i>; Ger., <i>Senf</i>; Sp., <i>Mostazo</i>.</p>	<p>Yellow and black mustard are the important kinds, although some seeds are brown, red or white in color.</p> <p>Mustard is used in condiments and medicinally.</p> <p>Oil pressed from mustard seeds is used in some countries for burning and soap-making.</p>	<p>Widely cultivated in Europe, as well as in the United States, Asia and the East Indies.</p>	<p>After drying, the leaves and twigs are broken up and packed for sale. Maté is a common beverage in many parts of South America. Attempts, not very successful, have been made to popularize it in Europe and America.</p>
<p><b>Pepper</b> is the fruit of a vine (<i>Piper nigrum</i>). Fr., <i>Poivre</i>; Ger., <i>Pfeffer</i>; Sp., <i>Pimienta</i>.</p>	<p>Black pepper consists of the dry, unripe berries, while white pepper is the ripe fruits with the outer skin removed.</p>	<p>Grown chiefly in the neighborhood of Singapore and on the Malabar coast of India.</p>	<p>Used in larger amount than any other spice.</p> <p>Black mustard, or a mixture of black and yellow mustard, produces on mixing with water a very pungent essential oil. To this is due the sharp smell and taste of mustard and its action on the skin (in mustard plasters, etc.).</p> <p>The flour made by grinding the seeds of black and yellow mustard enters into a great many condiments.</p>
			<p>Whole peppers, i. e., the entire berries, are pulverized to make ground pepper. Much of the white and pink grades of pepper the United States consists of whole black and white pepper.</p>

## FOODSTUFFS—Continued

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Red Pepper</b> (Cayenne pepper or chillies) is the fruit of a small plant ( <i>Capiscum species</i> ). Fr., <i>Poudre de Cayenne</i> ; Ger., <i>Spanische Pfeffer</i> ; Sp., <i>Pimiento</i> .	Enters into the composition of many condiments, and unripe appears as green peppers. There are large and small varieties.	Grown in almost all parts of the world and used in large amounts by people in warm climates, in Mediterranean countries, India, Africa, Mexico and West Indies.	In addition to the local production, the United States imports red peppers from Africa and Japan.
<b>Allspice</b> (or Pimento) is the dried unripe fruit of a tree ( <i>Pimenta officinalis</i> ). Fr., <i>Piment</i> ; Ger., <i>Jamaikapfeffer</i> ; Sp., <i>Pimiento</i> .	A common spice, sometimes called <i>Jamaica pepper</i> .	Grown and produced almost exclusively in Jamaica.	The berries are simply dried in the sun and are commonly used whole. Popular because of its cheapness.
<b>Cloves</b> are the dried flower buds of a tree ( <i>Jambosa caryophyllus</i> ). Fr., <i>Girofle</i> ; Ger., <i>Gewürznelke</i> ; Sp., <i>Clavos de Girofla</i> .	A spice used in food, confectionery and liquors. <i>Clove oil</i> is employed also in medicine and dentistry and is the basis for the manufacture of artificial vanilla.	Cultivated in the Molucca Islands, East and West Indies, Zanzibar and Pemba.	The manufacture of vanilla, or artificial vanilla, from oil of cloves is important. The United States is the largest consumer of cloves.
<b>Nutmegs</b> are the kernels of the fruits of a small tree ( <i>Myristica fragrans</i> ). Fr., <i>Muscade</i> ; Ger., <i>Muskatnuss</i> ; Sp., <i>Moscada</i> .	The fruit looks like a small pear and the kernel is covered by a thin shell, outside of which is a red seed coat, which when dry is mace, another spice.	Nutmegs and mace are produced chiefly in Banda Islands, East Indies.	The selling price has fallen within recent years so that West Indian plantations are no longer profitable.
<b>Vanilla</b> is the prepared, unripe seed pod of an orchid ( <i>Vanilla planifolia</i> ). Fr., <i>Vanille</i> ; Ger., <i>Vanille</i> ; Sp., <i>Vainilla</i> .	The pods, or beans, are used in flavoring. <i>Vanilla extract</i> is made from the beans and is imitated with tonka beans (from a South American tree) and artificial vanilla (from coal tar or oil of cloves).	Vanilla beans are produced in greatest amount and best quality in the state of Vera Cruz, Mexico. Réunion, Tahiti and Mauritius supply inferior grades. The tree requires a very moist climate.	Aside from the use in food, candy, chocolate, ice cream, etc., the cheaper grades of vanilla are employed extensively in flavoring chewing tobacco.
<b>Ginger</b> is the dried root-stalk of a plant ( <i>Zingiber officinale</i> ). Fr., <i>Gingembre</i> ; Ger., <i>Ingwer</i> ; Sp., <i>Gengibre</i> .	<i>Coated ginger</i> is dried with the skin on, while <i>peeled ginger</i> is scraped and washed. <i>Crushed</i> and <i>preserved ginger</i> , powdered ginger and ginger ale are commonly sold.	Grown in tropical countries, particularly in Bengal, Cochín China, China, Africa and Jamaica. African is usually coated ginger and Jamaica is the best quality of peeled ginger.	Ginger is next to pepper among spices in the amount imported yearly into the United States, and ginger is also reported in large amount from Canton, China.
<b>Turmeric</b> consists of the dried stems of a plant of the ginger family ( <i>Curcuma longa</i> ). Fr., <i>Curcuma</i> ; Ger., <i>Galbännel</i> ; Sp., <i>Curcuma</i> .	Curry, a much used condiment, is compounded with turmeric powder.	Grown in southeastern Asia and neighboring islands.	Used industrially in making yellow dye for cotton goods, in preparing fancy leather and in chemical work.
<b>Cinnamon</b> is the dried bark from young twigs of a small tree ( <i>Cinnamomum zeylanicum</i> ). Fr., <i>Cannelle</i> ; Ger., <i>Zimmt</i> ; Sp., <i>Canela</i> .	The best is in quills, or long rods, composed of pieces of bark rolled together. Cheaper cinnamon or cassia is inferior. Used as a spice, usually in powdered form. Cinnamon oil is distilled from the bark as well as from leaves and twigs.	The best quality is from Ceylon. Cassia is from China, India and Indo-China.	Cassia is cheaper and much more common than true cinnamon.
<b>Caraway</b> , anise, sesame, cardamoms, coriander, and pistachio are less important spices.	<i>Sarsaparilla</i> , fruit juices, <i>aloes</i> , <i>sassafras</i> and many <i>essential oils</i> are used in flavoring.	Most spices are natives of Asia and the East Indies and are cultivated in the tropics and subtropics.	Many flavoring materials and extracts are made artificially in the chemical laboratory.
<b>Olives</b> are the fruit of a tree ( <i>Olea europea</i> ). Fr., <i>Olive</i> ; Ger., <i>Olive</i> ; Sp., <i>Olivo</i> .	Pickled olives are usually the unripe fruits prepared and bottled in salt water. <i>Olive oil</i> (sweet oil) is the most popular oil for table purposes. Oils from cotton seeds, peanuts, sesame seeds and other sources are used like olive oil.	The tree, which lives to a great age, grows in Mediterranean countries, California and Australia. Only limited districts produce olives fit for bottling. Most olives are grown for the production of oil.	Olives for pickling are soaked in lye to remove bitterness and often spices are added to the pickle to give an aromatic flavor. Olive oil is pressed from the ripe fruit. The poorer grades of oil are used in lubricating and for soap-making.

## NARCOTICS AND MEDICINES

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Tobacco</b> is the prepared leaf of a plant ( <i>Nicotiana tabacum</i> , <i>N. rustica</i> , etc.). Fr., <i>Tabac</i> ; Ger., <i>Tabak</i> ; Sp., <i>Tabaco</i> .	Commercial grades are named from the locality of production as Havana, Sumatra, Mexican, Turkish, Virginia, etc. Certain grades are appropriate for use as cigar wrappers and others for fillers and are so named in the trade. <i>Cigars</i> , <i>cigarettes</i> , <i>chewing tobacco</i> , <i>smoking tobacco</i> and <i>snuff</i> are extensively used. The stems and ribs of the leaves are employed in <i>sheep-dip</i> and for fumigating greenhouses.	More tobacco is raised in the United States than in any other country and Kentucky raises more than any other state. India is the second largest producer. In Europe it is cultivated in Austria-Hungary, Russia, Germany, Netherlands, France, Belgium and Turkey. Cuba, Porto Rico, Mexico, Central and South America, China, Java, Sumatra, Philippines, Ceylon, Syria and Cape Colony are important producers. Seeds of Havana tobacco plants raised in Connecticut or elsewhere produce a grade of Havana tobacco. The many grades of tobacco are due to the varieties of the plant, as well as to soil, climate and cultivation. The curing of the leaf is of the utmost importance. It includes a period of slight fermentation and drying in well ventilated barns.	Cigars are nearly all made by hand, but many cigarettes are manufactured by machinery. Nearly all plug tobacco is flavored with molasses, vanilla, licorice or other substances. The United States exports over half of the tobacco raised, chiefly to England in the form of leaf tobacco. Few cigars are exported, but cigarettes and plug tobacco go to the East Indies, China and Australia. Leaf tobacco is imported in large amount from Cuba, Sumatra, and Turkey and manufactured cigars are brought from Cuba. Large revenues are raised in many countries from the taxation of tobacco, and in Austria, France, Spain, Italy and Japan the tobacco business is a government monopoly.
<b>Hops</b> are the dried fruits of the hop vine ( <i>Humulus lupulus</i> ). Fr., <i>Houblon</i> ; Ger., <i>Hoffen</i> ; Sp., <i>Lupulo</i> , <i>hoblon</i> .	Hops are employed chiefly in brewing beer and malt liquors.	They are cultivated in almost all parts of Europe, especially in England, Germany and Austria. In the United States, California, Oregon, Washington, New York and Wisconsin produce the largest crops.	Hops are added to the malt, liquor, or wort, before fermentation and give a bitter flavor to malt liquors. Hops are not exported on a large enough scale to be an important item in commerce.

## NARCOTICS AND MEDICINES—Continued

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Opium</b> is the dried juice of the white poppy ( <i>Papaver somniferum</i> ). Fr., <i>Opium</i> ; Ger., <i>Opium</i> ; Sp., <i>Opio</i> .	Opium is valuable as a narcotic because of the morphine and other alkaloids it contains. <i>Laudanum</i> is a tincture of opium and alcohol. <i>Paregonic</i> is a common preparation in which opium is an ingredient.	Opium culture is an important industry in northern India, China, Persia, Asiatic Turkey and Egypt. In China the government strongly discourages opium smoking and has greatly restricted the cultivation of the poppy. The juice is obtained by severing the seed capsule and collecting the little drops which exude on it. The juice is then further dried in the sun.	Opium for smoking is exported to China from India. It is used in the form of pills in Mohammedan countries like Persia and Turkey. The United States imports opium for medicinal purposes chiefly from Turkey in Asia.
<b>Quinine</b> is the bark of a tree ( <i>Cinchona</i> sp.). Fr., <i>Quinquina</i> ; Ger., <i>Chinarinde</i> ; Sp., <i>Quina</i> .	A drug of great importance, much used in the form of sulphate of quinine or other salts.	Originally native in the Andes and hence called Peruvian bark. The world's supply now comes from plantations in Java, Produced also in South America, Ceylon and India.	The principal market is Batavia, Java, from whence it is largely shipped to Holland.
<b>Coca</b> is the leaf of a small tree or bush ( <i>Erythroxylon coca</i> ). Fr., <i>Coca</i> ; Ger., <i>Cocablatter</i> ; Sp., <i>Coca</i> .	Cocaine, an alkaloid which produces local anesthesia, is the important constituent.	Cultivated chiefly in steep valleys in the Andes of Peru and Bolivia, in smaller quantities in India, Ceylon and Java.	The Indians of the Andes chew the leaves on account of the stimulating effect, and the bulk of the crop is so used. The residuum is exported to manufacturers of medicinal preparations in Europe and America.
<b>Medicinal Plants</b> and drugs are numbered by the hundred. Among the most important are:	These are used in the form of extracts, tinctures and other pharmaceutical preparations.	Many grow wild, but the tendency of modern medicine is to use material from carefully selected plants cultivated for the purpose.	The preparation of medicines is carried on by a great number of firms in practically all parts of the world. The trade in drugs, however, is of less relative importance now than it was in the middle ages, when rhubarb, for example, occupied a prominent place in the list of commodities.
<b>Rhubarb</b> , a genus of plants belonging to the natural order <i>Polygonaceae</i> . Fr., <i>Rhubarbe</i> ; Ger., <i>Rhabarber</i> ; Sp., <i>Rubarbo</i> .	Its root has long been recognized as of medicinal value owing to its astringent properties. The principal finds of medicinal rhubarb have received such names as Russian or Turkey, East Indian, Himalayan, Chinese, and English, according to their source.	The best comes from China, though it is called Turkey rhubarb in Europe and America, generally there are several kinds of rhubarb cultivated for the sake of their stalks.	Rhubarb possesses more or less purgative and astringent properties; this is essentially the case with the roots, and hence these are largely used in medicine. The leaf-stalks of certain species are now largely used for tarts, puddings, jam, etc., and the juice is made into a kind of wine.
<b>Sarsaparilla</b> , the dried roots of several plants of the genus <i>Smilax</i> . Fr., <i>Salsepareille</i> ; Ger., <i>Sarsaparilla</i> ; Sp., <i>Sarsaparilla</i> .	<i>Smilax</i> medicis supplies the sarsa of Vera Cruz. <i>S. aspidiotis</i> , or <i>S. purpurea</i> , yields the Lisbon or Brazilian sarsa. <i>S. aspidiotis</i> belongs to the kind known as Jamaica sarsaparilla. <i>Desmodium illinoense</i> yields the East Indian sort.	There are two special varieties obtained from Jamaica and Lima respectively. The roots are very long, of the thickness of a quill, dark brown in color and bitter in taste.	Sarsaparilla is valued in medicine on account of its mucilaginous and demulcent qualities. Various decoctions made from the roots are medicinally used as tonics and diuretics, and derive their properties from the presence of starch, resin, a volatile oil, and the crystalline principle <i>smilagine</i> .
<b>Aconite</b> is a hardy herbaceous plant, natural order <i>Ranunculaceae</i> , represented by the well-known wolfsbane or monkshood. Fr., <i>Aconit</i> ; Ger., <i>Aconitwurz</i> ; Sp., <i>Aconito</i> .	An alkaloid contained in the leaves of monkshood. It is one of the most powerful poisons known.	The plants are natives of Europe, Asia, and North America, but the woody aconite, or monkshood, is probably a native of Great Britain.	They are remarkable for their poisonous properties and medicinal qualities, being used internally as well as externally in rheumatism, gout, neuralgia, etc. In certain forms, a tincture of the root is used medicinally in cases of heart disease.
<b>Ipecacuanha</b> , the dried root of several plants of the natural order <i>Rubiaceae</i> . Fr., <i>Ipecacuanha</i> ; Ger., <i>Ipecacuanha</i> ; Sp., <i>Ipecacuanha</i> .	The best is the annulated, yielded by the <i>Cephaelis ipecacuanha</i> .	It is a native of Brazil, and the dried root is exported from the Rio Janeiro, Buenos Ayres, and other South American ports. Recently the cultivation of the plant has been introduced into India and Ceylon. The name of <i>Americus ipecacuanha</i> is given to the <i>Euphorbia ipecacuanha</i> , a plant which grows in sandy places in North America.	It is simply the root that is valuable, and in its bark exists the active principle emetine, which renders ipecacuanha of service in medicine. The color of the root is generally brown or red. The cases in which ipecacuanha is used are mainly dysentery, asthma, and coughs.
<b>Belladonna</b> , a plant, <i>Atropa belladonna</i> , or deadly nightshade, natural order <i>Solanaceae</i> . Fr., <i>Belladone</i> ; Ger., <i>Belladonna</i> ; Sp., <i>Belladonna</i> . All parts of the plant are poisonous, and the insensating effect of the berries has often produced death.	The insipidated juice is commonly known by the name of extract of belladonna.	A plant which has narcotic and poisonous berries, a native of Europe.	The extract of the plant is used medicinally for soothing irritation and pain, and by oculists for the purpose of dilating the pupil during an examination of the eye, and diminishing the sensibility of the retina to light. The activity of belladonna is owing to the presence of the alkaloid atropine.
<b>Nux Vomica</b> , the fruit of a species of <i>Strichnos</i> , order <i>Loganiaceae</i> . Fr., <i>Nux vomique</i> ; Ger., <i>Brechnuss</i> ; Sp., <i>Nuez vomica</i> .	The taste of the berries is exceedingly bitter, and from them the two alkaloids strychnine and brucine are obtained.	The plant is chiefly found in Cochinchina and the East Indies. The fruit of the tree is a large berry, much like a small orange, and in it the seeds are laid flat.	The seeds are mainly exported from India, and their only value is for the extraction of the alkaloids, which are used in medicine. The alkaloids are known as a very virulent poison.
<b>Castor</b> , the name of the plant <i>Ricinus communis</i> , and also of the oil extracted from the seeds of the plant. Fr., <i>Huile de ricin</i> ; Ger., <i>Rizinöl</i> ; Sp., <i>Acetie de ricino</i> .	The beans and the oil made therefrom.	It is a native of India, but its cultivation is now very widespread. The seeds are oval in shape, and mottled brown in color.	The oil is obtained from the seeds by bruising and pressing. It is afterward heated to the boiling point, which coagulates and separates the albumen and impurities. Castor-oil is used medicinally as a mild but efficient purgative. It is chiefly imported from India.
<b>Areca</b> , a genus of lofty palms with pinnated leaves, and a drupe-like fruit enclosed in a fibrous rind. Fr., <i>Arec</i> ; Ger., <i>Arec</i> ; Sp., <i>Arec</i> .	It produces nuts and fibers.	The tree grows in various parts of the East Indies, and is cultivated on account of its nuts. There are two species of areca and each of them is remarkable for the purposes to which its fruit is applied. One is the <i>Arec catechu</i> , also known as the betel-nut palm, which is one of the most beautiful trees of the East Indies.	With lime and the leaves of the betel pepper, the areca-nuts when green form the celebrated masticatory of the East. They are an important article in eastern trade. The nuts are also imported into Europe and America for the manufacture of tooth powder.

## NARCOTICS AND MEDICINES—Continued

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Aloe</b> , a plant of which there are nearly two hundred species. Fr., <i>Aloë</i> ; Ger., <i>Aloe</i> ; Sp., <i>Aloe</i> .	From the juice of the leaves of many species a drug is obtained, known as aloe, which is of much value in medicine. <i>Aloe ferox</i> is obtained from species of <i>aloe</i> , <i>agave</i> , <i>yucca</i> , etc., and is made into coarse fibres, ropes, etc.	The principal drug-producing species are the Socotrine aloe, the Barbados aloe, the Cape aloe, etc. A beautiful violet color is afforded by the leaves of the Socotrine aloe. The American aloe is a different plant altogether, as are also the aloes or lign-aloes of scripture, which are supposed to be the <i>Aquilaria</i> <i>agallocha</i> or aloë wood.	Some of the larger kinds are of great use, the fibrous parts of the leaves being made into cordage, fishing nets and lines, cloth, etc. The inspissated juice of several species is used in medicine, under the name of aloe, forming a bitter purgative. Formerly the chief source of the drug was Socotry, but it is now imported from various parts of the world.
<b>Kola</b> , the seeds or fruit of the <i>Sterculia acuminata</i> . The nuts are also known as gura nuts. Fr., <i>Noix de kola</i> ; Ger., <i>Kolanüsse</i> ; Sp., <i>Nueces de kola</i> .	Nuts and alkaloids.	The tree grows extensively in tropical Africa.	Medicinally the nuts are employed in case of diarrhoea and affections of the liver. Large supplies are shipped from the Gambia to France and Germany, where they are used to adulterate cocoa and chocolate.
<b>Angostura Bark</b> , the aromatic bitter medicinal bark obtained chiefly from <i>Galipea officinalis</i> . Also called euparia bark. Fr., <i>Ecorce d'Angostura de Columbie</i> ; Ger., <i>Angosturabinde</i> ; Sp., <i>Cortés de Angostura</i> .	Chiefly valuable for its bark.	The tree is 10 to 20 feet high, and grows in the tropical regions of South America.	The bark is valuable as a tonic and febrifuge and is also used for a kind of bitters. From this bark being adulterated by the poisonous bark of <i>Strychnos</i> <i>Nux Vomica</i> , its use as a medicine has been almost given up. It is an article of considerable commerce in Venezuela.

## FIBERS

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Manila Hemp</b> is a fiber obtained from the leaf stalk of a tree ( <i>Musa textilis</i> ) of the banana family. Fr., <i>Chanvre de Manille</i> , <i>Abacé</i> ; Ger., <i>Manilla hanf</i> ; Sp., <i>Abacé</i> .	The strongest rope fiber in common use, especially desirable for marine cordage. The finest fibers are used by natives in the Philippines for weaving a strong cloth.	Produced commercially only in the Philippine islands. Practically all of this fiber is cleaned by hand.	The most important export from the Philippines. The bulk of the production is sent to the United States and England.
<b>Sisal</b> (henequen or sisal hemp) is a hard, strong fiber from the leaves of a century plant ( <i>Agave rigida</i> ). Fr., <i>Sisal</i> , <i>Chanera d'Amérique</i> ; Ger., <i>Stad hanf</i> ; Sp., <i>Henequen</i> , <i>Maquay</i> . Many similar fibers are obtained from the leaves of other species of <i>agave</i> plants.	Sisal is very important for making rope and twine. All of these fibers are used locally for making mats, bags, ropes, harness, hammocks, etc., and several of them are employed in the United States and Europe for making sackings and brushes. <i>Mescal</i> and <i>pulque</i> are alcoholic drinks made in Mexico from the sap of <i>agave</i> plants.	Sisal is cultivated in Yucatan and the Bahamas. Plantations of henequen, or <i>maquay</i> , have been established in Cuba, Hawaii, India, German and British East Africa and the Philippines. The home of the <i>agave</i> plants in Mexico and Central America and this part of the world produces most of these fibers.	On modern plantations machines have superseded the primitive hand methods of cleaning the fiber. Sisal is the chief product of Yucatan and its greatest export. The bulk of the production is used in the United States in making rope, twine and sackings. All of the other <i>agave</i> fibers are of less commercial importance than sisal or henequen.
<b>New Zealand Flax</b> (or New Zealand hemp) is a fiber from the leaves of a plant ( <i>Phormium tenax</i> ) of the lily family. Fr., <i>Chanvre de la Nouvelle Zélande</i> ; Ger., <i>Neuseelandhanf</i> ; Sp., <i>Cañamo de la Nueva Zelanda</i> . Fibers more or less similar to the foregoing are obtained from the leaves of other plants.	Used in rope making.	A wild plant in New Zealand. Prepared by scraping away the pulpy part of the leaf.	An important cordage fiber. The fiber exported is all graded by New Zealand government inspectors, who certify to its quality.
<b>Flax</b> is the bast fiber of an annual herb ( <i>Linum catharticum</i> ). Fr., <i>Lin</i> ; Ger., <i>Flachs</i> , <i>Lein</i> ; Sp., <i>Lino</i> .	Flax or linen fiber and flaxseed oil are the chief products of the plant. <i>Tow</i> is a by-product in making linen and flax yarns and fabrics. <i>Lanseed oil</i> is used in paints, varnishes, printer's ink, oleic acid and linoleum. <i>Lanseed oil-cake</i> is a valuable cattle food. <i>Flax seeds</i> find limited use in medicine.	The plants grow wild in the warmer parts of both the old and the new worlds. Some are cultivated, but on a smaller scale than with sisal.	While these fibers are used to some extent in the mills of Europe and America, they are of relatively small importance.
		Flax is grown for fiber in Russia, Belgium, Italy, France, Holland, Ireland and Egypt. Little flax fiber is produced in the United States. Plants for fiber production are straight stemmed, while the varieties grown for seed have many branches. Flax seeds are produced in Russia, India, Argentina and the United States. Plants harvested for fiber are pulled up by the root in order to obtain the greatest possible length. The fiber is separated from the stalk of the plant by retting, a process of partial decay, breaking and scutching to remove the woody parts and hackling or combing. In the best grades of flax most of this work is done by hand.	Flax yarns are used in making rope, twine, lagging and coarse unbleached fabrics. Linen yarns are made into products of the better grade, including fine linens, cambrics, laces, etc. Linen is bleached by exposure to the sun and by treatment with a dilute solution of chloride of lime. Linen rags are the stock for the best qualities of paper. The United States imports flax fiber mainly from Europe, as well as large quantities of linens, laces, etc. Some flax seeds are imported and large amounts of flaxseed oil-cake are sent to Europe.

## FIBERS—Continued

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<p><b>Hemp</b> is the bast fiber from a tall plant (<i>Cannabis sativa</i>) of the nettle family. Fr., <i>Chanvre</i>; Ger., <i>Hanf</i>; Sp., <i>Canamo</i>.</p> <p>Other hemp's of different botanical origin and having quite different qualities are called by such names as manila hemp, sisal hemp, tampico hemp, Mauritius hemp, sunn hemp, bowstring hemp, etc. Strictly speaking, none of these is true hemp.</p> <p><b>Jute</b> is the bast from a tall plant (<i>Corchorus</i> sp.). Fr., <i>Jute</i>, <i>Chanvre de l'Inde</i>; Ger., <i>Jute</i>, <i>Jutehanf</i>; Sp., <i>Cañamo de las Indias</i>.</p>	<p>As with other cordage fibers of this character, the long, combed fibers are called line and the short strands, tow. The commercial fiber is longer, coarser and less strong than flax. It cannot be bleached perfectly white, although used in so-called white line. Russian, Italian and Kentucky, as applied to hemp, denote the country of origin. Italian hemp is the finest, Kentucky the strongest.</p> <p>Hemp oil is pressed from the seeds. The dried leaves (<i>slang</i>) are smoked or made into a drink in India and used, as is an extract (<i>hachek</i>), as an intoxicant.</p> <p>The commercial fibers are long, but softer and weaker than hemp. It does not bleach well and is less durable than hemp, especially when exposed to dampness. Extensively employed in cordage, burlap, bagging, carpets, etc.</p> <p>Jute burl, or rjections, are so important paper stock.</p>	<p>Cultivated in Russia, the warm countries of Asia, the shores of the Mediterranean, Kentucky, Missouri, Illinois and California. The fiber is extracted by retting, cleaning and combing, but more of the work is done by machinery than in the case of flax.</p> <p>Grown in large quantities in the Ganges valley, India, and in lesser amount through other parts of southeastern Asia.</p> <p>The stalks are retted and treated like flax and hemp.</p>	<p>Russia produces more hemp fiber than all the rest of the world. Russia and Italy are the largest exporters. The United Kingdom uses a very large amount of the fiber in making binder twine and bagging. Hemp is considerably used in carpet manufacture.</p> <p>The use of jute for making bagging and burlap has had the effect of lessening the demand for hemp.</p> <p>Hemp oil is used in paints, varnishes and soap. The oil-cake is a cattle food.</p> <p>Jute does not easily spin into fine threads. Its chief use is in making burlap and gunny sacks, although it is used in twine, rope, carpets, curtains, upholstery fabrics such as plushes, etc.</p> <p>Calcutta is the great shipping port for jute fiber and Dundee, Scotland, the most important place for its manufacture. There are large jute mills making burlap, etc., in India, the United States and other countries. Paper is made in this country use a large amount of jute burl for making wrapping papers.</p> <p>Used largely in China for weaving grass cloth, or Canton linen. The fiber is very difficult to dye. Many experiments are being made to find a satisfactory process. Now used in making fabrics of high quality for use in underwear, plushes, etc. Will be used more largely as its manufacture is improved.</p> <p>These fibers are not used on a large scale. Cuba bast is known to India and used for tying bundles of cigars.</p>
<p><b>Ramie</b> is the bast fiber from a plant (<i>Boehmeria nivea</i>) of the nettle family. Fr., Ger. and Sp., <i>Ramie</i>.</p>	<p>Commonly called China grass, or rhea, although fibers from other plants sometimes receive these names. Usually strong and silky in appearance, but difficult to clean and bleach.</p>	<p>Cultivated chiefly in China. Produced in Indo-China, India and on a small scale in Mediterranean countries. Will probably be cultivated widely when cheap processes can be employed for the preparation of clean fiber.</p>	<p>Used largely in China for weaving grass cloth, or Canton linen. The fiber is very difficult to dye. Many experiments are being made to find a satisfactory process. Now used in making fabrics of high quality for use in underwear, plushes, etc. Will be used more largely as its manufacture is improved.</p>
<p><b>Bast Fibers</b> from other plants are of some importance; among these are sunn hemp, India bast, Cuba bast and lace bark.</p>	<p>Sunn hemp is similar to jute in its qualities and uses. Linseed bast or Russian bast is made into mats, ropes, etc.</p>		
<p><b>Cocoanut Palm.</b>—This tree (<i>Cocos nucifera</i>) yields a great variety of useful products. Fr., <i>Cocotier</i>; Ger., <i>Cocospalme</i>; Sp., <i>Coco</i>.</p>	<p><i>Cocoanut fiber</i> (coir, or cocoa fiber) is obtained from the outer husk of the seed. The shells are made into cups. The milk is a nourishing drink. The kernel or meat of the nut is used for food as shredded or desiccated cocoanut. Dried cocoanut meat (<i>copra</i>) is pressed to make cocoanut oil for soap and candles making and cooking. The oil-cake is a valuable cattle food. Cocoanut wood (<i>porcupine</i>) from the trunk of the tree is out of great importance.</p> <p><i>Palm sugar</i> is made from the juice collected from the flower spathe or the juice is fermented to make alcoholic drinks (<i>toddy</i>, <i>tuba</i>, <i>arrack</i>).</p>	<p>The cocoanut (or coco-nut) palm grows in coast regions throughout the tropics. It is commonly cultivated, but frequently its products are of only local use. Plantations in nearly all parts of the world supply some articles for export.</p>	<p>Cocoanut fiber is made into matting, ropes and brushes, and the poorer grades are used in upholstery. Coir fiber comes chiefly from Ceylon and India. Much is imported into the United States in the form of yarn.</p> <p>Cocoanut oil and copra are among the chief exports of Ceylon. Copra is obtained also from islands in the Pacific and Indian oceans and in smaller quantities from other parts of the tropics. Cocoanut oil is manufactured and used on a larger scale in Europe than in the United States. Fresh cocoanuts come to this country largely from the West Indies and northern South America.</p>
<p><b>Cotton</b> consists of the seed hairs of a plant (<i>Gossypium</i> sp.). Fr., <i>Coton</i>; Ger., <i>Baumwolle</i>; Sp., <i>Algodon</i>.</p>	<p>The chief commercial types of cotton are American upland, sea island, Egyptian, Indian, Brazilian and Australian. They differ in the length of the individual fibers (staple). The quality is indicated by the grading under such names as fine, good, good fair, fully fair, middling fair, good middling, middling, etc.</p> <p>Cotton fiber is spun into yarn and made into thread, muslin, calico and hundreds of other cotton or part cotton fabrics. Mercerized yarn is prepared by treatment with strong caustic alkali. Cotton fibers are used in cheap yarns, cotton batting, mattresses, and the manufacture of celluloid and artificial silk. Cottonseed oil is used for table purposes, for packing sardines, for cooking, making soap, candles, etc.</p>	<p>Cotton is next to corn the most valuable farm crop of the United States. Nearly three-fourths of all the cotton produced annually in the world is grown in the south Atlantic and gulf states. The remainder comes mostly from India, Egypt, China, Brazil, and Asiatic Russia. A comparatively small percentage of the crop is sea island cotton from the coast of Georgia and from islands in the West Indies. The area of cotton production is spreading in the United States as well as in foreign countries.</p> <p>The cotton fiber, attached to the seeds, is picked by hand from the plants in the field. The seeds and fiber (or lint) are separated by machines (cotton gins) and the cotton is pressed into bales. Cotton seeds are subjected to heavy pressure in machines in order to extract the oil. The oil-cake is a valuable cattle food and the hulls are used for fuel or for paper making.</p>	<p>The greatest centers of cotton manufacture are in England, New England, the Carolinas and Georgia. Germany, Russia, India and Japan are among the important manufacturing nations.</p> <p>Modern cotton mills are of immense size. The bales are opened, the cotton cleaned, carded, and twisted into slivers, rovings, and finally into yarn. Raw cotton, cotton yarn and cotton fabrics are all important to trade. About half the crop of the United States is exported in bales to be manufactured in the mills of other countries. Sea island cotton has no longer staple and is used for the finest qualities of yarn and fabrics. Egyptian cotton also has a long staple. Large quantities are imported into the United States.</p> <p>England has an enormous foreign trade in cotton fabrics. The United States exports chiefly unbleached muslin, more of which goes to China than to any other country.</p> <p>These fibers can not be spun satisfactorily in the United States, only for upholstery. The chief European market is in Holland.</p>
<p><b>Silk Cotton</b> consists of the seed hairs of various trees and plants. Kapok is from a large tree (<i>Cordia alliodora</i>). Fr., <i>Kapok</i>, <i>Sole vegetable</i>; Ger., <i>Kapok</i>, <i>Wolle der Weltbaum</i>; Sp., <i>Kapok</i>, <i>Algodon de seda</i>.</p>	<p>Kapok or <i>ceiba</i> is the commonest vegetable silk in commercial use. Similar fibers from other sources are called <i>balsa</i>, <i>poche</i> and other names.</p>	<p>Kapok comes chiefly from Java, although the tree is common in many parts of the tropics. The drop is principally from wild trees.</p>	<p>These fibers can not be spun satisfactorily in the United States, only for upholstery. The chief European market is in Holland.</p>

## FIBERS—Continued

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Raphia</b> is peeled from the large leaflets of a palm tree ( <i>Raphia pedunculata</i> ). Fr., <i>Raffia</i> ; Ger., <i>Raphia-faser</i> ; Sp., <i>Raphia</i> .	Madagascar raphia is the only important grade. A similar soft fiber used locally is produced in West Africa.	From a very common wild tree.	Exported in considerable amounts from Madagascar and used by gardeners for tying plants. Used for making mats and baskets and in kindergartens.
<b>Piassava</b> comes from the sheathing bracts of certain palm trees, in West Africa <i>Raphia vinifera</i> ; in Bahia, Brazil, <i>Attalea funifera</i> ; in Para, Brazil, <i>Leopoldinia piassava</i> . Fr., Ger. and Sp., <i>Piassava</i> .	Stiff coarse fibers known as West African bass, Bahia or Para bass or piassava.	From wild trees.	Used in making brooms and brushes. Piassava is an important export from the producing regions.
<b>Kitfool</b> ( <i>Corypha urens</i> ) and <b>Palmyra</b> fiber or <b>bassine</b> ( <i>Borassus flabellifer</i> ) are from the leaf sheaths of other palms.	These and several other palm fibers of lesser importance are finer and less stiff than piassava.	Produced in Ceylon and India.	Fairly important for brush making, having some resemblance to bristles.
<b>Palmetto</b> fiber is from the leaf stalks and creeping stems of a palm ( <i>Serenoa serrulata</i> ).	The fiber and an extract used in tanning are both obtained from this palm.	Grows in Georgia, Florida, Alabama and Mississippi.	Manufactured in limited amount. Used for upholstery and in paper making.
<b>Crin Vegetal</b> is the shredded leaves of a palm ( <i>Chamaerops humilis</i> ). <b>Panama Straw</b> ( <i>Carludovica palmata</i> ) and many other fibers are of commercial value.	Crin vegetal and Spanish moss are used in upholstery, needles in brush making, exports for paper stock, and Panama straw for weaving hats.	Crin vegetal grows wild in Algeria. Spanish moss is prepared for use in the Southern states. Exporto comes from North Africa. Zaccatoa roots from Mexico. The best Panama straw is prepared in Ecuador and Peru.	These fibers are fairly important to trade. Panama straw enters into commerce only as Panama hats and is not an article of export in its crude state.
<b>Rattan</b> is the stem of a climbing palm ( <i>Calamus</i> species). Fr., <i>Ratin</i> ; Ger., <i>Indianische Rohr</i> , <i>Rotang</i> ; Sp., <i>Roten</i> , <i>Bejuco</i> .	Rattan cane is used whole or peeled. Split rattan is the bark which is removed from the peeled rattan.	Rattan vines grow wild in tropical forests of southeastern Asia. The thorny leaves and branches are cleaned away from the stems and the outer skin is removed. Then the rattan is cut into lengths, sorted according to thickness and tied in bundles.	Used for a multitude of purposes in the east. In Europe and America for making furniture, baskets, whips, etc. Split rattan is used for chair seats and peeled rattan for brushes and baskets. Exported largely from Singapore and Java.
<b>Bamboo</b> is the stem of the largest plant of the grass family ( <i>Bambusa</i> species). Fr., <i>Bamboo</i> ; Ger., <i>Bambusrohr</i> ; Sp., <i>Bamboo</i> , <i>Bambu</i> , <i>Caña</i> .	One of the most useful plants in the world. Whole stems and split bamboo are both important commercially.	Grows in tropical countries. Most common in southern Asia and the East Indies.	In the east, large bamboo serves for house construction, furniture, utensils, agricultural implements, fishing rods, and hundreds of other purposes. The young shoots are eaten as a fresh vegetable. Split bamboo is woven in baskets, mats, etc., and used in stiff brushes. Imported from the East Indies.

COMMERCIAL WOODS  
SOFT WOODS OR NEEDLE-LEAVED WOODS

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Fine Wood</b> is from various species of coniferous trees ( <i>Pinus strobus</i> , <i>P. palustris</i> , etc.). Fr., <i>Pin</i> ; Ger., <i>Fichte</i> , <i>Tanne</i> ; Sp., <i>Pino</i> .	Soft pines are of several kinds, chiefly white pine, western white pine, sugar pine and red pine. Hard or yellow pines are more numerous and include longleaf, <i>Georgia</i> , hard or southern pine, shortleaf (bald spruce), Cullen, slash, pitch or loblolly pine, western yellow pine and European (northern) pine, called also yellow deal and Scotch fir. Turpentine (spirit of turpentine) and resin (copal) are prepared from the sap of certain species of yellow pine trees. Tar, pitch, charcoal and other products are obtained by distilling yellow pine wood.	Soft pine forests yield lumber in the northern United States and Canada and in the Rocky mountains. White pine was formerly the common timber in the Appalachians, but the supply is almost exhausted. Yellow pine is cut in large amount in the forests from North Carolina to Texas, and other hard pines come from the middle and far west, as well as from Mexico and the West Indies. Scotch fir is one of the most important woods of northern Europe. Turpentine is distilled from the sap of pines in Georgia and adjacent states, Russia, Austria, France and India.	The industries relying mainly on the forest and its products in the United States employ almost a million workers and add perhaps two billion dollars annually to the wealth of the nation. Pine is the most important construction wood in use. Very little of the great area formerly covered with white pine now remains in this country. The yellow pine is being cut rapidly and the price of lumber has practically doubled in the past twenty years.
<b>Spruce</b> ( <i>Picea</i> species). Fr., <i>Sapin</i> , <i>Épinette</i> ; Ger., <i>Fichte</i> ; Sp., <i>Abeto</i> , <i>Picea</i> . <b>Hemlock</b> ( <i>Tsuga</i> species). Fr., <i>Ciguë</i> ; Ger., <i>Schierling</i> ; Sp., <i>Pinabete</i> . <b>Fir</b> ( <i>Abies</i> or <i>Pseudotsuga</i> species). Fr., <i>Sapin</i> ; Ger., <i>Tanne</i> ; Sp., <i>Abeto</i> , are coniferous soft woods of great importance.	These are known by many names and there are several botanical species of each. Black, white, red, tidesland and Norway spruces, Douglas fir and European silver fir ( <i>Sorbus picea</i> ) are most important.	The spruces are common in Canada, northern Europe and on the northern Pacific coast of America and Asia. Hemlock is cut in northern United States, Canada, Japan and Siberia. Fir is found in the same general region as spruce.	The United States exports soft woods, chiefly pine, spruce and hemlock, to Europe, the West Indies, South America, Australia, Hawaii and Africa. Canada exports large quantities of spruce and pine to the United States and England. Russia and Sweden supply great quantities of soft woods to Europe, although the forests of Sweden are being rapidly cut away.
<b>California Redwood</b> comes from a coniferous tree ( <i>Sequoia sempervirens</i> ).	A soft, straight-grained, durable wood. Much used in shingles.	One of the largest trees of the world. Found only on the Pacific coast.	Northern Japan and eastern Siberia contain forest areas rich in soft woods, which are beginning to be developed.
<b>Cedar</b> . Fr., <i>Cedre</i> ; Ger., <i>Zeder</i> ; Sp., <i>Cedro</i> , and <i>Cypresse</i> . Fr., <i>Cypresse</i> ; Sp., <i>Ciprés</i> , are of many species ( <i>Thuja</i> , <i>Chamaecyparis</i> , <i>Juniperus</i> , <i>Taxodium</i> , etc.).	Bald cypress, yellow cypress, Indian cypress, white cedar, juniper, red cedar and dozens of other woods have more or less similarity.	These woods are widely distributed and extensively used, but are not marketed in such large amounts as the pines, spruces and firs.	

**COMMERCIAL WOODS—Continued**  
**HARD WOODS OR BROAD LEAVED WOODS**

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Poplar, Tulp Poplar</b> ( <i>Liriodendron tulipifera</i> ) and <b>Carolina Poplar</b> ( <i>Populus deltoides</i> ) are both large trees. Fr., <i>Peuplier</i> ; Ger., <i>Pappelholz</i> ; Sp., <i>Alamo</i> .	Tulip poplar (white-wood) and Carolina poplar ( <i>luticeum</i> ), although classed in the trade as hard woods, are almost as soft as pine.	Both are from large trees in the eastern and central United States.	Poplars and lindes are soft, light, comparatively cheap woods, extensively used for general construction. They are not especially strong. All of them are important in paper making.
<b>Linden</b> comes from the basswood or lime tree ( <i>Tilia</i> species). Fr., <i>Tilleul</i> ; Ger., <i>Linde</i> ; Sp., <i>Tila</i> , <i>Tilo</i> .	Linden, basswood and white-wood are the names used in America. Linden, lime or lin are European names. The bark supplies a useful bast fiber for ropes, mats, etc.	Common in southern Canada, central United States and Europe, growing to be trees of fairly large size.	
<b>Maple</b> ( <i>Acer</i> species).—Fr., <i>Erable</i> ; Ger., <i>Ahorn</i> ; Sp., <i>Arce</i> , <i>Meple</i> . <b>Birch</b> ( <i>Betula</i> species).—Fr., <i>Bouleau</i> ; Ger., <i>Birke</i> ; Sp., <i>Abedul</i> . <b>Beech</b> ( <i>Fagus</i> species).—Fr., <i>Hêtre</i> ; Ger., <i>Buche</i> ; Sp., <i>Haya</i> . <b>Sycamore</b> ( <i>Platanus</i> species).—Fr., <i>Sycamore</i> ; Ger., <i>Platan</i> ; Sp., <i>Platano</i> . These four are among the important hard woods in common use.	<i>Sugar maple</i> , <i>silver maple</i> , <i>rock maple</i> , <i>black birch</i> , <i>cherry birch</i> , and many other names are employed. Peculiarities of the grain are known as bird's-eye, curly, etc., in the trade.	All of these are obtained from the hardwood forests of central United States and Europe. In some European forests the trees have been carefully planted and scientifically tended.	These are close-grained hard woods, suitable for furniture and cabinet work. Birch is the wood commonly used in imitation of mahogany. The silver maple and the Japan maple are highly valued as shade and ornamental trees.
<b>Oak</b> is from many species ( <i>Quercus alba</i> , <i>Q. rubra</i> , <i>Q. robur</i> , etc.). Fr., <i>Chêne</i> ; Ger., <i>Eiche</i> ; Sp., <i>Roble</i> , <i>Encino</i> .	White oak, chestnut oak, live oak, red oak, black oak, gum oak, willow oak, and many other varieties are found in the lumber trade. Oak bark is used in tanning leather. Oak is the bark of one species ( <i>Q. suber</i> ) found in Portugal, Algeria and Spain.	Chiefly from eastern and central United States and Europe. Oaks are found also in many other parts of the world.	An open-grained hard wood of great strength and durability. When cut parallel to the medullary rays (quartered oak) it exhibits a beautiful grain valued highly for cabinet work.
<b>Chestnut</b> ( <i>Castanea</i> species) is a large tree. Fr., <i>Châtaigne</i> ; Ger., <i>Kastanien</i> ; Sp., <i>Castaña</i> .	American and European chestnut woods are very similar. The nuts are popular for food. An extract from wood and bark is used in tanning.	Formerly a very common tree in the northern United States and still abundant. Common also in Europe.	The wood is used extensively for cabinet work. It is open-grained, softer and much less strong than oak.
<b>Ash</b> ( <i>Fraxinus</i> species).—Fr., <i>Frêne</i> ; Ger., <i>Esche</i> ; Sp., <i>Fresno</i> . <b>Elm</b> ( <i>Ulmus</i> species).—Fr., <i>Orme</i> ; Ger., <i>Ulm</i> ; Sp., <i>Ulm</i> . <b>Hickory</b> ( <i>Hicoria</i> species).—Fr., <i>Noyer</i> ; Ger., <i>Hickory</i> ; Sp., <i>Nogal americano</i> .	These woods are of much commercial value. Hickory nuts are marketed.	The trees are found in the central United States, some on the west coast. Ash and elm grow also in Europe and Asia.	Valuable for their toughness and elasticity. Used for tool handles, carriage and wagon building, furniture, etc.
<b>Walnut</b> ( <i>Juglans</i> species).—Fr., <i>Bois de noyer</i> ; Ger., <i>Nussholz</i> ; Sp., <i>Nogal</i> .	American black walnut, English, Italian, French and Moroccan walnut are commercial varieties. The nuts are exported from southern Europe.	Formerly a very abundant tree in the central United States. Has now become scarce, and high priced. Grown in many parts of Europe.	Used for gun stocks, cabinet work, veneering, etc. A highly decorative wood which has gone out of style in the United States because it is difficult to obtain.
<b>Cherry</b> is from the wild black cherry tree ( <i>Prunus serotina</i> ).		Native in the eastern United States.	Valued on account of its red color. The walnut, cherry has become scarce and high priced.
<b>Sweet Gum</b> is from a common tree ( <i>Liquidambar styraciflua</i> ).	The wood is called gum, red gum, bassal or bilated.	Native in the United States and Mexico. Cut chiefly in the Southern states.	A cheap cabinet wood, used to some extent in building.

**IMPORTED CABINET WOODS**

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Mahogany</b> is the wood of a tropical tree ( <i>Swietenia mahoganii</i> or <i>Khaya</i> species). Fr., <i>Acajou</i> ; Ger., <i>Mahagoniholz</i> ; Sp., <i>Caoba</i> .	<i>Santa Domingo</i> , Cuban and other kinds are named from the locality of production. Honduras big wood is of inferior quality. Nearly all of the wood with a beautiful grain, or figure, is cut into thin veneers.	A wild tree in tropical forests of the West Indies, Mexico, Central and South America. African mahogany ( <i>Khaya</i> ) comes from the west coast.	One of the most sought for of all cabinet woods. Largely imported into Europe and America. Particularly useful because of its beautiful color, grain and durability.
<b>Cigar-Box Cedar</b> is from a tree of the mahogany family ( <i>Cedrela odorata</i> ).	<i>Cedre</i> is the name under which this wood is largely handled.	Produced largely in West Indies, Mexico, Central America and northern South America. True mahogany of Australia is very similar.	One of the important woods of commerce. Too soft for the best grade but considerably used for furniture.
<b>Teak</b> is from a large tree ( <i>Tectona grandis</i> ). Fr., <i>Teck</i> ; Ger., <i>Teakholz</i> ; Sp., <i>Teca</i> .	Especially valuable for shipbuilding because it is practically indestructible.	Chiefly from Burma. Grows in southeastern Asia and adjacent islands.	A very important export from farther India.
<b>Ebony</b> ( <i>Diospyros</i> species).—Fr., <i>Ebène</i> ; Ger., <i>Ebenholz</i> ; Sp., <i>Ebano</i> ; and <b>Rosewood</b> ( <i>Dalbergia</i> or <i>Machroux</i> sp.).—Fr., <i>Bois de rose</i> ; Ger., <i>Rosenholz</i> ; Sp., <i>Falso rosa</i> . are important fancy woods.	<i>Cocobolo</i> , <i>tulip</i> , <i>amaranth</i> , <i>padouk</i> , <i>santwood</i> , and many others are used for cabinet work and fancy articles.	Nearly all of these hard woods of beautiful colors are from tropical forests.	<i>Lignum vitae</i> is especially useful for making pulleys and castor wheels. These woods are obtained in only limited quantity and many of them are sold by weight rather than measure.

GUMS, RESINS AND EXTRACTS

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Gum Arable</b> is from small thorny trees ( <i>Acacia</i> species). Fr., <i>Gomme arabique</i> ; Ger., <i>Arabisches gumm</i> ; Sp., <i>Goma arabe</i> . <b>Gum Tragacanth and Mesquite Gum</b> are similar.	<i>Kordofan gum</i> , <i>Senechal gum</i> , <i>Babary gum</i> , <i>Copa gum</i> and <i>Wadai gum</i> are all of similar nature.	The trees grow wild in sandy regions in Africa and Australia.	These gums are soluble in water. Used for making moustique, confectionery, etc., and in stiffening and printing silk and cotton fabrics.
<b>Copal</b> is resin produced by trees of many species. Fr., and Ger. <i>Copal</i> ; Sp., <i>Goma copal</i> . ( <i>Trachylobium</i> , <i>Dammara</i> , <i>Hymenaea</i> , <i>Agathis</i> , etc.).	Copals are named usually from their locality as <i>Zanzibar</i> (the hardest), <i>Sandaran</i> , <i>Mosambique</i> , <i>Torre Leone</i> , <i>Brasilia</i> , <i>Angola</i> , <i>Lodaga</i> , <i>South American</i> , <i>Manila</i> , etc. <i>Kauri</i> is from the <i>kauri</i> pine tree of New Zealand.	These resins are mostly gathered from the trunks and branches of living trees. The best and hardest varieties, like <i>Zanzibar</i> and <i>kauri</i> , are found underground, having been formed perhaps ages ago and become partly fossilized.	Used for making varnishes by dissolving them in spirits of turpentine and oil. The most expensive are commercially important.
<b>Dammar</b> , <b>Sandarach</b> , <b>Benzoin</b> , <b>Asafetida</b> , <b>Myrrh</b> , <b>Olibanum</b> , <b>Aloes</b> , <b>Gulac</b> , <b>Dragon's blood</b> , <b>Kino</b> , <b>Peru Balsam</b> , <b>Tolu</b> , <b>Copalba</b> , <b>Storax</b> and <b>Gamboge</b> are resins, gum resins or extracts from the juices of plants.	Gum resins and resins of many kinds are used in varnishes, medicines, incense, etc.	Such forest products are gathered in nearly all countries.	Not of so much relative commercial importance as such materials were in the middle ages.
<b>Rubber</b> is the milky juice (latex) of many trees and vines of the tropics and subtropics. ( <i>Hevea</i> , <i>Manihot</i> , <i>Castilloa</i> , <i>Ficus</i> , <i>Landolphia</i> , etc.). Fr., <i>Caoutchouc</i> , <i>Gomme elastique</i> ; Ger., <i>Kautschuk</i> , <i>Federholz</i> ; Sp., <i>Caucho</i> , <i>Hule</i> , <i>Goma elastica</i> .	Crude India rubber, or <i>caoutchouc</i> , has dozens of commercial varieties differing greatly in quality according to the nature of the plant and the process of preparation ( <i>Para</i> , <i>Ceylon</i> , <i>Central American</i> , <i>African</i> , <i>Ceylon</i> , <i>plantation</i> , etc.). Crude rubber is treated with sulphur (vulcanized) to make elastic and waterproof articles, as well as hard rubber goods (vulcanite and ebonite). Substitutes for rubber are made from rapeseed oil, corn oil, etc.	The largest supplies of rubber come to market from the Amazon valley. <i>Para</i> rubber is prepared by smoking (drying) the latex over a fire. The latex is coagulated often by simple drying in the air and frequently by chemical or mechanical processes. Mexico and Central America, Africa and the East Indies furnish large amounts. Most of the world's supply comes from wild trees. Every year there is a larger production from plantations, and much of this, like the Ceylon rubber, is of very fine grade and brings the highest market price.	Rubber has, within a very few years, become an important article in the world's commerce. Its uses are multiplied and its price has risen in proportion. Factories in Europe and America make automobile tires, rubber bands, elastic cloth, toys, shoes, tubing, hose, waterproof cloth, stoppers, erasers, etc., as well as articles of hard rubber, such as combs, buttons, surgical and chemical appliances. Rubber is used in floor cloths, cements and varnishes. Old rubber articles are worked over and the reclaimed rubber utilized.
<b>Gutta-Percha</b> is from the milky juice of a tree ( <i>Diospyros</i> species). Fr., and Ger., <i>Gutta-Percha</i> ; Sp., <i>Guta-Percha</i> .	Similar in some ways to rubber.	From the East Indies.	Used to insulate submarine cables and for making golf balls. Singapore is the chief port of shipment.
<b>Balata</b> is similar.			
<b>Chicle</b> is from the milky juice of a tree ( <i>Achras zapota</i> ). Fr., Ger. and Sp., <i>Chicle</i> .	Chicle is called also <i>gum chicle</i> , or <i>crude chering gum</i> .	Chiefly from Yucatan.	Used in chewing gum.

OILS, FATS AND WAXES

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>See Cotton, Corn, Olive, Flax, Hemp, Coconut, Cacao</b> for other oils. See also various animal oils and petroleum.	Vegetable oils are of two important types, <i>fixed</i> or <i>fatty</i> oils and <i>volatile</i> or <i>essential</i> oils. Fixed oils are either <i>drying</i> oils like <i>linseed</i> or <i>non-drying</i> like <i>olive</i> .	Fixed oils are obtained from seeds by pressure in powerful machinery or by chemical processes. The oil-cake remaining is used for cattle food and fertilizer.	Drying oils are used to paints and varnishes, preparing leather, etc. Non-drying oils are used for table purposes, cooking, illuminating, lubricating, soap and candle making, etc. <i>Glycerine</i> is a by-product in soap making.
<b>Castor Oil</b> is from the seeds of the castor plant ( <i>Ricinus communis</i> ). Fr., <i>Huile de ricin</i> ; Ger., <i>Ricinusöl</i> ; Sp., <i>Acetie de ricino</i> .	The cold drawn or cold pressed oil is used in medicine. Much castor oil is treated with sulphuric acid to produce <i>Turkey red oil</i> for use in dyeing and calico printing.	The largest production is in India. Grown in the tropics and warm temperate climates.	Used in soap making, lubricating, preparing artificial leather and celluloid.
<b>Palm Oil</b> is from the pulp and seeds of a palm ( <i>Elaeis guineensis</i> ). Fr., <i>Huile de palme</i> ; Ger., <i>Palmöl</i> ; Sp., <i>Acetie de palme</i> .	Palm oil is from the pulp, palm kernel oil from the seeds.	From the coast of the gulf of Guinea, West Africa.	For making soap and candles, and used in the preparation of tinsplate.
<b>Peanut Oil</b> , <i>sunflower</i> , <i>almond</i> , <i>sesame</i> , <i>poppy</i> , <i>rape seed</i> , <i>kapok</i> , <i>soy bean</i> and various other oils are used.		Seeds for oil production are little cultivated in India with the exception of flaxseed, cotton and cora.	Marseilles, Rotterdam, and several other European cities have great mills for the production of vegetable oils of this character.
<b>Essential Oils</b> are made chiefly from flowers and leaves of plants.	<i>Attar of roses</i> , <i>patchouli</i> , <i>lavender</i> , <i>cloves</i> , <i>lemon</i> , <i>orange</i> , <i>ananas</i> , <i>peppermint</i> , <i>citronella</i> , <i>lemon grass</i> , <i>cinamon</i> , <i>bay</i> , <i>almond</i> , <i>caraway</i> and many others are prepared.	Fragrant oils are prepared in large amount for the perfumery trade in France, Italy, Germany and Austria, from roses, violets and other cultivated plants. <i>Peppermint</i> oil is produced in the United States, and it, as well as <i>menthol</i> , comes from Japan.	These oils are obtained by distillation of the plants with water or else by absorbing the fragrance in <i>lard</i> or <i>oil</i> (essence). They are used in perfumery, for flavoring and in medicine.
<b>Camphor</b> is from the wood of the camphor tree ( <i>Cinnamomum camphora</i> ). Fr., <i>Camphre</i> ; Ger., <i>Kampher</i> ; Sp., <i>Alcanfor</i> .	Although called <i>gum camphor</i> , this is strictly a volatile or essential oil.	From Formosa, Japan, China and Borneo. Prepared by distilling the wood with water.	Nine-tenths of the world's supply is exported from Formosa. Its production is a monopoly of the Japanese government. Used in making celluloid and smokeless powder, in medicine and as a protectant against insects.

## OILS, FATS AND WAXES—Continued

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Vegetables Waxes</b> are from myrtleberries ( <i>Myrica</i> species), Japanese waxberries ( <i>Rhus</i> species) or the leaves of the carnauba palm ( <i>Copernicia cerifera</i> ). Fr., <i>Cire végétal</i> ; Ger., <i>Vegetabilisches Wachs</i> ; Sp., <i>Cera vegetal</i> .	<i>Myrtleberry</i> or <i>Bayberry</i> wax, Japan wax and carnauba wax are much like beeswax in their nature and uses.	Japan wax is produced only in Japan. Carnauba wax is from Brazil.	These waxes are found in commerce but are not of great importance.

## DYESTUFFS AND TANNING MATERIALS

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Logwood</b> ( <i>Hæmatoxylon campechianum</i> ).—Fr., <i>Campeche</i> ; Ger., <i>Kampeschholz</i> ; Paribolt; Sp., <i>Palote Campeche</i> . <b>Brill wood</b> ( <i>Cassipoula</i> species).—Fr., <i>Bois de Brésil</i> ; Ger., <i>Branholz</i> ; Sp., <i>Madera de Brasil</i> . <b>Fustic</b> , <b>Young Fustic</b> , <b>Sappan</b> , <b>Cam</b> , <b>Bar</b> , <b>Peach</b> and other woods. <b>Indigo</b> is obtained from the juice of the indigo plants (mostly <i>Indigofera</i> species). Fr., <i>Indigo</i> ; Ger., <i>Indigo</i> ; Sp., <i>Añil</i> , <i>Indigo</i> .	Handled commercially in chips, or very commonly in the form of extract.	From the forests of tropical America and the West Indies.	Azulin and other azulin dyes have increased the demand for these, as well as almost all other vegetable dyes. There is still a fairly large trade in logwood.
<b>Madder</b> , <b>Anatto</b> , <b>Safflower</b> , <b>Queritron</b> , <b>Turmeric</b> , <b>Turnsole</b> , <b>Persian Berries</b> , <b>Saffron</b> , <b>Archil</b> , <b>Cudbear</b> , <b>Litmus</b> , <b>Wood</b> and many other vegetable substances are used as dyes.		India, Ceylon, Java and Central America are the chief producers. Formerly cultivated much more extensively.	Prepared by soaking the plants in water. The green solution turns blue on exposure to the air, the indigo separates and falls to the bottom of the tank.
<b>Tanbarks</b> are from many species of trees.	<i>Hemlock</i> , <i>white oak</i> , <i>willow</i> , <i>mangrove</i> , <i>larch</i> and <i>willow</i> are used.	Obtained mostly as by-products of lumber industry. In the United States, hemlock is most important.	Extracts from the bark are usually prepared and the material is found in commerce in this form. The value is largely dependent on the percentage of tannin.
<b>Tanning extracts</b> are prepared from many woods, fruits, leaves, roots and galls.	<i>Oak</i> , <i>chestnut</i> , <i>quebracho</i> and <i>cutch</i> are extracts from wood. <i>Myrobala</i> , <i>salicina</i> , <i>div-diti</i> and <i>algarobilla</i> are fruits yielding tannin. <i>Sunaw</i> and <i>gambel</i> leaves, <i>cassare</i> and <i>palmetto</i> roots and <i>oak</i> and <i>sumac</i> galls are all employed.	Obtained in nearly all parts of the world.	Different substances or extracts are employed in preparing different qualities of leather.

## MISCELLANEOUS SUBSTANCES

NAME OF RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Vegetable Ivory</b> is the seed of a palm tree ( <i>Phytolapha</i> species). Fr., <i>Ivoire végétal</i> ; Ger., <i>Holzelfenbein</i> ; Sp., <i>Corato</i> , <i>Tagua</i> .	Other species of palm produce vegetable ivory in the South Sea islands.	From Ecuador, Colombia and Panama.	Used for making buttons, etc. Exported to United States and Europe.
<b>Argols</b> , a deposit in wine casks. Fr., <i>Tartre</i> ; Ger., <i>Weinstein</i> ; Sp., <i>Tártaro</i> .	<i>Apical</i> or <i>tree</i> are the only source of tartaric acid and tartarates.	Principally from Portugal.	Used in dyeing, making baking powder, cream of tartar, acidule powders and tartar emetic.
<b>Lycopodium</b> powder consists of the spores of certain mosses. Fr., <i>Lycopode</i> ; Ger., <i>Lycopodium</i> , <i>Barlapp</i> ; Sp., <i>Licopodio</i> .		Exported from Russia.	Used in fireworks and by pharmacists.
<b>Pyrethrum</b> is the powdered flowers of a plant allied to the chrysanthemum. ( <i>Pyrethrum</i> species).	Used in insect powders.	From Persia and southeastern Europe.	

## ANIMAL PRODUCTS

ANIMAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Cattle</b> are of several important types. The most abundant is the domestic ox ( <i>Bos taurus</i> ). Fr., <i>Bœuf</i> ; Ger., <i>Rindvieh</i> ; Sp., <i>Ganado</i> . The Indian Humped Ox and the Water Buffalo are raised in the East.	<i>Beef</i> , fresh, dried, salted, canned or otherwise preserved is the most valuable of all cattle products. <i>Hides</i> (including skins and calfskins) are second only to beef in importance. <i>Milk</i> is sold fresh, condensed, evaporated, or is made into butter, cheese, cream and sugar of milk. <i>Horns</i> , <i>hoofs</i> and <i>bones</i> are used for buttons, handles for knives, brushes, umbrellas and fancy articles, or made into gelatine and glue. <i>Tallow</i> from leaf fat is used in food, soap, candles and lubricants. <i>Oleo</i> and <i>lard</i> are from tallow and are used in making oleomargarine or butterine. <i>Xen's food</i> oil is a lubricant. <i>Dried blood</i> is used in purifying sugar, clarifying wines, and in dyeing. <i>Cow hair</i> is mixed in plaster. <i>Feathers</i> and <i>penne</i> are made from the stomach. All waste parts go into fertilizer.	The United States, Russia, India, Argentina, Germany, Austria-Hungary, France and Australia are the greatest cattle raising countries. In this country, the cattle raising area has moved rapidly westward. More than half of the beef cattle are now found in Texas, Iowa, Missouri, Kansas, Nebraska, Colorado and Wyoming. They are fattened in the corn belt (Illinois, Iowa, Nebraska, Kansas) and killed in the slaughter houses of Chicago, Kansas City, St. Louis and Omaha. The by-products of slaughtering are very numerous and the industry is conducted so economically that, in the great slaughter houses, no part of the animal is wasted. In some parts of the world hides and tallow are the chief products of the cattle industry on account of the difficulty of transporting the meat.	The United States, Argentina and Australia are the greatest exporters of live cattle and beef. Great Britain buys the greater part of the cattle products reported by the United States. Refrigerator cars and cold storage in steamships make possible the shipment of fresh meat to long distances. Fresh meat is a growing export from Argentina, Australia, New Zealand and South Africa to Europe. The dairy industry is of growing importance and New Zealand exports butter and cheese to England, Denmark, Sweden, Holland, Switzerland, Canada and Australia export dairy products. Notwithstanding the large production of hides in the United States, our tanning industry is so large that millions of dollars worth are annually imported, chiefly from South America. Sole leather is made from cattle hides. Leather is split and finished in a great number of styles.

ANIMAL PRODUCTS—Continued

ANIMAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Sheep</b> ( <i>Ovis aries</i> ) are of a great number of breeds (Merino, Lincoln, Leicester, Southdown, Highland, etc. Fr., <i>Moutons</i> ; Ger., <i>Schafe</i> ; Sp., <i>Carneros</i> ).	Wool is the most valuable product of the sheep. The grades of wool are named according to the breed of sheep, the locality and the use to which they may be put. Clothing wools are fine and comparatively short, combing wools are of medium length, carpet wools are long and coarse. Meat (mutton and lamb) is of less importance than beef and pork. Sheep and lamb skins are used with the wool on, for rugs and furs (Persian lamb, broddell, Astrakhan, Tibet). Skins (roasts) are tanned for Morocco and fancy leather. Chamels is usually oil-tanned sheepskin. Catgut is made of sheep intestines, tallow from the fat, cheese from the milk and fertilizer of all waste. The meat is by far the most valuable product. It is sold fresh, salted, pickled and smoked and in the form of ham, bacon and sausage. Lord, lard oil, stearin, and other fats and oils are obtained from the fat. The skins are made into leather and all waste parts are utilized in fertilizers or converted into prussiate (cyanide) of potash. Bristles come chiefly from China and Russia, where pigs have not been improved by breeding. Angora and Cashmere are breeds which produce exceptional quality of hair. The hair from the common goat is coarse and is used in making carpets and blankets. Goat and kid skins are the most valuable products of these animals. Camel hair is the only product which enters into general commerce. Locally the flesh, milk and hide are utilized.	Raised chiefly in temperate countries, in largest numbers in Australia, Argentina, Uruguay, Russia and the United States. The finest wools are raised in Germany, Argentina, Australia, South Africa, and the United States. Combing wools come from England, Scotland, France, Austria and the United States. Carpet or native wools are produced in Russia, Asia Minor and China from sheep of unimproved breed. Sheep raising is an industry appropriate to a fairly open, temperate country which is sparsely settled. For this reason it has prospered in the western United States, Argentina, Australia, New Zealand and South Africa, where good breeds of sheep have been introduced.	Within the past hundred years, cotton has displaced wool as the most important commercial textile fiber. Wool is carded and spun into wools yarns or combed and spun into worsted yarns. Woolens and worsteds are the two types of wool fabrics. Cotton is very largely mixed with wool to cheapen the product. The United Kingdom, Germany and France supply the world with dupions and worsted fabrics. The United States mills supply mainly the home market. Nearly all the factories are in New England and the Middle states. Live sheep are exported from Argentina, Australia, the United States and Canada, but a large value is represented in frozen mutton, which goes in refrigerator ships from New Zealand, Australia and Argentina to Europe.
<b>Swine</b> are of many breeds ( <i>Sus scrofa</i> ). Fr., <i>Cochon</i> ; Ger., <i>Schwein</i> ; Sp., <i>Puerco</i> , <i>Cochino</i> .	Pigs are raised in almost all parts of the world, but the hog raising industry is greatest in the United States. Corn is the food which is most important in fattening the animals for market.	Pigs are raised in almost all parts of the world, but the hog raising industry is greatest in the United States. Corn is the food which is most important in fattening the animals for market.	Chicago, Kansas City and Omaha are the chief pork packing centers. Probably is no other industry is every by-product more completely utilized. Hog products constitute one of the most valuable of this country's exports, greatly exceeding the value of even cattle products.
<b>Goats</b> are less varied in their breed than many other domestic animals ( <i>Capra</i> species). Fr., <i>Chèvre</i> ; Ger., <i>Zeige</i> ; Sp., <i>Cabra</i> .	The greatest number of goats are raised in western Asia. There are many in southern Europe and northern Africa. Angora goats are raised in Asia Minor, South Africa, Texas and Australia. Swiss goats are raised for their milk, and cheese made from it.	The greatest number of goats are raised in western Asia. There are many in southern Europe and northern Africa. Angora goats are raised in Asia Minor, South Africa, Texas and Australia. Swiss goats are raised for their milk, and cheese made from it.	Large numbers of goat and kid skins are imported into the United States, chiefly from the East, South America and South America. These are largely tanned with chrome to make glazed kid and soft leather. Other products, Morocco and glove leather are prepared.
<b>Camels</b> ( <i>Camelus</i> species) are of two types, the one-humped or dromedary, and the two-humped or Bactrian. Fr., <i>Chameau</i> ; Ger., <i>Kamel</i> ; Sp., <i>Camello</i> .	Camels are found throughout central Asia and northern Africa. Camel hair comes chiefly from interior Asia.	Camels are found throughout central Asia and northern Africa. Camel hair comes chiefly from interior Asia.	The hair or wool is soft and suitable for making hosiery, underwear and shawls.
<b>Alpaca</b> is an animal similar to the camel ( <i>Auchenia pacos</i> ). Fr., <i>Alpaga</i> ; Ger., and Sp., <i>Alpaca</i> .	Imported into Europe and United States.	Raised in Peru.	Imported into Europe and United States.
<b>Horses</b> are chiefly beasts of burden ( <i>Equus caballus</i> ). Fr., <i>Cheval</i> ; Ger., <i>Pferde</i> ; Sp., <i>Caballos</i> .	Horsehair is from manes and tails. Hides are tanned to make leather. Pony skins are used as furs.	Horsehair is exported chiefly from Russia, Argentina, Germany, and other countries.	The hair is used for making haircloths and brushes, and for stuffing mattresses and furniture.
<b>Wild Animals</b> of many kinds are killed for the sake of their skins.	Important furs are obtained from the sable, fox, weasel, marten, ermine, mink, skunk, raccoon, bear, otter, beaver, muskrat, seal, nutria, squirrel, chinchilla, mole, monkey, rabbit, etc.	Good furs come mostly from Siberia, Russia and British America, with the exception of skins of the monkey and cat families.	London and Leipzig are the world's great fur markets. Skins of the domestic cat are dyed and dressed so as often to resemble more costly fur. Rabbits are similarly altered. Great numbers of rabbit skins are imported from Australia and New Zealand to the United States and the fur from them is used in making felt hats. Nutria fur is used for the same purpose.
<b>Other Animals</b> furnish products of value.	Ivory is chiefly from the tusks of African and Indian elephants.	Deer horns for knife handles, etc., come from many parts of the world. Deer skins are tanned for leather.	Musk, a perfume, comes from the musk ox in Asia. Castoreum from the beaver and civet, from the civet cats of Africa and Asia, are the bases for perfumes.
<b>Whales</b> are of several species ( <i>Balaena</i> , <i>Physeter</i> ). Fr., <i>Baleine</i> ; Ger., <i>Wal-fisch</i> ; Sp., <i>Ballena</i> .	Whale oil (sperm oil) is drained from the blubber of <i>Physeter</i> is from the mouth, spermaceti from the blubber and cavities in the head and ambergris from the intestines. Porpoise leather is from the skin of the white whale.	The Greenland fishery is most important, but whaling is not as prosperous an industry now, as it was one hundred years ago. This is largely because of the scarcity of whales and partly because kerosene is so generally used for illuminating.	Whale oil is used in leather dressing, boring, soap making and lubricating. Spermaceti is used in candle making and for waxing carriage covers; whalebone for corset and dress, making brushes and whips; and ambergris in perfumes.
<b>Sponges</b> are the skeletons of peculiar animals ( <i>Spongia</i> ). Fr., <i>Eponge</i> ; Ger., <i>Schwamm</i> ; Sp., <i>Esponja</i> .	The qualities differ with the species and locality.	Obtained in the Mediterranean and West Indies.	Imported largely from the eastern Mediterranean.
<b>Fish</b> are of hundreds of species but there are comparatively few that are of great commercial importance. Fr., <i>Poisson</i> ; Ger., <i>Fisch</i> ; Sp., <i>Pescado</i> .	Of the food fish, cod, haddock, herring, sardines, mackerel and salmon are handled in large quantities fresh, canned, salted or otherwise cured. Caviar is the prepared roe of sturgeon. Jaspelin is a pure gelatine made from the swimming bladders of sturgeon and other fish.	The great fisheries of the world are the "Grand Banks" off Newfoundland, the North Sea and the coast of Norway. Salmon are canned on the northwest coast of America and on a smaller scale in Japan, Siberia and Norway. Portugal, Spain and France lead in canning sardines. Oil, made from mackerel and other fish are used in preparing leather, in paints, oiling ropes, etc. Cod liver oil is used in preparing chamams and other leather and in pharmacy.	Canned salmon leads in value over exports of fish products, and goes mainly to England. We import herring, etc., in oil from Europe and considerable quantities of fresh or canned lobsters from New Scotland. Fish bones are prepared from the refuse from fish canneries and from fish which are not otherwise useful.

## ANIMAL PRODUCTS—Continued

ANIMAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND CULTIVATION	MANUFACTURE, USES AND TRADE
<b>Oysters</b> are the most valuable shellfish. ( <i>Ostrea</i> species, <i>Meleagrina</i> , etc.) Fr., <i>Ouïres</i> ; Ger., <i>Auster</i> , <i>Austern</i> ; Sp., <i>Ostras</i> .	Oysters are gathered on the coasts of Europe and America. Some are canned but the greater amount are consumed fresh. Pearl oysters ( <i>Meleagrina</i> ) supply mother of pearl and occasionally true pearls. Abalone ( <i>Haliotis</i> ) and various mussel shells are also used.	Pearl oysters are found off the coasts of Ceylon, Society Islands, northern Australia, Panama, in the Gulf of California, the Red Sea and the Persian gulf. Abalone shells come from the shores of the Pacific.	Pearl shell is used for buttons, knife handles, etc. Mother of pearl is imported largely from the South Pacific.

## PRODUCTS OF BIRDS

RAW MATERIAL	CHIEF COMMERCIAL ARTICLES PRODUCED	HABITAT AND PRODUCTION	MANUFACTURE, USES AND TRADE
<b>Eggs</b> are chiefly from the domestic fowl. Fr., <i>Oeufs</i> ; Ger., <i>Eier</i> ; Sp., <i>Huevos</i> .	Avoids from their use as food, eggs supply egg albumen. Large numbers are bought in the spring and summer and preserved by cold storage.	There is a large and increasing foreign trade in fresh eggs.	Eggs are used in preparing tanned leather for gloves, etc.; and egg albumen is photographic paper, clarifying sugar, etc.
<b>Feathers</b> and bird skins are from many kinds of wild and tame birds. Fr., <i>Plumes</i> ; Ger., <i>Federn</i> ; Sp., <i>Plumas</i> .	Ostrich, cock, goose, duck, turkey, pheasant, heron, grebe, and many wild birds furnish plumes for decorative purposes.	Ostrich feathers are obtained by killing wild birds in central Africa and from ostrich farms in South Africa. Smaller quantities come from North Africa, Argentina and California. Down, for pillows and feather beds, is from the domestic goose. From dry islands and caves.	The United States imports feathers and down chiefly from Europe. The greater part of the supply of ostrich feathers comes from South Africa, and from California ostrich farms.
<b>Guano</b> is the accumulated excrement of birds and bats. Fr., Ger. and Sp., <i>Guano</i> .	A valuable fertilizer. Refuse from fish canneries and oil factories goes under the name of fish guano.		Exported mainly from islands in the Pacific.

## INSECT PRODUCTS

<b>Silk</b> is from the cocoons of the cultivated silkworms ( <i>Bombyx mori</i> ). Fr., <i>Sole</i> ; Ger., <i>Seide</i> ; Sp., <i>Seda</i> . Pongee and other wild silks are produced by insects of different species ( <i>Antheraea</i> ).	<i>Silk cocoons</i> are reeled to obtain raw silk. The unreelable parts of the cocoons are silk waste, which is converted into spun silk. Raw silk is "thrown" or twisted giving tram and organzine for weaving.	Silkworms are reared and cocoons produced commercially only in China, Japan, India and Mediterranean countries, particularly Italy, southern France, Greece, Turkey and western Asia. Here, cheap and competent labor can be obtained and it cannot in any other part of the world where the climate is favorable. The reeling of the raw silk from the cocoon is largely conducted in modern factories.	China exports almost half the raw silk of commerce. Japan and Italy each export less than half as much as China. The United States leads the world in the quantity of silk manufactured. France uses almost as much raw silk and makes fabrics of high grade. More than half the raw silk imported into the United States comes from Japan. We import silk fabrics in large amounts from France, Germany and Switzerland.
<b>Honey</b> (Fr., <i>Miel</i> ; Ger., <i>Honig</i> ; Sp., <i>Miel</i> ) and <b>Beeswax</b> (Fr., <i>Cire de abeilles</i> ; Ger., <i>Bienenwachs</i> ; Sp., <i>Cera de las abejas</i> ) are produced by the honey bee ( <i>Apis mellifica</i> ).	<i>Honey</i> is sold either in the comb or extracted. <i>Beeswax</i> is obtained by melting the comb. Beeswax is adulterative and imitated by the use of paraffin, stearine, and vegetable waxes. Wax is used for candles, waxing floors and thread, artificial plants, salves, etc.	Honey and wax are produced in northern Europe and the United States.	Most honey is shipped from California to other parts of the United States and Europe. Beeswax is imported from Europe and South America.
<b>Lac</b> is a resinous substance formed on twigs by the lac insect ( <i>Coccus lacca</i> ). Fr., <i>Laque</i> ; Ger., <i>Lack</i> ; Sp., <i>Laca</i> .	<i>Stick lac</i> is the crude material as gathered from the trees. <i>Shell lac</i> and <i>button lac</i> are partly purified. <i>Red lac dye</i> is a by-product now of little importance or value. <i>Orange shellac</i> is bleached to make white shellac.	From forests of northern India and Indo-China.	Dissolved in alcohol to make varnishes. Used in sealing wax, putty, for maling paper, stiffening felt hats, etc.
<b>Cochineal</b> consists of the dried bodies of insects ( <i>Coccus cacti</i> ). Fr., <i>Cochenille</i> ; Ger., <i>Cochenille</i> ; Sp., <i>Cochinilla</i> .	Used as a red dye for wool.	Raised on cactus plants in Mexico, Central America, Tenerife, and the East Indies.	Of little present importance due to the extensive use of dyes from coal tar.
<b>Cantharides</b> are the dried bodies of beetles ( <i>Cantharis</i> , <i>Mylabris</i> , etc.) Fr., <i>Cantharides</i> ; Ger., <i>Kan-thariden</i> ; Sp., <i>Canthridas</i> .	Cantharides, Spanish flies and Chinese blistering beetles are similar.	From southern Europe, India and China.	Used medicinally for blistering purposes, and internally as a stimulant to the urinary organs.

## MINERAL PRODUCTS

METALS	ORES AND CHIEF PRODUCTS	LOCALITY AND PREPARATION	MANUFACTURE, USES AND TRADE
<b>Iron</b> is the most useful metal. Fr., <i>Fer</i> ; Ger., <i>Eisen</i> ; Sp., <i>Hierro</i> .	<i>Hematite</i> (sesquioxide of iron) is the ore which supplies three fourths of the iron of commerce. Limonite brown (hematite) is a hydrous oxide and furnishes nearly one-fourth of the world's supply of the metal. Magnetite and siderite are less common ores. <i>Pig iron</i> is the crude form of the refined metal and is transformed into cast iron, wrought iron and steel in their multitudinous forms. These three forms of iron differ in hardness, strength, elasticity, malleability, etc., according to the amount of carbon, sulphur, phosphorus, manganese and other elements. <i>Oxides</i> and metallic paints are iron oxides. <i>Prussian blue</i> and <i>copperas</i> are iron compounds. <i>Pyrrite</i> (iron pyrites or fool's gold) is a sulphide of iron, useless as an iron ore.	The United States, Germany, Great Britain, Spain and France are the greatest producers of iron. Its ores occur in almost all parts of the world. Hematite is mined in Minnesota, Michigan, Alabama and other parts of the United States and in Germany, England, France, Spain, Russia, etc. Limonite is also widely distributed. <i>Pig iron</i> is made by smelting iron ore in a blast furnace. The ore, mixed with limestone, is melted by burning coke, coal or charcoal. <i>Pyrrite</i> is found in Spain and many other parts of the world and is valuable in the preparation of sulphuric acid (oil of vitriol).	The United States manufactures more iron and steel than any other country. Almost half of the production is in Pennsylvania. Cast iron appears in many articles but is weaker than other forms of iron. Wrought iron contains less impurity and is used for bars, plates, wire, structural material and parts of machinery. Steel (Bessemer, Siemens-Martin, open hearth, etc.) contains more carbon than wrought iron, possesses both strength and hardness, and is used for rails, structural material, machinery, tools, wire rope, sheet steel, etc. Its hardness may be increased by tempering. The United States imports iron ore from Cuba and Spain, pig iron from the United Kingdom and a little manufactured iron and steel from Europe. We export large quantities of manufactured iron and steel.

MINERAL PRODUCTS—Continued

METALS	ORES AND CRUDE PRODUCTS	LOCALITY AND PREPARATION	MANUFACTURE, USES AND TRADE
<b>Lead</b> is the softest, heaviest, most malleable and most easily melted of the common metals. Fr., <i>Plomb</i> ; Ger., <i>Blei</i> ; Sp., <i>Plomo</i> .	<i>Galena</i> (lead sulphide) is the only important ore; it often carries a considerable percentage of silver. Carbonates and sulphates of lead are less common. <i>Siderite</i> and <i>type metal</i> are alloys of lead with tin and antimony. <i>White lead</i> is a carbonate of lead and is a white powder. <i>Red lead</i> is a sesquioxide of lead and is a red powder. <i>Chrome yellow</i> and <i>chrome mineral</i> are red compounds used as pigments.	Ores are found in many countries but the main supply is from the United States, Spain, Germany and Mexico. The chief lead mines of the United States are in Missouri, Idaho, Utah, Colorado and Kansas. Much lead bullion is from smelters where silver ores are reduced.	The chief use of metallic lead is in piping, sheet lead, shot and alloys. Large amounts of ore are transformed not into metallic lead but into white lead for use in paints. Lead ore and lead bullion are imported from Mexico, England is the greatest importer of lead and lead ore.
<b>Zinc</b> is one of the most useful metals. Fr., <i>Zinc</i> ; Ger., <i>Zink</i> ; Sp., <i>Zinc</i> .	<i>Sphalerite</i> or <i>blend</i> (zinc sulphide) is the chief ore. Most of the zinc is obtained from the zinc sulphide. Zinc and oxides of zinc are found. Crude zinc (specie) is distilled from roasted ore. <i>Brass</i> , German <i>zinc</i> and other alloys contain zinc. <i>Galvanized iron</i> consists of a coating of zinc on sheet iron. <i>Zinc oxide</i> (zinc white) resembles white lead and is used in paints.	Germany, United States and Belgium supply most of the zinc. In this country, Missouri and Kansas lead in zinc production.	Used in electric batteries, making hydrogen, fine steels, etc. The greatest amount of zinc is used in alloys and zinc compounds. Zinc and zinc ores are both imported and exported by the United States, the imports exceeding the exports. Zinc oxide is exported in larger amount than any other form.
<b>Copper</b> is, next to iron, the most important metal in use. Fr., <i>Cuivre</i> ; Ger., <i>Kupfer</i> ; Sp., <i>Cobre</i> .	There are many ores. <i>Chalcocite</i> , and <i>bornite</i> , (copper sulphide of copper and iron) are widely distributed. <i>Chalcocite</i> (copper sulphide) is mined in Montana, malachite and azurite (carbonates of copper) in Arizona and metallic copper in Michigan. <i>Copper matte</i> is the crude metal as it comes from the smelter. <i>Brass</i> and <i>bronze</i> are alloys of copper with zinc, tin, aluminium, etc. <i>Copper sulphate</i> (blue vitriol) is the most important chemical compound of copper.	The greatest production is in the United States, in Arizona, Montana, Michigan, and Utah. Spain, Japan, Chili, Australia and Germany produce smaller amounts. The metal is purified by smelting, and refined, often by electrolytic methods.	The value of copper has increased within recent years, due to its enormous use in electrical work. Aside from this, copper is employed in large amount in the various alloys into which it enters, and in coils, utensils, printing plates, etc. Copper sulphate is extensively used in electrical apparatus, dyes, chemical work and as an antiseptic. Large amounts of manufactured copper are exported to Europe. Chiefly for the titles of ores, matte and regulus are imported from Mexico, South America and other countries. Copper wire is extensively used by telephone and telegraph companies.
<b>Gold</b> is the standard precious metal. Fr., <i>Or</i> ; Ger., <i>Gold</i> ; Sp., <i>Oro</i> .	Gold ore are usually gravels or beds of quartz rock in which the metal occurs in small particles. <i>Chloride of gold</i> , used in photographic work, is its only important compound. Pure gold is called 24 carats fine. A smaller figure indicates that the metal is alloyed to harden it.	Found in nearly all parts of the world. South Africa and the United States are the leading producers. Australia, South America and parts of Europe possess important gold fields. Gold is separated from gravel (placer mines) by washing with water. The particles of metal, being heavy, sink and can be collected. Rock containing gold is crushed to fine powder and the gold combined with mercury (amalgamation). Low-grade ores are treated with a solution of cyanide of potassium which dissolves the gold and the metal is later separated.	Gold is used for money, jewelry, gold leaf (gilding) and in dentistry. It is almost always alloyed with copper and silver. Gold is the world's accepted standard of value. Shipments of gold go from one country to another chiefly to balance international business dealings. Government treasuries and bank vaults are the chief storehouses for gold, either as bullion or coin.
<b>Platinum</b> is a rare metal. Fr., <i>Platine</i> ; Ger., <i>Platin</i> ; Sp., <i>Platina</i> .	Found in gold, iridium and other rare metals in placer mines.	Chiefly from Russia. Smaller amounts from Colombia, California, Canada and Australia.	Used in the terminals of incandescent electric lamps. Also employed by chemists, jewelers and dentists.
<b>Silver</b> is the common precious metal. Fr., <i>Argent</i> ; Ger., <i>Silber</i> ; Sp., <i>Plata</i> .	<i>Argentiferous galena</i> (lead ore) is the commonest ore of silver. The amount of silver per ton varies greatly. Zinc and copper ores often carry silver. Many sulphides of silver (argenticite, pyrrargyrite, etc.) are found, as well as chlorides and bromides (cerargyrite and bromargyrite). <i>Chloride and azurite of silver</i> are used in photography. <i>Cinnabar</i> (sulphide of mercury) is the source of the metal, although a little is found in nature in the pure state. <i>Vermilion</i> (artificially prepared cinnabar) is used in paint. <i>Calomel and corrosive sublimate</i> are used in medicine and <i>fulminate of mercury</i> in explosives. <i>Bauxite</i> (aluminium hydrate) is the only ore. <i>Cryolite</i> (fluoride of aluminium and sodium), a mineral mined only in Greenland, was formerly used as an ore but is now utilized in the manufacture of alum and soda. <i>Alum</i> (a sulphate) is made from cryolite or clays. <i>Corundum</i> (aluminium oxide) is, next to diamond, the hardest natural mineral. <i>Sapphire and ruby</i> are transparent forms suitable for gems. <i>Emerald</i> is an impure form of corundum. <i>Feldspar</i> is a silicate of aluminium with other metals.	Silver is produced in greatest amount in the Rocky mountains and the Andes. The United States, Mexico, Australia, Bolivia, Chili, Peru and Germany furnish nearly the entire supply. Montana, Colorado, Nevada and Utah lead in silver production in the United States. The ore are usually smelted and refined to purify the metal.	Manufactured into innumerable articles for household use and personal adornment. The cheapest are not solid (sterling) but are electrically plated with a very thin coating of silver. Silver coins form the bulk of the currency of the world, although in most countries gold is the standard.
<b>Mercury</b> (or quick silver) is a heavy metal which is liquid at ordinary temperatures. Fr., <i>Mercur</i> ; Ger., <i>Merkur</i> , <i>Quecksilber</i> ; Sp., <i>Mercurio</i> .	Produced in Spain, the United States, Austria, Italy and Russia. California supplies most of this country's quota. Obtained by distillation of the ore.	Produced in Spain, the United States, Austria, Italy and Russia. California supplies most of this country's quota. Obtained by distillation of the ore.	Used principally in the extraction of gold and silver from their ores by amalgamation. Employed in thermometers and barometers, silvering mirrors, and in making amalgams for dental work. Half of the mercury produced in this country is exported to Mexico, Central America and China.
<b>Aluminium</b> (or aluminum) is the lightest metal in common use. Fr. and Ger., <i>Aluminium</i> ; Sp., <i>Aluminio</i> .	<i>Bauxite</i> (aluminium hydrate) is the only ore. <i>Cryolite</i> (fluoride of aluminium and sodium), a mineral mined only in Greenland, was formerly used as an ore but is now utilized in the manufacture of alum and soda. <i>Alum</i> (a sulphate) is made from cryolite or clays. <i>Corundum</i> (aluminium oxide) is, next to diamond, the hardest natural mineral. <i>Sapphire and ruby</i> are transparent forms suitable for gems. <i>Emerald</i> is an impure form of corundum. <i>Feldspar</i> is a silicate of aluminium with other metals.	Bauxite is mined in France, Ireland, Austria, Arkansas, Alabama and Georgia. Aluminium is refined by electric processes, the works in America being located near Niagara Falls.	Used largely as an addition to iron and steel, preventing bubbles and waste in castings. Used in electrical work and for purposes where a light, strong metal is necessary, as in certain machinery, hulls for submarines, etc. Refineries are located in Switzerland, France and Great Britain.
<b>Clay</b> is chiefly silicate of aluminium and other metals. <i>Kaolin</i> is its purest form. The properties of clay vary with its composition. <i>China clay</i> , <i>fire clay</i> , <i>pipe clay</i> , <i>brick clay</i> , etc.	<i>Feldspar</i> is a silicate of aluminium with other metals.	Mined in Canada, Pennsylvania, Connecticut, New York, Maine and Norway.	Ground up for use in pottery making. The location of manufacturing centers of pottery of all kinds and of bricks is dependent on clay deposits. In pottery making, Ohio, New Jersey and Pennsylvania lead the United States. Abroad, fine china is made in France, Germany and China. All of these countries export chinaware.

## MINERAL PRODUCTS—Continued.

METALS	USES AND CHIEF PRODUCTS	LOCALITY AND PREPARATION	MANUFACTURE, USES AND TRADE
<b>Tin</b> is less abundant than most of the common metals. Fr., <i>Etain</i> ; Ger., <i>Zinn</i> ; Sp., <i>Estao</i> .	<i>Cassiterite</i> (tin oxide) is the only important ore. This mineral is commonly found as pebbles (stream tin) in gravel. <i>Stannite</i> and alloys containing tin are of enormous importance in the arts. Of these, <i>bronze</i> is chief. <i>Gun metal</i> , <i>printer's metal</i> , <i>type metal</i> and <i>brass</i> are other alloys. <i>Snails</i> of tin are used in dyeing, glass making, etc. <i>Stibnite</i> (antimony sulphide) is the chief ore of antimony. <i>Bismuth</i> occurs in small amounts in a pure state and also combined with sulphur. These metals form many alloys such as <i>type metal</i> , <i>anti-friction metals</i> , <i>white metal</i> , <i>babbit metal</i> , <i>fusible metals</i> , etc. <i>Tartar emetic</i> and other antimony compounds are used in medicine and dyeing. <i>Garnierite</i> (a silicate of nickel and magnesium) is the common ore. <i>Magnetic iron pyrite</i> ( <i>pyrrhotite</i> ) often carries several per cent of nickel. <i>Sulphides</i> and other compounds occur. <i>German silver</i> contains nickel, copper and zinc. It enters into other alloys.	The Malay peninsula and nearby islands (Borneo and Biliton) produce over half the tin ore of the world. The remainder is mined in Bolivia, Australia, Tasmania and Cornwall, England. Small deposits occur in the United States. Tin melts at a low temperature and is easily refined.  Antimony is produced in Germany, France, Italy, Hungary, United States, Japan, and other countries.  Bismuth comes mainly from Bolivia and Germany. Some is produced in Saxony and England.  In Ontario, Canada, nickel is found in <i>pyrrhotite</i> . <i>Garnierite</i> is mined in largest amount in New Caledonia. Norway produces other ores.	England manufactures more tin than any other country. <i>Stannite</i> , used for tin cans, roofing and kitchen utensils, is made by dipping sheet iron or steel in a bath of molten tin, then covering it with a thin layer of tin. <i>Stannite</i> is manufactured in the United States and imported from England. Tin metal is imported from England and Straits Settlements.  While the total amounts of these metals in use are relatively small, they are of high importance due to their peculiar properties. Our imports of antimony are mainly in the form of regulus or metal.  France and Germany refine nickel from imported ore, chiefly from New Caledonia. <i>Nickel</i> , especially hard and tough, is used for armor plate, special machinery and wire rope. <i>Nickel</i> is extensively used for cheap electroplating. <i>Nickel</i> and <i>nickel oxide</i> are exported to Holland and England from the United States and ores and matte are imported from Canada.
<b>Antimony</b> .—Fr., <i>Antimoine</i> ; Ger., <i>Antimon</i> ; Sp., <i>Antimonio</i> . <b>Bismuth</b> .—Fr., Ger. and Sp., <i>Bismuth</i> .			
<b>Nickel</b> .—Fr. and Ger., <i>Nickel</i> ; Ger., <i>Nickel</i> ; Sp., <i>Niquel</i> . <b>Cobalt</b> is found with nickel and forms pigments. Fr., <i>Cobalt</i> ; Ger., <i>Kobalt</i> ; Sp., <i>Cobalto</i> .			

## THE FOLLOWING METALS ARE LITTLE USED IN THE PURE STATE, BUT ENTER INTO THE COMPOSITION OF MANY USEFUL MINERALS

METALS	USES AND CHIEF PRODUCTS	LOCALITY AND PREPARATION	MANUFACTURE, USES AND TRADE
<b>Magnesium</b> .—Fr., <i>Magnésium</i> ; Ger., <i>Magnesium</i> ; Sp., <i>Magnesio</i> .	The metal is used in flash powders for photographic use. <i>Magnesia</i> (magnesium carbonate) is used in making earthen dishes and <i>epsons</i> salts and for preparing <i>magnesia</i> (calcined magnesia). <i>Dolomite</i> (magnesium calcium carbonate) is common limestone, used for building. <i>Talc</i> (hydrated magnesium silicate), <i>scapolite</i> or <i>scapolite</i> , is a soft mineral. <i>Merschaum</i> or <i>aspidolite</i> (magnesium silicate).	Chiefly mined in Austria, Germany and Greece.  Found in many parts of the world.  Mined in Maryland, Virginia, North Carolina, etc., and in Europe.  From Asia Minor and New Mexico.	Used in chemical manufacture, in fireproofing and lining furnaces. Imported into the United States.  Calcined dolomite is used for lining iron furnaces.  Made into laundry tubs, firebrick, hearthstones, griddles, slate and tailor's pencils, gas tips, etc. Imported in small amount from France and Italy. Easily carved. Made into pipes and cigar holders in Austria and France. Largely limited.
<b>Calcium</b> (Fr., <i>Calcium</i> ; Ger., <i>Calcium</i> ; Sp., <i>Calcio</i> ) has no commercial use in the metallic state. Its compounds, both natural and artificial, are of great economic importance.	<i>Asbestos</i> is a fibrous variety of serpentine (a magnesium silicate). <i>Mined</i> used is an artificial fibrous mineral. <i>Limestone</i> (calcium carbonate) is a very common rock used for building. It may be of almost any color and coarse or fine in texture. <i>Marble</i> is a name applied to limestones suitable for polishing or ornamental work. <i>Marble</i> is in translucent. <i>Chalk</i> is of peculiar soft texture; <i>whiting</i> is prepared chalk used to make pottery and paint; <i>precipitated chalk</i> is similar. <i>Lime</i> is made by burning (calcining) common limestone. <i>Fattened</i> and <i>hydraulic cements</i> are prepared by calcining siliceous limestones or a mixture of limestone and clay. <i>Chloride of lime</i> (or bleaching powder), <i>acetate of lime</i> , <i>calcium carbide</i> and many other compounds are of industrial value. <i>Gypsum</i> (hydrated calcium sulphate) is used in fertilizers (land plaster). <i>Plaster</i> is prepared by calcining (burning) gypsum. <i>Plaster of Paris</i> is its purest form. <i>Alabaster</i> is compact white gypsum. <i>Fluorite</i> (calcium fluoride) is a less common mineral. <i>Phosphate rock</i> (chiefly calcium phosphate, is important in the preparation of fertilizers and chemicals containing phosphorus.	Mined in Quebec, Canada. Another variety of asbestos comes from Italy. Mines recently discovered in Wyoming.  Limestones are found and utilized in all parts of the world. In the United States, Pennsylvania, Illinois, Ohio, Indiana, New York and Missouri are the chief producers. Fine marbles are quarried in Italy, Egypt, France, Spain and Greece. Vermont, Georgia, Tennessee and New York supply the greater part of the marble used in the United States. <i>Hydraulic cement</i> and <i>cements</i> are of enormous commercial importance, being used in concrete construction work. Europe and the United States produce large quantities. Pennsylvania is the leading state in this industry.  A common mineral mined in many parts of the world. Michigan, Kansas, New York, Ohio and other states produce it.  Mined in England, Kentucky and Illinois.  Found in deposits of organic origin in South Carolina, Florida, Tennessee, the West Indies, Canada, Spain, France, Germany and England.  Germany, England, Canada the United States and Spain produce the ores. Chemical laboratories transform them into the useful compounds.	Made into laundry tubs, firebrick, hearthstones, griddles, slate and tailor's pencils, gas tips, etc. Imported in small amount from France and Italy. Easily carved. Made into pipes and cigar holders in Austria and France. Largely limited.  A fireproofing material. This mineral fiber is spun and woven into fireproof fabrics for theater curtains or made into felt building paper, pipe covering, etc. As building material, limestone is used everywhere. Lime is used in chemical industries and mortar.  Handsome marbles are imported from Carrara, Italy, and other parts of Europe. Mexican onyx is also imported. Chalk comes mainly from the south of England. We export some Portland cement and import a little from Europe.  Buildings (both shops and residences) are constructed of this material. <i>Plaster of Paris</i> is used for casts, decorative plaster work, cement, etc.  Used in chemical manufacture and as a flux for ores. The natural phosphates are treated with sulphuric acid as a first step in the manufacture of phosphate fertilizers. Exported in large amount to Germany, England and other countries.  Sheep dip, rat poison, insecticides, emulsifying fluid, pigments and dyes are prepared with arsenic compounds. Arsenic salts are used in preparing certain coal-tar colors.
<b>Arsenic</b> .—Fr., <i>Arsenic</i> ; Ger., <i>Arsenik</i> ; Sp., <i>Arsénico</i> .	<i>Arsenopyrite</i> (arsenic and iron sulphide), <i>arsenite</i> and <i>realgar</i> (sulphides of arsenic) are the sources of arsenic. <i>Arsenic</i> (white arsenic, arsenious acid or oxide of arsenic), <i>arsenic green</i> and other compounds and salts are prepared.		

## METALS—Continued

METALS	ORES AND CHIEF PRODUCTS	LOCALITY AND PREPARATION	MANUFACTURE, USES AND TRADE
<b>Chrom.</b> —Fr. and Ger., <i>Chrome</i> ; Sp., <i>Cromo</i> .	<i>Chromite</i> (oxide of chromium and iron) is the only ore. <i>Bichromate of potash</i> is the most important compound.	Mined in Asia Minor, Greece, Canada, New Caledonia, California, etc. Salts are prepared in the chemical laboratory.	Bichromate of potash and chromic acid are used in tanning soft leather. A small percentage added to steel makes it very hard and suitable for burglar-proof safes, tools, etc. Salts of chrome are used for dyes and pigments (chrome yellow, chrome green).
<b>Barium.</b> —Fr., <i>Baryte</i> ; Ger., <i>Barium</i> , <i>Baryt</i> ; Sp., <i>Bario</i> .	<i>Barytes</i> or barite is a heavy white mineral (barium sulphate).	Mined in the United States and Germany.	A substitute for adulterant for white lead in paints and used in making oxygen.
<b>Strontium.</b> —Fr. and Ger., <i>Strontium</i> ; Sp., <i>Estroncio</i> .	<i>Strontianite</i> (strontium carbonate) and <i>celestite</i> (strontium sulphate) contain this element.	Found in Germany, Scotland, Texas and New York.	Strontium salts are used in sugar refining and making red fire.
<b>Potash</b> (or potassium), an alkaline metal. Fr. <i>Potasse</i> ; Ger., <i>Kalium</i> ; Sp., <i>Potasio</i> .	Chlorides, sulphates, etc., are found in Germany. Wood ashes and sugar beet refuse furnish much of the world's potash.	Stassfurt, Germany, possesses the only known large deposit of natural potash salts.	These salts are the source of potash in many chemical industries and in fertilizers. Exported in large amount from Germany to England, France and America.
<b>Sodium</b> (Fr., <i>Sodium</i> ; Ger., <i>Natrium</i> ; Sp., <i>Sodio</i> ) is the most important alkaline metal.	Salt (rock salt, sea salt, lake salt, halite or sodium chloride) is the commonest natural compound of sodium. Important for food and in chemical manufacture.	Rock salt is mined in Germany, Austria, Spain, England, Louisiana, Kansas, India and other parts of the world. Obtained by evaporating salt water from wells in England, Michigan, New York, Ohio and China, or by evaporating salt water in the West Indies, Great Salt Lake, etc.	Used for meat packing, curing fish, in silver plating, and the preparation of hydrochloric acid, soda ash, carbonate of soda, etc. The foreign trade in salt does not represent very large values.
	<i>Soda niter</i> (nitrate of sodium) is a very easily soluble mineral.	Found in quantity only in the deserts of northern Chili.	Exported in large amounts to Europe and America for fertilizer and the manufacture of nitric acid and other chemicals.
	<i>Borax</i> (hydrous sodium borate) occurs in nature in an impure form and is prepared also from calcium borates.	Borates are found in Tuscany, Central Asia, California and Nevada, and in South America.	Borax and boracic acid are used in pottery manufacture, for the preservation of meat, in dyeing and in medicine.
<b>Rare Metals.</b> —Tungsten, molybdenum; vanadium, uranium, thorium, cerium, lanthanum and yttrium.	The ores of these metals are unusual minerals.	Found in Colorado, Arizona, Germany, England and Sweden.	Used in making special high grades of steel. Their salts are used in dyeing.
	Monazite, samarskite, thorite and other rare minerals contain these elements.	Found in North Carolina, Norway, Brazil and Ceylon.	Used in preparing the mantles for incandescent gas lights.
Lithium.	Lithium silicates are the source of this element.	Principally from South Dakota, California and Sweden.	In chemical laboratories converted into lithium carbonate for medicinal tablets and mineral waters.
Radium.	Occurs with ores of uranium.	A newly discovered very rare element.	The chloride has peculiar properties and is used chiefly by physicians.

## NONMETALLIC MINERALS

MINERAL	ORES AND CHIEF PRODUCTS	LOCALITY AND PREPARATION	MANUFACTURE, USES AND TRADE
<b>Sulphur.</b> —Fr. <i>Soufre</i> ; Ger., <i>Schwefel</i> ; Sp., <i>Azufre</i> .	<i>Sulphur</i> or <i>brimstone</i> is found in a pure state in volcanic regions or associated with gypsum and limestone. <i>Pyrite</i> (sulphide of iron) is also a source of sulphur compounds.	Sicily, Italy, Japan, Louisiana and Utah have mines of native sulphur.	Used in manufacturing sulphuric acid, gunpowder, matches, as a disinfectant, for bleaching and vulcanizing rubber. Blue vitriol, green vitriol and alum are sulphates. Sulphur is imported from Sicily and Italy.
<b>Quartz</b> (silica) is of many varieties, crystalline to amorphous. Fr., <i>Quartz</i> ; Ger., <i>Quarz</i> ; Sp., <i>Cuarzo</i> .	<i>Rock crystal</i> is employed for lenses. Many semiprecious stones are varieties of quartz, as <i>agate</i> , <i>moose agate</i> , <i>onyx</i> , <i>sard</i> , <i>chalcodendrite</i> , <i>chrysoprase</i> , <i>jasper</i> , etc. <i>Rock flint</i> , <i>flint</i> and <i>quartz sand</i> are used in making glass and pottery. <i>Sandstones</i> of various colors are chiefly quartz.	Rock flint is mined in Connecticut and Pennsylvania. Flint comes from the chalk cliffs of England and France. Sandstones are quarried and used for building in almost all parts of the world. Pennsylvania, Ohio, and New York supply the greatest quantities in the United States. <i>Hornstones</i> and <i>whetstones</i> are mostly sandstone, and in this country are largely quarried in Arkansas, Michigan and New Hampshire.	Outside of building stones, quartz is used in greatest amount in making glass and pottery. For glass it is melted with alkali (soda ash) and either lime or lead oxide. Glass is either blown or molded. Belgium, Austria, Germany, France, Great Britain and the United States manufacture glassware. Pennsylvania, Indiana and New Jersey are the leading states. Large amounts are imported by England and the United States.
<b>Gems</b> of many kinds are found in nature. Fr., <i>Pierres précieuses</i> ; Ger., <i>Edelsteine</i> ; Sp., <i>Piedras preciosas</i> .	These are nearly all transparent stones having brilliancy or beauty of color. Aside from diamond, emerald and varieties of quartz, the following are important— <i>topaz</i> , <i>emerald</i> , <i>apuanmarine</i> , <i>tourmaline</i> , <i>zircon</i> , <i>sphene</i> , <i>moonstone</i> , <i>opal</i> , <i>turquoise</i> and <i>garnet</i> .	Produced in many parts of the world. Siberia, Russia, Ceylon, India, Brazil, North Carolina and Montana are all important.	Cut and polished for use in jewelry. Much of this work is done abroad.
<b>Mica</b> is a common mineral found in rocks in many parts of the world. Fr., <i>Mica</i> ; Ger., <i>Marienglas</i> , <i>Glimmer</i> ; Sp., <i>Espicjuelo</i> .	Several varieties occur ( <i>muscovite</i> , <i>biotite</i> , etc.) Valuable only when found in large sheets which can be split smoothly.	Mined in India, Canada, North Carolina and South Dakota.	Transparent sheets are used for lamp chimneys and stove doors. Employed in electrical work, and lubricating. Imported from India.
<b>Building Stones.</b> —Fr., <i>Pierres de construction</i> ; Ger., <i>Bausteine</i> ; Sp., <i>Piedras de construcción</i> .	<i>Granite</i> , <i>gneiss</i> , <i>marble</i> , <i>basalt</i> and other hard or durable rocks.	Quarried for local use in all parts of the world.	Only stone of exceptional beauty is shipped to a great distance. Scotland, Norway, Massachusetts, Maine and other localities produce fine stones.

## CARBON AND CARBON COMPOUNDS

MINERAL	FORMS AND CHIEF PRODUCTS	LOCALITY AND PREPARATION	MANUFACTURE, USES AND TRADE
<b>Coal</b> is the most important fuel. <i>Fr., Charbon de terre, houille; Ger., Kohle, Steinkohle; Sp., Carbon mineral.</i>	<i>Peat, lignite and brown coal are poor in quality, retaining much appearance of vegetable origin. Bituminous coal, coking coal, non-coking coal, anthracite coal, cherry coal, splint coal, gas coal, steam coal, etc., are all varieties of soft coal and contain a considerable percentage of volatile matter. A suberose coal is almost pure carbon.</i> By distillation, bituminous coal yields gas, ammonia, coal tar and coke. Coal tar products are numbered by the thousand. Among them are naphtha, benzene, oil of turpentine, perfume, flaxene, drugs, saccharine, aniline and other dyes, phenol, carbolic acid, naphthalic acid, naphthalene, photographic developers, cresolite, oil tar and pitch.	Coal is a result of the alteration of vegetable matter. Deposits occur in almost all parts of the world, but many are almost entirely undeveloped; as, for example, the coal fields of China. The largest production is in the United States, Wales, England, Germany, Austria, Russia and Australia. Mines are worked in India, Japan, Borneo and the Philippines. Pennsylvania, Ohio, West Virginia, Alabama, Indiana, Iowa and many other states mine coal in great amount. Pennsylvania produces nearly all of the anthracite and a large quantity of bituminous coal.	Bituminous coal is the fuel which runs the factories, railways and steamships of the world. The distillation of coal tar and the utilization of its numerous by-products, is one of the best examples of modern economy which turns waste material into useful products at large profits. Much coke is made without any by-product. The United States exports coal, both bituminous and anthracite to Canada and ships bituminous coal to Mexico, Cuba and other countries. Some coal is imported from British America. Great Britain has a large export trade in coal. Much of that shipped from Cardiff, Wales, is in the form of briquettes or blocks made by mixing small coal with pitch or tar and pressing it into shape.
<b>Petroleum</b> (or coal oil).— <i>Fr., Pétrole; Ger., Petroleum, Bergöl; Sp., Petróleo.</i>	Petroleum or coal oil, in its crude state, is a dark colored liquid. It yields by distillation, first, light oils, gasoline, naphtha, benzene; second, illuminating oil, kerosene, kerosene oil, etc.; third, lubricating oils, engine oil, cylinder oil, machine oil; fourth, petroleum residuum (for asphalt paving) and coke. Petroleum, naphtha and paraffin wax are by-products in petroleum refining.	Obtained from wells in the United States, Russia, Dutch East India, Galicia, Rumania and other countries. More than half of the world's output is from the United States, the leading districts being (1) Kansas and Oklahoma, (2) California (3) Illinois, (4) Pennsylvania and (5) Texas. Crude oil is transported from the wells for hundreds of miles through pipe lines to the refineries.	Probably no modern industry is more effectively organized and carried on than the petroleum business. There is no waste in the distillation of the crude oil and no part of it for which uses have not been found. In addition, the business of selling the oil is managed with the highest skill. American kerosene oil is exported to all parts of the globe. Crude oil is sold as well as other petroleum products.
<b>Asphaltum</b> (or mineral pitch).— <i>Fr., Asphalte, Goudron minéral; Ger., Asphalt; Sp., Asfalto.</i>	A bituminous mineral substance found more or less pure, in some localities. Rock asphalt consists of sandstone or limestone impregnated with asphalt. Much asphalt is produced in refining certain grades of petroleum—such as those obtained in California and Texas.	The pitch lake of Trinidad and the Bermudez lake at the mouth of the Orinoco in Venezuela, are the largest known deposits of moderately pure asphalt. Smaller deposits of high grade occur in Utah, Cuba and the Barbadoes. Rock asphalts are mined in France, Switzerland, Sicily, California, Kentucky and Oklahoma.	For paving, rock asphalts are much used in Europe. Trinidad and Venezuelan asphalt are exported in large quantities to the United States and Europe. For paving, these lake asphalts are mixed with broken stones, sand and petroleum residuum. Pure varieties (gilsonite, marjak, glance pitch) are made into black varnish, used for insulating, etc.
<b>Graphite</b> is almost pure carbon. <i>Fr., Graphite; Ger., Graphit; Sp., Gráfico.</i>	Plumbago or black lead is used in making erasables, lead pencils, lubricants for heavy machinery, stove polish, foundry facings, paint, etc. Artificial graphite is made from coal or coke by an electric process.	Produced in Bohemia, Ceylon, Italy, Germany, Mexico and the United States. The deposits in Ceylon are the largest in the world. Much of that mined in New York and Alabama is of very high grade.	Powdered graphite is mixed with fine clay in greater or less proportion and then molded and baked to form such articles as pencils and lead for pencils. Graphite is imported from Ceylon to the United States, and lead pencils from Europe.
<b>Diamond</b> is pure crystallized carbon. The hardest known substance. <i>Fr., Diamant; Ger., Diamant; Sp., Diamante.</i>	Many diamonds are transparent, colorless stones. Some are blue or yellow. Some stones (soft and uncolored) are used for gems but valuable for polishing or in diamond drills.	South Africa produces the bulk of the world's supply. These deposits are in rock. In Brazil and India a few diamonds are found in gravel. Most of those from Brazil are opaque and dark colored (carbonado).	The beauty of a diamond is largely due to cutting. The diamond cutting industry is centered in Amsterdam and Antwerp. Diamonds are imported to the United States mainly from Holland and Belgium after cutting. Carbonado is used in diamond drills. Diamonds are used in cutting glass and for grinding and polishing.
<b>Amber</b> is a fossil resin. <i>Fr., Ambre; Ger., Bernstein; Sp., Ambar.</i>		Found chiefly along the shores of the Baltic.	Used in making mouthpieces for pipes, cigar holders, beads, etc.
<b>Carborundum.</b>	Carbide of silicon. Harder than any known substance but the diamond.	Manufactured at Niagara Falls, by electrically heating a mixture of coke, sand and salt.	Used for making polishing powder, in grinding wheels, sharpening stones, abrasive cloth, etc.

**MONEY, BANKING AND FINANCE.**

Money comprises all things which every one accepts in exchange for his property and services and in exchange for which one can always procure the property and services of others which are on the market for sale. It includes coins made of gold, silver and copper, notes issued by banks, and, in the United States and some other countries, certain government notes.

**Functions of Money** may be described by the phrases *standard of value* and *medium of exchange*. By the former is meant that commodity in terms of which the value, or ratios of exchange, of commodities are measured and expressed. Gold is that commodity in the chief commercial countries of the world at the present time, and a certain definite portion of it, in the United States 23.22 grains, is declared by statute to be the unit of value and is given a special name, as the dollar, pound sterling, mark, franc, etc. By the medium of exchange is meant those things which *mediate*, or act as go-betweens, in exchanges. It includes coins made of the

standard commodity, all other things included under the head money, and many things not ordinarily so included, such as bank deposits, some other book accounts, various devices for making payments used by express companies and post offices, private tokens, etc.

**The Elements of the Medium of Exchange** common to the leading countries at the present time may be classified as *standard coins*, *subsidiary coins* and *bank currency*. In some countries are also found certain special coins not classifiable either as standard or subsidiary, and certain government notes.

**Standard Coins** are those made from the commodity which serves as the standard of value, are minted freely or at a small charge for whoever brings metal of the proper standard to the mints, and are legal tender for all payments public and private.

**Subsidiary Coins** are usually made of silver with an intrinsic value below their face value, are redeemable in standard coins, are legal tender only for small amounts, and are minted in limited quantities on gov-

ernment account. Among special coins may be mentioned the United States silver dollar, the five-franc piece of France, Belgium, Switzerland and Italy, and the thaler of Germany. These are coins which possess full legal tender power in their respective countries, and are not directly redeemable in standard coins, but are either longer coined at all or only coined from time to time in limited quantities under the authority of special laws.

**The Government Notes** referred to are usually noninterest-bearing promissory notes issued by governments in various denominations suitable for monetary purposes, and payable to bearer on demand. In the early stages of their history they are frequently not redeemable on demand in standard coins, and consequently depreciate in various degrees according to the likelihood of their redemption in a long or a short period, the fiscal condition of the government issuing them, and other circumstances.

**United States Money.**—The medium of exchange of the United States at the present

time, exclusive of its bank currency, consists of gold coins, silver dollars, silver half and quarter dollars and dimes, a nickel five-cent piece, a copper cent, gold certificates, silver certificates, greenbacks and Sherman notes.

**Gold and Silver Certificates** are issued, the former chiefly in large, and the latter in small denominations, by the treasury department in exchange for gold coins and silver dollars respectively, which are held for their redemption.

**Greenbacks**, also called **United States notes**, were first issued in 1862 and 1863 to assist in financing the Civil war. Until January

1, 1879, they were not redeemable in coin and were consequently depreciated. Since that time the Secretary of the Treasury has been obliged to redeem them in gold on demand, and for that purpose has kept on hand a gold reserve, which was fixed at \$150,000,000 by the act of 1900. When redeemed, they can only be reissued in exchange for gold coin, and the total amount which may be issued under existing laws is \$346,681,016.

The **Sherman Notes** were issued under authority of an act passed in 1890 providing for the purchase each month of 4,500,000 ounces of silver bullion at its market price,

to be paid for in treasury notes, which were to be redeemable on demand in gold coin or silver dollars at the option of the Secretary of the Treasury.

In 1893 the silver purchase clause of this act was repealed, about \$150,000,000 of the certificates having been issued to that time. The bullion accumulated in the vaults of the treasury under authority of this act was subsequently coined by authority of law, silver certificates issued, and, by authority given in the act of 1900, gradually substituted for the Sherman notes, less than \$4,000,000 of which still remain in circulation.

#### MONETARY SYSTEM OF THE UNITED STATES AS AT PRESENT CONSTITUTED I. Gold, Silver and Minor Coins

	GOLD COIN	STANDARD SILVER DOLLARS	SUBSIDIARY SILVER COIN	MINOR COIN
<b>Weight</b> .....	25.8 grains to the dollar.	412.6 grains.	355.5 grains to the dollar	5 cent piece: 77.16 grains, 75 per cent copper, 25 per cent nickel. 1 cent piece: 48 grains, 95 per cent, copper, 5 per cent tin and zinc. Nobles of the people. 5 cents, 1 cent. Not to exceed 25 cents.
<b>Finesness</b> .....	900-1000.	900-1000.	900-1000.	For all dues up to 25 cents.
<b>Ratio to gold</b> .....	Unlimited.	15.988 to 1.	14.953 to 1.	For all dues up to \$10.
<b>Limit of issue</b> .....	Unlimited.	Coins ceased in 1905.	Needs of the people.	For minor coin.
<b>Denominations</b> .....	\$20, \$10, \$5, \$2½.	Unlimited, unless otherwise contracted.	50 cents, 25 cents, 10 cents.	In lawful money at the treasury in sums or multiples of \$20.
<b>Legal tender</b> .....	Unlimited.	For all public dues.	For all dues up to \$10.	In lawful money at the treasury in sums or multiples of \$20.
<b>Acceptable</b> .....	For all public dues.	For silver certificates and minor coin.		
<b>Exchangeable</b> .....	For gold certificates, as below, and subsidiary and minor coin.			
<b>Redeemable</b> .....				

#### II. Paper Currency

	GOLD CERTIFICATES	SILVER CERTIFICATES	UNITED STATES NOTES	TREASURY NOTES OF 1890	NATIONAL BANK NOTES
<b>Limit of issue</b> .....	Unlimited for gold coin unless gold reserve falls below \$100,000,000.	Amount of silver dollars coined, \$562,172,530.	\$346,681,016.	No further issue; volume steadily diminishing by redemption in silver dollars.	Not to exceed capital of banks.
<b>Denominations</b> .....	\$10,000, \$5,000, \$1,000, \$500, \$100, \$50, \$20, \$10.	\$100, \$50, \$20, \$10, \$5, \$2, \$1.	\$1,000, \$500, \$100, \$50, \$20, \$10, \$5, \$2, \$1.	\$1,000, \$500, \$100, \$50, \$20, \$10, \$5, \$2, \$1.	\$1,000, \$500, \$100, \$50, \$20, \$10, \$5.
<b>Legal tender</b> .....	Not a tender.	Not a tender.	For all debts, public and private, except customs and interest on public debt.	Unlimited, unless otherwise contracted.	Not a tender.
<b>Acceptable</b> .....	For all public dues.	For all public dues.	For all public dues.	For all public dues.	For all public dues except customs.
<b>Exchangeable</b> .....	For subsidiary and minor coin.	For silver and minor coin.	For silver and minor coin.	For silver and minor coin.	For subsidiary silver and minor coin.
<b>Redeemable</b> .....	In gold coin at the treasury.	In silver dollars at the treasury.	In gold at the treasury.	In gold at the treasury.	In lawful money at the treasury, or at bank of issue.

#### COINAGE OF THE UNITED STATES, 1793-1910

DENOMINATION	PIECES	VALUES	DENOMINATION	PIECES	VALUES
<b>GOLD</b>					
<b>Double eagles</b> .....	112,807,169	\$2,256,143,380.00	<b>Half dimes</b> (coinage discontinued, act of Feb. 28, 1879).....	97,604,388	\$4,880,219.40

The Medium of Exchange of Other Countries, exclusive of their bank currency, resembles that of the United States

in most essentials, but differs from it in some particulars. Canada.—That of Canada approximates it

most closely, the unit of value being the same, and government notes playing an important rôle. The gold coins of both

England and the United States, however, are there current, and the governor-general may declare other gold coins legal tender at their bullion value.

**England** has a large unit of value, consisting of 123.274 grains of standard and 113,001 grains of pure gold, which is represented in a coin called the *sovereign*. Its silver coins are all subsidiary, the shilling weighing 87.9 grains 0.925 fine, being the unit among them and having a tale value of one-twentieth of a sovereign. The penny and the farthing are minor coins of copper having tale values respectively of one-twelfth and one-fourty-eighth of a shilling.

Unlike the United States, England does not use government notes as an element of currency.

**France, Belgium, Switzerland, and Italy** have the so-called franc system, the franc, consisting of 4.978 grains of standard and 4.4872 grains of pure gold, being the unit. In these countries all the silver coins are subsidiary, except the five-franc piece, which in its status closely resembles the silver dollar of the United States. It contains 385.8 grains of standard and 347.22 grains of pure silver, and from 1865 to 1874 was coined in unlimited amounts for private persons at a seigniorage charge of one and two-thirds francs per kilogram. Between 1874 and 1878 they were coined in limited quantities for government account only, but since the latter date their coinage has been suspended. However, they still remain legal tender at their tale value for all amounts.

**Germany** makes the mark its unit, consisting of 6.1457 grains of standard gold. All silver coins are subsidiary except the thaler. The silver mark weighs 85.733 grains, and all subsidiary coins are legal tender only in payments of twenty marks or less. The thalers are remnants of the old currency systems in use before the foundation of the empire and are legal tender for any amount. Imperial treasury notes constitute a small element of the currency of the empire.

**Banks.**—The largest element of the medium of exchange of commercial nations is supplied by banks, which also frequently perform other important financial functions, such as the encouragement of saving, the purchase and sale of securities, the promotion of industrial enterprises and the execution of trusts of various kinds. Their most fundamental operations are the conduct of deposit accounts and the making of loans and discounts.

**Deposits** are credits on the books of a bank obtained by business men and others by the sale to the bank of their surplus cash, their own personal notes, and of credit instruments representing payments due them from other people. These credits give the customer the right to call upon the bank for legal tender money or for a transfer to the credit of some other person of all or some part of the amount due him. Some, known as *demand deposits*, give the right to demand payment at any time without notice, and others, known as *time deposits*, only after the lapse of a certain time from the date of demand.

**Check.**—In making use of his rights the customer employs the *check*, which is a written order to the bank to pay to bearer or to the order of a specified person a specified sum.

**Loans and Discounts.**—The personal notes and bills of exchange payable at some future date received by the bank in return for credits allowed or cash advanced are usually described in bank accounts as *loans* and *discounts*.

**Bank Notes.**—Instead of opening credit accounts or advancing legal tender money to its customers a bank having the authority may *issue notes*—that is, transfer to them its promises to pay to bearer on demand—in denominations convenient for use as money. To the bank these notes represent obligations of the same kind as deposits, but to the customer they serve as hand-to-hand money and may be substituted for government notes, and, for many purposes, for coin.

**Banking Processes.**—Through the processes involved in *loaning, discounting, conducting deposit accounts, and issuing notes*, banks perform a large part of the world's exchange. In the United States the major part. Nearly all business men and a large percentage of other people are their customers.

Purchases of goods are generally made on time, the credit instruments, such as personal notes and bills of exchange, which represent the obligations thus created, are discounted by the banks, and deposit accounts opened against them. By transfers of these from one person to another the mutual indebtedness created by purchases and sales on credit are canceled and the transactions thus completed and closed.

**Profits.**—The interest on the discounted notes and bills, which it has purchased by credit accounts bearing no interest or a lower interest, than is charged on loans or by notes, is the chief source of a bank's profits.

**Exchange.**—In the conduct of their business banks find themselves each day in the possession of checks, drafts and other bills of exchange drawn on other banks in the same or other cities.

**Clearing Houses.**—In order to collect those drawn on banks located in the same town or cities, banks have organized clearing houses in all large and in many small cities. These are places at which clerks of the various banks meet for the purpose of exchanging checks, drafts, etc., and settling mutual obligations.

**Correspondents.**—For the collection of paper drawn on out-of-town banks and the supply of their customers with the means of meeting out-of-town payments, banks usually employ what are known as *correspondents*. These are banks in commercial and financial centers with which they open deposit accounts on which they arrange to have credited the amounts of checks, drafts, etc., sent for collection, and debited the drafts drawn in favor of their customers. Through this correspondence system the banks of the entire commercial world have been organized into a great machine for the conduct of commerce, business men anywhere being able through their banker to make payments in any part of the world or to receive amounts due them.

Through it, also, the mutual indebtedness of the people of different cities, states and nations, created by mutual trade, investments, and other financial operations, are canceled in substantially the same manner as those between citizens of the same place are canceled by local banks and clearing houses.

**Bank Balances.**—The aggregate of the debits and credits which the banks of a place have with their correspondents represents a considerable degree of accuracy what the people of the place owe to outsiders and what outsiders owe to them. The balance between these aggregates may be great or small, in favor of the banks or against them, and their payment, if demanded, must be accomplished by the

shipment of money. If payment is not demanded the banks will ordinarily pay interest on adverse balances and receive interest on favorable ones. The banks are thus put to expense whenever the balance is against them and are making a profit whenever it is in their favor. In the first case, in order to indemnify themselves, they must charge a premium on drafts on out-of-town places, and in the second case they can afford to sell drafts at a discount, provided they can make more out of their funds at home than the interest allowed on their balances with correspondents.

**Rate of Exchange.**—This premium charged or discount allowed on drafts is known as the *rate of exchange*. If a premium is charged, *exchange is said to be at a premium*; if a discount is allowed, it is said to be at a discount.

The rate of exchange at a given time is fixed by a process of bargaining between either the banks of a place which have favorable balances with correspondents and therefore desire or are willing to sell exchange, and those which have unfavorable balances and consequently desire or are willing to buy exchange, or, in case all the banks are in the same situation as regards the condition of their balances, between the banks and those of their customers who want exchange.

**Foreign Exchange.**—In the foreign exchange, between countries having the same standard, the so-called *par of exchange* must be calculated; that is, the exact equivalent of the unit of one nation in terms of the other. Between the United States and other nations this calculation consists of dividing the number of grains of pure gold contained in the foreign unit by 23.22, the number of grains of pure gold in our dollar.

Between countries having different standards—for example, between gold and silver standard countries—the place of the par of exchange is taken by the relative market values of the two metals. If one or both of the nations have a secondary standard its depreciation must be calculated as well as the par of exchange or the relative values of the metals constituting their primary standards.

The rates of exchange between foreign countries fluctuate above or below the par of exchange or the substitute for it as the domestic rate fluctuates above and below the par value of domestic drafts. Between gold standard countries the upper and lower limits of these fluctuations are determined by adding to and subtracting from the par of exchange the cost of obtaining and shipping gold, and are called the *gold points*.

**Foreign Drafts** are drawn by parties of various degrees of financial reputation and are made payable at different dates. Accordingly the element of interest enters into the calculation when he sells a *time-draft* draft he receives the pay for it at the date of sale and still draws interest on the total amount of his balance for sixty days, the draft not being payable until after the lapse of that period of time.

When a New York banker sells a *cash* there is no appreciable interval between the time at which he receives the pay for it and the time at which his balance with his foreign correspondent is diminished by the amount drawn, when he sells a *time-draft* draft he receives the pay for it at the date of sale and still draws interest on the total amount of his balance for sixty days, the draft not being payable until after the lapse of that period of time.

Leaving out of consideration, therefore, the cost of the cablegram, he could afford to

sell a sixty-day draft at the price of a cable minus interest on the amount for sixty days at the rate received on balances with his correspondent.

**Classes of Banks.**—From the standpoint of the source of their authority to do business, banks in the United States may be classified as *national, state and private* according as they are chartered by Congress or by state legislatures or operate without charters under the authority of the common law.

State banks may be subclassified into *commercial banks, savings banks and trust companies.*

The basis of this classification is the nature of the business performed.

**Commercial Banks** perform the functions described and cater to the needs of the commercial classes.

**Savings Banks** specialize in the business of promoting saving by keeping time deposits, upon which they allow relatively liberal rates of interest, and by investing them in high-class securities, like bonds and real estate mortgages, instead of commercial loans of the kind chiefly sought by commercial banks.

**Trust Companies** were originally organized for the purpose of administering financial trusts of all kinds, such as the estates of deceased persons, or of living persons who are unable or unwilling to administer them for themselves, and those of charitable, educational and other institutions. They have added to these, however, numerous other functions, such as acting as financial agents for corporations, states, municipalities, and at times even the federal government; promoting and financing new enterprises, especially combinations, mergers and trusts; stock jobbing; the promotion of saving; and, when not forbidden by law, commercial banking.

In fact the tendency of their development is in the direction of making them financial department stores in which every branch of finance is carried on.

**Banking Laws.**—The laws governing the different classes of institutions are not uniform throughout the United States, although there is a tendency toward uniformity observable in recent legislation.

**The National Banks** are regulated by the federal banking code, which among other provisions confers the right to issue notes on the security of government bonds deposited with the comptroller of the currency; prohibits loans on real estate security and holding of real estate except for certain carefully specified purposes; limits the amount that may be loaned to any single firm or person to 10 per cent of the bank's capital and surplus; and prescribes a minimum capitalization of \$25,000, and a reserve against deposits of 15 per cent in the case of country banks and of 25 per cent in the case of others.

**Touching Other Banks.**—The legislation of the various states regarding commercial banks is far from uniform, but the national banking code has served as a model in many cases. The chief differences between the rights and privileges of the two classes of institutions are the following:

(1) State banks do not issue notes chiefly because the national government levies a tax of 10 per cent on such notes and sometimes also because such issues are prohibited by law.

(2) In most states commercial banks with a capital stock as small as \$10,000 are permitted and in a few no minimum is prescribed.

(3) The laws of most states are more liberal than the national banking code in the matter of real estate loans and in that of the amount permitted to be loaned to a single firm or individual.

The laws regarding savings banks differ somewhat according as the institution belongs to the *mutual or the stock* class, but usually limit their investments to certain specified classes of securities, limit the amount of deposits in the name of a single individual, and permit the bank to require a certain number of days' notice of the depositor's intention to withdraw deposits.

Legislation regarding trust companies is changing rapidly. The tendency in some states now is to require them to segregate the different branches of their business and to conform to the laws regulating institutions which specialize in each branch; for example, to the laws regarding commercial banks in the management of their strictly commercial business, to those regarding savings banks in their savings business, etc.

**European Banking Systems** differ from ours chiefly in the presence in each country of a central bank in such relations to the government and the other banking institutions as to make it the center and balance wheel of the entire system.

In England this central institution is the Bank of England, in France the Bank of France, and in Germany the Imperial Bank. The most important other commercial banking institutions of these countries fall into groups somewhat different from those in the United States.

In England they are the *joint-stock and private banks, foreign and colonial banks and discount firms and companies.*

In France, five great incorporated institutions which do the bulk of the business; *private banks, provincial banks, and foreign and colonial banks.*

In Germany, eight large incorporated banks, *private banks, provincial banks, mortgage and cooperative banks.* In all of these countries these banks operate extensively through branches.

**Postal Savings Banks.**—In most European countries are also found postal savings banks conducted by the post-office departments of their respective governments, and in many of them so-called mortgage banks for loaning on real estate security and cooperative banks for loaning to peasants, artisans and others on the joint security of their combined properties.

**The Financial Center** of each country, which is usually also its chief commercial center, is the seat of its chief money market. By this is meant the place where the machinery for the keeping and distribution of the money funds of the country, for the determination and registration of loan rates, for the investment of a large portion of its capital, and for the sale and registration of its principal securities, is located. The central money market of this country is in New York City; that of England is in London, and those of France and Germany in Paris and Berlin respectively.

**Machinery of the Money Market.**—The most important parts of the machinery of the New York money market are the *banks, state and national, organized into the clearing house association, groups of trust companies, private banks and foreign banks, the United States subtreasury and assay office, and the stock exchange.*

**The Associated Banks** act as reserve agents and correspondents for banks and trust companies in every part of the country,

and in this capacity hold balances to the credit of these institutions which aggregate very large sums.

**The New York Subtreasury** receives and disburses a very large percentage of the revenues of the federal government, and thus at times draws heavily on the funds on deposit in the associated banks and at others pours large amounts into their coffers.

**The Assay Office** is the principal avenue through which new supplies of the precious metals reach the market.

**The Trust Companies** serve as financial agents for the great railroads, trusts and other corporations of national scope and influence and also do a large commercial banking business.

**The Foreign Banks** mediate between foreign financial centers and New York.

**The New York Stock Exchange** lists the bonds and stocks of great railroads, public service corporations, trusts and other industrial corporations of national scope, the bonds of the United States government, and occasionally those of foreign countries, of states and municipalities, and the stock of banks and trust companies. It furnishes a carefully regulated market for the daily purchase and sale of these securities and also a place for the loaning of such funds as bankers and other parties wish to place at the disposal of stock brokers, speculators and investors.

The private banks and brokerage firms mediate between the investors of the country, the stock exchange and the banks.

**The Cash Reserves** of the associated banks thus constitute the central money reservoir of the country. From it are drawn a considerable portion of the funds needed by banks in every part of the country for the accommodation of their customers and to it ultimately flows their surplus cash. From it also the United States government draws most of its supplies and to it contributes from time to time its surpluses.

**The Financial Barometer.**—The amount of these reserves in excess of 25 per cent of their deposits, the minimum amount required by law to be kept constantly on hand in their vaults, called the *surplus reserves*, is an excellent barometer of the power of the New York banks to lend, and is, therefore, constantly watched by persons and institutions whose operations are based on loans obtained in the New York market.

The rates charged for loans are also affected by the fluctuations of these reserves, usually rising when they fall and vice versa. When the surplus reserves fall to a low point or entirely vanish, as a result of drafts on the New York banks from various parts of this country, from foreign countries, from the subtreasury, or from all three combined, the money rates accordingly rise to very high points, and operators on the stock exchange, being deprived of funds for further operations and being called upon to pay their loans, are forced to sell the securities lodged as collateral at such prices as they will bring.

**Panics.**—At such times the values of securities fall, and sometimes, when this movement goes to extremes, a panic ensues. If the efforts thus to raise funds to meet obligations to the banks wholly or to a considerable degree fail, bank failures at commercial centers result, followed by a rapidly widening circle of banking and commercial failures throughout the country. In other words a commercial crisis follows. The originating cause or causes of the crisis may be outside of and possibly widely

distant from New York, but it is quite certain to follow the course indicated on account of the vital connection of the New York market with the rest of the country.

**The European Central Banks.**—In Europe the central banks play a leading rôle in the money markets. They hold the reserves of the other banks, rediscount bills for them in case of need, act as bankers for their respective governments, issue most or all of the notes, and exercise a controlling influence over rates.

**Importance of Gold.**—Their ability to perform these functions depends primarily upon their power to influence the international flow of the precious metals, especially gold, and to issue notes against commercial bills. When, for example, the reserve of the Bank of England falls below a certain point, on account of drafts made upon it by other institutions, it raises the rate of discount.

This normally causes the market rate to rise, since the interest rate on deposits paid by other banks and financial institutions varies with the rate of discount.

rate and they must charge higher rates in order to reimburse themselves.

The rise in the market rate attracts funds from the continent or checks an outward flow and this increases the bank's reserve or prevents a further decline. The increased bank rate also acts as a check on borrowers and in this way also contributes toward the protection of the reserves.

**The Issue of Notes** against commercial securities by the Bank of France and other central institutions, having this right, contributes to the same end. When, for example, the demand for currency increases in France, larger drafts are made upon the Bank of France and these may be met in whole or in part by issues of notes instead of by payments of cash which would diminish the reserves. When the demand causes the surplus notes are deposited in the banks, returned by them to the central institution and canceled or preserved for issue at another time.

The same procedure is possible in Germany, though there, if the issues of the

Imperial Bank exceed a certain maximum, a tax of 5 per cent must be paid to the government on the excess.

The issues of the Bank of France are also limited by law to a certain maximum, but this is changed from time to time and is ordinarily maintained at so high a point as to leave the bank a large margin for increases in time of need.

**Advantages of Elastic Notes.**—In countries like these, in which the central banks have the right freely to issue notes against their general assets as well as to manipulate the exports and imports of gold through changes in their discount rates, the rates charged on loans both by the central and the other banks are more stable and fluctuate within narrower limits than in England, where the central bank lacks this special resource. The fluctuations are very much smaller both in number and in magnitude than in the United States, where, in the absence of a central bank, the means for manipulating exports and imports of gold are inadequate and the system of note issues quite as inelastic as that of England.

# UNIVERSAL GAZETTEER

**THE EARTH—Shape and Size of the Earth.**—The Earth is very nearly an oblate spheroid, whose shorter axis coincides with its axis of rotation passing through the two poles. It rotates at a velocity of 15 degrees an hour (about 17,366 miles a minute at the equator); a 1 degree is therefore equal to 4 minutes.

The circumference of the globe is about 24,855 miles, and the diameter about 7,900 miles. More exactly—

Earth's equatorial semidiameter equals 3963.290 miles.

Earth's polar semidiameter equals 3949.790 miles.

Earth's mean semidiameter equals 3956.794 miles.

Earth's oblateness equals one-three-hundredths.

One degree of latitude at pole equals 69.407 miles.

One degree of latitude at equator equals 68.704 miles.

The temperature increases on an average about 1 degree F. for every 64 feet descent. But this amount is variable according to the locality, geological formation, and dip of strata. In the Calumet and Ilwaco mines, observations show an increase of 1 degree in about every 125 feet. At Bendigo it is shown to be 1 degree per 80 feet of descent. At Bonchamp colliers, on the other hand, the temperature increases 1 degree F. in only 49 feet.

**Chemical Composition.**—By combining a large number of analyses of rocks of all sorts, F. V. Clarke has estimated the relative amounts of elements in the crust of the earth:

	Per Cent		Per Cent
Oxygen	47.02	Manganese	.07
Silicon	28.06	Sulphur	.07
Aluminum	8.16	Barium	.05
Strontium	4.64	Silver	.02
Calcium	3.50	Chromium	.01
Magnesium	2.62	Nickel	.01
Sodium	2.63	Lithium	.01
Potassium	2.32	Chlorine	.01
Titanium	0.41	Fluorine	.01
Hydrogen	0.17		
Carbon	0.12		100
Phosphorus	0.09		

**The Magnetic Pole.**—The geographical poles of the earth are the extremities of the imaginary line passing through its center of gravity and about which it revolves, and are therefore symmetrically located with regard to the equator.

The magnetic poles, however, are not coincident with the geographical poles, nor are they diametrically opposite to each other. The latest results show that the north magnetic pole, or locality where the dip is 90 degrees, is situated in King William's Land, Canada, in about 97 degrees west, 70 degrees north (extending over a considerable area). The position of the south magnetic pole has been located in latitude 72 degrees 23 minutes south and longitude 164 degrees east, by Prof. Edward David and Mr. Douglas Mearns, members of Lieut. Shackleton's expedition to the south pole which left New Zealand on January 1, 1908.

For reason of the annual variation of the magnetic needle, it is believed that the magnetic poles are not stationary, but have a slow motion around the geographical poles.

**The Land.**—The land covers 55,063,000 square miles on the assumption that 250,000 square miles of land remain to be discovered within the arctic regions, and that the supposed antarctic continent has an extent of 2,500,000 square miles within the antarctic circle.

**Heights and Depths.**—The mean height of the land has been estimated at 2,445 feet; the mean depth of the sea, 11,470 feet (Kartastan); the greatest depth of the ocean as yet discovered (in the Pacific, between Guam and Midway) is 31,614 feet. If the whole of the arctic crust of the earth were to be leveled, so as to form a spheroid, it would still be covered by an ocean of a uniform depth of 8,000 feet (Prof. Penck).

**THE OCEANS.**—The oceans, including the inland seas connected with them, cover 141,877,000 square miles, or 72 per cent of the total surface of the earth. There are 2.59 square miles of ocean to every square mile of land. Murray states the greatest depth of the Atlantic Ocean at 27,366 feet; Pacific Ocean, 30,000 feet; Indian Ocean, 18,582 feet; Southern Ocean, 25,200 feet; Arctic Ocean, 9,000 feet. The Atlantic Ocean has an area, in square miles, of 24,536,000; Pacific Ocean, 70,000,000; Indian Ocean, 17,084,000; Arctic Ocean, 5,500,000; Southern Ocean, 30,592,000.

**Antarctic Ocean.**—Is situated about, or within, the antarctic circle. The great Southern Ocean is that part of the ocean which surrounds the world between the latitude of 40 degrees south and the antarctic circle. The northern portions of this sea are often called the South Atlantic, South Indian and South Pacific, while the southern portions are usually called the Antarctic Ocean. The average depth of the continuous ocean which surrounds south polar land is about two miles; it gradually shoals toward antarctic land, and in some places is met with a short distance within the antarctic circle. Life is abundant in the arctic waters, but scarce in the bottom of the ocean. Only five navigators, Cook, Weddell, Ross, Seely, and Shackleton have crossed the 70th parallel south.

(See further, Polar Regions).

**Arctic Ocean.**—Lies to the north of Europe, Asia, and North America, and is situated within the arctic circle; it is usually defined as the water area within the arctic circle. Physiographically, the North Atlantic, the Barents Sea, and the Kara Sea, Norway and Greenland, belong to the same basin as the Arctic Ocean. If the Arctic Ocean is regarded as lying wholly within the arctic circle, then it is almost land-locked, between that circle and the parallel of 70 degrees north. It communicates with the Pacific by Behring strait, and with the Atlantic through Davis strait and the wide sea between Norway and Greenland. The area of the ocean is about 5,500,000 square miles, and into it there drain about 8,000,000 square miles of land.

The coasts of Europe and Asia are low, and have several deep indentations; the principal being the White Sea and Gulf of Ob. The shores of North America are skirted by a most irregular assemblage of islands, forming numerous gulfs, bays, and channels.

(See further, Polar Regions).

**The Atlantic Ocean.**—The Atlantic Ocean separates the old world from the new, and has been likened to a longitudinal valley divided by a series of mountain ranges into an eastern and a western half. Upon those plateaus there rise the volcanic islands of the Azores, St. Paul, Ascension, and Tristan da Cunha. The ocean, including the Mediterranean and other Inland Seas, covers an area of 21,410,000 square miles. Its greatest depth (4,261 fathoms) has been sounded to the north of the Virgin Islands, and has been named the international deep.

The currents are primarily originated by the wind. The trade winds, which blow from the northeast toward the equator, give rise to the northern and southern equatorial currents, which are deflected on reaching the eastern coasts of North and South America, returning toward the Gulf of Guinea (equatorial current or Guinea current), a portion following the northern coast of West Africa, and another the Caribbean Sea and the Gulf of Mexico, where it issues as the gulf stream. It is to the warm waters of the gulf stream that we owe our mild climate and freedom from icebergs. The cold currents flowing out of Baffin bay, southward along the coast of North America, and the cold Southern Ocean along the east coast of South America and the west coast of Africa, produce a series of fogs, and are the lowering of the

**Islands in the Atlantic.**—*Iceland* (Danish).—39,756 square miles, population (1901) 78,470. The island

consists in the main of a plateau, from which rise snow-capped mountains (Jökull) including the twin-peaked volcano. The highest summit is Vatna Jökull, 6,955 feet. There are few trees, and the hilly parts of the island does not exceed 1,600 square miles. Climate comparatively mild and equable. The fisheries and sheep-breeding are of importance. The exports include dried fish, wool, blubber, tallow, eiderdown, ponies, etc. Capital is Reykjavik, population 2,500.

*Bermudes* (British).—A group of coral islands in the northern Atlantic. Area 19 square miles, population (1901) 21,258, including 10,000 whites. Staple exports onions, potatoes, bulls, nearly all being exported to the United States. Of the tonnage entered 88 per cent is British.

*Azores*.—A group of volcanic islands in the North Atlantic, mountainous (Pico, 7,710 feet), but fertile. Area 922 square miles, population 157,000, mostly Portuguese and Roman Catholics. The exports include oranges, wine, cereals, etc. The islands form an integral portion of Portugal. Capital is Ponta Delgada, population 17,000, on St. Michael's.

*Madiera* (Portuguese).—An island of volcanic origin, belonging to Portugal. Hilly (6,100 feet). Climate moist equable, and breezy. Area 314 square miles, population (1900) 150,228, mostly Portuguese. Exports wine, sugar.

*Canaries*.—A group of islands of volcanic origin near the African coast, mountainous (Pico de Teide, on Tenerife, 12,190 feet). Area 2,830 square miles, population 359,290. Staple exports vegetables, bananas, cochineal. The islands form an integral portion of the kingdom of Spain.

*St. Paul*.—A tiny volcanic islet, formerly used as the equator. Uninhabited.

*Fernando de Noronha*.—A hilly island with a Brazilian penal settlement.

*Trinidad*.—Small island, 2,300 feet. Uninhabited.

Belongs to the group of the West Indies.

*Ascension*.—A British island of volcanic origin, rising 2,740 feet. Area 38 square miles, population 1,500. Island of commerce and coaling station. Celebrated for its turtles.

*St. Helena*.—A British island of volcanic origin, rising 7,000 feet. Area 47 square miles, population 5,200.

*Tristan da Cunha* (British).—A group of islands in the southern Atlantic; 45 square miles, population 70.

**Indian Ocean.**—That great body of water which has Asia on the north, the Bunda Isles and Australia on the east, Africa on the west, and the Antarctic Ocean on the south. The Cape of Good Hope and the southern extremity of Tasmania may be considered its extreme southern limits on the west and east. Its length from north to south somewhat exceeds 6,500 miles; its breadth varies from 6,000 to 4,000 miles.

It is traversed by the equatorial current flowing east to west, and its navigation by sailing vessels is more or less modified by the periodic trade-winds and monsoons. Its chief arms are the Bay of Bengal on the east of India, and the Arabian Sea on the west, and the latter being the Persian gulf and Red Sea.

**Islands.**—Some of the most characteristic coral atolls and fringing reefs are to be found toward the central part of the Indian Ocean, such as the great Maldivian group, the Chagos, Diego Garcia, and the Kerguelen Islands. Almost all the tropical shores are skirted by fringing and barrier reefs. Christmas Island is an upraised coral formation. St. Paul's, Mauritius, Rodriguez, and others are of volcanic origin, while Madagascar, Ceylon, and Socotra are typical continental islands.

**Pacific Ocean.**—In its largest and the great divisions of the ocean, occupying about one-half of the water-surface of the globe and more than one-third of the area of the globe. It is situated to the westward of the north, communicating with the Arctic Ocean by the narrow (40 miles) and shallow Behring strait, with the Atlantic Ocean by the deep Southern and Antarctic oceans. Its length from north to south (the antarctic circle) is about 9,000 miles; its greatest width, at the equator, is over 10,000 miles; its area is approximately 70,000,000 square miles. The average depth of the Pacific is 10,000 fathoms, and the depths of the Atlantic, and its bed more uniform. Recent soundings between the Friendly Islands and New Zealand point to a great rise in the water level, fathoms (nearly six miles) not far from Kermadec islands.

In the Pacific the tides never attain the maximum heights for which some parts of the Atlantic and Indian Ocean are celebrated. On all the west

coast of America the rise of the tide is usually below 10 feet, and only in the Bay of Panama does it vary from 12 feet to 18.

The trade-winds of the Pacific are not so regular in their limits as those of the Atlantic, and thus irregularly extend over the Pacific. In the region in the case of the southeast trade-wind than in the case of the northeast. The cause of this is the greater number of islands in the Pacific than in the Atlantic Ocean, which, especially in the hot season, disturb the uniformity of atmospheric pressure by local condensations. The southeast trade-wind remains the whole year through within the northern hemisphere. The southeast trade-wind, on the other hand, advances beyond the equator both in summer and winter, still preserving its original direction. In the region stretching from New Guinea and the Solomon Islands southward there are no regular winds. The zones of the two trade-winds are separated by regions of calms and of light winds, the limits of which vary of course with the varying limits of these zones. In the Chinese seas the terrible typhoon occasionally rages, and may occur at any season of the year.

**Islands.**—The Pacific Ocean is remarkable for the innumerable small islands and island groups which stud its surface, but the area occupied by the truly oceanic islands is very small; they are principally congregated toward the central and western portions of its basin, while the eastern portion is comparatively bare. The largest islands—the Hawaiian Islands, the Philippines, the larger islands—Borneo, New Guinea, Celebes, Java, Sumatra, etc.—are continental. The oceanic islands—the Hawaiian Islands, the Carolines, Gilbert Islands, the Solomons, Fiji, Friendly Islands, Samoa, etc.—of the Pacific are all either volcanic or coral reefs. The volcanic islands within the zone of coral-reef builders being fringed with coral reefs, while many are entirely of coral formation.

**Early Navigation.**—The Portuguese were the first Europeans who entered the Pacific, which they did from the east. Balboa, by 1513 discovered it from the summit of the mountains which traverse the Isthmus of Darien. Magellan sailed across it from east to west in 1520. Brackets, Carles, Behring, Anson, Byron, Bougainville, Cook, Vancouver, Lapourer, and others, traversed it in different directions in the seventeenth and eighteenth centuries.

**POLAR REGIONS.**—Antarctic.—The lands within or near the antarctic circle are imperfectly known, and a very large area around the south pole is altogether unknown. Among land-masses that have long been known to exist in the Antarctic Ocean, though our knowledge of them is very imperfect, are those to which have been attached the names Graham land, Victoria land, Wilkes land, Enderby land, South Shetland islands, etc. The antarctic regions are cold and more inhospitable than the arctic, and partly on account of their remoteness from maritime nations there have been fewer efforts at their exploration, the south pole being far less a goal of discovery than the north.

**Discoveries.**—In 1841-2 Sir James Ross reached the highest south latitude attained till recent years, discovering Victoria land (extending to about 79° south latitude) with its volcanoes Erebus and Terror. His farther progress south was checked by a barrier of solid ice, which he judged to be 300 feet high in parts, and after sailing along this for 100 miles without discovering any break in it he found it stretching away as far as the eye could reach.

A point slightly farther south was attained in 1900 by E. Borchgrevink, but the next great and important advance was made by Capt. Scott, R.N., in command of an English expedition, one of four that set out from Europe to explore the Antarctic Ocean early in the twentieth century. Capt. Scott, who was in command of the *Discovery*, reached Ross' farthest point early in 1902, and then coasted eastward along the glacier ice barrier, reaching a mass of high land in longitude 152°-160°, which was named King Edward VII. Land. Turning back to the neighborhood of Mts. Erebus and Terror, he found the ice barrier, not on the mainland, but took up his quarters there and made a great sledge journey to the southward, which brought him to latitude 82° 17', a point hundreds of miles nearer the pole than Ross' farthest point. Other sledge journeys of exploration were also made, and after spending fully two years within the antarctic circle, the expedition returned in 1904.

The most remarkable of the most recent, Antarctic expedition, was made by the *Nimrod* in command of Lieut. E. H. Shackleton, of the British navy, in 1908-9, during which a latitude of 88° 23' was reached—at

a point 110 miles from the south pole. The results of Shackleton's expedition also included the first ascent of the volcano Erebus, 15,350 feet.

#### ANTARCTIC EXPLORATION

Commander	Nation-ality	Date	South Latitude	Longitude

**Arctic Regions.**—Comprise the regions round the north pole, and extending from the pole on all sides to the arctic circle in latitude 66° 32' north. The arctic or north polar circle is the northern limit of the northern hemisphere, cuts off the southern and narrowest

rior, a lofty plateau is covered with a cap of ice, from which glaciers descend into the sea. Only 34,000 square miles are included as habitable. Population 11,895. Of trees there are only dwarf willows and birches, and a juniper tree in the extreme south. Fishing and hunting are the principal occupations. Exports are walrus, cod-liver oil, seal-skins. Capital is Godthaab.

**Arctic Islands of America.**—529,000 square miles (432,000 square miles within the arctic circle). At most a thousand inhabitants. All the other islands within the arctic circle are uninhabited.

**Svalbergen.**—2,570 square miles, a group of mountainous islands, accessible almost throughout the year along its western shore. There are reindeer, ice bears, forces. The island is frequented by sealers and whalers, but has no permanent inhabitants.

**Novaya Zembla.**—(New Land) 35,500 square miles, Samoyed fishing settlement.

**Frans Jozef Land.**—7,400 square miles as far as known. No inhabitants, and difficult of access.

**The Arktis Islands.**—10,800 square miles. The first coast of Siberia, including New Siberia. Uninhabited.

**Wrangel Land.**—1,800 square miles. Uninhabited.

The most notable expeditions of discovery in the arctic regions are given in the following table:

#### ARCTIC EXPLORATION

Commander	Nation-ality	Date	N. lat. and	Locality
John Davis.....	British	1587	72° 41'	West Greenland.
Wm. Barents.....	Dutch	1594	75° 20'	Novaya Zembla.
Henry Hudson.....	British	1607	80° 23'	Greenland and Spitzbergen.
Hilary Hudson.....	British	1610	—	Hudson Strait.
William Baffin.....	British	1616	76° 45'	Smith sound.
Belcher.....	British	1728	70° 45'	East Behring Strait.
Tchelyuskin.....	Russian	1743	77° 48'	North Siberia.
C. P. Phipps.....	British	1773	80° 30'	Spitzbergen Sea.
William Scoresby.....	British	1806	71° 12'	East Greenland.
W. E. Parry.....	British	1827	82° 43'	Spitzbergen Sea.
John Franklin.....	British	1846	—	North Canada.
E. B. Kane.....	Amer.	1854	78° 45'	Smith Sound.
O. Nordenskiöld.....	Swede	1868	81° 42'	Spitzbergen Sea.
C. A. Adams.....	Amer.	1870	81° 42'	East Behring Strait.
Julius Paeyer.....	Austrian	1874	82° 5'	East, Franz Josef Land.
G. R. Nares.....	British	1876	83° 20'	Grimmell Land.
Nordenskiöld.....	Swede	1876	86° 9'	North-east passage.
—.....	—	1882	83° 24'	North Greenland.
Frederick Jackson.....	British	1896	81° 20'	Frans Josef Land.
Frederick Jackson.....	British	1896	80° 54'	East of Frans Josef Land.
Hubert of Albatraz.....	Italian	1900	80° 33'	North of Frans Josef Land.
R. H. Peary.....	Amer.	1906	87° 6'	North of Grant Land.
F. A. Cook.....	Amer.	1908	—	Claimed to have reached the pole, April 21.
R. E. Peary.....	Amer.	1909	—	Reached the pole April 6.

portion of Greenland, crosses Fox's Strait north of Hudson's bay, whence it goes over the American continent to Behring Strait. Thence it runs to Odorsk at the mouth of the Ob, crosses northern Russia, the White Sea, and the Scandinavian peninsula, and returns to Iceland.

Though much skill and heroism have been developed in the exploration of this portion of the earth, there is still an area around the pole, estimated at 2,500,000 square miles, which is a blank to geographers.

Valuable minerals, fossils, etc., have been discovered within the arctic regions. In the arctic north of the American continent excellent coal frequently occurs. The mineral erodite is mined in Greenland. Fossil ivory is obtained in Iceland at the mouth of the Lena. In Scandinavia, parts of Siberia, and northwest America, the forest region extends within the arctic circle. The most characteristic features of the arctic regions are the Estivans. The most notable animals are the white bear, the musk-ox, the reindeer, and the whalebone whale. Fur-bearing animals are numerous. The most intense cold ever registered in those regions was 73° below zero Fahrenheit. The aurora borealis is a brilliant phenomenon of arctic nights.

**Islands.**—Within the arctic circle, as far as discovered, there exist an area of 2,333,000 square miles. The more important of these islands are:

**Greenland.**—838,000 square miles, of which 717,000 are within the arctic circle. The inter-

**THE CONTINENTS.**—Europe.—Is geographically merely a peninsula of Asia. It is bounded by the Arctic Ocean, the open Atlantic and the Mediterranean, and separated from Africa and Asia only by narrow straits. Development of coastline 19,820 miles, or one-ninth of coast to every 182 square miles. Extent from the North Cape to Cape Malapan 2,400 miles, from Cape St. Vincent to the Straits of Gibraltar 3,450 miles. Total area 3,811,273 square miles, including peninsulas, and islands.

**Surface.**—The Alps form the backbone of the most vital part of the continent, and constitute a well-marked physical boundary between north and south. They send branches into Italy and the Balkan peninsula, and reappear eastward in the Carpathians. On their outer side they are encircled by the Cevennes, the Jura, and other ranges, the land thus enclosed constituting a tableland. Isolated mountain ranges are those of Scandinavia, of the Iberian peninsula, and the Ural. The great lowland of Europe stretches from the Pyrenees to the Ural, and from the Arctic to the Black Sea. It covers over 1,000 million square miles. Minor plains are those of Hungary, of Rumania, and of the Po.

**Rivers and Lakes.**—Rivers are numerous, and give ready access to the heart of the continent. The most important basin is that of the Caspian Sea, fed by the Volga (drainage area 563,630 square miles). Other large rivers are the Danube (318,416 square miles), Dnieper (203,480 square miles), Don (160,120 square

miles), Drina (141,080 square miles), Pechora (127,260 square miles), and Rhine (86,640 square miles). Ladoga is the largest lake. **Climate.**—The greater part of Europe lies within the temperate zone, and is subject to the beneficial influence of the gulf stream the extremes of heat and cold are moderated, and the rainfall is sufficient. Under the arctic circle, on the coast of Norway, the mean temperature is the same as at Quebec, 47° north.

**Races.**—1. European Aryans, 384,957,000, including 134,073,000 Teutons, 116,056,000 Greco-Latins, 131,221,000 Slav, 2. Asiatic Aryans (Gypsies, etc.) 654,000. 3. Semites (Jews, etc.) 8,965,000. 4. Mongolians (Turks and Tartars, Magyars, Finns, etc.) 23,204,000. **Religions.**—1. Christians, 401,002,000 (184,666,000 Roman Catholic, 112,666,000 Greek Catholic, 103,515,000 Protestants, 155,000 Armenians). 2. Jews, 8,690,000. 3. Mohammedans, 6,982,000. 4. Buddhists, etc., 161,000. 5. Heathen (including most of the Gypsies), 210,000.

**Political Divisions.**—Three great state systems (according to language or nationality), viz.: 1. Teutonic states, 630,073 square miles, population 150,850,000, of whom Teutons 83 per cent, Protestants 61 per cent. 2. Greco-Latin states (including Belgium and Roumania), population 112,666,000, of whom Greco-Latin 94 per cent, Roman Catholic 92 per cent. 3. Slav states (including Bosnia), population 128,256,000, of whom Slavs 82 per cent, Greek Catholic 78 per cent. 4. Hungarian, population 20,025,000, of whom Magyars 45 per cent, Roman Catholic 61 per cent. 5. Turkey, population 6,130,000, of whom Turks 12 per cent, Mohammedans 41 per cent.

**Asia.**—The great continent of the old world, is really one with Europe, which is merely its largest and most important peninsula, and is joined to Africa by the Isthmus of Suez. Development of coast line 36,000 miles, or one mile of coast to every 473 square miles. Distance from Asia Minor to Behring strait 5,990 miles; from Cape Cheiryuskin to Cape Bait, near Singapore, 8,315 miles. Total area 17,048,000 square miles (of which mainland 10,003,000 square miles) inclusive of peninsulas and islands.

**Surface.**—The lofty plateau of Tibet rises in the center of Asia like a huge citadel. It is bounded on the south by the Himalayas, on the north by the Kuen-lun; ramifies in the east, and southeast to the coast of China, and is continued in the west by the Hindu Kush and the plateaus of Iran, Armenia and Asia Minor. A second plateau, of much inferior height, lies to the north of Tibet, being girt by the Pamir, the Fergana and other ranges. It includes the basin of the Tarim, the Turfan basin, believed to be depressed below the sea-level, and the great desert of Gobi. The principal isolated highland regions of Asia are the mountains of Korea, the Decan, the mountains of Syria and Arabia, the Caucasus, the Caspian range, Kurdistan and the great Sierra to the Arctic Ocean; that of the Euphrates and Tigris, of Hindustan and China.

**Rivers and Lakes.**—A large portion of inner Asia forms a continental basin, sending no river to the sea, and in many parts riverless. Within it lie the Caspian Sea, 384 feet below sea-level; Lake Aral, fed by the Syr and Amu Daria (Oxus); Lake Balkash with the Ili, Lob Nor, Kuku Nor. The great rivers of the continent are the Ob (draining an area of 1,190,000 square miles), the Yenisei (587,000 square miles), which flows through Lake Baikal (12,441 square miles); the Lena (871,000 square miles); the Amur (907,000 square miles); the Irtysch (840,000 square miles); the Yangtze-kiang (723,000 square miles); the Ganges (500,000 square miles), and the Euphrates (255,000 square miles).

**Climate.**—Great contrasts between the very cold of North Siberia and the hot damp of the Malay archipelago. Temperature is generally lower than that of Europe under similar latitudes, and the range between summer and winter is greater. In the East, except parts of central Asia, little or no rain falls.

**Races.**—1. European Aryans, as colonists or permanent residents, numerous only in Siberia

(Russians) and Asia Minor (Greeks), 12,055,400. 2. Asiatic Aryans, viz., Hindus, Afghans, Baluchi, Persians, Kurds, Armenians, Caucasians, etc., 229,707,000. 3. Semites (Arabs, Jews, etc.), 7,900,000. 4. Mongolians, including Mongols, Turks and Tartars, Chinese, Japanese, Tungus, etc., 509,812,000. 5. Malays, 45,835,000. 6. Dravidians, India, 64,788,000. 7. Various, 450,000, including a few Eskimo (Chukchi), negroes, etc.

**Religions.**—1. Christianity, although Asia was its birthplace, only numbers 29,516,000 adherents, of whom 13,215,000 in the Russian empire. 2. Jews, 462,300. 3. Mohammedans, 173,039,000, of whom 67,115,000 within the British possessions. 4. Hindus, Buddhists, Hindu, Buddhist, Confucian, etc., number 685,109,000 adherents. 5. Heathen, 12,670,000.

**Political Divisions.**—European possessions, population 380,900,000, including British Asia, population 308,316,000; Dutch Asia, population 30,000,000; Russian Asia, population 27,732,000 (35 per cent European, 41 per cent Mongol and Turk); French Asia, population 25,800,000; American Asia (Philippines), population 7,635,000; Portuguese Asia (Goa, Timor), population 705,000. 2. Mohammedan states (Turkey, Persia, Afghanistan, independent Asia), population 31,799,000. 3. Mongolian states (China, Japan, Siam, Korea, Nepal, etc.), population 500,000,000.

**Africa.**—Is attached to Asia by the Isthmus of Suez, separated from Europe by the Mediterranean. Africa extends 4,980 miles from north to south (Cape Bianco in Tunis to Cape Aguilha), and 4,840 miles from west to east (Cape Verde to Cape Guadalupe). Its area, including Madagascar and other islands, is 11,520,000 square miles.

**Surface.**—Nearly all Africa is a plateau. There are no extensive lowlands, but a few localities are depressed below the level of the sea (Shab Meir, Siwah, Fayum). The mean elevation is 1,975 feet. The Atlas mountains form a distinct highland region (Aynashin, 14,150 feet), the Abyssinian highlands, 10,000 feet. Daashan rises 15,300 feet, but the loftiest summits of all Africa are found in the East African lake region, Kilimanjaro, 19,270 feet; Kenia, 17,150 feet; Ruwenzori, 16,815 feet.

**Rivers and Lakes.**—Among the rivers the Nile is the most famous, but the Congo has the largest basin. Other rivers are the Niger, the Zambezi, and the Orange river. Among the continental basins (having no drainage to the sea), those of Lake Chad, Lake Ngami, Lake Rudolf and the Hawash are the most conspicuous. The largest lakes are the Victoria Nyanya, Taad, Tanganyika, Nyansa and Rudolf.

**Climate.**—Only one-fifth of Africa lies within the temperate zone. At the sea-level a mean temperature of less than 68° is experienced only in Barbary and in the coast-region of South Africa from Durban to Mossmedes. The Mediterranean coasts and a small part of the Cape Colony have winter showers, while the greater part of the continent has tropical rains. Two extensive regions—viz., the Sahara, in the north, and the Kalahari adjoining districts, in the south—are almost rainless.

**Races.**—1. Negroes, 87,517,000, classed into Sudan negroes, Bantu, and the scattered tribes of pygmies among them. 2. Hamites, 10,964,000, viz., Berbers, Arabs, Tuareg, in Barbary and the Sahara; Copts, Beja, and Nuba, in the Nile valley; Agua, etc., in Abyssinia; Danakil, Somali, and Galla, in East Africa. 3. Semites, 26,044,000, including Arabs and Abyssinians, both much mixed with Berber and negro blood. 4. Hottentots and Bushmen, 420,000, in South Africa. 5. Malays, principally in Madagascar, 2,516,000. 6. Europeans, 3,410,000, of whom 961,000 are in continental North Africa, 1,115,000 in South Africa, and only 61,000 in tropical Africa. 7. Hindus and other Asiatics, as laborers in the Mascarenes, 401,000; 8. Egyptians, 1,000,000.

**Religions.**—1. Christians, 9,788,000, including Copts and Abyssinians. 2. Mohammedans, 31,272,000, including all Arabs and Berbers,

Beja, Nuba, Somali, increasing numbers of other Hamites, and negroes. 3. Jews, 450,000. 4. Buddhists, etc., 304,000. 5. Heathen, 89,500,000.

**Political Divisions.**—Nearly all Africa has now been absorbed or partitioned by various European powers, but most native tribes or states included within European spheres are still virtually independent. Egypt and the Egyptian Sudan, although nominally under the suzerainty of Turkey, are really controlled by Great Britain. The remaining territory of Africa unoccupied is a part of the great desert of Sahara and the independent states of Abyssinia, Liberia, and Morocco.

**North America.**—Forms the north and larger portion of the new world discovered by Columbus. It is separated from Europe by the Atlantic Ocean and from Asia by Behring strait. Its main mass is triangular in shape, and its outline varied by large peninsulas, broad gulfs and numerous bays. Development of coast line 25,130 miles. Length, 4,500 miles; breadth, 3,100 miles. Area, 9,419,469 square miles, including Greenland, the Arctic Archipelago of Tehuantepec to the Arctic Ocean. In the center it broadens out, and inclosed within is a great basin having no outlet to the sea. The highest summits are Mt. McKinley, in the north; Mt. Harvard, in the Rocky mountains; Mt. Whitney, in the Sierra Nevada; and the Popocatepetl or Peak of Orizaba, in Mexico. The Appalachian highlands in the east form the second great mountain system, and are continued to the north of the St. Lawrence in the Laurentides, the Canadian lake plateau and the arctic highlands. A great central plain lies between these mountains, extending from the Gulf of Mexico to the arctic regions. The mean height of the continent is 2,730 feet.

**Rivers and Lakes.**—The great rivers of North America are the Mississippi, with its tributaries, 1,240,039 square miles; the St. Lawrence, which has for its reservoirs the Great lakes, and drains 532,190 square miles; the Saskatchewan, with its tributaries, 472,206, which enters Hudson's bay and drains 449,830 square miles; the Mackenzie, tributary to the Arctic Ocean, drains 679,400 square miles. The great lakes cover 88,330 sq. mi.

**Climate.**—Largely determined by the direction of the mountain ranges. Five climatic regions, viz., an arctic region, whose mean temperature is less than 32° F.; an Atlantic temperate region, extending as far as the Mississippi, with abundant rains and dense woods; an inland temperate region, dry, with steppes or prairies; a Pacific coast region; and a tropical region.

**Race.**—82,901,000 Europeans, 14,367,000 Americans, 16,121,000 Indians and Eskimos, 1,168,000 Semites (Jews), 157,300 Mongols (Chinese and Japs), 18,000 Asiatic Aryans (coolies). Of the Indians, only 420,000 are within the limits of the United States and the United States, while in Mexico and the other Spanish republics they constitute the bulk of the population. Of negroes about 11,000,000, in the United States and British North America, while only 3,087,000 are to be found in the West Indies and elsewhere.

**Religions.**—1. Christians, 379,000. 2. 1,215,000 Jews. 3. 174,000 Buddhists, etc., 142,000 heathen.

**Political Divisions.**—British North America, population 7,352,000; United States, not including Alaska, population 91,870,000; Latin republics, population 19,468,000; French, population 378,930; Danish, population 42,500; Dutch, population 6,800; Cuba, population 2,048,980; Hayti, population 2,010,000.

**South America.**—Forms the south half of the new world. In shape triangular, it extends 4,550 miles from north to south, 3,390 miles from east to west. Its coast line is far less broken than that of North America and there are fewer islands. Development of coast line 15,700 miles, or one mile to

every 435 square miles of mainland. Total area, 6,881,700 square miles, of which islands comprise 81,321 square miles.

**Surface.**—The Cordilleras de los Andes extend close to the Pacific, from southern extremity of the continent as far as the Caribbean Sea, and send a branch eastward into Venezuela. Their parallel ranges inclose several plateaus, among which that of Bolivia is the most extensive. The loftiest summits are: Aconcagua; Illimpu, or Peak of Sorata; Chimborazo. Isolated mountain regions are the Sierra Nevada de Sta. Marta, on the Caribbean Sea; the highlands of Guayana (Roraima), and the Brazilian highlands (Itatiaia). Vast lowland plains, covering altogether

nearly 70 per cent of the total area, lie between these mountains, and open out upon the Atlantic. These plains include the llanos or stepping-places of the Orinoco, the selvas or forests of the Amazon river, and the plains of the Rio de la Plata. Mean elevation of the continent, 2,490 feet.

**Rivers and Lakes.**—Nearly the whole drainage is toward the Atlantic. The three great rivers are the Orinoco (drains 328,000 square miles), the Amazon (drains 2,700,000 square miles), and the Rio de la Plata (drains 1,240,000 square miles).

**Climate.**—The Andes form a sharp climatical boundary, and while the rainfall is generally

abundant to the east of them, it is deficient or falls altogether on the Pacific coast, from latitude 4 degrees south to 30 degrees south. Races.—13,260,000 Europeans, 20,000,000 American Indians, 9,072,000 negroes, 200,000 Asiatic Aryans (coolies), 33,500 Semites (Jews and Arabs), 56,000 Mongols (Chinese), 4,000 Malays.

**Religions.**—40,631,000 Christians, 30,000 Mohammedans, 34,000 Jews, 229,000 Buddhists, etc., 1,863,000 heathen.

**Political Divisions.**—British South America, population 608,000; French, population 33,000; Dutch, population 156,400; Brazil (Portuguese), population 19,910,640; Spanish states, population 25,510,000.

INDEPENDENT COUNTRIES OF THE WORLD. TABLE I. GOVERNMENTS AND RULERS

COUNTRIES	CAPITAL	FORM OF GOVERNMENT	TITLE OF RULER	PRESENT OFFICIAL HEAD	BORN	ACCERD	SALARY OR INCOME
Abyssinia	Addis Ababa	Feudal monarchy	King	Menelik II.	1843	March 12, 1889	.....
Afghanistan	Cabul	Monarchy	Amir	Habibullah Khan	1872	Oct. 3, 1901	.....

## COUNTRIES OF THE WORLD AND THEIR CHIEF DEPENDENCIES

**Abyssinia.**—A country of North Africa, occupying a highland region southwest of the Red Sea. The country is made up of a number of states, the chief of which are Tigre in the north, Amhara in the west and Galla, and Shoa, in the south.

**Surface.**—It consists mainly of a huge table-land with a mean elevation of 7,000 feet. The declivity to the bordering tract on the Red Sea is abrupt; toward the Nile behind it is gradual. The main mass has been cut into a number of island-like sections by the streams, which have worn their channel into ravines of vast depth—as much sometimes as 4,000 feet. Isolated mountains, with naked perpendicular sides, present the most singular forms. The Samen mountains have summits rising to the height of 15,000 feet.

**Rivers.**—The principal are the head-streams of the Blue Nile, issuing from the great Lake Tanna, Tana, or Dembea, and the Atbara, also a tributary of the Nile; less important are the Marsh and the Hawak.

**Climate and Vegetation.**—The climate, notwithstanding its tropical position, is on the whole moderate and pleasant owing to its elevation, though in the river valleys and swamps the heat and moisture are suffocating and pestilential. As a whole, the country is exceedingly fruitful; and its productions are of the most varied nature, from the banana, fig, and lichen of North Europe to the choicest tropical plants. Two, and in some places three, crops can be raised in one year.

**Animals.**—The larger animals are lions, panthers, elephants, rhinoceroses, hippopotamuses, muses, jackals, hyaenas, bears, numerous antelopes, monkeys, and crocodiles.

**People.**—The population consists of various tribes, the chief of the Abyssinians proper—brown, well-formed people, belonging to the Semitic stock. The basis of the language is the ancient Ethiopic (see Ethiopia) or Ge'ez, a Semitic language which is now the sacred language. The modern dialect of Amhara is the prevalent language of the country. There are Galla and Somalis in the south and southeast. The Falashas are of Jewish origin, and still retain many of their racial peculiarities.

**Towns.**—The towns are small—Addis Ababa, capital of Shoa and of Abyssinia; Gondar,

in Amhara; Adowa, or Adua, in Tigre; Axum, the old capital—not to speak of Harar, lately annexed. Any foreign trade comes mainly through Massowah. The religion of the Abyssinians proper is a debased Christianity; but the Galla and other alien tribes are nearly Mohammedans.

**Afghanistan.**—An inland country of Asia, forms the northeastern portion of the great Iran plateau. Its breadth is about 500 miles, and its length, from the Hindustan boundary to the Khashiir, about 600 miles. It is bounded on the east by the tribes on the northwest frontier of India under British control; on the south by Baluchistan; on the west by Persia; on the north by the Russian central Asian states. Cabul is the capital.

**Surface.**—Afghanistan consists chiefly of lofty, bare, uninhabited table-lands, sandy barren plain, ranges of snow-covered mountains, offsets of the Hindu Kush or the Himalayas, and deep ravines and valleys. Many of the last are well watered and very fertile, but about four-fifths of the whole surface is rocky, mountainous and unproductive. The surface on the northeast is covered with lofty ranges belonging to the Hindu Kush, whose peaks are often 18,000 or sometimes 20,000 feet. The whole northeastern portion of the country has a general elevation of over 6,000 feet, but toward the southwest the declivity is gradual. The principal mountain chains of the interior rise, the general elevation declines to not more than 1,600 feet. In the interior the mountains sometimes reach the height of 15,000 feet. A great part of the frontier toward India consists of the Sulaiman range, 12,000 feet high.

There are numerous practicable avenues of communication between Afghanistan and India, the most important being the famous Khyber pass, by which the river Kabul enters the Punjab; the Gomul pass, also leading to the Punjab; and the Bolan pass on the south, through which the route passes to Sind.

**Rivers.**—Of the rivers the largest is the Helmand, which flows in a southwesterly direction more than 400 miles, till it enters the Hamoon or Arabian swamp. It receives the Arghandab, a considerable stream. Next in importance are the Kabul in the northeast, which drains to the Indus, and the Hari Rud in

the northwest, which, like other Afghanistean streams, runs itself in the sand.

**Climate and Vegetation.**—The climate is extremely cold in the higher, and intensely hot in the lower regions, yet on the whole it is salubrious. The most common trees are pines, oaks, birch, and walnut. In the valleys fruits, in the greatest variety and abundance, grow wild.

**Animals.**—The chief domestic animals are the dromedary, the horse, ass, and mule, the ox, sheep with large fine fleeces and enormous fat tails, and goats; of wild animals there are the tiger, bears, leopards, wolves, jackal, hyaenas, foxes, etc.

**People.**—The population is very mixed. The Afghans (or Duranis) have been predominant since 1747, especially in Kandahar; next come the Ghilzai (military and commercial) and the Tajiks (aboriginals, who are cultivators or retail traders). All are Sunni Mohammedans, except the Hasaras and Kishlathies, who belong to the Shiite sect. The national tongue is Pushtu.

**Towns.**—The chief towns are Cabul (the capital), Kandahar, Ghuzni, and Herat.

**Argentine Republic.**—A vast country of South America, the chief of which is 2,300 miles, and the average breadth a little over 500 miles, the total area reaching 1,135,840 square miles. It is bounded on the north by Bolivia, on the east by Paraguay, Brazil, Uruguay, and the Atlantic, on the south by the Antarctic Ocean; and on the west by the Andes. The republic is made up of fourteen provinces and a number of territories. On the west, the Andes divide this republic from Chili; Bolivia bounds the country on the north, while Paraguay, Brazil, Uruguay, and the Atlantic Ocean form the eastern limit. The great island-group of Fuegia, on the south, belongs partly to this republic and partly to Chili.

**Surface and Vegetation.**—Except for the sub-Andean America, the country is a few other low and unimportant hilly or mountainous tracts, nearly all the country consists of vast plains or pampas. The northern plain region (the Chaco) is in part desert; but most of the pampa country is open, presenting wide ranges of treeless pasture, varied by patches of huge thistles and other coarse plants. In the Patagonian region

there are extensive districts interspersed with clumps of thorny brushwood, and baying in the hollows many strongly saline ponds or lakes.

**Animals.**—The native fauna includes the puma, the jaguar, the large feline, the alpaca, the vicuña, armadillo, the rheu or marmot (a species of ostrich), etc.

**Rivers.**—The greater part of the republic is well watered and highly fertile, but there are extensive regions of waste land. The rivers Paraná and Uruguay, with their large tributaries, are important channels of trade.

**Climate.**—The climate in the extreme north is very hot, for it lies south of the tropic of Capricorn. The more remote southern territories have an extremely bleak, windy, and disagreeable climate, but are not really so cold as might be expected from their relatively high latitude. But the country in general enjoys an equable, temperate, and healthful climate.

**People.**—The people of the country are mostly Spanish in their language and descent, although there are many Italians, French, and other European immigrants. The Gauchos are a race of half-bred cattle-rearers and horse-breakers; they are continually on horse-back, following over the plains, collecting their herds and droves, taming wild horses, or catching and slaughtering cattle. In such occupations they acquire a marvelous dexterity in the use of the lasso and bolas.

**Cities.**—The principal seaport is Buenos Ayres, the capital and largest city. Among the other large towns are Cordoba, Rosario, La Plata, Mendoza, Tucuman, Corrientes, Salta, and Santa Fé.

**Australia.**—The smallest of the continents, the largest among the islands of the world. Extends 2,500 miles from west to east, 1,970 miles from north to south, and its coast line has a development of 10,629 miles (exclusive of all minor bays). The commonwealth of Australia was formed in 1901, and consists of the six original states of New South Wales, Victoria, Queensland, South Australia, West Australia, and Tasmania. Most of the coast is barren and uninviting. Inlets and natural harbors abound only in the east, southeast, and northwest. The southern portion, for a distance of 1,400 miles, is fringed by coral reefs.

**Surface.**—The great dividing range runs along the east coast, rising to a height of 7,336 feet. The greater part of the interior consists of a table-land of moderate elevation, either barren or fit only for pasturage. The great lowland plains are those of the Murray valley and of Lake Eyre, supposed to be below the level of the sea.

**Rivers.**—The Murray, draining an area of 275,000 square miles, is the only river of importance, but even it is navigable only during part of the year.

**Climate.**—Tropical in the north, temperate in the south. An annual rainfall of over twenty-five inches is experienced only along the southeast, east, and north coasts, and in a small district in the southwest. In the bulk of the interior the annual rainfall is less than ten inches.

**Animal and Vegetable Life.**—When discovered there were neither carnivorous animals (except the dingoo) nor ruminants. Pouched animals (such as the kangaroo), cockatoos, the emu, and birds of paradise, are most characteristic of the continent. The vegetation is equally peculiar, the principal trees being Eucalypti (gum trees, gum trees, iron bark, etc.), acacias, and eucalyptus (oaks). The woods are confined to regions of heavier rainfall. Much of the interior is an open grass-land with scattered trees, degenerating in the more and parts into a veritable desert.

**Cities.**—The largest cities are Melbourne, capital of Victoria; Sydney, of New South Wales; Adelaide, of South Australia; Brisbane, of Queensland; and Ballarat, and Sandhurst in Victoria.

**People.**—The population is almost all of European origin, the predominating element being British. The British-born are no longer the most numerous element in the colonial populations, the native-born being

now over three-fourths. Chinese and Germans number about 30,000 and 38,500 respectively; there are many Polyynesians (Kanakas) in Queensland; also many Scandinavians, Americans, and French.

**Austria** is the usual name of the great empire now called the Austro-Hungarian monarchy. Since 1867 the empire is composed of a union of two states under one emperor, but administratively distinct. The one is Austria, the other Hungary and the Bohemian crown lands. The Austrian dominions form geographically a compact territory, with a circumference of about 5,350 miles. The total area is greater than that of any other European state save Russia, and is nearly twice the area of the United Kingdom. The body of the empire lies in the interior of Europe, though it has about 600 miles of sea-coast on the Adriatic.

**Bosnia-Herzegovina**, which had since the treaty of Berlin in 1878 been occupied and administered by Austria-Hungary, was in 1908 formally annexed to the empire.

**Surface.**—Three-fourths of Austria is mountainous or hilly, being traversed by three great mountain chains, the Alps, the Carpathians, and Sudetes, whose chief ridges are of primitive rock. The Rhetian and Noric Alps stretch from Switzerland to the Danube, and contain the highest points of the Austrian territories, the Ortler Spitze rising to 12,514 feet.

The Carpathian chain, extending for 880 miles, rises on the left bank of the Danube, near Presburg, and, sweeping in a curve, first east, and then southward through Transylvania, again meets the Danube; it culminates at 8,517 feet.

The Sudetes run through the northeast of Moravia and Bohemia, in which last the range is known as the Riesengebirge, or Giant mountains. Continuous with this range, but beginning on the left bank of the Oder, is the Riesengebirge, or Giant mountains, on the confines of Saxony. The chief plains of the Austrian empire are the vast lowlands of Hungary and the plain of Galicia.

**Lakes and Rivers.**—The chief lakes are Lake Neusiedler, 392 square miles, and the Neusiedler See, both in Hungary; and remarkable is also the Zirknitz Lake in Illyria.

The leading rivers are the Danube, which has a course of 680 miles within the Austrian dominions; its navigable affluents being the Inn, Save, Drave, March, Waag, and the Theiss, which drains nearly half of Hungary; the Vistula, with its tributary, the Bug; the Elbe, with the Moldau and Eger; the Danube and Adige.

The climate of Austria varies much on account of the extent and diversity of the surface.

**Cities.**—The most important cities are the capital, Vienna, and seven other towns above 100,000—Budapest, Prague, Trieste, Lemberg, Gratz, Brünn and Szegeid. Thirteen others have above 50,000.

**People.**—More than half of the European states except Russia exhibit such a diversity of race and language as the Austrian empire.

The Slavs—who differ greatly, however, among themselves in language and civilization—amount to 46 per cent. of the total population, and form the great mass of the population of Bohemia, Moravia, Carniola, Galicia, Dalmatia, Croatia, Slavonia, northern Hungary, and half the population of Serbia and Bukovina.

The Germans form almost the sole population of Austria, Salzburg, the greatest portion of Styria and Carinthia, almost the whole of Tyrol and Vorarlberg, large portions of Bohemia and Moravia, the whole of West Silesia, etc.; and they are also numerous in Hungary and Transylvania.

Of the Magyar or Hungarian, form nearly half of the inhabitants of the kingdom of Hungary and the connected provinces.

Of the Italic or western Romanic stock there are about 750,000, and of the Roumanian or eastern Romanic stock. The number of Jews is above 2,000,000; and there are other races, such as the gypsies (1,500,000), who are most numerous in Hungary and Transyl-

vania, and the Albanians in Dalmatia and the adjacent parts.

**Belgium** is one of the smaller European states, and consists of the southern portion of the former kingdom of the Netherlands, lying between France and Holland, the North Sea and the Rhine. Its greatest length from northwest to southeast is 173 miles; and its greatest breadth from north to south 105 miles. There are nine provinces—Antwerp, West Flanders, East Flanders, Hainaut, Liège, Brabant, Limburg, Luxembourg, and Namur, of which Luxembourg is the largest and Limburg the smallest.

**Surface.**—It is, on the whole, a level, and even the lying country; diversified, however, by hilly districts. In the southeast, a western branch of the Ardennes highlands separates the basin of the Meuse from that of the Moselle. The fertile Campine, composed of marshes and barren heaths, extends along the Dutch frontier. In Flanders dikes have been raised to check the encroachments of the sea.

**Rivers.**—The abundant water-system of Belgium is chiefly supplied by the great navigable rivers, the Scheldt, the Meuse, and the Rhine, which run in France, and have their mouths in Holland. These rivers have numerous and important tributaries, and there are some forty canals.

**Cities.**—Brussels, the capital, is, with its suburbs, the largest city; Antwerp is its second. Liège and Ghent have more than 50,000 inhabitants; and there are twenty other towns with over 20,000.

**People.**—The population of Belgium is of partly Germanic, partly Celtic origin. The Flemings (Flemish stock) and Walloons (Celtic in origin) speak each their own dialects of Dutch and French; there are also numbers of Germans, Dutch, and French. East and West Flanders, Antwerp, and Brabant are almost wholly Flemish; and Brussels mainly so. The French language has gained the ascendancy in educated society and in the offices of the government; but the Flemish is prevalent commercially in the proportion of nine to eight.

**Bolivia** is situated on the west side of South America, and formed till 1825 part of the vice-royalty of Buenos Ayres. It is included by Brazil, Peru, Paraguay, Chile, and Uruguay, and Chili. Bolivia lost its coast provinces to Chili through the war carried on by Bolivia and Peru against Chili in 1879.

**Surface.**—Bolivia contains the greater part of the loftiest and most mountainous district of America, as comprising a section of the Andes system at its broadest extension. The lofty plateau of Oruro, with an average height of 13,000 feet, and about 150 miles broad, is inclosed between the Andes proper (now the western boundary of Bolivia), and the Cordillera Real, to the east. There are also intermediate ranges and isolated groups of the volcanoes, all the western region. Sahama, Illimpu, and Illimani, are over 21,000 feet high.

The great Cordillera falls into two parts, of which the northern is the more inhabited, as containing the lake of Titicaca and many well-watered valleys around it. The southern and lower table-land is chiefly a desert.

The Cordillera Real system descends abruptly, on the north, to the plain of the Amazon; but its eastern edge is a series of terraces, sinking gently to the plains of eastern Bolivia. The eastern terraces, between 9,000 and 11,000 feet, have a temperate climate, and wheat and corn are produced; in those between 5,000 and 9,500 feet, tropical fruits flourish.

**Climate and Vegetation.**—Although situated entirely within the tropics, Bolivia, from its varied elevation, possesses a wide range of climate and vegetation. In the *punas* (over 11,000 feet high) the climate is cold and dry, and the vegetation scanty. The valleys of the eastern terraces, between 9,000 and 11,000 feet, have a temperate climate, and wheat and corn are produced; in those between 5,000 and 9,500 feet, tropical fruits flourish.

East of the inner cordillera lie the plains under the 5,000-foot limit. This district, with its numerous streams, its luxuriant tropical vegetation, its rich forests of valuable trees in the north, and its immense open

savannas in the south, surpasses most countries of South America in fertility and resources.

**Lakes.**—The waters of Lake Titicaca are conveyed to Lake Aullaga by the Desaguadero. The latter lake (which is salt) has only an insignificant outlet.

**People.**—The population of Bolivia is a mixture of half-caste Spaniards and Indians, and a few negroes. The Indians are partly civilized (Quechuas and Aymaras), partly semicivilized (Chiquitos and Moxos), and partly wild.

**Brazil, United States of,** occupies nearly half of the continent of South America. Greatest length, east to west, 2,630 miles; greatest length, north to south, 2,540 miles; with an area about one-sixth smaller than Europe. It is bounded southeast, east, and north-east by the Atlantic Ocean, north by French, Dutch, and British Guiana, and Venezuela; west and southwest by Ecuador, Peru, Bolivia, Paraguay, the Argentine republic, and the republic of Uruguay. Brazil is divided into a federal district, twenty states, many of them larger than Great Britain, and a territory.

**Surface.**—There are three regions—1. The Brazilian highlands in the southwest, rising boldly from the coast, and culminating in the Itatiaiy, 8,200 feet. The western slopes well wooded; in the interior extensive caupias. 2. The great forests of the Amazonas in the northwest. 3. The lowlands on the upper Paraguay and the uplands region of Matto Grosso in the west.

**Rivers.**—Brazil possesses three great river-systems—the Amazon, La Plata, and San Francisco. The Amazon and its tributaries drain fully a half of the country. To the east of the Madeira these tributaries are table-land rivers, broken by rapids and freely navigable for comparatively short distances. West of the Madeira they are lowland rivers, sluggish, bordered by extensive flood-plains, and afford free navigation for long distances. The La Plata system drains nearly one-fifth of the country through its three branches—the Paraguay, Paraná, and Uruguay. The first of these is a lowland river, freely navigable for a long distance, while the other two are table-land rivers, with numerous obstructions and without free outlets for their upper-level navigation.

The San Francisco is a table-land river, flowing northeast between the Serra and Maritime mountains, and then, breaking through the latter, southeast to the Atlantic. It is not freely navigable because of the Paulo Afonso falls.

The other coast rivers are generally short. **Climate.**—The climate of Brazil varies greatly—the lowlands of the Amazon and a great part of the coast being hot, humid, and unhealthy, while the table-lands and some districts of the coast except the trade winds are temperate and healthy.

**Vegetable and Animal Life.**—The vegetation of Brazil is luxuriant and varied. The vast forests of the Amazon contain hundreds of species of trees, draped and festooned by climbing plants, lianas, orchids, etc. Rose-wood, Brazil-wood, and others supply valuable timber; while tropical fruits are abundant.

The number of species of animals is also very large, but the individuals in each are comparatively few. Beasts of prey are the jaguar, puma, tiger-cat, and ocelot; the smaller animals include the monkey, tapir, capybara, peccary, ant-eater, sloth, and boa-constrictor. Alligators, turtles, porpoises, and manatees swarm in the Amazon; and among birds the parrots and humming-birds are especially numerous.

**Cities.**—The chief cities above 75,000 are Rio de Janeiro, Bahia, Pernambuco (or Recife) Sao Paulo, Para, and Porto Alegre.

**People.**—The population of Brazil consists of Brazilians, Indians, and a small number of mixed blood. The native Brazilians, mostly descendants of the Portuguese settlers, but often with a mixture of Indian or African blood, are said to be greatly wanting in energy. The white population, which is, perhaps, a

third of the whole, has in recent years been increased by Italian, Portuguese, and German immigrants.

The negroes are over 2,000,000 in number, and till 1888 were partly slaves. Of the Indians some are semicivilized, but others (estimated at 600,000) roam about in a wild state, and are divided into a great many tribes, speaking different languages.

The state language is Portuguese.

**Bulgaria** is situated in the Balkan peninsula, between the Danube and the Balkans. It was created by the treaty of Berlin in 1878, and since 1885 eastern Roumelia, lying to the south, has been practically incorporated with it.

**Surface and Drainage.**—The physical aspects of eastern Roumelia are varied, the surface in the west being broken up by the foothills of the Albanian ranges, and in the north and northeast by the Balkans and their spurs. The north of Bulgaria is a fertile plain and hilly country; the south is wooded and mountainous. A fine waterway on the northern boundary affords an outlet to the Black Sea.

**Cities.**—Sofia is the capital, the other principal towns being Varna, Shumen, Rustchuk, Widin, Rasgrad, Sistova, Tirnova, and Plevna; Philippopolis is the chief port.

**People.**—Over three-fourths are Bulgarians, 300,000 Turks, 60,000 gypsies, 100,000 Roumanians, 70,000 Greeks, and 34,000 Jews.

**Canada.**—The Dominion of Canada consists of the upper portion of the North American continent except part of Labrador, which belongs to Newfoundland, and Alaska, which belongs to the United States. It includes the various provinces of North America formerly known as Upper and Lower Canada (now Ontario and Quebec respectively), New Brunswick, Nova Scotia, Prince Edward Island, British Columbia, and the territories of the Hudson Bay company, now styled Manitoba, Saskatchewan, Alberta, the Northwest territories, and the Yukon.

**Surface.**—The most striking physical features of Canada are the Rocky mountains, the Laurentian range (which forms the watershed between Hudson Bay and the St. Lawrence, and varies in height from 1,600 to 3,000 feet), and the chain of Great Lakes. The eastern portions of Canada are generally well timbered, as are also British Columbia and the Northwest territories north of the Saskatchewan. Westward of the Red river, between the 40th and 55th parallels of latitude, there is an immense fertile plain, suitable for general agriculture and grazing (the eastern end being about 100 feet above the level of the sea), extending nearly to the Rocky mountains. This range consists of triple chains with valleys between; the most easterly has the greatest elevation near the 52d parallel, the highest peaks being Mount Brown (16,000 feet), Mount Murchison (15,789 feet), and Mount Hooker (14,702 feet). The average height of the chain is from 7,000 to 8,000 feet.

**Rivers and Lakes.**—Canada is well watered, the map presenting a network of lakes and rivers. The system of the St. Lawrence, with the great lakes Superior, Huron, Michigan, Erie, and Ontario, drains an area in Canada of 330,000 square miles. With their outlet the lakes form the greatest fresh-water way in the world. Other important lakes are Winnipeg, Winnipegosis, Manitoba, Lake of the Woods, Great Slave, Great Bear, and Athabasca.

Other rivers are the Saskatchewan and the Winnipeg, flowing into Lake Winnipeg; and the Nelson, flowing from it into Hudson Bay; the Assiniboine and the Red river, which flow in the Lake Winnipeg; the Assiniboine and the Churchill, emptying into Hudson Bay; the Athabasca and the Peace rivers, flowing into Lake Athabasca, and the Slave river, from it into Great Slave Lake; the Mackenzie, fed from both the Great Slave and the Great Bear lakes, and emptying into the Arctic Ocean; the Fraser and Thompson, in British Columbia, emptying into the Pacific; the Columbia and the Sacramento, emptying into the St. Lawrence; and the St. John, in New

Brunswick, which it partly separates from the state of Maine.

**Climate.**—The cold in winter and the heat in summer are frequently extreme, but the climate is a healthy one. The winter may be said to continue from the middle of November to the end of March, although the average of half months. British Columbia and probably possesses the finest climate in North America.

**Cities.**—The chief towns are Montreal, Toronto, Quebec, Ottawa (the capital of the Dominion), Hamilton, Winnipeg, Halifax, and St. John.

**People.**—The nationality of the inhabitants is varied. Ontario is settled principally by emigrants from Great Britain and their descendants, with considerable numbers of Germans and Americans. In the province of Quebec the people are mostly French in origin, speech, and customs, being mainly descendants of the French colonists who inhabited the region before it became British. There are, besides, the Indian tribes and the Eskimo, the latter in the extreme north. In the Dominion, Quebec, and Manitoba the population is divided into two classes in either language. The French spoken by the *Abolians*, as the French-Canadians are called, is a patois which in many respects resembles the French spoken in the islands more closely than the French of modern Paris.

**Ontario** (formerly called Upper Canada), area, 260,862 square miles; population, 2,182,947; extends across the middle of the River St. Lawrence and the great lakes, and is important as containing the Dominion capital, Ottawa.

**Quebec** (formerly called Lower Canada) lies eastward of Ontario, occupying both banks of the St. Lawrence.

**Nova Scotia**, a province of the Dominion, is a peninsula, and is connected with New Brunswick by a low ferry-bridge, the shortest in the world. New Brunswick is situated in the eastern divide of the continent of North America.

**Manitoba** (formerly called the Red River settlement, and entered the Dominion in 1870. It takes its name from Lake Manitoba, which is situated on the western border of the province.

**British Columbia**, Canada's maritime province on the Pacific, extends from the United States boundary to the Rocky mountains, and is bounded on the east by the province of Alberta.

**Prince Edward Island** lies in St. Lawrence Gulf, north of the Strait of Bellefleur, between New Brunswick and Cape Breton.

**Saskatchewan**, a province proclaimed Sept. 1st, 1905, was carved out of the Northwest Territories. It comprises the eastern half of Athabasca and the greater part of the old territory of Alberta.

**Alberta**, a new province proclaimed Sept. 1st, 1905, was carved out of the Northwest Territories. It includes the former district of Alberta, the western half of Athabasca, and a strip of Assiniboia and Saskatchewan.

**The Northwest Territories** comprise those territories formerly known as Rupert's Land, the Northwestern Territory and the district of Keewatin (except the provinces of Manitoba, Saskatchewan and Alberta, and the Yukon territory), together with all British territories and possessions in North America and all islands adjacent to any such territory, and all islands, rocks, shoals, and lead and its dependencies.

The Yukon Territory was in 1905 constituted a separate territory, and is administered by a commissioner.

**Central America**, a geographical division, including the territory from the Isthmus of Panama to the Isthmus of Tehuantepec, but by political arrangements the limits most generally assigned to it include the five republican states of Guatemala, Honduras, San Salvador, Nicaragua, and Costa Rica, with British Honduras and the Mosquito coast. It thus has Mexico on the northwest, Panama on the southeast, and the Pacific Ocean and Caribbean Sea on either side. Its entire length is about 800 miles, with a breadth varying from between 20 and 30 to 350 miles. It is generally mountainous, contains numerous volcanoes, and on the whole is a rich and fertile, but almost totally undeveloped region.

**Costa Rica**, the most southern state of the republics of Central America; bounded north by Nicaragua, east and north by the Caribbean Sea, and south by Colombia; and south and west by the Pacific.

**Surface.**—The country is intersected diagonally by the primary range or cordillera of the isthmus, which throws off numerous spurs on either side. The principal range contains several lofty and

ances (the highest 11,740 feet) and volcanoes, both active and extinct or dormant.

**Colombia.**—The capital is Bogota. The two established ports are Punta Arenas, on the Pacific side, and Porto Limon, on the Caribbean Sea. The other towns are Caracas, Abaco, and Heredia. **People.**—The inhabitants are chiefly descendants of Spaniards from Galicia. Some negroes and half-breed dwell on the coast, but the interior is about 5,000 civilized and 3,000 uncivilized Indians.

**Guatemala.** A republic of Central America, bounded by Mexico, Belize, the Gulf of Honduras, Honduras, San Salvador, and the Pacific.

**Surface.**—The greater part of Guatemala is mountainous, the highlands having a mean elevation of 7,000 feet above the sea; but the surface presents great variety, with extensive valleys, fertile, and upland valleys—the last notable for their beauty, fertility, and favorable climate. Of the volcanoes, several are active, the most noted is Terrazal Fuego (12,075 feet). Earthquakes are frequent; sulphur and other hot springs are numerous.

**Rivers.**—The state is well watered by numerous streams, none of much importance. There are several lakes, the most important being Dulce, through which a great part of the foreign trade of the state is carried on; Amatitlan, Atitlan, and Yoten.

**Climate.**—The climate, except in the low-lying districts where the temperature ranges from 70° to 90°, may be described as perpetual spring, and is generally healthy, but the hot coast lands on the Pacific are liable to yellow fever.

**Vegetable and Animal Life.**—The forests contain over a hundred kinds of trees, such as mahogany, haricot beans, peas, potatoes, wheat and rice grow in various districts. Other products are coffee (the chief export), sugar, indigo, rubber, tobacco, cotton, hemp, sarsaparilla, and many medicinal plants, bananas, and other fruits.

The fauna includes the jaguar, puma, cougar, coyote, red deer, tapir, porcupine, armadillo, several monkeys, iguanas, turkeys, and snakes. The birds are of great variety and beauty; the national emblem is the superbly colored quetzal.

**Coast.**—The capital is Guatemala la Nueva (New Guatemala), on the Bay of Amatique, on the Pacific; Champereon, on the Pacific, and Livingston, on the Bay of Honduras, on the Caribbean Sea.

**People.**—About a third of the people are said to be of European descent, and the rest aborigines (Maya-Guaras) and negroes.

**Honduras.** The middle state of Central America, is bounded on the north and west by Yucatan; west and south by Guatemala; and east by the Bay of Honduras.

**Surface.**—Except for a narrow strip of swampland on the either side of the Bay of Amatique, the entire of elevated plains broken by broad and fertile plains and valleys, or a rise to mountain ridges that culminate in the Cordillera Occidental (10,120 feet). The Cordillera proper traverses the country irregularly in a northwest and southeast direction.

**Rivers and Climate.**—Honduras is watered by innumerable (small-navigable) streams; the Wanks or Tegucigalpa, the boundary with Nicaragua, has a length of 350 miles. Roatan and the other fertile bay islands, off the north coast, belong to Honduras. The climate is hot on the coast, but elsewhere fever prevails; but the highlands are cool, and fruit is not unknown. The flora and fauna are like those of Guatemala.

**Coast.**—The capital is Tegucigalpa. The ports are Amapala, on the Bay of Fonseca, Puerto Cortes or Puerto Cabello, Orma, and Truxillo.

**People.**—The whites are very few in number, the Indians (including Carib, negroes, and mixed race) including all but some 6,000 or 7,000 of the population.

**Nicaragua.** is the largest State of Central America, with a long seaboard on both the Atlantic and the Caribbean Sea, and having on the north and northeast the state of Honduras, and on the south Costa Rica.

**Surface.**—The state is traversed by the Cordillera of Central America, and the Pacific coast there is a remarkable depression extending for 300 miles and containing Lake Nicaragua and the smaller Lake Managua at no great elevation above the sea. Along the coast is a chain of volcanic cones, rising in some cases to 7,000 feet. From the Cordillera the surface slopes to the Caribbean coast (Mosquito territory), which is low and marshy.

**Rivers.**—Flowing eastward are the Coco or Wanks, the northern boundary; the San Juan, which drains Lake Nicaragua and separates Nicaragua from Costa Rica; the Bluefields and the Rio Grande. The low coast belt, called the Mosquito territory, is lined with salt lagoons.

**Climate.**—The climate is on the whole healthy, especially in the interior and mountainous parts.

**Vegetation.**—The forests include mahogany, rosewood, logwood, fustic, sandalwood, india-

rubber, medicinal plants, gums, and dyewoods. The rich soil of the western region yields maize (the staple food), coffee, cocoa, sugar, cotton, rice, tobacco, indigo, and a great variety of tropical fruits.

**People.**—Of the population of 600,000, one-third are Indians, and one-half mulattoes and negroes.

**Cities.**—The western districts contain the chief seats of population; there are the towns Managua, the capital; Leon, Granada, Chinandega, and Hivas.

**Navigation.**—The country is by far the most thickly populated of the Central American Republics, consists of a strip of territory stretching between Honduras and the Pacific. It is 140 miles in length by about 60 in average breadth.

**Surface.**—Except for a narrow seaboard of low alluvial plains, Honduras consists of a plateau, some 2,000 feet above the sea, furrowed by river valleys and broken by numerous volcanic cones, and bounded on the north by the Central American Cordillera. Of the volcanoes many are extinct; earthquakes are frequent.

**Rivers and Climate.**—The Lempa (140 miles) receives the surplus waters of the Laguna de Cuica, and the San Miguel drains the southern slopes of the Cordillera. The climate is equable, very healthy in the interior, and even along the coast less unwholesome than on the Atlantic seaboard of America, and the soil exceedingly fertile.

**Coast.**—The ports are Amatique, La Libertad, and San Salvador. The principal towns are San Juan de los Rios and San Miguel.

**People.**—The population consists mostly of (Asteo) Indians and white races, the latter numbering 20,000. The Indians almost all speak Spanish.

**Chili or Chile,** a country of South America, extends along the Pacific coast from latitude 33° degrees south nearly to Cape Horn, and including Chiloe and many other islands and part of Tierra del Fuego. It is bounded on the north by Peru (the river Sama being the boundary), on the northeast and east by Bolivia, and the Argentine Republic, from which it is separated by the chief range of the Cordilleras. Its length from north to south is about 2,400 miles; its breadth, on an average, 80 miles.

**Surface.**—The surface is greatly diversified, but rises in elevation as it recedes from the coast, and approaches the Andes, along the eastern and northern parts of the country, a series of low hills, or the Cordillera, runs. Some of the summits here rise to 20,000 feet or more, but the elevation decreases toward the south. Chiloe and numerous other islands rise from the coast in the south. Earthquakes are common.

In the Chilean Andes there are twenty volcanoes, at least three of which (Antuco, Villarica, and Osorno) are still active.

**Climate.**—The climate is remarkably salubrious. In the northern provinces it rarely rains—in some parts perhaps never; in the central parts rain is sufficiently abundant, while in the extreme south there is even an excess of moisture.

**Rivers.**—The rivers are numerous, but small, and have generally rapid currents; the principal are the Bio Bio, the Maipo, the Maule, Itata, and Chuapa (or Illapel).

**Cities.**—The chief are Santiago, the capital; Valparaiso, Talca, Concepcion, Iquique, and Chillan; the last four range from 50,000 to 60,000.

**People.**—The natives of Chili are a mixture of Spanish with the Araucanian Indians. In the upper classes the race has been kept pure. Spanish is the language of the South American country. The language spoken in Chili is Spanish, but with many local words of Indian origin.

**China, Manchuria,** and its dependencies of Mongolia, Tibet, and The Great Wall, the Chinese empire, embracing a vast territory in Eastern Asia only inferior in extent to the total dominions of Great Britain and Russia. The dependencies are not colonies but subject territories. The chief facts concerning the latter follow:

**Manchuria.** 362,510 square miles, population 10,000,000. It is the seat of the reigning dynasty, extends from the Gulf of Liaotung to the Helong, Kiang or Amur river. Its southern and central parts are fertile, with coal, gold and silver, and other metals are found in the north, and other Tungus still occupy the greater part of the country, but they are outnumbered by Chinese immigrants, who are gradually taking possession of all tracts fit for cultivation.

Three provinces: (a) Shangkai, in the south (54,780 square miles, population 5,000,000), capital Peking, 600,000; (b) Shantung, 60,000; (c) Port Arthur (now Japan); (d) Kirin, (103,000 square miles, population 2,000,000), capital 500,000. (e) Ching, 100,000 square miles, population 500,000 capital Tientsin, 600,000.

**Mongolia.** 1,100 square miles, population 1,800,000, mainly Buddhist Mongols, but also Calmucks and other Tatar tribes. It is a pastoral region, the chief of its wealth is its great herds of cattle, 70,000, sheep, 3,750, and horses, 10,000.

**Shankai.** 550,000 square miles, population 10,000,000. It is the seat of the Chinese empire, the basin of the Tarim, between the Tien Shan, or Celestial mountains, and the Kwen Lun (Chinese Turkestan), and extends to the Hsi to the north of the former. Most of the country is barren desert. Population much mixed, but the Turkish element and Mohandannum predominate. Capital, Urumchi, 25,000; Yarkand (4,000 feet above sea-level), 65,000; Kashgar, 50,000.

**Shen-Nor,** a pastoral highland region, named after the lake which occupies its center (10,400 feet), 274,000 square miles, population 150,000, Tangut Mongols.

**Tibet.** 477,320 square miles, population 1,500,000, the infertile tableland in the world, with mountains covered with eternal snow. The population is about 1,500,000, the chief of its wealth is its Upper Brahmaputra. The country is ruled by the Dalai Lama, an incarnation of Buddha, and the official capital is the Nanting (or Southern Capital), Lhasa (11,900 feet), 20,000, nearly one-half of its people are priests and monks.

**Surface.**—China proper may be described as sloping from the mountainous regions of Tibet toward the shores of the Pacific on the east and south. The most extensive mountain range is the Nanting (or Southern range), a far-extending spur of the Himalayas. Commencing in Yunnan, it bounds with a continuous barrier (penetrated by only a few difficult passes) Kwang, Kwangtung, and Fukien on the north, and, passing through Chekiang, reaches the sea at Ningpo. North of this long range, and west of the Nanting, the mountains of Northern Tibet, the country is mountainous, while to the east and from the great wall on the north, to the Poyang lake in the south, there is the Great Plain, comprising the greater part of the provinces of Shantung, Shantung, Honan, Anhui, and Kiangsu.

**Rivers.**—The rivers of China—called for the most part by the north, and *chiang* (kiang) in the south—include the Yellow River, and the Yangtze or Yangtze Kiang. They rise not far from each other among the mountains of Tibet. The Ho purues a tortuous course seaward through North China; the Kiang or Yangtze through central China. The terrible calamities caused by the inundation of the Hoang-Ho have procured for it the name of China's Sorrow. So recently as 1887 it burst its southern bank near Kwanghchau, and, having nearly thirty millions of people, and the destruction of millions of lives, into the populous province of Honan. The Ho is not much under the Chiang in length—somewhat over 3,000 miles.

The Great Canal, which goes farther east, water communication from Peking to Hang-chau in Chekiang, a distance of more than 600 miles. The lakes are many, but not so great as those of the north. **Animal Life.**—The animals are identical with or differ but little from those of Europe. In the south and southwest the tiger, the rhinoceros, and elephant are found; bears are common in many parts; other carnivores are the wild-cat, badger, lynx, marten, etc. Camels and elephants are used in a domestic state, but the chief domesticated animal is the horse. The horse is a poor creature. Among birds the most beautiful are the gold and silver pheasants. Fish swarm in all inland waters as well as on the coast, the natural supply being immensely increased by artificial means.

**Vegetable Life.**—As regards the flora of China, it is tropical in the south (coco and sago palms, banana, pandanus, etc.), subtropical in the north, and temperate in the north. A number of plants and trees identical with or closely akin to those of middle Europe. Flowering plants, shrubs, and trees are so

Flowering plants, shrubs, and trees are so

Flowering plants, shrubs, and trees are so

Flowering plants, shrubs, and trees are so

Flowering plants, shrubs, and trees are so

Flowering plants, shrubs, and trees are so

exceedingly abundant, as to form a feature. The bamboo, from the immense number of uses to which it is put, is one of the most valuable trees. Oaks, the chestnut, hazel, pines, yew, walnut, etc., are among forest trees. Wax tree, camellia, tree tobacco, Azales are exceedingly numerous; other flowering plants are the camellia, rose, passion-flower, cactus, Lagerstroemia, etc. Fruits are abundant and varied.

**Climate.**—The greater part of China belongs to the temperate zone, but it has what is called an excessive climate. At Peking in summer the heat ranges from 90° to 100° in the shade, while in the winter so cold that the rivers are usually frozen from December to March. At Shanghai, the maximum temperature reaches 100°, and the minimum falls at least to 20° below freezing-point. In the south the climate is of a tropical character, the summer heat rising to 120°. Here the southwest and northeast monsoons blow with great regularity.

**Cities.**—The capital of China is Peking. Other chief towns are Sianquan; Singan; Canton; Hankau; Tientsin; Shanghai; Fuchau; Chungking; Suchau; Hangchow; Nanking; and Ningpo.

**Peoples.**—The Chinese people are the result of a fusion of various invading Mongolian tribes, from B. C. 3000 to 700 A. D., with the aborigines of various stocks; the Manchurian dynasty has ruled since 1644. Three types may still be recognized in China—a northern Manchu-Korean, a central and nearly pure Chinese, and a southern with Malayan and other admixtures.

**Colombia.**—A republic occupying the north-west corner of the South American continent, and till 1903, when Panama became independent, including also the Isthmus of Panama.

**Surface.**—The surface of the country is extremely varied, with lofty mountains in the west, and vast plains in the east scarcely above the level of the sea. From the central Cordillera descend the two principal rivers of Colombia, the Magdalena and its tributary the Cauca, which flow north into the Caribbean Sea, besides several affluents of the Amazon in the east, and the Pacific, which forces its way to the Pacific through a gorge between cliffs 10,000 to 12,000 feet high.

The eastern Cordillera, by far the largest, extends a great part of the way to the Andes, cool and healthy, and is the most thickly populated portion of the republic; on one of its plateaus, at an elevation of 8,094 feet, stands the capital, Bogotá. Eastward from this Cordillera stretch vast *llanos* or plains.

**Rivers.**—The chief rivers are the various tributaries of the Orinoco. Other rivers are the Sao Juan (navigable 150 miles), on the Pacific coast, and the Atrato and Zulia, flowing north.

**Climate.**—The climate is naturally as varied as the surface of the country, but over a great part of the republic is very hot. At Cartagena, on the Caribbean Sea, and on the Pacific coast, yellow fever is endemic at some places; while in the elevated country, as the plains of Bogotá, 8,000 feet above the sea, the climate is perfectly salubrious, and the temperature seems that of eternal spring.

**Vegetable and Animal Life.**—The flora is rich and luxuriant. A great part of the country is still covered with virgin forest, which yield excellent building-wood, Peruvian bark, caoutchouc, vanilla, etc.

The fauna includes the jaguar, puma, tapir, armadillo, sloth, various species of deer, and the gigantic condor.

**Cities.**—The chief towns are Bogotá, the capital, Medellín, Barranquilla, Cartagena, and Bucaramanga.

**People.**—The population is mainly descended from the numerous Indian tribes, partly Hispanized in language and habits. The chief aborigines of the country, the Chibcheas or Muzecas, inhabiting the plateau of Bogotá, were a comparatively civilized race at the discovery of the new world; the uncivilized Indians are now mostly confined to the eastern plains, the northern portion of Magdalena, and the districts of Darien and the Atrato. The pure whites form about a fifth of the

entire population, and the Indian half-breeds more than half; mulattoes and *zambos*, resulting respectively from the union of negroes with whites and Indians, exceed a sixth of the whole.

**Cuba.**—The most westerly and largest of the West Indian islands, since 1902 an independent republic, stretches in the form of a long narrow crescent, convex on the north side, at the entrance of the Gulf of Mexico, which it divides into two channels—the northwest, 124 miles wide, and the southwest, 98 miles at its narrowest part. Cuba is 759 miles long from north to west, with a breadth varying from 27 miles to 90 miles, and a coast-line of 1,976 miles.

**Rivers.**—The rivers, running north and south are navigable for only a few miles by small boats, but are very serviceable for irrigation.

**Climate and Vegetation.**—The climate, more temperate than in the other West Indian islands, is healthy in the elevated interior, but the coasts are the haunts of fever and ague. No month of the year is free from rain, the greatest rainfall being in May, June, and July. Earthquakes are frequent.

The soil is eminently fertile, a large part still covered with virgin forest, containing magnificent mahogany, cedar, etc.

**Cities.**—The chief commercial ports and harbors are, on the north, Havana (the capital), Cienfuegos, Sagua, and Matanzas; on the south, Santiago, Trinidad, Cienfuegos, and Guanatanamo.

**People.**—The population of Cuba may be classified into the following groups: white (58 per cent), black Cubans and colored Cubans (32 per cent), Spaniards and foreigners (9 per cent). The white Cubans are increasing at a rapid rate, whereas the blacks are barely holding their own. The former comprise the officials and the owners of the soil; the black and colored form the laboring classes; the Spaniards, the commercial class.

**Denmark.**—The smallest of the three Scandinavian kingdoms, consists of the peninsula of Jutland and a group of islands in the Baltic, and is bounded by the Skager-Rak, the Kattegat, the Sound, the Baltic, the Little Belt, and the North Sea.

**Surface.**—Except in Bornholm, the surface of Denmark is very similar in every part of the kingdom, and is uniformly low, its highest point, in the southeast, Jutland, being only 564 feet above sea-level. The coast is generally flat, skirted by sand-dunes and shallow lagoons, especially along the west side. Both the continental portion and the islands are penetrated deeply by numerous fiords, the largest being Limfjord, which intersects Jutland, and has insulated the northern extremity of the peninsula since 1825, when it broke through the narrow isthmus which had separated it from the North Sea.

**Rivers.**—Denmark has numerous streams but no large rivers; the principal is the Guden, which flows northeast through Jutland into the Kattegat. It is navigable for part of its course. Less important streams are the Holm, the Lønborg, and the Stor Åa. All the others are insignificant brooks and streamlets.

The lakes are very numerous but not large, none exceeding 8½ miles in length by about 1½ miles broad. There are numerous windings in the sea that penetrate far into the land. The largest of these, the Limfjord in Jutland, entering from the Kattegat by a narrow channel, winds its way through to the North Sea, where it meets the open sea, and really an island. In this fiord, which widens out greatly in the interior and gives off various minor fiords, there are one large and various small islands.

**Climate.**—The climate is milder, and the air more humid than in the more southern but continental Germany; it is not unhealthy, except in the low-lying islands, such as Læsø, where the effects of the sudden heat of the summer occasions fevers.

**Vegetation.**—The center and west of Jutland is nearly bare of wood, but in the other parts of the peninsula the forests, especially of oak, cover about 215,000 acres, and in the islands over 291,000 acres.

**Cities.**—Copenhagen is the capital; other chief

towns are Odense, Aarhus, Aalborg, Randers and Horsens.

**People.**—The population of Denmark is composed almost exclusively of Danes, with a few thousand Swedes and Germans. The Danes have regular features, fair or brownish hair, and blue eyes. They still maintain their reputation for seafaring skill and hospitable customs.

**Dominican Republic.**—for Santo (commonly San) Domingo, a state formed of the eastern portion of Hayti.

**Surface and Vegetation.**—The country is mountainous, being traversed longitudinally by northern, central, and southern ranges, terminating in headlands on either coast; but between these ranges are wide and fertile plains. The highest peak is Loma Tina.

The mountains are clothed with forests of pine and oak, and the island is rich in mahogany, satinwood, rosewood, and other valuable timbers. Cotton, rice, maize, cocoa, ginger, arrowroot, yams, tobacco, and numerous fruits are indigenous.

**Climate.**—The climate is hot and moist in the lowlands, the temperature at Port au Prince ranging from 67° to 104° F.; the mean range in the highlands is from 60° to 70° F. Earthquakes are frequent, and occasional hurricanes visit the island.

**People.**—The population is mainly of mixed race descended from the original Spanish inhabitants and the aborigines. Spanish is the prevailing language.

**Ecuador.** a republic of South America, so named from its position on the equator, is bounded on the west by the Pacific Ocean, and is inserted like a wedge between Colombia and Peru. But its only certain limits are those defined by the ocean, where it has a seaboard of some 400 miles; most of the frontier east of the Andes has never been determined.

**Surface.**—Ecuador consists of three divisions—the lowlands west of the Andes, the mountainous plateau of the interior, and the elevated forest country to the east. Besides the main range of the Andes, forming the backbone of the country, there is an outer range, with peaks rising to 15,000 feet; from the cordillera proper numerous long spurs, attaining a height of 14,000 feet, are thrown out toward the east, between which rise great affluents of the Amazon, while the coast range presents only short and very precipitous spurs.

The principal mountains of Ecuador either are or have been volcanoes. Tunguragua (16,690 feet) broke out in 1887; Pichincha is by no means extinct; Cotacachi and Sangai (17,465) are constantly active.

**Rivers.**—Of the coast streams the principal are the Guayasquil river, and the Rio Esmeraldas; east of the Andes the chief rivers are the Napo and its affluents, flowing into the Marañon.

**Animal Life.**—The country is comparatively poor in mammals, although various kinds of deer as well as tapirs and peccaries are found in the forests. Parrots and humming birds are also numerous, but perhaps the most remarkable of the birds of Ecuador is the condor, which dwells on the slopes of the Andes. Reptiles, including serpents, are numerous.

**Vegetation and Climate.**—The forests yield cinchona bark, caoutchouc, sassaaparilla, vegetable ivory, etc. The climate on the plains, both in the east and the west, is moist, hot, and unhealthy. In the higher regions the climate is rugged, cold, and dry, except the elevated valleys, as that of Quito, enjoy a delightful climate.

**Cities.**—The principal cities are Quito (the capital), Guayaquil (the chief port), Cuenca, Esmeraldas, Latacunga, and Ambato.

**People.**—Of the present population, the aboriginal red race form more than half; the rest are negroes, mulattoes, mestizos (a degenerate breed of mixed negro and Indian blood), and Spanish creoles or whites. The latter are the chief possessors of the land, but are deficient in energy.

**France.** a maritime country in the west of Europe, forming one of its most extensive, most populous, and most influential states. It is bounded on the north by the Straits of Dover

and the English channel; west by the Atlantic (Bay of Biscay); south by Spain and the Mediterranean Sea; east and northeast by Italy, Switzerland, Germany, and Belgium. Its greatest length from north to south is 600 miles, and its greatest breadth 547 miles.

**Divisions.**—France, formerly divided into some provinces (Normandy, Brittany, Champagne, Burgundy, Auvergne, Languedoc, Provence, etc.—see the separate articles), was at the revolution redistributed into departments named generally after the rivers. These departments cover an area of 1,600 and 2,600 square miles in area, are, including Corsica and the territory of Belfort, thirty-seven in number.

**Possessions.**—The possessions of France outside Europe, both colonies and protectorates, cover an aggregate of 4,072,076 square miles, and have a population of more than 61,000,000 inhabitants. Of these, Algeria is rapidly becoming a part of France proper, and is considered as such for nearly all administrative purposes. The large territory of the Tunis has since 1881 been under French protection. By a treaty signed in 1893 Madagascar was placed under the protection of France, which also now holds a large area in West Africa, in Guinea, the Ivory coast, and on the Gaboon and Congo. In Asia, Tonkin was placed under French protection, and portions of Siam acquired in 1893. The details of the French colonies and protectorates are given in the subjoined table:

	Area square miles	Pop.
In Asia—		
French India.....	190	273,000
Cochin-China.....	22,000	2,900,000

Establishments, Oceania.....	1,520	29,000
Total.....	4,072,076	61,139,340

**Surface.**—The territory of France proper embodies highlands in the south and southwest; in the south it comprises the northern slopes of the Pyrenees, and toward the southeast frontier part of the Alps. The remainder of the territory is nearly equally divided between extensive lowlands in the northwest and a great plateau which covers the southeastern half, but is separated from the Alps by the broad and deep valley of the Lower Rhone.

**Mountains.**—The interior is traversed from southwest to northeast by successive chains of mountains, commencing with the Pyrenees and including the Cevennes, the Côte d'Or, the Vosges, and others, forming the watershed, on one side of which the rivers flow west and north into the Atlantic and the English channel, on the other side east and south into the Mediterranean. At its northeastern extremity this system is met by the Alps and the Jura. A considerable portion of the western Alps belongs to southeastern France. Mt. Blanc itself (15,781 feet) is mostly within the French boundary-line. Some lofty Pyrenean peaks are also within French territory, on the highest being Vignemale (10,792 feet). Near the center of France, and separate from the great watershed of the country, are several groups of volcanic mountains known by the general name of the mountains of Auvergne, the chief peaks of which are the Plomb du Cantal (5,983 feet), the Puy de Sancy (6,100 feet), and the Puy de Dôme.

**Rivers.**—The square thrown off by the great watershed divide France into seven principal river basins, six of which are on the north-western slope and one on the southeastern. These are:

1. The basin of the Garonne and its affluents (the Arège, Tarn, Lot, and Dordogne on the right, and the Gers on the left); with the two secondary basins of the Charente on the north, and the Adour on the south.

2. The basin of the Loire and its tributaries (Nièvre and Maine on the right, the Allier, Indre, Cher, Indre, Vienne, and Sèvre Nantaise on the left).

3. The basin of the Seine and its tributaries (the Aude, Marne, and Oise on the right, the Yonne and Eure on the left). To the north is the English Channel, and to the south the Atlantic.

4. The basin of the Meuse, with its affluent the Sambre.

5. The basin of the Escaut or Scheldt, with its affluent the Rhine. Only a comparatively small portion of these two basins is included within the political boundaries of France.

6. The basin which pours a number of tributaries, the principal of which is the Moselle, into the Rhine. Only a comparatively small portion of this basin also is included within the political boundaries of France.

7. The basin of the Rhone, occupying the whole of the territory which lies to the southeast of the great watershed, the tributaries being the Ain, the Saône, Ardèche, and Gard on the right, and the Isère, Drôme, and Durance on the left. The secondary basins are those of the Var and the Aude. The four great rivers of France are the Loire, Seine, Rhone, and Garonne. France has in all more than 200 navigable streams, with a total navigation of about 6,000 miles. Lakes are few, and individually very limited in extent.

**Climate.**—France enjoys on the whole a very fine climate; not so continental as that of central Europe, nor so maritime as that of England. If we omit the highilly tracts of the Alps and the Pyrenees, the coldest region of France is evidently that of the high plateau of its cold winters, though it has hot summer days. The climate of Brittany is very much like that of the southwest of England; while that of the plains on the Bay of Biscay is warm and dry, and the slopes of the Pyrenees, has the deserved reputation of a sanitary station. The climate of Languedoc and Provence assumes a tropical character, and Africa, and the temperate winter is succeeded by a burning hot summer, moderated from time to time by the mistral.

**Cities.**—More than 8,000,000 people live in the twenty-seven chief cities having each more than 30,000 inhabitants. Fifteen cities have populations of more than 100,000: Paris, Marseilles, Lyons, Bordeaux, Lille, Toulouse, St. Etienne, Roubaix, Nantes, Le Havre, Rouen, Rheims, Nice, Nancy and Toulon. There are 182 cities of two others of over 50,000 inhabitants.

**People.**—The character of the French people combines the impressibility, the vivacity, the rapidity of conception, and the artistic

feeling of the men of the south with the persistence, laboriousness, and rationalism of the men of the north. Their language was developed out of the *lingua Romanorum* of the Roman conquerors, which displaced the native Celtic tongues, and was afterward modified in vocabulary and phonetics (but not in structure) by the invading Teutonic Franks, who gave their own names both to the language and to the country. In the south the Provençal, another Romance type, is still the popular dialect. In the northwest the ancient Celtic Breton tongue survives and in the southwest the distinct and peculiar Basque language is spoken in the department of Basse-Pyrénées. Finnish is spoken in French Finland, the Walloons speak their own Romance dialect in the northeast of France; and German is still spoken in some districts of those parts of Alsace and Lorraine still left to France.

**Germany** (or the German empire) lies between the Baltic Sea, Denmark, and the North Sea on the north, and Switzerland and Austria-Hungary on the south. The greatest length measured from near Memel in the northeast to beyond Mülhausen in the southwest, is 330 miles, and the shortest, from Swinemünde at the mouth of the Oder to beyond Rastatt in the (Saxon) Lusatia, 196 miles. The states of the empire, together with their areas, and their populations in 1905, are shown in the following table:

STATES	AREA SQ. MILES	POPULATION
KINGDOMS		
1. Prussia.....	134,616	37,293,324
2. Bavaria.....	39,292	6,624,372

Total Foreign Dependencies.....	1884-90		1,027,820	14,546,000

\*Exclusive of the bay with an area of about 200 square miles, and the neutral zone with an area of about 2,500 square miles, and population of 1,200,000.

**Surface.**—Germany proper presents two very distinct physical formations:

1. A range of high table-land, occupying the center and southern part of the country, interspersed with numerous ranges and groups of mountains, the most important of which are the Harz and Teutoburgwald, in the north; the Taunus, Thuringerwald, Erzgebirge, and Riesengebirge, in the middle; and the Black forest (Schwarzwald), Raube Alb, and Bavarian Alps in the south (with the Zugspitze, the highest point in Germany, 9,665 feet high); and containing an area of 110,000 square miles.

2. A vast sandy plain, which extends from the center of the empire north to the German Ocean, and from the Netherlands into Russia, contains an area of about 98,000 square miles, and is varied by slight terrace-like elevations marked by summits of 600 to 800 feet high. A large portion of the plain is occupied by sandy *travertis* interpermed with deposits of peat; but other parts are moderately fertile, and admit of successful cultivation.

**Rivers.**—The surface of Germany may be regarded as belonging to three drainage basins. The Danube from its source in the Black forest to the borders of Austria belongs to Germany; and through its channel the waters of the greater part of Bavaria are poured into the Black Sea. By far the greater part of the surface has a northern slope, and belongs partly to the basin of the North Sea, partly to that of the Baltic. The chief German streams flowing into the North Sea are the Rhine, with its tributaries the Neckar, Main, Lahn, Sieg, Wupper, Ruhr, and Lippe on

the right, and the Ill and Moselle on the left; the Weser and the Elbe. Into the Baltic flow the Oder, Vistula, Memel, and Pregel. The natural and artificial waterways of Germany are extensive, especially in the northern plain, and connect the rivers flowing into the Baltic and the North Sea with those flowing into the English channel and the Black Sea. The North Sea and Baltic ship canal, from Brunsbüttel at the mouth of the Elbe to Kiel (1887-95), is intended chiefly for warships.

Numerous lakes occur, but few of them are of any great size. The so-called "haffs" of the north coasts are landlocked salt-water lagoons or coast lakes. Mineral springs occur principally in Nassau, Württemberg, Baden, Bavaria, and Rhenish Prussia.

**Climate.**—The climate of Germany presents less diversity than a first glance at the map might lead one to infer. Though the country extends over 8½° of latitude, its mean annual temperature is remarkably uniform. This is owing mainly to the different elevations of the surface, the low plains of the north having a higher, while the hills and plateaus of the south have a lower temperature than their latitudes might seem to indicate. The mildest climate is enjoyed by the valleys of the Rhine and the Moselle.

**Cities.**—German towns are officially distinguished as large towns (with 100,000 inhabitants and upward); medium towns (20,000 to 100,000 inhabitants); small towns (5,000 to 20,000 inhabitants); and country towns (2,000 to 5,000 inhabitants). In 1905 only 1 town had over 1,000,000 inhabitants; 10 others over 250,000; 30 others over 100,000;

43 between 50,000 and 100,000; and 137 between 20,000 and 50,000. Of these the chief are Berlin (the capital of the empire), Hamburg, Munich, Dresden, Leipzig, Breslau and Cologne.

**People.**—Of the German-speaking inhabitants of the empire, a considerable proportion are not of German stock. Among the peoples retaining their own language are Poles (exclusively in eastern and northeastern Prussia); Wends (in Silesia, Brandenburg, and Saxony); Czechs (in Silesia); Lithuanians (in eastern Prussia); Danes (in Schleswig); French (in Rhenish Prussia, Alsace, and Lorraine); and Walloons (about Aix-la-Chapelle in Rhenish Prussia).

The Germans are divided into High and Low Germans; the language of the former is the cultivated language of all the German states; that of the latter, known as *Platt deutsch*, is spoken in the north and north-west.

**Great Britain** is so distinguished from Britannia Minor, or Brittany, in France, and was not officially so called till in 1064 James I. styled himself "King of Great Britain."

Great Britain is the largest island of Europe and is bounded by the Atlantic, the North Sea, the English channel, the Irish Sea, and St. George's channel. The most northerly point is the *Scilly* head, in Caithness; the most southerly, Lizard point, in Cornwall; and the most easterly, Lowestoft Ness, in Suffolk; and the most westerly, Ardnamurchin point, in Argyllshire. Its greatest length is about 608 miles, and its greatest breadth (from Land's End to the east coast of Kent) about 325 miles.

**Surface.**—The northern part of Britain is, for the most part, rugged, mountainous, and barren, this being the character of much of Scotland. To the north of a line drawn from the Firth of Clyde on the west to Stonehaven on the eastern coast is the region generally known as the highlands. To the north and northern and a southern portion by the great hollow of Glenmore through, which runs the Caledonian canal.

The chief feature of the southern portion is the mountain mass of the Grampians, the culminating points of which, Ben Nevis and Ben Macdui, are the highest British summits. South of the highlands lie the plains, into the Firth and Clyde a region of coal and iron, in which the chief manufacturing industries of Scotland are carried on. South of this again is the elevated region of the southern highlands or southern uplands, less rugged and more pastoral than the highlands proper.

Toward the southeast are the Cheviot hills, on the borders of England and Scotland. Here commences the long Fennine chain running south into England, branching off into the mountains of Cumberland and the lake district (Cumbrian mountains), and terminating beyond the Peak of Derby, in the heart of England. The highest summit of the English mountains is in the northwest (lake district), namely, Scafell, 3,210 feet. Farther south and west is the Cambrian range, spread over the green of Wales, and containing, among the highest, the highest mountain of South Britain—Snowdon, 3,571 feet.

Over great parts of England the elevations are mostly insignificant, and the general character of the country is that of undulating plains.

**Rivers.**—The chief rivers entering the sea on the east coast, proceeding from north to south, are the Spey, Don, Dee, Tay, Forth, Tweed, Tyne, Uss, Trent, and Thames, the last named in navigable importance the greatest river of England. The rivers of importance empty either on the north or south coast. From the western coast, the rivers which descend in that direction have generally a short course, and are comparatively unimportant. From the eastern coast, to this rule are the Clyde and the Severn.

Owing to the great central flat of Ireland its rivers usually flow on in a gently winding course in different directions from the coast. Those of importance are not very numerous; but one of them, the Shannon, is the longest river of the British isles, its length being about 225 miles; while the Thames is 215. The Tay (length 130 miles) is said to have the largest volume of water.

The lakes of the British isles are distinguished for beauty rather than size; the largest, but among the least important, is Lough Neagh, in the north of Ireland.

**Climate.**—Their maritime situation has a favorable effect on the climate of the British isles, making it milder and more equable than that of continental countries in the same latitude. The temperature of the Atlantic, raised by the influx of the gulf stream, is communicated to the winds and vapors which are wafted along its surface, and the prevailing westerly breeze being from the southwest, the country is kept constantly at a relatively high temperature. The southwest winds, too, are charged with vapor, and often bring rain, thus supplying the country with abundant moisture. Ireland, from its more westerly position, has these characteristics in the most marked degree, the warmth and moisture of the west winds striking it markedly "a green island." For the same reason the western shores of the islands have a milder and more equable temperature than the eastern shores, the former being on an average one or two degrees cooler in summer and several degrees warmer in winter.

**Cities.**—The three largest cities in Wales are Cardiff, Rhonda, and Merthyr Tydfil. The capital of England and of the British empire is London. The cities next in size (in order of population) are Liverpool, Manchester and Salford, Birmingham, Leeds, Sheffield, Bristol, Bradford, Nottingham, and Hull.

The capital of Scotland is Edinburgh. Glasgow, Dundee, and Aberdeen each con-

tain upward of 150,000 inhabitants. After these come, in order of population, Perth, Leith, Greenock, Coatbridge, Kilmarnock, Kirkcaldy, Perth, Hamilton, Motherwell, and Falkirk.

The capital of Ireland is Dublin; the other chief towns are Belfast, Cork, Limerick, and Londonderry.

**People.**—The earliest inhabitants of the United Kingdom known to history were Celts, who came from Great Britain and Ireland at the time of the Roman occupation. In the fifth and sixth centuries, however, the Celts were displaced through the greater part of South Britain and in the eastern lowlands of North Britain by the Anglo-Saxons, a Teutonic race from which the modern English and lowland Scotch are mainly descended. The Celts as a distinct people were gradually confined to the mountainous districts of Wales and Cornwall and the highlands of Scotland, and only in Wales and Scotland has the Celtic language survived in Great Britain, being still also spoken by many in the west of Ireland. There is a considerable Celtic element, however, among the population everywhere.

**Greece** is a maritime kingdom in the southeast of Europe. The country is composed of a large central part, almost separated into two parts by the gulfs of Patras and Lepanto on the west, and the gulf of Argina on the east, the archipelago of the *Agæan* Sea, and the Ionian islands, and is divided into twenty-six provinces, called nomarchies.

**Surface.**—The mountain range which cuts off the peninsula from the continent of Europe is an extension of the Balkans. From it run chains from north-northwest to south-southeast, which form the skeleton of Greece. The western boundary of Thessaly is formed by Pindus, the main offshoot of the Balkans. The eastern boundary is also marked not only by the sea but by important mountains derived from the Balkan system. These are Olympus, Ossa, Mavroviti, and Pelion. The southern branch of Pindus, forming the southern boundary of Thessaly. This branch is continued in the celebrated mountains Parnassus and Helicon, forms the land of Attica, and reappears as the islands of Cos, Cythnos, and Siphnos. The Peloponnesus, "the island of Pelops," or by its modern name the Morea, is connected with northern Greece merely by the narrow isthmus of Corinth, now crossed by a canal; its highest point is Taygetus.

**Rivers.**—The rivers of Greece are unimportant. The chief in the Peloponnesus are the Eurotas (Basilopotamo), the Alpheus (Ruphis), draining Arcadia and Elis; and the Peneus, draining Elis.

**Climate.**—The climate is generally mild, in the parts exposed to the sea equable and genial, but in the mountainous regions of the interior sometimes very cold. None of the mountains attains the limit of perpetual snow; but several retain it far into the summer. During summer, rain rarely ever falls, and the channels of the minor streams become dry. Toward the end of harvest rain becomes frequent and copious; and intermittent fogs become common.

**Cities.**—Athens is the capital. The next in size are Patras, Piræus, and Trikala, all above 20,000; and there are eight others between 20,000 and 10,000.

**People.**—The Greeks called themselves *Hellenes*, and the inhabitants of Italy called them *Græci*. The modern Greeks are by no means pure-bred descendants of the ancient Greeks. Indeed, it has been maintained that from the seventh century A. D. there have been no pure Greeks in the country, but only Slavs. It is, however, pretty certain that the 244 million of modern inhabitants are descendants of three races that conquered the soil at the time of the Roman conquest.

**Hayti, or Haiti**, is, after Cuba, the largest of the West Indian islands, now divided into the independent states of Hayti and the Dominican Republic. It is nearly equidistant from Porto Rico, Cuba, and St. As in the rest of the Greater Antilles, its greatest length (about 400 miles) is in the direction—from west to east—of the chain of which it forms a part; its greatest breadth

is 160 miles. Area, including the islands of Young, Gonave, nearly that of Scotland. **Surface and Rivers.**—It is intersected west to east by three chains of mountains, connected by offsets, with extensive plains and savannas between. The central chain contains the highest peaks. The lowest and most fertile plain is the fertile Vega Real, between the northern and central ranges.

The rivers are numerous, but of small size. Climate is tropical. The whole is one of the healthiest of the West Indian islands. The seasons are a wet, during which heavy rains are most frequent in May and June; and a dry, during which little or no rain falls.

**Animals and Vegetables.**—Like the fauna, it includes the agouti, European cattle and pigs run wild, snakes, caymans, turtles, etc. The flora includes pine, mahogany trees, fustic, satinwood, lignum vitae, and other cabinet and dye woods, plantains, bananas, yams, batatas, oranges, pineapples, etc.

**Cities.**—Among the principal towns in Hayti are Port au Prince, San Domingo, Jacmel, and Cap-Haïtien.

**People.**—The population, consists of negroes and mulattoes, with a considerable admixture of whites. The dialect is a debased French.

**Italy** is a kingdom occupying the central of the three great peninsulas of southern Europe, together with Sicily, Sardinia, and some smaller islands. The peninsula, which at the Strait of Otranto approaches within less than 50 miles of Albania, is bounded west and south by that portion of the Mediterranean known as the Tyrrhenian Sea, east by the Adriatic, and north by the Alps, separating it from France, Switzerland, and Austria-Hungary. Its greatest length is 710 miles; the breadth ranges from 351 miles in the north to about 20 between the Gulfs of Sts. Eufemia and Squillace, but in most places is about 90 or 100 miles.

**Surface.**—Among the principal physical features of Italy are the Alps on its northern frontiers, and the chain of the Apennines, which run down the middle of the peninsula through the center of the Strait of Messina, while numerous branches branch off laterally, and form an endless succession of wooded hills, olive-clad slopes, and fertile valleys.

The Po, in the north, enclosed between the ranges of the Alps and Apennines, is a vast and fertile plain, intersected by the Po and its tributaries. Two active volcanoes belong to the kingdom, Vesuvius in Southern Italy and Etna in Sicily. The eastern shore of Italy is generally flat and uninteresting, presenting particularly along its northern part a series of sandy islands and lagoons, which dam up the mouths of the rivers, and occasion the formation of pestilential marshes.

On the west coast the same thing is occasionally seen, as in the case of the Pontine marshes and the Tuscan Maremma; but as a rule the west coast is more elevated, and often presents delightful scenery, as around the Gulf of Genoa and the Bay of Naples.

**Rivers.**—The whole of northern Italy belongs to the basin of the Po. The Adige and Brenta are other streams. Many of the Po's tributaries spread out at the foot of the Alps into considerable bodies of water, among which are the Lago di Garda, Lago Maggiore, and Como. From Rimini to the Gulf of Trieste the Adriatic coast is flat and marshy, and fringed by lagoons.

**Climate.**—The climate of Italy is the climate resembles that of Africa, being dry and burning and subject to the sirocco. In the northern regions, the neighborhood of the Alps, and the abundance of water courses, serve to maintain a pleasant temperature. Yet this region is at times extremely cold, especially in the interior of the great plains. In general the climate of Italy is healthy, except in the marshy districts, such as the rice plantations of Lombardy, the Tuscan Maremma, the Campagna of Rome, and the Pontine marshes, which give rise to exhalations ungenial to the human system. The coast of the Gulf of Genoa, is a favorite winter resort from more northern regions.

**Vegetable Life.**—The natural productions of the soil of Italy are as various as its climate. In the Alpine regions all plants belonging

to temperate climates flourish, while the southern regions possess almost a tropical flora. Its wines are numerous and celebrated, and olives and olive-oil are furnished by Tuscany, Liguria, and the province of Bari; while fruit abounds and is largely exported. The cultivation of silk forms an important agricultural industry.

**Cities.**—The largest city is Naples. Rome is the capital. Milan, Turin, Palermo, Genoa, Florence, rank next. There are four others about 150,000; and 23 towns over 50,000.

**People.**—The population of Italy is in general homogeneous. There are, however, varying numbers of French, Teutonic, Albanian, Greek, and Spanish (Catalan) origin, and Slavs.

**Japan.**—This ancient and extensive empire consists of four large and many small islands, said to comprise in all above 4,223, the principal of which are Honshu (the name of the empire being Nihon), Shikoku, Kiushu, Hokkaido or Yezo, situate to the north of the main island, from which it is separated by the Tsugaru straits, and Formosa, called by the Japanese Taiwan. In addition, the Russo-Japanese war gave to Japan the southern portion of the island of Sakhalin; while in 1910 Korea, a protectorate since the conclusion of the same war, was formally annexed.

**Surface.**—The islands of Japan appear to be the highest portions of a huge chain of mountains which rises from a deep ocean bed. This chain, though dotted with volcanoes, is not therefore itself of volcanic origin. Earthquakes occur very frequently in Japan, although the western slope is exempt. Japan is one of the most mountainous countries in the world.

Its plains and valleys, with their foliage of luxuriant richness, its forest-clad heights, its alpine peaks, towering above ravines noisy with waterfalls, its foam-fringed headlands, give it a claim to be considered one of the fairest portions of the world. The most sublime coast, the sacred Fujiama (Fujiyama), a rather dormant volcano, rises to a height of 12,365 feet; and there are six peaks between 8,000 and 10,000 feet (to be active volcanoes).

The three other large islands also abound in mountains. Yezo has eight active volcanoes. Throughout the empire there are solfataras, and sulphurous springs. The plains, most of the valleys, and many of the lower hills are highly cultivated.

**Rivers.**—The rivers are of no great length; Tonegawa, the longest, is only about 172 miles. Biva, in the south of Honshu, is the principal lake, being some 60 miles in length, with an extreme breadth of 20 miles.

**Climate.**—The climate ranges from an almost arctic cold in the north to a nearly tropical heat in the south. In the island of Yezo winter begins about October and continues to April, its winters being marked by severe frosts and snowstorms; while in Yokohama, and the winter is genial, with a bright sky and a temperature much like England. From July to September the thermometer often registers as high as 95° in the shade.

**Vegetable and Animal Life.**—The vegetation of Japan is very varied, in consequence of its wide range of temperature. The vegetation of the tropics is strangely intermingled with that of the temperate or frigid zone; the tree-fern, bamboo, banana, and palm grow side by side with the pine, oak, and beech, and conifers in great variety. The camellia, the Paulownia, and the chrysantheum are indigenous.

Wild animals are not numerous, but bears, wild boars, monkeys, deer, small foxes, stoats, and squirrels occur; and there are said to be varieties of the tiger, leopard, and the Japanese cat has only a stump of a tail. There are numerous water birds; land birds are less plentiful. Edible fishes, including salmon, are abundant, and insect life is especially varied.

**Cities.**—The capital is Tokyo, formerly called Yedo, the residence of the emperor. Other cities are Osaka, Kioto (the ancient capital), Kobe, Yokohama, and the cities of Saitama, Saki, Sendai. There are also nineteen other towns of between 50,000 and 100,000.

**People.**—The Japanese belong to the great Mongolian family, though ethnologists recognize more than one element in the population. They are generally distinguished by broad features, the chin-bone prominent, the eyes, obliquely set; long black hair, and a yellow or light-olive complexion; some are good-looking, and many are well-made, active men. They are a frugal, skillful, persevering, courageous race, who combine these characteristics with much frankness, good humor, and courtesy.

**Liberia.** a negro republic on the Pepper coast (Guinea) of West Africa, extending 500 miles northward and northeast of Cape Palmas, and reaching 200 miles inland.

**Surface.**—The coast region consists of mangrove swamps, lying behind a belt of sand dunes, is traversed by numerous rivers, and interrupted by projecting headlands of rock. About 20 miles or so inland the surface begins to rise into undulating uplands.

**Climate and Vegetation.**—The climate and vegetation are tropical; the temperature ranging between 75° F. and 88° F. The rainy season lasts about seven and the dry season five months. The chief products are palm oil, palm oil and palm kernels, cocoa, arrowroot, cashew, ivory, kola nuts, etc.

**People.**—These consist of liberated American slaves and their descendants, indigenous negroes, including the Kroomen.

**Cities.**—There are thirteen ports of entry along the 350 miles of coast, viz., Robertsport, Monrovia, Marshall, Grand Bassa, River Cressa, Greenville, Hanna, Kono, Harper, Half Cavalia, Jenebo, Grand Cess, and Garraway.

**Mexico** is a federal republic of North America, embracing twenty-seven states, a federal district, and two territories.

It extends between the United States and Guatemala, with an extreme length of nearly 2,000 miles; its breadth varies between 1,000 and 1,500 miles. The Gulf of Tehuantepec, 180 miles long, separates the two countries. The extremities of the republic there extend the peninsulas of Yucatan and Lower California, inclosing the gulfs of Campeche and California respectively.

**Surface.**—For the most part Mexico consists of an immense table-land, which commences in the United States, and rises to over 8,100 feet at Marquez, 16 miles north of the city of Mexico City; at El Paso, on the northern frontier, the elevation is only 3,717 feet. The most important range is the Sierra Madre (over 10,000 feet, and extending from Tehuantepec into the United States); parallel with this run the sierras of the east coast and of Lower California.

The surface of the country is also much broken up by short cross ridges and detached peaks, the principal being the Cordillera de Anahuac, culminating in Toluca, the highest point on the North American continent, and Popocatepetl. Most of the Mexican volcanoes are extinct or quiescent; violent earthquakes are of rare occurrence.

On the Atlantic side the plateau descends abruptly to the narrow strip (about 60 miles) of fertile alluvial coast land; toward the Pacific, where the coast lands vary in width from 40 to 70 miles, the descent is more gradual.

**Rivers.**—The largest river is the Rio Grande del Norte, forming part of the boundary with the United States; most of the others are rather insignificant. The lakes, which abound, are individually of little importance; some of them have no outlet.

**Climate and Vegetation.**—In the plateau region the climate is almost that of perpetual spring; but agriculture is dependent on irrigation, and the desert tracts are cultivated by the Chihuahuas and Zacatecos. On the coast lands wood and water are abundant, and the soil fertile, but the climate is such that white men cannot work as laborers there.

The coast belt and the terrace up to 3,000 feet constitute the *tierras calientes*, where the temperature ranges from 60° to 110° F., and in the south magnificent tropical vegetation, the tall rubber (Ficus) tree, the cold lands, or *tierras frias*, embrace all the country above 8,000 feet. South of about 28° north latitude

there are only the wet and the dry season, the former from June to October. Farther north there are four seasons.

The vegetation of Mexico has the same wide range as the climate. In the lowlands dye woods and valuable timbers abound in the virgin forests, as well as medicinal plants, india rubber, palms, etc.; and oranges and bananas are raised. The principal crops are wheat, maize, sugar, coffee, cotton, rice, indigo, cotton, and tobacco, besides the omnipresent maize, all thrive.

**Cities.**—The chief cities are Mexico (the capital), Puebla, Guadalupe, San Luis Potosi, Leon, Monterey, Pachuca, Zacatecas, Guanajuato, Merida, Queretaro, Morelia, Oaxaca, Orizaba, Aguascalientes, Saltillo, Durango, Chihuahua, Vera Cruz, Toluca, and Ocelaya.

**People.**—The proportion of the different races in the population is believed to be 20 per cent of pure whites, 43 per cent of mixed race, and the remainder Indian. The crooks or half-breeds (*mestizos*), are naturally the dominant race. The Spanish language is generally spread over Mexico.

**Monaco.**—A miniature principality on the Mediterranean, between France and Italy, consisting of the rocky town of Monaco, La Condamine, and Monte Carlo, where there is a gambling establishment, and comprising a narrow strip of country extending from the Monaco cemetery on the west to St. Roman on the east.

It is about 3 miles long and 1½ miles broad, with a yearly average of over 1,200,000 visitors. The whole available ground is built over, so that there is no cultivation.

**Montenegro** is a kingdom lying between Northern Albania on the south and Herzegovina on the north.

**Surface.**—Beyond the low coastal fringes, which has a climate like that of the south of France, comes a rugged mountain region ranging up to 5,500 to 8,000 feet, not in a series of chains but in a confusing mass of peaks and gigantic crags and blocks, wild gorges and natural caves, the bare, crystalline rock being everywhere visible.

**Rivers and Vegetation.**—The streams in some cases have underground channels. The center of the country is occupied by the branching valleys of the rivers Zeta and Moratcha, which flow south into Lake Scutari. East and north of them the mountains are well wooded, principally with beech and pine.

**Cities.**—The capital is Cetinje; other cities are Podgorica, Dulegnio, Niksic and Antivari.

**People.**—The Montenegrins belong almost entirely to the Serbian branch of the Slav race. They are a brave, warlike, and simple people, noted for their honesty and their chastity. They live in small stone houses, in small villages.

**Morocco, or Marocco,** is an empire or sultanate in that part of northwest Africa bounded on the east by Algeria and on the south by Cape Nun and the Sahara, though the north lies on the Sahara side of the Atlas the limits of the empire are rather indeterminate.

**Surface.**—Morocco is, as a rule, mountainous, the Atlas traversing it in several chains from southwest to northeast, and by various spurs both to the coast country and to the desert. There are, however, numerous level plains, some of which are fertile and very rich. Farther south, and on the other side of the Atlas, sandy wastes are the prevailing characteristic. In western Morocco, though the soil is sometimes thin, actual desert is rare.

**Rivers.**—The rivers are unimportant, being mostly dry for part of the year, and generally diminishing in volume as they approach the sea. The coast is fringed by a narrow strip, the most frequented are Tangier, El-Araish (Larache), Rabat, and Mogador.

**Climate.**—The climate in many parts is pleasant and temperate, in many others the summer heat is oppressive.

**Vegetable and Animal Life.**—The flora includes the excellent oak and cork oak; in the higher regions of the Atlas the cedar and Aleppo pine; the olive, the fig, the almond, and south of the Atlas. All the fruits of the south of Europe are cultivated to some extent.

Among the wild animals are the lion, panther, jackal, hyena, wild boar, gazelle, and several species of large antelope. The locust is a cause of much devastation. The ostrich is found on the southern frontiers. The spirited small horses for which the country was once famous are still numerous.

**Cities.**—Morocco has three capitals or imperial residences—Fez, Makinas or Mequinez, and Marrakech or the City of Morocco. Besides these the principal coast towns are Tangier, Tetuan, Larache (El-Arishi), Rabat, Sale, Casablanca, Maragan, Safi, and Mogador.

**People.**—The inhabitants consist of six principal groups—Berbers or Kabyles (Tuaregs, etc.), the aborigines, Arabs, Jews, a few thousand Spaniards, Moors (Arabs with an admixture of Spanish blood, living in towns, though the name is often given to all the Mohammedan inhabitants), and negroes.

**Netherlands, The, or Holland, a kingdom of Europe, lies on the North Sea north of Belgium and west of part of northern Germany. Its greatest length (north to south) is 185 miles, and its greatest breadth 110 miles. It is little more than one-tenth of the size of Great Britain and Ireland. Luxembourg was till 1890 connected with Holland.**

The country is divided into eleven provinces.

PROVINCES	AREA SQ. MILES	POPULATION DEC. 3, 1900
North Brabant.....	1,980	629,101
Gelderland.....	1,965	639,431
South Holland.....	1,166	1,433,277
North Holland.....	1,070	1,103,514
Zeeland.....	690	231,938
Utrecht.....	614	285,180
Friesland.....	1,282	262,912
Overijssel.....	1,291	379,814
Groningen.....	1,190	201,213
Drenthe.....	1,030	172,992
Limburg.....	850	334,586
Total.....	12,648	8,825,198

**Colonies.**—In addition to her European territories Holland possesses extensive colonies and dependencies in the Asiatic archipelago and America; including Java, Sumatra, great part of Borneo, Celebes, the Dutch East Indies, Surinam or Dutch Guiana, the West Indian islands of Curaçao, Saba, St. Eustatius, etc.

**Surface.**—The Netherlands (or Low Countries, as the name implies) form the lowest, fertile portion of the great plain of northern and western Europe. It is the lowest part of this immense level, some portions of it being 10 to 20 feet below the surface of the sea, and nearly all parts too low for natural drainage.

The coast line is very irregular, being marked by the great inlet of the Zuider Zee, as well as by various others, and fringed by numerous islands. In great part the coast is so low that were it not for massive sea dikes large areas would be inundated and lost to the inhabitants. In the interior also dikes are a common feature, being built to protect portions of land from the lakes or rivers, or to enable swamp pieces of land to be reclaimed by draining, the water being commonly pumped out.

Almost the only heights are the sand hills, about 100 to 180 feet high, forming a broad sterile band along the coast of South and North Holland, and a chain of low hills, of similar origin perhaps, southeast of the Zuider Zee.

**Rivers.**—The principal rivers are the Rhine, Maas, and IJssel, with the mouths of the Schelde. Many canals, regulated by locks, connect the rivers, and the IJssel forms a link between the Rhine and the canals and mews of Friesland. Thus it is possible to travel on water through the whole of Holland.

**Climate.**—The climate of Holland is much like the climate of England, especially in its frequent and rapid changes; but, as a rule, the Dutch summer is hotter and the Dutch winter colder. April is about equivalent in the low-lying regions of the west.

**Cities.**—The four largest towns are Amsterdam, Rotterdam, the Hague, Utrecht, each with over 100,000 inhabitants.

**People.**—The great majority of the inhabitants are descendants of the old Batavians, or Teutonic stock. They comprise over 70 per cent of the population, and are chiefly

settled in the provinces of North and South Holland, Zeeland, Utrecht, and Gelderland. The languages of North Brabant, Friesland, and the Frisians, inhabiting Friesland, Groningen, Drenthe, and Overijssel, form the other groups.

**Norway** is a country in the north of Europe, bounded to the northeast by Russia, to the east by Sweden, and washed on all other sides by the sea—the Arctic Ocean on the north, the Atlantic and the North Sea on the northwest, and the Baltic and the Skagerrack on the south. It is about 1,080 miles in length, and its greatest breadth is about 275 miles, but toward the north it narrows so much as to be in some places not more than 20 miles.

It is divided into 20 provinces, or amts, as follows:

AMTS	AREA ENGLISH SQ. MILES	POPULATION DEC. 3, 1900
Christiania.....	6 4	227,626
Akershus.....	2,017 0	116,228

Total.....	124,129 7	2,240,032

**Surface.**—The coast consists chiefly of bold precipitous cliffs, and is remarkable both for the innumerable islands by which it is lined, and the bays or fjords which cut deeply into it in all directions. The surface is very mountainous, particularly in the west and north. Very commonly the mountain masses assume the form of great plateaus or tablelands, called *fjelds* or *fjells*, as the Dovre fjeld, Hardangere fjeld, etc. The highest summits belong to the Sogne fjeld, a series of elevated masses, glaciers, and snow fields in the center of the southern division of the kingdom, where rise Galdhøpiggen, Glittertind, and Skagstøtind. Immense snow fields and glaciers are a feature of Norwegian scenery.

**Rivers.**—The few important rivers that Norway can claim as exclusively her own have a southerly direction, and discharge themselves into the Skagerrack; of these the chief are the Glommen (400 miles), and its affluent the Lofoten. The most important river in the north is the Tanen, which forms part of the boundary between Russia and Norway, and falls into the Arctic Ocean. Lofty waterfalls are numerous. Lakes are extremely numerous, but generally small. The principal is the Mjøsen Vand.

**Vegetable and Animal Life.**—The forests are estimated to cover about a fifth of the whole surface, and form a very important branch of national wealth. The principal forest tree is the pine.

The reindeer forms the principal stock in the extreme north. Among the larger wild animals are the wolf, bear, elk, and deer. The fisheries are of very great value; they include the cod, herring, mackerel, salmon, shark, walrus, seal, and lobster, the cod and herring (chiefly) being by far the most important. The rivers and lakes abound with salmon and salmon-trout, and make Norway one of the best angling countries in the world.

**Cities.**—The chief cities are the capital, Christiania, and Bergen. Other important towns are Trondhjem, Stavanger, and Drammen.

**People.**—The people are almost entirely of Scandinavian origin. A small number of Finns (chiefly in Norway) and Quenes (a Finnish people) dwell in the northern parts. The Norwegian language is radically identical with the Icelandic and with the Danish. For centuries Danish was generally

employed as the literary and educated language of the country, as it still is; but during the last century a very decided literary movement has sprung up, claiming to employ the national language—has sprung up.

**Oman, or Muskat,** is a sultanate in the southeast of Arabia, partly on the Persian gulf, partly on the eastern coast of Africa. It has been considerably reduced during the last hundred years.

**General Features.**—The chief features of the country are a series of barren sand and rock mountains, reaching the height of 10,000 feet; fertile valleys and plains, yielding abundance of grain, sugar, fruits, cotton, coffee, etc., Oman being the richest part of the Arabian peninsula in agricultural products and in mineral treasures.

The inhabitants are tolerant, but very superstitious and immoral. They are mostly Arabs, but there is a considerable mixture of Persians, Hindus, Africans, and others.

**Panama.**—The republic of Panama was constituted on Nov. 3, 1903, having previously been a department of the republic of Colombia.

The country is divided into 7 provinces, each under a governor, with other subordinate officials. The chief ports are: on the Atlantic—Colon (Cristobal (old name)), Bocas del Toro, and Puerto Bello; on the Pacific, Balboa (in canal zone) and Pedregal.

The railway runs from Colon to Panama across the isthmus, and is the chief artery, and belongs to the United States government, as does the canal zone, which extends 6 miles on each side of the canal, except the cities of Panama and Colon at the ends. The population of the canal zone is 54,036. The soil is very fertile, but not well cultivated. Bananas are exported, and some rubber, coconuts, and hides.

The modern city of Panama, the capital, is the chief city. The majority of the population are of Indian and negro descent, and half-breeds.

**Paraguay,** a republic of South America, surrounded by the Argentine republic, Brazil, and Bolivia, separated from the west by the River Paraná, its tributary the Paraguay, and the Pilcomayo, a tributary of the latter; from Brazil by the Paraná, a range of hills, and the Apa, a tributary of the Paraguay.

**Surface and Climate.**—The northern portion of Paraguay is in general undulating, covered by low, gently-swelling ridges, separated by large grass plains, dotted with palms. There are mountains in the northeast and northwest corners. The southern portion is one of the most fertile districts of South America, consisting of hills and gentle slopes richly wooded, of wide savannas, which afford excellent pasture-ground, and of rich alluvial plains, some of which are marshy, but a large proportion are of extraordinary fertility and highly cultivated.

The temperature occasionally rises to 100° in summer, but in winter is usually about 45°.

**Vegetable and Animal Life.**—The banks of the rivers Paraná and Paraguay are occasionally better wooded, but in general the lowlands are destitute of trees.

The natural fertility of the soil is shown by a vegetation of almost unequalled luxuriance and grandeur. In the forests are found at least six varieties of timber trees, besides dye-woods, gums, drugs, perfumes, vegetable oils, and fruits. Many of the hills are covered with the *proba mait* or Paraguay tea.

The large plains are roamed over by immense herds of cattle.

Tapirs, jaguars, pumas, ant-eaters, wild boars, peccaries, and deer abound; birds are also numerous; the most characteristic fish, and their banks are the resort of alligators and coypus. Snakes, including enormous boas, are numerous, but very few of them are venomous.

**Cities.**—The capital is Asuncion; other towns are Villa Rica, Concepcion, San Pedro, Luque, Carapegua, Paraguari, and Villa del Pilar.

**People.**—The population of Paraguay is composed of whites of Spanish descent, Indians, a few negroes, and a mixture of races. Trade in the towns is almost wholly in the hands of Italians, French, and Germans.

**Persia**, called by the natives Iran, the most important native kingdom of western Asia, is bounded by Russian Caucasasia, the Caspian Sea, the Russian Transcaucasian provinces, Afghanistan, Baluchistan, the Straits of Ormuz, the Persian gulf, and Asiatic Turkey. It extends 900 miles from east to west, and 700 miles from north to south.

**Surface**.—Persia is an elevated plateau, broken by clusters of hills or chains of rocky mountains, which alternate with extensive plains and barren deserts; the desert of Khorassan in the northeast alone absorbs about one-seventh of the entire area. Low tracts exist on the Persian gulf and the Caspian.

The interior plains have an elevation of from 2,000 to 6,000 feet above the sea. This vast central plateau is supported in the north and south by two great mountain chains or systems, and from these all the minor ranges seem to spring.

The north chain, an extension of the Hindu Kush, enters Persia from northern Afghanistan, proceeds across the country, and reaches its greatest elevation at the south of the Caspian, where it takes the name of the Elburz mountains, and attains at Mount Demavend a height of nearly 20,000 feet. Still farther west it becomes linked with the mountains of Ararat. The other great mountain system runs from north to south, nearer the Persian gulf, is of considerable width, and forms several separate ranges. In one of these an elevation of 17,000 feet is reached.

**Rivers**.—The rivers are few and insignificant. Not one of them affords any navigable importance, except the Euphrates, which only waters a small portion of the southwest frontier, and the Karun, recently opened to the navigation of the world. The latter is entirely within Persian territory, and flows into the Shat-el-Arab, or united Tigris and Euphrates. Of the streams which flow northward into the Caspian the only important one is the Kizil, or Red, and (White river), which has a course of about 350 miles. There are a great number of small fresh-water lakes, and a few very extensive salt lakes, the largest being Urmiah in the extreme northwest.

**Climate**.—The climate varies considerably in different provinces, and in the central plateau intense summer heat alternates with extreme cold in winter. The shores of the Persian gulf are scorched up in summer; those of the Caspian Sea, especially the parts covered with dense forest, are humid, but also noted for malaria.

**Animal and Vegetable Life**.—The forests of the Elburz swarm with wild animals, as wolves, tigers, jackals, boars, buffaloes, foxes, and the Caspian cat. Leopards abound in Mazandaran, and lions in parts of Fars and Arabistan. The horses have always been celebrated for their beauty, speed, and endurance. The Caspian rivers abound with fish, especially sturgeon.

Some parts of the country are of exceeding fertility and beauty; the immense valleys, some of them 100 miles in length, between the various ranges of the Kerman mountains, abound with the rarest and most valuable vegetable products.

**Cities**.—Teheran is the capital; chief trade centers: Teheran, Tabreez, Isfahan; chief ports, Bushire and Bender Abbas on the Persian gulf. Other large towns are Meshed, Balfoorch, Kerman, Yezd, Hamadan, Shiraz, Kasvin, Kom, Reht.

**People**.—The settled population are chiefly Tajiks, the descendants of the ancient Persians, race, with an intermixture of foreign blood. To this class belong the agriculturists, merchants, artisans, etc. The Tajiks are Mohammedans of the Shiite sect, with the exception of the remaining Parsees who are found chiefly at Yezd, and still retain their purity of race and religious faith. The nomad, or pastoral tribes, are of four distinct races—Turks (not Osmanli Turks), Kurds, Arabs, and Afghans. Of the latter, the Turks is the most numerous, and to it belongs the present Kajar dynasty.

**Peru**.—A republic of South America, bounded on the north by Ecuador and Colombia, on the west by the Pacific, on the south by Chili, on the east by Bolivia and Brazil.

**Surface and Climate**.—The coast extends from the base of the Andes to the Pacific Ocean, and consists of a sandy desert covered by some forty rivers along whose banks there are fertile valleys; the sierra, or region of the Andes, about 250 miles wide, contains stupendous chains of mountains, elevated plains and table-lands, warm and fertile valleys and ravines; and the *montana*, skirted by the steep slopes of the Andes, consists of tropical forests traversed by great tributaries of the Amazon. Since 1570 there have been seventy destructive earthquakes recorded on the west coast, including those of 1665 and 1877.

The Peruvian Andes attain 22,000 feet. From November to April there is usually continuous dryness on the coast, from September the sky is obscured for weeks by mists, sometimes accompanied by drizzling rain. The maximum temperature is about 78° in summer and 60° in winter.

The valleys and plateaus between these ranges form the Sierra of Peru, and include every variety of climate and scenery. They may be divided into four sections, commencing from the north; in the third is Cuzco, the capital of the Inca; while the fourth section is the basin of Lake Titicaca, about 150 miles in length and breadth. The lake itself is 80 miles long, and 12,874 feet above the level of the sea. The Sierra of Peru is the original home of the potato.

**Animals**.—The animals which specially belong to the Peruvian sierra are the domestic llama and alpaca, and the wild vicuña, the viscacha, the chinchilla, deer, dogs, and foxes; notable among birds are the condor and the flamingoes, geese and wading birds of Lake Titicaca. The fauna of the forests also includes monkeys, badgers, bears, pumas, jaguars, tapirs, wildcats, deer, and many rodents; with curassows, ibises, cranes, spoonbills, parrots, toucans, and many snakes.

**Vegetation**.—The *montana* is the region of tropical forests within the basin of the river Amazon; the forests drained by the Marañon, Ucayali, and Ucayali form the northern portion. The whole length of the *montana* from the Marañon to the Bolivian frontier is 800 miles. The subtropical portion, comprising the eastern slopes of the Andes, is the region of the cinchona trees, and of the cocoa, and here coffee and cacao of the finest quality are cultivated. From the forest-covered plains come india-rubber, sarsaparilla, and a great variety of useful and ornamental timber.

**Cities**.—The principal towns are Lima (the capital), Arequipa, Cusco, and Truxillo; principal ports, Callao (port of Lima), Molendo (port of Arequipa), and Truxillo.

**People**.—The population consists of about 57 per cent aboriginal Indians, 23 per cent mixed Indian races, and 20 per cent of descendants of Spaniards. European chiefly Italians, French, and Spaniards, and Asiatics (chiefly Chinese).

**Portugal**, a republic (since 1910) of Europe, lying mainly between the Atlantic and the west side of the Iberian peninsula, stretches 350 miles from north to south, and varies in width from 70 to 140 miles. The area is a little larger than Ireland.

The six best provinces are Minho, Trás-os-Montes, Beira, Estremadura, Alentejo, and Algarve; to which are to be added the Azores and Madeira, always reckoned not colonies but as parts of the mother country.

**Colonies**.—The colonial possessions of Portugal, situated in Africa and Asia, are as follows:

COLONIAL POSSESSIONS	AREA SQUARE MILES	POPULATION
<i>Possessions in Africa:</i>		
Cape Verde Islands (1900) . . . . .	1,480	147,424
Sierra Leone (1900) . . . . .	13,940	320,000
Prince's and St. Thomas Islands (1902) . . . . .	360	42,163
Angola (1900) . . . . .	484,800	4,118,000
Mozambique (1900) . . . . .	293,400	3,120,000
East Africa . . . . .	793,960	8,248,527

COLONIAL POSSESSIONS Continued	AREA SQUARE MILES	POPULATION
<i>Possessions in Asia:</i>		
In India—Goa (1900) . . . . .	1,409	475,513
Daman, Diu (1900) . . . . .	109	56,285
Indian Archipelago (Timor, etc.) . . . . .	7,330	300,000
China—Macao, etc. (1900) . . . . .	4	61,591
Total, Asia . . . . .	8,972	866,739
Total, Colonies . . . . .	802,952	9,144,316

**Surface**.—Portugal is only partially separated from Spain by natural boundaries. The surface is occasionally bold, and rises to a great height; but the far greater part is low and marshy, and not infrequently lined by sands and reefs, which make the navigation dangerous.

The interior is generally mountainous, a number of ranges stretching across the country, forming a succession of independent river basins, while their ramifications form the watersheds of numerous subsidiary streams, and inclose many beautiful valleys. The loftiest range is the Serra da Estrela, a continuation of the central chain stretching across Spain, which attains the height of 7,324 feet. The nucleus of the mountains is usually granite, especially in the north and middle.

**Rivers**.—No rivers of importance take their rise in Portugal. The Minho in the north, the Douro, and the Tagus all flow from east to west. The Guadiana is the only large river which flows mainly south. Portugal can only claim as peculiarly her own the Vouga, Mondego, and Sado.

**Climate**.—The vicinity to the ocean tempers the climate, and exempts it from the dry heat of Spain. The inequalities of the surface produce, however, diversities of climate; for, while snow falls abundantly on the mountains in the northern provinces, it is never seen in the southern lowlands. Rain falls abundantly in the south, the east, and west, and fever prevails in the low flat lands and near the salt marshes.

**Vegetation**.—Few countries have a more varied flora than Portugal. The number of species has been estimated to exceed 4,000, and of these more than 3,000 are phanerogamous. Many of the mountains are clothed with forest trees, among which the common oak and the cork oak are conspicuous. In the central provinces chestnuts are prevalent; in the south both the date and the American aloë are found; while in the warmer districts the orange, lemon, and olive are cultivated with success. The mulberry affords food for the silkworm, and a good deal of excellent silk is produced.

**Cities**.—The chief towns are Lisbon, Oporto, Braga, Setúbal, Funchal (Madeira), Coimbra, Ponta Delgada (Azores), and Évora.

**People**.—The Portuguese are a mixed race—originally Iberian or Basque with later Celtic admixture. Jewish and Arabic blood are strongly present in the center, and African in the south. The Portuguese differ widely from the Spaniards.

**Romanians**.—A kingdom in southeast Europe, lying mainly between the Carpathians, the Pruth, and the Danube, and bordering on Hungary, Russia, Bulgaria, and Servia. It is crescent-shaped, and has a circumference of 358 miles and a breadth of 190 miles.

**Surface and Rivers**.—The surface is mainly occupied by undulating and well-watered plains of great fertility, gradually sloping upward to the Carpathians on the north and west borders, where the summit range from 2,650 to 8,800 feet above sea-level.

The entire kingdom is in the basin of the Danube, which has a course of 985 miles in Rumania, forming the boundary with Bulgaria nearly the whole way. Its chief Rumanian tributaries are the Oita (or Aluta), Ardia, Jalomita, Sereth, and Fruth (or Siret). The border of the Danube forms a number of marshy lakes as it approaches the alluvial region of the Dobrudda, through which it discharges itself into the Black Sea by the St. George, Sulina, and Kilia mouths. **Climate**.—The climate is much more extreme than at the same latitude in other parts of

Europe; the summer is hot and rainless, the winter sudden and very intense; there is almost no spring, and the autumn is long.

**Cities.**—The capital of Roumania is Bukharest in Wallachia, about 30 miles from the Danube; and the chief town of Moldavia is Jassy, near the Pruthi. Other towns are the suburbs of Galatz and Ibrail (or Braila) at the mouth of the Danube, Craiova (Krajoa), Botosani, Ploiesti (Ploeschti), Pitesti, and the ancient capital Curtea d'Ardeaz.

**People.**—The Roumanians are descended from the ancient inhabitants—probably Thracians or Dacians—of the country, modified by elements derived from the Roman, Gothic, Bulgarian, and Slavonic invaders. They include many Jews, and gypsies.

**Russia.** a great empire, is second in area only to the British empire, and third as regards population, the Chinese empire ranking first, the British second. It comprehends most of eastern Europe and all northern and part of central Asia.

The following table exhibits the area and population according to the last issue of the Russian central statistical committee in 1900:

GOVERNMENTS AND PROVINCES	AREA ENGLISH SQUARE MILES	POPULATION 1905	DENSITY PER SQ. MILE
1. European Russia.....	1,862,524	113,841,000	61.0
2. Poland.....	49,018	12,660,000	257.7
3. Ciscaucasia.....	85,201	4,601,200	54.0
Total, Russia in Europe.....	1,996,743	129,803,100	65.0
4. Trans Caspian.....	95,462	95,000	66.1
5. Siberia.....	4,786,730	7,347,200	1.5

**Surface.**—The leading feature in the physical structure of European Russia is a broad, flat, swelling about 700 feet above sea level, with an average height of 800 feet, which crosses it from southwest to northeast and connects the elevated plains of middle Europe with the Urala. A belt of lowlands stretching from east Prussia to the Caspian Sea fringes this central plateau on the northwest, separating it from the hilly tracts of Finland; while the plains of Bessarabia, Kherson, the Sea of Azov, and the lower Volga limit it on the southeast.

The central plateau is diversified by three or four depressions. The Urala, which separate the lowlands of European Russia from those of Siberia, consist of a series of parallel ridges running southwest to northeast, their chief summits reaching 4,950 to 5,100 feet high.

Beyond the Urala in Asiatic Russia are the vast Siberian plains slightly inclining to the north, and becoming mountainous in some parts toward the south and east. Great swamps are areas toward the Arctic Ocean are known as *tundras*. Part of the Thian Shan mountains and of the Altai mountains, on the boundary between the Russian and Chinese empires, belong to Siberia.

**Rivers and Lakes.**—European Russia is watered by numerous and important rivers, some of great magnitude and running a course of 1,000 to 2,000 miles. The Volga, the Mezen, Northern Dvina, and Onega are the principal rivers of European Russia which send their waters to the Arctic Ocean; the Neva, Duna, Niemen, and Vistula belong to the Baltic basin; the Black Sea basin comprises the Pruth, Dniester, Dnieper, and the Don; whilst the Caspian receives, besides other rivers, the Ural and the Volga, the latter the largest of all European rivers.

Asiatic Russia has also a number of very large rivers, as the Obi, Yenisei, and Lena in Siberia, and the Amur toward the Chinese frontier. This great river system is of incalculable value to Russia, as by its means internal communication is carried on. Canals connect the navigable rivers, so as to form continuous water-ways. River steam navigation has been much developed of recent years.

The lakes are also on a gigantic scale. Lake Ladoga, near St. Petersburg, is the largest in Europe. Other large lakes in

Europe are those of Onega, Peipus, and Ilmen. In Asia there is the Sea of Aral, larger than any of the former mentioned, followed by Baikal, Balkhash, and others. The Caspian Sea now also forms a Russian lake. From the extent of the plains and steppes, the swamps, moors, desert wastes, and forests of Russia the scenery as a whole is very mountainous.

**Climate.**—All over European Russia, except in the Baltic provinces, the south of the Caucasus, and the southern shores of the Black Sea, the climate is continental. A very cold winter, followed by a spring which sets in rapidly; a hot summer; an autumn cooler than spring; early frosts; and a small rainfall, falling during the summer and the autumn, are the main features. The winter is cold everywhere. All over Russia the average temperature of January is below the freezing point, and it only varies between 22° F. in the west and 5° to 7° in the east. All the rivers are frozen over early in December, and they remain under ice for from 100 days in the south to 160 in the north. In summer the temperature is high all over Russia, and reaches 78° at Astrakhan.

**Vegetable Life.**—The flora of Russia marks four regions: (a) the arctic tundras are chiefly covered with mosses, lichens, and low shrubs; (b) the forest region, which covers the whole of northern and middle Russia, is either forest-forest proper or prairies dotted with forests; (c) the steppe, or immense plains covered with grass, and devoid of forests. (d) The flora of the Mediterranean region occupies a narrow strip along the southern coast of the Crimea.

**Animal Life.**—The fauna of European Russia is very much like that of middle Europe. Among wild animals are the bear, the wolf, wild hog, elk, and various animals which are hunted for their fur. Both on the coasts and in the rivers a great number of productive fisheries are carried on. In the Arctic Ocean vast numbers of seals are taken. The rivers, particularly the Caspian and Volga, of Asov, particularly the Ural and Volga, are celebrated for their sturgeon. In the same quarters are also important salmon fisheries. In the regions bordering on the Arctic Ocean large numbers of reindeer are kept in the south, among the Tartars of the Crimea and the inhabitants of the Caucasus, the camel is often seen.

**Cities.**—The largest towns are St. Petersburg (the capital), Moscow, Warsaw, Odessa, Lodz, Riga, Kiev, Kharkov, and Tiflis.

**People.**—Russia contains many different peoples. The Russians form the main body of the Slavonic race. The number of Slavs is fully 92 millions, including over 7 million Poles. There are over 3 million Lithuanians, fully 1,800,000 Germans, nearly 1,200,000 Armenians, over 5 million Jews, nearly 6 million Finns, over 13½ million Turco-Tartars, 2½ million Cossacks, and other Caucasian races, besides various minor races.

**San Marino.** a small republic, founded in 400, near Rimini, on the Adriatic, founded, it is stated, by a pious mason of Dalmatia in the fourth century, and governed by a council of 60, of whom two are elected as regents in the northeast of the Balkans in the south, the population 10,480. There is an army of about 1,000. The city of San Marino (population 1,500) occupies the slope of Mount Titian, and has an impregnable citadel, where King Berengar of Lombardy took refuge in 950 A. D., a fine church and government palace, and a theater. Agriculture and viticulture flourish.

**Servia.** is a kingdom of the Balkan peninsula, south of the Danube, and borders on Bosnia, Hungary, Roumania, Bulgaria, and Turkey.

**Surface.**—The surface is elevated and is traversed by ramifications of the Carpathians in the northeast, of the Balkans in the south, east, and of the Dinaric Alps in the west. The summits seldom exceed 3,000 feet, though the highest reaches 6,325. The whole surface belongs to the basin of the Danube, which receives the drainage partly directly, and partly by the frontier river Save, augmented by the Drin and the Timok, but chiefly by the Morava, which flows through the center of the kingdom.

**Climate.**—The climate is somewhat rigorous in the elevated districts, but mild in the valleys and plains, where there are extensive forests and uncultivated wastes.

**Cities.**—The principal towns are Belgrade (the capital), Nis, Kragujevatz, Leskovatz, Surdevatz, Shabatz, Vranje, and Pirot.

**People.**—The Servians are a well-built, stalwart Slavonic race, proud and martial by temperament. The population includes 46,000 Gypsies, and 20,000 of other nationalities. Besides the Servians there are also a number of pure Servians by race, as are also the Bosnians and Herzegovinians.

**Slam** occupies the central portion of the Indian business peninsula, stretching a distance of nearly 1,100 miles; greatest breadth 750 miles.

**Surface.**—The Malay peninsula excluded, the plain of the Menam valley, the adjoining eastern coast, and the Korat plateau (from 400 to 1,000 feet high) occupy the greater portion of the country. These plains are fringed by hills up to 5,000 feet high, and the north generally is hilly.

**Rivers.**—The Menam, with a course of 600 miles, is the principal river. Two other streams, the Meklong and the Bangpakong, flow into the Gulf of Siam. The Meklong has the main part of its course in the Siamese territory, but navigation for vessels of any size is impeded by rapids. The rivers form the principal trade routes, and in and around Bangkok there is intricate network of canals. Only the land adjoining the rivers is under cultivation, and the greater portion of the country is covered by pathless jungle.

**Vegetable and Animal Life.**—The forests produce almost wood, sappan wood, teak timber, bamboos, rattans, gutta-percha, dammar, catechu, benzoin, etc. Cocoa and areca palms are numerous in Siam; fruits are abundant and of excellent quality; black pepper, tobacco, cardamoms, and gamboge are important products.

Among wild animals are the tiger, leopard, bear, rhinoceros, gaur, golang, and horn-billed rhinoceros, and elephant, which here attains a size and beauty elsewhere unknown. The last, when of a white color, is held in the highest reverence. The forests abound with peacocks, pheasants, and pigeons, and in the islands are large flocks of the swallows that produce the famed edible birds'-nests. Crocodiles, geckos, and other kinds of lizards, and the cobra, are numerous. The python attains an immense size, and there are many species of snakes.

**Climate.**—The climate is considered healthy for the tropics; low malarial fever is the most frequent illness in the European community. There are two seasons—the wet and the dry, the former lasting from May till November. The average temperature for the year is 81°.

**Cities.**—The capital and commercial center of the kingdom is Bangkok. Other less notable places are Puket, Korat, Pooknam, and Narathiwat.

**People.**—The Siamese are members of the great Mongolian family, and of the same race as the people of Burma and Annam. In stature they do not average more than 5 feet 3 inches in height, they have a lighter-colored skin than the western Asiatics, but darker than the Chinese. They are generally vain, indolent, superstitious, and cowardly, but polite, cheerful, hospitable, and tolerant.

**Spain** occupies the larger part of the southwestern peninsula of Europe, and is bounded by the Bay of Biscay, the Pyrenees, the Mediterranean, the Atlantic, and Portugal. From Fuenterrabia in the north to Cape Tarifa in the south is 560 miles, and from Cape Finisterre in the northwest to Cape Creus in the northeast is 650 miles.

**Surface.**—The interior is considerably diversified, but its characteristic feature is its central table-land, which has an elevation of from 2,200 to 2,800 feet, and a superficial extent of not less than 90,000 square miles. It descends gradually toward the north and Portugal, but on the east, toward the provinces of Catalonia and Valencia, it presents an abrupt step or line of cliffs, with the character of an ancient sea margin. It is bounded on the north by the Asturian and

Cantabrian mountains, reaching an elevation of about 8,500 feet; on the south by the Sierra Morena; and is crossed from east to west by the rivers Douro, Tagus, and Guadiana. Between these little ranges are intersected by two important ranges of mountains running nearly east and west, the northern being the Guadarrama with its continuations, separating the valleys of the Douro and Tagus, and attaining in one of its peaks a height of 8,200 feet; and the southern, the Sierra de Toledo, and its continuations, between the Tagus and the Guadiana.

South of the Sierra Morena is the valley of the river Guadalquivir. Besides these ranges there is the chain of the Pyrenees, which, though partly belonging to France, presents its highest and its loftiest summits within it. The highest peak in this range is La Maladetta, or Pic de Nétou; but the highest peak in Spain is Mulhacén, belonging to the Sierra Nevada in the south.

The latter chain possesses some of the wildest scenery in Europe.

**Rivers.**—The chief rivers enter the Atlantic, but in the northeast is the Ebro, an tributary of the Mediterranean. The Douro, Tagus, and Guadiana belong partly to Portugal. The lakes are few and unimportant.

**Cities.**—There are two cities with over 400,000 inhabitants, Madrid and Barcelona; others of importance are Valencia, Seville, Malaga, and Murcia.

**People.**—The people of Spain are of very mixed origin, the most and the inhabitants of the Iberians (now represented probably by the Basques or Biscayans of the northeast), being afterward mingled with Celtic, Phœnician, and Caucasian, and Roman colonists, Goths, Jews, and Arabs or Moors. They are generally of medium height and of spare habit, with black hair, dark eyes, and sallow complexion.

**Sweden,** a kingdom in the north of Europe, forms with Norway the great Scandinavian peninsula. It consists of the three great divisions of Svealand, or Sweden proper, in the middle, Gotland, or Gothland, in the south, and Norrland in the north.

**Surface.**—The country may be generally described as a broad plain sloping southward from the Kjolen mountains to the Baltic. The only mountainous district adjoins Norway; the peaks sink in altitude from 7,000 to 3,800 feet. Immediately south of this point a subsidiary chain strikes off to the southeast, and, threatening the lake region of central Sweden, swells out beyond into a table-land with a mean elevation of 850 feet and maximum of 1,240 feet. Fully two-thirds of the entire surface lies lower than 800 feet, and one-third lower than 300 feet, above sea-level.

**Rivers and Lakes.**—The rivers and lakes are very numerous. To the Baltic basin belong the Tornea, the Lulea, Umea, the Angermana, the Ljusne, and the Gäddede. The principal rivers belonging to the basin of the German Ocean are the Klar and the Göta. In general the rivers are useless for navigation, and the chief natural means of communication are the lakes, the chief of which are Lake Wener (area, 2,014 square miles), Lake Wetter (715 square miles), and Lake Malär, which has the capital on its shores. By canal, lake, and river there is an inland waterway—the Göta canal—from the Kattegat to the Baltic.

**Climate and Animals.**—There is hardly any spring or autumn intervening between the heat of summer and the cold of winter, which in the north lasts for nine, and in the south for seven months. The extremes of heat and cold are much greater than in Britain, but on the whole the climate is eminently favorable to health. Among the larger wild animals are the wolf, bear, elk, red and roe deer, lynx, gibbon, fox, and even the beaver. Among birds the most remarkable are eagles, the eagle-owl, and the capercaillie. The rivers and lakes are well stocked with salmon and trout.

**Cities.**—These include Stockholm (the capital), Gothenburg, Malmö, Norrköping, Gäfle, Helsingborg, Karlskrona, Jönköping, and Örebro; and twelve more exceeding 10,000.

**People.**—The inhabitants of Sweden, with the exception of the Laplanders, numbering about 7,000, and the Finns, numbering about 20,000, found only in the north, belong to the Scandinavian branch of the Teutonic family, and are characterised by a tall, robust build, light hair, blue eyes, and light complexions.

**Switzerland** is a confederation or republic of cantons, and is geographically divided into half-cantons, situated in the center of Europe between France, Germany, Austria, and Italy. The greatest length east to west is 216 miles, the width being 137 miles.

**Surface.**—The characteristic physical features of Switzerland are its lofty mountain ranges, enormous glaciers, magnificent lakes, and wild romantic valleys. The loftiest mountain chains belong to the Alps, and are situated chiefly in the south.

The central nucleus is Mount St. Gothard, which unites the principal watersheds of Europe, and sends its waters into four large basins—north by the Rhine to the German Ocean, south by the Rhodanus into the Mediterranean, southeast by the Po to the Adriatic, and east by the Danube to the Black Sea. In like manner it forms a kind of striding point for the loftiest ranges of the Alps—the Helvetic or Lepontine Alps, to which it belongs itself; the Pennine Alps, which include Mont Blanc, the culminating point of Europe, extending beyond the Swiss frontier into Savoy; and the Rhaetian Alps, which stretch east and northeast across the canton of Grisons into the Tyrol.

North of the Alps is the chain of the Jura, and between the two is a sort of upland plain, or wide irregular valley, the most populous part of the country.

**Rivers and Lakes.**—Owing to the mountainous nature and island position of the country, the rivers of the Swiss aqueduct are in their limits as to become of much navigable importance. The Rhine, formed by two head-streams in the canton of Grisons, flows north into the Lake of Constance, and thence westward to the North Sea, rising in the celebrated falls of that name. Below these falls its navigation properly begins. Its principal affluent in Switzerland is the Aar, which rises in the canton of the same name (Valais), flows northwest into the Lake of Geneva. Immediately after issuing from the lake at the town of Geneva it receives the Arve, and about 10 miles below quits the Swiss frontier. The waters which the Po receives from Switzerland are carried to it by the Ticino; those which the Danube receives are carried to it by the Inn.

The largest lakes that of Geneva in the southwest and of Constance in the northeast, as well as that of Maggiore on the north side of the Alps, belong partly to other countries; but within the limits of Switzerland, and not far from its center, are Lake Neuchâtel, with Morat and Biann in its vicinity, Thun with its feeder Brienz, Lucerne or Vierwaldstätter-see, Sempech, Baldeg, Zug, Zürich, and Wallenstätter-see. All the mountain lakes belong to the basin of the Rhine.

**Climate.**—Owing to differences of elevation the climate is extremely variable even in the same locality.

**Cities.**—The largest towns are Zürich, Basel, Geneva, and Bern, the last being the federal capital.

**People.**—The Swiss are a mixed people as to race and language. German, French, Italian, and a corrupt kind of the Latin, called Romansh or Roumanch, are spoken in different parts. German is spoken by the majority of inhabitants in fifteen cantons, French in five, Italian in one (Ticino), and Romansh in one (the Grisons).

**Turkey** is a Mohammedan state of south-eastern Europe and western Asia, under the rule of a sultan. In Europe it occupies a small portion of the Balkan peninsula, but the larger part of Turkey is in Asia. A number of islands in the Ægean belong to Turkey. Crete and Samos are autonomous. Egypt too is nominally part of the Turkish dominions.

In 1908 Bulgaria declared its independence

of Turkey, and Bosnia and Herzegovina were definitely annexed by Austria-Hungary. **Surface and Climate.**—European Turkey is traversed in different directions by numerous mountainous chains, but the main systems are the Balkan range, stretching from west to east between Bulgaria and eastern Roumelia to Cape Kaniash on the Black Sea; Rhodope, south of the Balkans, and the Taurus and Grammos on the west, continued northward under various names into Bosnia and Herzegovina.

The most important river basin is that which drains into the archipelago of the Ægean Sea, which receives the Vardar, the Struma, the Mista or Karasu, and the Maritsa. The Adriatic and Ionian Seas receive from Turkey no rivers worthy of notice, and the Sea of Marmora receives only a few mountain torrents. The chief lakes are those of Skutari, Ohrida, Janina, Prespa, and Takhyno.

There are several places remarkable for their fertility and beauty. The climate is Mediterranean, with subtropical rains and summer droughts. Temperature is very variable, and owing to the bitter north-east wind is colder than that of Italy or Spain, which are in the same latitude.

**Cities.**—Chief towns are Constantinople, Salonica, and Adrianople.

**Turkey in Asia** comprises the peninsula of Asia Minor, the country intersected by the Euphrates and the Tigris, the mountainous region of Armenia between their upper courses and the Black Sea, the ancient lands of Syria and Palestine, and the coast strips of Arabia along the Red Sea and Persian gulf.

Omitting Arabia, the country consists mainly of (1) a high plateau traversed by the mountain of Taurus and Anti-Taurus, and stretching from the archipelago to the borders of Persia; (2) a plateau of less elevation and extent (Syria and Palestine) traversed by the double range of Lebanon; and (3) the peninsular strip of Mesopotamia on the Lower Tigris and Euphrates.

**Palestine** includes the sanjak (or province) of Jerusalem—to which was added in 1906 the sanjak of Haussa, and the vilayet of Beirut, and part of the vilayet of Syria. The number of Jewish colonies originally founded by Baron E. de Rothschild, but handed over in 1900 to the Jewish Colonization Association, are now about 100. There are also German colonies. The cultivation of the orange is increasing largely. The population of Jerusalem is approximately 80,000, of Jaffa 40,000, of Gaza 35,000, and of Nazareth 20,000. The population of the province is increasing.

The chief towns in Asiatic Turkey are Smyrna, Damascus, Bagdad, Aleppo, and Beirut.

**People.**—In European provinces under immediate Turkish rule, Turks, Albanians, and Greeks nearly equal in numbers, are 70 per cent. of the population; Bulgarians, Roumans, Armenians, Magyars, gypsies, Jews, and Circassians. In Asiatic Turkey the Turks come first, with four-fifths of the population; Bulgarians, Syrians, Kurds, Circassians, Armenians, and Jews.

**United States of America,** the most important republic of the world, embraces nearly one-half of the habitable area of the North American continent, and about seven-eighths of its inhabitants.

Its area is more than three-fourths that of all Europe; including Alaska, it is almost equal to it; but its population is less than half that of Europe. It occupies the central part of the continent from the Atlantic to the Pacific Ocean, and from Canada on the north to Mexico on the south. Its greatest length east to west is about 2,700 miles, and its greatest width, north to south, about 1,600 miles. Besides Alaska, there are fifty political divisions. Of these, forty-six are states enjoying the full privileges accorded by the federal constitution, and five territories, all are organized but not yet admitted to statehood. The Philippines have a modified territorial government.

The following particulars give numerous important facts concerning the states and territories:

## STATES AND TERRITORIES OF THE UNION—

STATE OR TERRITORY AND AREA 1911	ORIGIN AND MEANING OF NAME	DATE OF ADMISSION INTO UNION	SETTLEMENT	ORIGINAL TERRITORY FROM WHICH DERIVED	POPULA- TION WHEN ADMITTED OR ACQUIRED	MILES OF RAIL- ROAD 1910	PER- CENT TO SQ. MILE 1910
			Where, When, By Whom				
<b>Alabama</b> 51,998 sq. miles.	Indian—Here we rest.	1819	Mobile Bay, 1702, by the French.	Louisiana, Georgia and Mississippi and Alabama territories.	127,901	5,165.24	41.1
<b>Alaska</b> 590,884 sq. miles.	Al- <i>as</i> - <i>ka</i> , meaning "the great country."	1867	Three Saints, 1784, by the Russians.			302.92	0.1
<b>Arizona</b> 112,956 sq. miles.	Indian—meaning "sand hills."	1911	Tucson, 1580, by the Spaniards.	New Mexico territory.	205,000	1,994.36	1.8
<b>Arkansas</b> 53,335 sq. miles.	From a tribe of Indians.	1836	Arkansas Post, 1683, by the French.	Louisiana and Louisiana, Missouri and Arkansas territories.	97,574	5,236.52	30.0
<b>California</b> 156,297 sq. miles.	From an old Spanish romance.	1850	San Diego, 1768, by the Spaniards.	New Albion, Upper California.	92,567	7,528.86	15.2
<b>Colorado</b> 103,948 sq. miles.	Spanish—Red, or Ruddy.	1876	Aurora, 1859, by the Americans.	Louisiana and Mexican cession. Colorado territory.	175,000	5,454.43	7.7
<b>Connecticut</b> 4,965 sq. miles.	Indian—Long River.	*1788	Windsor, 1636, by the English.	North Virginia, New England.	237,664	1,004.74	231.3
<b>Delaware</b> 2,370 sq. miles.	In honor of Lord De La Warr.	*1787	Wilmington, 1637, by the Swedes.	New Sweden, New Netherlands, three lower counties on the Delaware.	59,096	336.64	103.0
<b>District of Col.</b> 70 sq. miles.	In honor of Columbus.	1791	Rome, 1663, by the English.	Ceded to government by Maryland and Virginia.		35.27	5,517.8
<b>Florida</b> 58,666 sq. miles.	Spanish—Blooming	1845	St. Augustine, 1565, by the Spaniards.	Florida territory.	87,445	4,254.05	13.7
<b>Georgia</b> 59,265 sq. miles.	In honor of George II.	*1788	Savannah, 1733, by the English.	One of the original thirteen states.	82,546	6,939.59	44.4
<b>Hawaii</b> 6,440 sq. miles.	From the native Owhyhee.		Honolulu, 1820, by the Americans.	Sandwich islands.	154,001	149.34	3.0
<b>Idaho</b> 84,313 sq. miles.	Indian—Gem of the Mountains.	1890	Coeur d'Alene, 1842, by the Americans.	Oregon, Washington, and Idaho territories.	84,385	2,134.30	3.9
<b>Illinois</b> 56,665 sq. miles.	Indian—The Men.	1818	Kaskaskia, 1682, by the French.	Northwest, Indian and Illinois territories.	55,211	11,850.91	100.7
<b>Indiana</b> 36,354 sq. miles.	Indian's Ground.	1816	Vincennes, 1702, by the French.	Northwest and Indiana territories.	147,178	7,382.55	75.3
<b>Iowa</b> 56,147 sq. miles.	Indian—Drowsy Ones.	1846	Dubuque, 1833, by the Americans.	Louisiana, Missouri, Michigan, Wisconsin, and Iowa territories.	182,000	9,751.94	40.0
<b>Kansas</b> 82,158 sq. miles.	Indian—Smoky Water.	1861	Leavenworth, 1854, by the Americans.	Louisiana, Kansas territory.	107,206	8,952.59	20.7
<b>Kentucky</b> 40,509 sq. miles.	Indian—Dark and Bloody Ground.	1792	Bonesboro, 1769, by the English.	Virginia.	73,677	3,467.43	57.0
<b>Louisiana</b> 48,506 sq. miles.	In honor of Louis XIV.	1812	New Orleans, 1718, by the French.	Louisiana, Territory of Orleans.	76,556	5,456.26	36.6
<b>Maine</b> 33,040 sq. miles.	The Main Land.	1820	Saco, 1623, by the English.	New England, Laconia, and Massachusetts.	298,335	2,165.66	24.8
<b>Maryland</b> 12,327 sq. miles.	In honor of Queen Henriette Maria.	*1788	St. Mary's, 1632, by the English.	One of the original states.	319,728	1,445.21	130.3
<b>Massachusetts</b> 8,266 sq. miles.	The Place of Great Hills.	*1788	Plymouth, 1620, by the English.	North Virginia, New England, Massachusetts Bay.	378,787	2,116.10	418.8
<b>Michigan</b> 37,980 sq. miles.	Indian—Great Lake.	1837	Sault Ste. Marie, 1668, by the French.	Northwest, Indiana, and Michigan territories.	212,267	9,058.83	48.9
<b>Minnesota</b> 84,052 sq. miles.	Indian—Cloudy Water.	1858	St. Paul, 1838, by the Americans.	Louisiana and Northwest and Minnesota territories.	172,793	8,568.30	25.7
<b>Mississippi</b> 46,860 sq. miles.	Indian—Great River, or Father of Waters.	1817	Biloxi, 1699, by the French.	Louisiana and Georgia, Mississippi territory.	75,448	4,397.64	38.8
<b>Missouri</b> 69,420 sq. miles.	Indian—Great Muddy.	1821	St. Genevieve, 1755, by the French.	Louisiana and Louisiana and Missouri territories.	66,586	8,045.47	47.9
<b>Montana</b> 145,572 sq. miles.	Spanish—A Mountain.	1889	Yellowstone River, 1809, by the Americans.	Louisiana and Nebraska, Idaho, Dakota and Montana territories.	175,000	4,135.10	2.6
<b>Nebraska</b> 77,520 sq. miles.	Indian—Shallow Water.	1867	Bellevue, 1847, by the Americans.	Nebraska territory.	122,993	6,015.02	15.5
<b>Nevada</b> 110,690 sq. miles.	Spanish—Snow-covered.	1864	Genoa, 1850, by the Americans.	Upper California and Utah and Nevada Territories.	35,000	2,135.23	0.7
<b>New Hampshire</b> 9,341 sq. miles.	Hampshire, England.	*1788	Portsmouth, 1623, by the English.	North Virginia, New England, Laconia.	141,585	1,248.86	47.7
<b>New Jersey</b> 8,224 sq. miles.	In honor of governor of Jersey Island.	*1787	Elizabethtown, 1617, by the Dutch.	New Netherlands.	184,139	2,255.79	337.7
<b>New Mexico</b> 122,634 sq. miles.		1911			330,000	3,003.96	2.7
<b>New York</b> 49,204 sq. miles.	In honor of Duke of York.	*1788	New York, 1614, by the Dutch.	New Netherlands.	340,120	5,448.15	191.2
<b>North Carolina</b> 52,426 sq. miles.	In honor of Charles II.	*1789	Albemarle Sound, 1633, by the English.	Albemarle colony.	393,751	4,860.24	45.3
<b>North Dakota</b> 70,837 sq. miles.	Indian—Allied.	1889	Pembina, 1859, by the Americans.	Louisiana, Minnesota and Nebraska and Dakota territories.	182,000	4,200.30	8.2

**Coast Line.**—As compared with Europe the coast of the United States has few indenting bays or projecting peninsulas, though the Gulf of Mexico is of considerable and commercial importance. Long Island sound, Delaware and Chesapeake bays, Albemarle and Pamlico sounds, the harbors of Charleston and Savannah, though not great geographical features, are of commercial importance. On the Pacific, Puget sound, the Bay of San Francisco, and the harbor of San Diego are almost the only noticeable breaks. Long Island is the largest of the islands.

**Surface.**—The two great mountain systems of North America, one along the western, the other near the eastern border, form the framework or skeleton of the physical structure. **Appalachian Region.**—In the east are the Appalachian mountains, from whose eastern base a coast plain extends to the sea. Narrow in Maine, the system grows gradually wider, until in North Carolina it attains a width of 200 miles. The southern coast region seldom exceeds 100 feet above the sea. It has a sandy soil, and many large swamps near the coast. The middle elevated region is diversified by hills and valleys, and has a productive soil.

**Mississippi Valley.**—West of the Appalachian system and lying between it and the western highland is the central valley, forming part of the great continental depression which extends from the Arctic Ocean to the Gulf of Mexico. It is almost an absolute plain, rising gradually from the Gulf toward the chain of great lakes in the north, and toward the mountains on the east and west. The only important departure from the level is the ridge of the Great Smoky mountains, to 2,000 feet, running from northern Missouri through northwestern Arkansas.

This great valley occupies about half the entire area of the United States, and the fertile prairies and bottom lands of the eastern and central portions make it the most important agricultural basin of the globe. From an irregular line west of the Mississippi river the land rises in an almost imperceptible slope till it reaches the base of the western plateau. Much of this region, known as the great plains, has a light rainfall, but affords admirable pasturage.

**Rocky Mountain Region.**—The western or Rocky system of mountains is a great plateau of 4,000 to 10,000 feet surmounted by a complex system of ranges, in its widest part more than 1,000 miles broad.

Of this region the Rocky mountains form the eastern and the Sierra Nevada and Cascade mountains and the Coast ranges the western border. In the ranges of central Colorado alone nearly forty of the summits have an altitude of more than 14,000 feet. In the Rocky mountains of Wyoming and Montana are the headwaters of the three great river systems of the United States—those of the Colorado, Columbia, and the Mississippi. Between the Wahsatch range and the lofty mountains in Colorado is a region furrowed by canyons or gorges, whose sides are nearly vertical; and the bed of the Colorado is in some places more than a mile and a quarter below the surface of the plateau.

**American Desert.**—Between the Wahsatch range and the Sierra Nevada lies the Great Basin, much of it an absolute desert.

**Pacific Coast Region.**—The Sierra Nevada and the Cascade range are topographically continuous. Most of the peaks of the Sierras are, however, of granite and metamorphic rock, while those of the Cascade range are volcanic. The greatest altitude is attained in Whitney; the sublimity of the scenery is justly celebrated. From 40 degrees north there extends northward one of the most remarkable groups of extinct or faintly active volcanoes to be found anywhere in the world; the lava overflows in this region cover an area of upward of 200,000 square miles. The passage of the Columbia river is a grand canyon more than 3,000 feet in depth. North of the Great Basin, between the Cascade range and the Rocky mountains, is the northern or Columbian plateau. The Shoshone falls of the Snake river probably rank next to Niagara in grandeur. Between the Coast range

and the Sierra Nevada, and Cascade ranges is a series of broad valleys, in Oregon that of the Willamette, and in California those of the Sacramento and the San Joaquin.

**Rivers and Lakes.**—Beside the chain of great lakes which forms a part of the northern boundary, there are thousands of lakes in the New England states and in New York, nearly ten thousand in Minnesota, and numerous mountain lakes among the Cordillera. The peculiar lacustrine character of the northern portion of the United States is undoubtedly a legacy of the glacial period.

The drainage areas may be broadly classified as the great lake or St. Lawrence, the Atlantic, the Pacific, and the Great Basin or interior systems of drainage.

The Atlantic system might be subdivided into two classes, one comprising the streams

flowing directly to the sea, the other comprehending those of the central valley which discharge their waters into the Gulf of Mexico. Among the rivers of the Atlantic are the Penobscot, Kennebec, Merrimack, Thames and Connecticut in New England, the Hudson, Delaware, Susquehanna, Potomac, James, Roanoke, Neuse, Cape Fear, Great Pedee, Santee, Savannah, Altamaha, and St. John's.

The Mississippi-Missouri, with its tributaries, the Ohio, Platte, Arkansas and Red rivers, is the chief stream of the central valley, and in length and extent of navigable water it surpasses all other rivers of the world. East of the Mississippi are the Mobile and Appalachicola, and to the west the Sabine, Brazos, and Rio Grande.

The Colorado, the Sacramento and San Joaquin, the Willamette and the Columbia are the chief rivers emptying into the Pacific.

#### CHIEF AMERICAN RIVERS

Name	Length in Miles	Source	Mouth
Alabama	175	Junction of Coosa and Tallapoosa, Ala.	Mobile river.
Allegheny	450	Allegheny county, N. Y.	Ohio river.
Andrews	140	Embargo lake, Me.	Atlantic Ocean
Arkansas	2170	Rocky mountains, N. C.	Mississippi river
Black	126	Highland lakes, N. Y.	Lake Ontario
Black Warrior	360	Formed by Locust and Mulberry forks, Ala.	Mississippi river
Brazos	750	Adirondack, N. Y.	Atlantic Ocean
Cape Fear	250	Junction of Haw and Deep rivers, N. C.	Atlantic Ocean
Chesapeake	430	Allegheny mountains, Pa.	Atlantic Ocean
Chowan	250	Mott and McNeill, N. C.	Atlantic Ocean
Colorado	690	Llano Estacado, Texas	Gulf of Mexico
Columbia	1400	Junction of Colorado and Grand rivers, Utah	Atlantic Ocean
Connecticut	410	Lewis and Clark's fork	Pacific Ocean
Coosa	275	Connecticut lake, Vt.	Lake Ontario
Cumberland	600	Junction of Coosawalla and Etowah rivers, Ga.	Ohio river
Delaware	400	Junction of Poor and Straight forks, Ky.	Delaware bay
Des Moines	375	Catakill mountain, N. Y.	Mississippi river
Flint	400	Lake Stetick, Mich.	Atlantic Ocean
Genesee	145	Allegheny mountains, Ga.	Atlantic Ocean
Grand	200	Allegheny county, N. Y.	Lake Ontario
Grand	200	Allegheny mountains, N. M.	Mississippi river
Grand	200	Southern Iowa	Missouri river
Grand	200	Highlands, Mich.	Lake Michigan
Grande del Norte	1800	Rocky mountains, Colo.	Atlantic Ocean
Great Pedee	380	Yadkin river, N. C.	Atlantic Ocean
Green	520	Cumberland mountains, Ky.	Ohio river
Honolauloe	520	Tagalaie mountains, Nava.	Indian Ocean
Hudson	280	Lake Sanford, Adirondack mountains, N. Y.	New York bay
Illinois	445	Des Plaines river, Wis.	Mississippi river
Kalamazoo	430	Jackson and Fox rivers, N. C.	Chesapeake bay
Kanawha	200	Highlands, Mich.	Lake Michigan
Kaskaskia	320	Junction of Greenbrier and New rivers, Va.	Ohio river
Kennebec	900	Rocky hills, Me.	Atlantic Ocean
Kentucky	320	Grand Prairie, Ill.	Mississippi river
Lewis Fork	100	Moosehead lake, Me.	Atlantic Ocean
Memnonine	300	"Forks" Cumberland mountains, Ky.	Ohio river
Merrimack	130	Rocky mountains, Ore.	Columbia river
Minnesota	364	Junction Brule and Mesquameum rivers, Wis.	Green bay
Mississippi	1500	White mountains, N. H.	Atlantic Ocean
Missouri	1200	Eastern Dakota	Mississippi river
Muhawk	135	Lisa lake, Minn.	Gulf of Mexico
Munongahela	300	Rocky mountains, Mont.	Mississippi river
Nahavaka	120	Oreida county, N. Y.	Hudson river
Nechas	180	Rich mountains, W. Va.	Ohio river
Neuse	250	Junction of Sweetwater and North Fork, Wyo.	Atlantic Ocean
Ocmulgee	250	Highlands, Wis.	Green bay
Ohio	950	Tallands, N. C.	Pamlico sound
Omaha	460	Allegheny mountains, Ga.	Atlantic Ocean
Pennobscot	270	Range county, N. Y.	Mississippi river
Potomac	380	George county, N. Y.	Chesapeake bay
Red	1600	East Seberson lake, Me.	Atlantic Ocean
Red (of the North)	700	Allegheny mountains, Md.	Chesapeake bay
Roanoke	205	Allegheny mountains, Md.	Atlantic Ocean
Sabine	400	Indian Lake, Minn.	Winnipeg lake
Sacramento	400	Ian and Platte, Wyo.	Albermarle sound
St. Croix	400	Highlands, Tex.	Gulf of Mexico
St. Francis	400	Sierra Madre mountains, Cal.	San Francisco bay
St. John	230	Ontonagon river, Wis.	Mississippi river
St. Joseph	230	St. Ignace, Mich.	Mississippi river
St. Lawrence	250	Everglades, Fla.	Atlantic Ocean
San Juan	350	Highlands, Ind.	Lake Michigan
Savannah	340	Sierra Nevada mountains, Cal.	Atlantic Ocean
Susquehanna	200	Junction of Wateree and Congaree, N. C.	Atlantic Ocean
Susquehanna	617	Allegheny mountains, S. C.	Atlantic Ocean
East Branch	216	Tallands, Ohio.	Ohio river
West Branch	208	Osteo lake, N. Y.	Susquehanna R.
Main	153	Allegheny mountains, N. Y.	Chesapeake bay
Tallapoosa	175	Junction of east and west branches, Pa.	Alabama river
Tennessee	1200	Allegheny mountains, Ga.	Ohio river
Tombigbee	475	Allegheny mountains, Miss.	Mobile river
Trinity	200	Highlands, Texas	Gulf of Mexico
Wabash	420	Allegheny mountains, N. C.	Ohio river
Wahsatch	450	Potomac hills, Ark.	Red river
White	650	Boston mountains, Ark.	Arkansas river
Willamette	400	Cascade, Ore.	Columbia river
Winconsin	400	Ontonagon river, Wis.	Mississippi river
Yadon	400	Junction of Goldwater and Tallahassee rivers, Miss.	Mississippi river
Yellowstone	200	Yellowstone lake	National river
Yukon	2000	Eastern Alaska	Behring bay

**Climate.**—The United States, stretching over such a vast area and having such great tracts of mountain and plain, must necessarily present a great variety of climate. The mean annual temperature ranges from under 40 degrees to 75 degrees. The inclination of 55 degrees mean annual temperature crosses the center of the country from east to west, passing through St. Louis. Places in the latitude of New York and Chicago have nearly the same mean temperature for the year as the British isles. The mean annual rainfall for the whole country is about 30 inches, but there is a great difference in this respect between different parts. The rainfall is most abundant on the northwest Pacific coast, on the gulf coast, and on the higher mountain ranges. On the great plains it is only 10 to 20 inches, and there are large desert stretches in the Rocky mountain region with a rainfall of less than 10 inches.

**Vegetation.**—The distribution of forests is greatly determined by rainfall. East of the great plains the country is well wooded, but the great plains themselves and a great part of the mountain region are almost treeless. In the Pacific States, and especially in California there are extensive forests of valuable conifers, including pines, redwood, and sequoias. The principal trees of the east are white pine, now becoming scarce, yellow pine in several varieties, walnut, chestnut, oak, poplar, cherry, spruce, balsam, and hemlock. There is wide variety in the vegetation, which is semitropical in the south and has a more temperate character in the north. The western deserts are characterized by cactuses, the yucca, and the sagebrush.

**Animal Life.**—Among the principal native animals, some almost exterminated, are elk, deer, moose, caribou, bison or buffalo, the American elk, the big-horn or Rocky moun-

tain sheep, the Rocky mountain goat, prairie dogs, coyotes, foxes, opossums, and jack rabbits. The rattlesnake and other snakes are notable among reptiles.

**Birds, Reptiles, Fish.**—The birds include the great white-headed eagle, osprey, and eagles of various sizes, and a multiplicity of smaller birds of kinds generally common to the world, but a few of which, such as the Baltimore oriole, mocking-bird, etc., are peculiar to this country.

The reptiles furnish many varieties of both poisonous and innocuous serpents; the alligator is an inhabitant of the southern rivers, and the venomous insect—mosquito—in particular—are more plentiful than agreeable.

The coasts and rivers of the republic teem with fish of the finest edible descriptions—cod, mackerel, salmon, trout, bass, shad, etc.—and the mollusks and cetacean varieties are amply represented.

## POPULATION OF CITIES OF THE UNITED STATES, CENSUS OF 1910

TABLE I. CITIES OVER 100,000 POPULATION

Note.—The index notations following names of cities indicate their location on the respective maps. Thus 6-N-5 means that Albany is located on map 6 at, or near, the junction of the lines N and 5.

NAME	POPULATION 1910	PER CENT INCREASE 1900-1910	NAME	POPULATION 1910	PER CENT INCREASE 1900-1910	NAME	POPULATION 1910	PER CENT INCREASE 1900-1910

**Insular Possessions.**—The Philippine islands form a large group of the Asiatic archipelago, from which it is separated by the two deep abysses of the Sulu (Mindoro) and Celebes Seas, 2000 to 4,000 fathoms deep. It is washed on the east side by the Pacific Ocean and on the northwest by the China Sea, and comprises an aggregate of over 2000 islands of all sizes, ranging from mere islets and reefs to Luzon and Mindanao, the former rather more, the latter somewhat less, than 40,000 square miles in area.

The other chief members of the group, collectively called *Vizcaya*, are *Mindoro*, 9,000 square miles; *Palawan* (Paraguas), 10,000; *Luw*, 3,000; *Cebu*, 10,000; *Bohol*, 2,000; *Maribato*, 1,200. *Surfosa* and *Rivera*—Two main ridges ramify the island of *Mindoro*, the highest peak being *Apog* in the southeast of *Mindoro* (10,400 feet). The shore lines and internal structure of the larger islands are extremely rugged and mountainous. The islands are clothed with a gigantic and ever-teeming vegetation; and between these life-extensive slopes are places of the richest tropical forest, watered by numerous lakes and rivers which afford abundant means of irrigation and transport.

**Climate.**—The climate on the whole is healthy, but hurricanes are common. Earthquakes are frequent, and often very destructive. Owing to the prevailing sea breezes, the climate, although moist and hot, is less insalubrious than that of most tropical lands. The temperature varies from about 77° in December to 96° in May.

**Vegetation.**—The magnificent primeval forests contain dyewoods, hard-grained timbers, and medicinal and other useful plants. The principal agricultural product is rice, and next in importance are sugarcane, tobacco, and coffee. Fibrous

plants are also abundant, and among the chief of these are the well-known mule hemp, the cotton plant, the gomuti palm, ramie, etc. The pineapple is grown both for its fiber and its fruit. **Animals and Minerals.**—The largest wild mammal is the buffalo, and next to it the gibbon; there are several other species of apes and lamurs, antelopes and deer. The earliest man is represented by the species *Pithecanthropus*, the inferior by the *porcupine*. The only dangerous animals are the crocodile, snakes, and some other reptiles.

Birds are very numerous, of the gallinaceous family especially. Insects are very various; and the forest trees and shrubs were abundant in fables, turtles, mollusks, and sponges.

Of minerals the most widely diffused are coal and iron; copper also occurs, as well as gold, lead, silver, and tin. The common stones are besides jasper, marble, and fine building stones.

*Veget.*—Besides Manila, the capital, there are several other considerable towns: *Batang, Lipa, San Francisco, Zamboanga, Zamboanga, Zamboanga, Zamboanga.*

*People.*—The original inhabitants of the Philippines were undoubtedly the Negroes, now reduced to a few remnants. They were supplanted by new races, the Malays, who are now the most numerous, at least 20,000. Half-caste Negro communities are extremely numerous, the indigenous element

having amalgamated with the intruding Indonesian and Malay peoples. The Indonesians (akin to the Polynesians) are mostly pagans, whereas nearly all the Malays are either Roman Catholics or Mohammedans. The Tagal and Visayan languages are the predominant types.

**History.**—Discovered in 1521 by Magellan, who was killed here, the Philippines were officially annexed to Spain in 1569, and till 1898 remained an integral part of the Spanish dominion. A rebellion in 1896 went on till the Spanish-American war was begun in 1898. As a result of the Philippine war

of 1898 the islands were ceded to the United States on a payment of \$20,000,000.

the Hawaiian Islands are a group of eight inhabited and four uninhabited islands in the North Pacific. They were annexed to the United States in 1898, attached to the department of California for military purposes, and made a territory in 1900, with one delegate in the United States Congress.

The administration is carried on by a governor with legislatures of two houses, a senate of 15 and a house of 30 members. The natives almost all profess the Christian faith, and education is free. **Sports.**—Sugar, rice, coffee, fruits and nuts, hides, skins, shells and bone. The bulk of the trade is with the United States. **Islands.**—The islands with America, Australia, China, and Japan. **Population** includes over 25,000 Chinese, over 60,000 Japanese, and about 28,000 whites. **History.**—Discovered by Christopher Columbus in 1493, rice, until 1898 a Spanish colony, but then ceded to the United States by the Spanish-American treaty of peace, lies to the east of San Domingo,

It is administered by a governor with an executive council, consisting of six officials and five natives appointed by the president, and a legislative assembly of thirty-five members elected for two years on a franchise restricted by a small property qualification and a low educational test. The island of Culebra, between Porto Rico and St. Thomas, has been made a United States naval base.

The island is mountainous, the climate healthy, and the chief exports are coffee, fruit, sugar, tobacco, and timber. Free trade between the island and the United States was inaugurated in July, 1901, with very beneficial results on the sugar and tobacco trades. The United States sends the great bulk of the imports and takes most of the exports. The population, census of 1910, is 1,118,012, of whom about 861,000 are negroes.

• **Principal reports:**

about 300,000 mulattoes, and about 500,000 whites. The chief towns are San Juan and Ponce.

**Samoa Islands.**—By an agreement between Great Britain and Germany concluded in 1899, and proved 1900 by the United States, the Samoa Islands, which lie in the Western Pacific, were divided. Upolu and Savaii being assigned to Germany, and Tutuila and the other Samoa Islands to the United States. Great Britain renouncing all her rights over the islands. Tutuila (area, 54 square miles, population 5,800) has the magnificent harbor of Pago Pago. The other islands all have an area of about 25 square miles, with about 2,000 inhabitants.

**Guam.** the largest of the Mariana and Ladrones islands, was ceded to the United States in 1898, for use as a coaling station. It has a good roadstead. Area about 200 square miles; population about 8,601. The capital is Agaña; population 6,000.

**Panama Canal Zone.**—Article two of the treaty between the United States and the republic of Panama, ratified by the United States Senate February 23, 1904, treaty in effect February 20, 1904, provided for the canal, in perpetuity, by Panama, of a strip of territory adjacent to the canal, as follows:

"The Republic of Panama grants to the United States in perpetuity the use, occupation, and control of the zone of land and land under water for the construction, maintenance, operation, sanitation, and protection of said canal of the width of ten miles, extending to the distance of five miles on each side of the center line of the route of the canal to be constructed; the said zone beginning in the Caribbean Sea, three marine miles from the low-water mark, and extending to and across the Isthmus of Panama into the Pacific Ocean to a distance of three marine miles from mean low water mark, with the proviso that the cities of Panama and Colon and the harbors adjacent to them, which cities, whether included within the area of the zone above described, shall not be included within this grant.

"The Republic of Panama further grants to the United States in perpetuity the use, occupation, and control of any other lands and waters outside the zone above described which may be necessary and convenient for the construction, maintenance, operation, sanitation, and protection of the said enterprise."

"The Republic of Panama further grants to the United States in perpetuity the use, occupation, and control of all islands within the limits of the zone above described, and in addition thereto the group of small islands in the Bay of Panama, called Perico, New Colón, and others."

**Panama Canal.**—The idea of connecting the Atlantic and Pacific Oceans by a canal across the Central American Isthmus arose as early as the 16th century; but no steps were taken to carry out any

plan until Ferdinand de Lesseps, of France (fame, conferred in Paris in 1879 an international congress to discuss the plan of cutting through the Isthmus of Panama).

On February 28, 1881, the first detachment of canal employees arrived at Colon; in 1882 the canal company purchased the Panama railway. An expedition was sent to Panama to locate a route, that a canal could be made for \$43,000,000 francs, but later De Lesseps announced that a tide-level lock was essential, and the project was abandoned, 300,000 francs.

Work was begun, and loans followed year after year, until the company was forced into liquidation in 1895. The Panama scandal (see 1895) with prosecutions and imprisonments (De Lesseps, 1895).

In 1902 the United States arranged to purchase the existing works, with the right to finish the canal, but the necessary treaty was rejected by Colombia in 1903, where the republic of Panama revolted, and the new republic signed a treaty (see above) with the United States in November 1903, giving the United States full control of a strip of land on either side of the canal, which is practically a detachment of the Isthmus of Panama.

**Factor Concerning Construction.**—The canal is to be about 50 miles in length from deep water in the Caribbean Sea to deep water in the Pacific Ocean. The distance from deep water to the shore line in Limón Bay is about 4½ miles and from the Pacific shore line to deep water is about 10 miles. The length of the canal, from shore to shore will be approximately 40½ miles.

The channel from mile 0 in the Caribbean to mile 6.70 will be 500 feet wide from the south end of Gatun locks to mile 23.50 not less than 1,000 feet wide; from mile 23.50 to mile 20.50, 800 feet wide; from mile 20.50 to mile 700 feet wide; from mile 27.00 to mile 21.25, 500 feet wide; from mile 21.25 to Pedro Miguel lock (mile 39.30), 300 feet wide; and from Pedro Miguel lock to Miraflores locks and from Miraflores locks to deep water in Panama Bay, 500 feet wide.

The average bottom width of the channel in this project is 649 feet and the minimum bottom width is 300 feet.

The canal will have a minimum depth of 41 feet.

**Estimated Cost.**—The cost estimated by the present canal company is \$200,000,000 for the canal, which includes \$20,053,000 for sanitation and \$7,382,000 for civil administration.

The average bottom width of the canal is 649 feet and the minimum bottom width is 300 feet.

The figures in this table are taken from the "official table of distances" used by the war department of the United States government, except the distances to cities marked (\*), which are computed along the best routes of travel. All distances are in statute miles.

## WORLD TRAVEL DISTANCES

The chief ports of the world are named in alphabetical order across the top and down the sides of the table. The distances between any two ports will be found at the intersection of the two columns which contain the names of the selected ports. Thus the distance from Baltimore to Bombay is given as 8,131, and the small "g" shows that the route is via Suez Canal. Distances are for full-powered steam vessels reckoned in nautical miles.

## WORLD TRAVEL DISTANCES—Continued

The chief ports of the world are named in alphabetical order across the top and down the sides of the table. The distance between any two ports is found at intersection of the two columns which contain the names of the selected ports. Thus the distance from New York to Melbourne is given as 11,060. The small "c" shows that the route is via Cape of Good Hope. Distances are for full-powered steam vessels reckoned in nautical miles.

## CALIFORNIA

Vermont, 1866-71; president University of Michigan, 1871-1909; member Anglo-American International Commission on American Fisheries, 1887; chairman Canadian-American Commission on Deep Waterways from Lakes to Sea, 1896; appointed minister to Mexico, 1897; died May 1898. President, University of Michigan, 1898-1909. Author: *Progress in International Law* (1898); *The Fisher* (1900-07).

**Angelo** (an-jé'lo), **Michael de Buonarroti**. See **Michelangelo**.

**Anglo** (an-jé'lo), **Margaret Mary actress**, was born at Ottawa, Canada, 1876; educated at Loretto Abbey, Toronto, and convent of the Sacred Heart, Montreal, 1894; made her debut at Grandstand, New York, 1901; leading woman with *Le Héros*, 1901-02; *River of the Gods*, 1902-03; and in Empire Theatre Stock Co.; starred in *Sue*, 1903-06; with Henry Miller, in *The Great Divide*, 1906-07.

**Angouleme** (an-jé'lon), **Louis Antoine de Bourbon**, duc d'Angoulême son of Charles X. of France, was born at Versailles, France, 1775. In 1799 he married his cousin, Marie Thérèse, only daughter of Louis XVI., "the only man in the family," in the words of Napoleon. After the Restoration he made a feeble effort, as lieutenant-general of France, to oppose Napoleon on his return from Elba. During the revolution of 1830 he accompanied his father into exile, and died at Gora in 1844.

**Anna Comnena** (kom-né'na), a learned Byzantine princess, author of one of the most valuable works to be found in the collection of the Byzantine historians, was the daughter of the emperor Alexander I. (Comnenus), born 1083. She framed a conspiracy against the life of her brother then as Emperor in 1118. Her father spared her life, but punished her by confiscation of her property, which, however, he soon after generously restored. Disappointed and grieved, she withdrew from the court and sought refuge in literature. Died 1144.

**Anna of Austria** (an-jé'la), **Philip II. of Spain**, was born at Madrid in 1601, and in 1615 became the wife of Louis XIII. of France. On the death of the king, in 1643, she became queen-regent, and availed her discernment by choosing as her minister Cardinal Mazarin, by whose able management the young king Louis XIV. was reared, and by his majority, into possession of a throne firmly established on the ruins of contending parties. Died in 1666.

**Anne de Beaujeu**, daughter of Louis XI., was born about 1462; married Peter Beaujeu, duke of Bourbon, and, constant, and powerful, she attained as regent of the kingdom during the minority of her brother, Charles VIII. Died in 1522.

**Anne de Brittany**, daughter of Duke of Duke Francis II., was born at Nantes, France, in 1476. In 1491 she was united to Charles VIII., king of France, and governed France as regent during the expedition of that prince to Italy. After his death she married Louis XII. in 1499, over whom she exercised great influence, and died at Blois in 1514.

**Anne of Cleves**, the fourth wife of Henry VIII., to whom she was married in 1540, was born at Cleves, Germany, 1515. She was the daughter of John, third duke of Cleves. The match was projected by Cromwell, and was partly the cause of that minister's ruin. Henry put her aside, settled on her a liberal annuity, with which she was well satisfied, and she spent the remainder of her days in England, where she died in 1557.

**Anne, Queen of England**, was the second daughter of King James II. by his first wife, Anne Hyde, and was born in London, England, in 1664. Anne ascended the throne on March 8, 1702. During her reign, which was made illustrious by her early triumphs of the duke of Marlborough, Sir George Rooke and Sir Cloudesley Shovel conquered the fortress of Gibraltar, and in which Spain has never been able to regain; and the legislative union of Scotland with England was effected. The glorious galaxy of writers, in which every branch of learning, who flourished in her time, has caused it to be considered the Augustan age of British literature. She died in 1717.

**Annonato** (an-nó'na'tó), **Gabriele d'**. See **D'Annunzio, Gabriele**.

**Anselm of Canterbury**, a scholastic philosopher, was born at Aosta, Italy, about 1033. He was attracted by the reputation of Lafrane, he went in 1060 to study at the monastery of Bee, in Normandy. There he remained until 1063, when he was elected abbot of the monastery, the most famous school of the eleventh century. Lafrane, who in 1063 had been elected abbot of the monastery, died in 1093, and in 1093 Anselm was appointed.

**Anselm of Wilton**, an English jurist, was born at Wilton, Sussex, 1843; M. P. for Oxford University since 1899; trustee of the National Gallery, London, 1899; rector of the diocese of Oxford since 1899; warden of All Souls' College, Oxford, since 1891. He was educated at Eton and Balliol, Oxford, and was a member of All Souls', 1867; vice-chancellor of the University of Oxford, 1886-90; parliamentary secretary to the board of education, 1890-91; author of *Principles of the English Law of Contract, Law and Custom of the Constitution*.

**Anthony of Padua**, St., born at Lisbon 1195, was at first an Augustinian monk, but in 1220 he joined the Franciscan order, and became one of the most active propagators. He was canonized by Gregory IX. in the following year. According to tradition, he preached and fishes on the coast used to hear him; hence he is the patron of the lower animals, and is often represented as accompanied by a dog.

**Antony the Great**, St., the founder of monastic institutions, was born 251 near Alexandria, Egypt. In 267, having sold all his property, and given the proceeds to the poor, he withdrew into the desert, and within a number of years he had acquired the reputation of sanctity, and thus was formed the first order of monks. Died 356. **Antony** (an-tó'ny), **Alexander the Great**, a distinguished general of Alexander the Great, on whose death he became governor of Phrygia, Lycia, and Pamphylia, and after defeating and slaying Eumenes, and waging other successful wars, assumed the title of king. His ambitious schemes united his rivals, and he was slain in battle of Ipsus, Died 301 B. C.

**Antiochus** (an-tó'chú), III., surnamed **the Great**, was born about 238 B. C. He was the father, Seleucus Callinicus, as king of Syria in 223 B. C., and was the most distinguished of the Seleucids. He became involved in war with the Romans, who had conquered Macedonia; but declined to invade Italy at the instigation of Hannibal, who had come to him for refuge. He refused, and he was slain only on condition of his yielding all his dominions east of Mount Taurus, and paying a heavy tribute. He was afterwards defeated by the Romans at the battle of Elymais, when the people rose against him, and killed him in 187 B. C.

**Antiochus Epiphanes**, became king of Syria in 175 B. C. He fought against Egypt and conquered a great part of it. He twice took Jerusalem, and endeavoring to establish the worship of Greek gods, excited the Jews to a successful insurrection under Matthias and his allies, the Maccabees.

**Antipater** (an-típ'á'tér), Of the many persons who bore this name in antiquity the most celebrated was one of the generals of Alexander of Macedon, born about 400 B. C. When Alexander led his troops into Asia he left Antipater with Parmenio to guard the rear, and to dissuade him from the expedition, as governor of Macedon. He died 319 B. C.

**Antisthenes** (an-tíst'hen-és), father of Herod the Great; took part in the disputes between Hyrcanus II. and Aristobolus II. He assisted in placing Hyrcanus on the throne of Judaea, and afterwards strived to get the power in his own hands. He was afterwards appointed Procurator of all Judaea.

**Antoinette** (an-tó'net), **Marie**. See **Marie Antoinette, Josephine**.

**Antonicino** (an-tón'icé-no), **Cardinal Giacomo**, Roman prelate and statesman, was born in Italy in 1800, and died at Rome in 1876. He was raised to the rank of cardinal in 1847, and became secretary of foreign affairs for the papal states.

**Antonine** (an-tón'ín-é), **Marcus Aurelius**. See **Marcus Aurelius Antoninus**.

**Antoninus Pius** (Tito Aurelius Fulvius), Roman emperor, was born 86 A. D. In 120 he was made consul; afterward was sent by Hadrian as procurator into Asia, where the wisdom and gentleness of his rule won for him a higher reputation than had been enjoyed by any of his predecessors. In 138 he was adopted by the Emperor Hadrian, in consequence of his merits, and came to the throne in the same year. He died at Lugurii, Italy, in 161.

**Antony, Mark**, celebrated Roman general, was born at Rome in B. C. He took part in the civil wars of the republic, and with him was made consul in 44 B. C. After Caesar was killed, Antony, with Augustus, formed a triumvirate, which defeated the republican army of Brutus and Cassius at Philippi. Antony afterward visited Asia, and was slain by Cleopatra. His love for her made him forget the provinces he was to govern. When at the height of his power he was slain by a soldier so desperate that Augustus sent a force against him and defeated him in the naval battle of Actium. The greatness of his power was deserted by the Egyptian fleet. He took his own life in 30 B. C.

**Antony, Paul**, the most celebrated painter in ancient times, the son of Pythias, and probably born at Colophon, Asia Minor. He flourished about the fourth century B. C. He was a he and united the fine coloring of the Ionian, with the accurate drawing of the Sicilian school. He painted Colchis, and was the first of the second century, was born at Damascus. He worked at Rome for the Emperor Trajan, and built the temple of Venus which he dedicated to his name, but his greatest work was a huge bridge over the Danube at its confluence with the Al. He was killed by Colchis, and was buried in his name, but his greatest work was a huge bridge over the Danube at its confluence with the Al. He was killed by Colchis, and was buried in his name, but his greatest work was a huge bridge over the Danube at its confluence with the Al.

**Apollonius** (ap-pó'lon'í-us), of Perga, in Asia Minor, called "the Great Geometer," lived in the third century B. C. He is generally considered one of the founders of the mathematical sciences.

**Apollonius Rhodius** (Apollonius Rhodius) was born in Alexandria 280 B. C. He presided over an academy at Rhodes, was an

eminent rhetorician, and wrote a poem, in four books, on the expedition of the Argonauts, and other Classical subjects.

**Apponyi** (ap-pó'ny), **Count Albert**, Royal Hungarian Minister of Public Education since 1906, was born in 1856. He was a member of the late Chief Justice of the kingdom of Hungary. He has written many articles on questions of international politics, and in 1910 was elected to the German, English, and American magazines; visited United States, 1911.

**Apponyi, Count George**, Hungarian statesman, was born 1808. He was a member of the Presburg Diet of 1843, and chancellor of Hungary in 1847, when he opposed the revolut. movement, and then breaking out, and which caused his retirement in 1850. He was made a member of the imperial council in Vienna, and was instrumental in bringing about the reconciliation between Austria and Hungary. He is now among the ablest of European statesmen. Died 1899.

**Appuleius** (ap-pú'ly-us), a satirical writer of the second century, born at Numidia, Africa, studied at Carthage. He was so extremely popular that the senate of Carthage and other states erected statues in his honor.

**Aquinas** (a-quí'nos), **St. Thomas**, celebrated scholastic divine, born about 1227, died in 1274, was descended from the counts of Aquino, in the Kingdom of Sicily. He was educated at the Benedictine monastery at Monte Cassino, and at the University of Naples, where he studied for six years. About the age of seventeen he entered a convent of Dominicans, much against the wishes of his family.

He attended the lectures of Albertus Magnus at Cologne, in whose company he visited Paris, 1245 and 1246. Here he became involved in the dispute between the university and the Begging Friars as to the liberty of teaching, advocating the rights claimed by the latter with great energy. In 1257 he received the degree of doctor from St. Sorbonne, Paris, and began to lecture on theology, rapidly acquiring the highest reputation. In 1263 he is found at the Chapter of the Dominicans in London. In 1268 he was only lately landed at Rome, and died elsewhere. In 1271 he was again in Paris lecturing to the students; in 1272 professor at Naples. In 1263 he had been offered the archbishopric of Naples by Clement IV., but declined it. He was called on his way to Lyons to attend a general council for the purpose of uniting the Greek and Latin churches.

He was called, after the fashion of the times, the *angelic doctor*, and was canonized by John XXII. The most important of his numerous works, which were all written in Latin, is the *Summa Theologiae*, which, although only professing to treat of theology, is in reality a complete and systematic summary of the knowledge of the time. His disciples were known as *Thomists*.

**References**.—Vaughan's *Life of St. Thomas Aquinas*; Townsend's *Scholasticism of the Middle Ages*; and *Histories of Philosophy* by Erdmann and Leibniz.

**Arabi Ahmed** (ar-ab'ih) ("Arabi Pasha"), leader of the military insurrection in Egypt in 1882, was born in Egypt in 1823. He was called to his troops that he was inspired by the prophet to undertake a holy mission, the motto of which was, "God and the sword." He was killed, and became the leader of a great rebellion. After his defeat Arabi was banished to Cayron, but was permitted to return to Egypt.

**Arago** (ar-jé'), **Dominique**, celebrated French philosopher, was born at Estagel, France, 1786. He was in 1808 by the emperor Napoleon, and was an ardent of merit. His subsequent life was distinguished by an ardent and successful devotion to science. In 1818 appeared his *Recherches Observations géologiques, astronomiques, et physiques*. He died in 1853.

**Aratus** (ar-tó'us), a Hellenic statesman, born at Sicyon, Greece, 271 B. C.; died 213 B. C. He liberated Sicyon from the tyrant Nicles in 251, and he is said to have been poisoned by Philip of Macedon.

**Arbaces** (ar-bé'sé), one of the generals of Bardanes, who was sent in 876 to B. C. of the Median empire. The dynasty of Arbaces lasted until 899 B. C., when Cyrus overthrew it.

**Arbutnot, Bernard** (ar-but-not), **John**, British physician and poet, the much-loved friend of Swift and Pope, was born at Arbutnot, Scotland, 1674. He was educated at the University College, Oxford; but took his M. D. degree at St. Andrews, 1696. In 1708 he was appointed physician to the queen, and her death in 1714 was a severe blow to his prosperity. In 1715, along with Pope, he was elected Gay in the *Twelve Hours*. He was a friend of Swift, and a champion of literary fame. Arbutnot was the earliest, if not the sole author of the brilliant *Memoirs of Maritane*.

young men for the universities. Appointed head master of Rugby school in 1828, he raised that institution beyond the ordinary level of the remarkable success of his pupils and by the introduction of new branches of study into the Rugby school. The best known of his works are his edition of *Thucydides*, and his sermons delivered in the chapel of Rugby school. Died 1842.

**Arnold of Winkelried**, a Swiss of Unterwalden, who, according to tradition, made a way for his kinsmen into the castle of Morgarten in 1306, by grasping an armful of Austrian spearheads and plunging them into his own bosom.

**Arrhenius** (*arr'-eh'-ee-us*), a Swedish chemist, was born in 1859. At nineteen he received the degree of doctor of philosophy from the University of Uppsala. His chief contributions are in physical chemistry, more particularly in the theory of solutions, although his study of osmotic pressure added to our knowledge of that subject. Received Nobel prize for chemistry, 1903.

**Artian** (*ar'-ee-on*), or **Flavius Arrianus**, Greek historian, was born in Nicomedia, Bithynia, about 100 A. D. The emperor Hadrian made him a Roman citizen and governor of Cappadocia, in 136. When fifty years old he settled in his native city for the rest of his life.

**Artaxerxes I.** (*ar-tak'-ser'-ez*), king of Persia, surnamed Longimanus, the second son of Xerxes, escaped from the conspiracy of Artaban and others, who succeeded the throne in 424, and reigned, extending to 425, was marked by a decline of power. Died 425 B. C.

**Artaxerxes II.** (*ar-tak'-ser'-ez*), Marmoon, succeeded his father, Darius II., in 405 B. C. After gaining the victory over his brother, Cyrus, he became involved in a war with Sparta, which ended with the Antalcidean treaty of peace. Died 361 B. C.

**Artavertus III.**, surnamed Ochus, was the son and successor of Artaban, king of Persia. In the true style of oriental despotism until 338 B. C. One of his most daring exploits took place in Persia, where he caused the divine bull Apis to be slaughtered and cooked as ordinary beef. He was poisoned in 338 by his eunuch, Bagaces.

**Arvidsson** (*ar'-vid'-son*), a popular Finnish leader of the fourteenth century, was a brewer in Ghent. His wealth, eloquence, and talents made him the most prominent man on the side of the citizens in their struggles against Count Louis of Flanders. His power was secure for ten years, but in 1355 he was banished by Edward III. of England, persuading him to assume the title of king of France. To strengthen the alliance, he married the young daughter of Edward III. of England, persuading him to assume the title of king of France. To strengthen the alliance, he married the young daughter of Edward III. of England, persuading him to assume the title of king of France.

**Arvidsson** (*ar'-vid'-son*), a popular Finnish leader of the fourteenth century, was a brewer in Ghent. His wealth, eloquence, and talents made him the most prominent man on the side of the citizens in their struggles against Count Louis of Flanders. His power was secure for ten years, but in 1355 he was banished by Edward III. of England, persuading him to assume the title of king of France. To strengthen the alliance, he married the young daughter of Edward III. of England, persuading him to assume the title of king of France.

**Arthur, Julian**, actress, was born in Hamilton, Ontario, 1869, of Irish and Welsh parentage; real name, Ida Lewis; first New York success at Union Square theatre in *The Black Magician*. Her debut, 1895, in Henry Irving's company, playing roles such as *Henry Irving*, *Marriv*, 1898, *Benjamin P. Cheney, Jr.*

**Asbury** (*as'-bu-ry*), Francis, the first bishop of the Methodist Episcopal church in America, was born in 1745. In 1765 he was appointed general assistant by John Wesley. He brought Wesley into the States of New York and Virginia, and to the revolution, when many ministers returned to England, he kept on in his labors. At the end of the war, it was decided that the Methodist Episcopal church for America, and he was ordained in 1784 as bishop, by his colleagues and already a member of the General Conference of England. For more than thirty years he worked earnestly and successfully, and the wonderful growth of Methodism in America was largely due to his efforts and ability. He died in 1816.

**Ascham** (*as'-ham*), Roger, English writer and classical scholar, was born at Wymondley, in Yorkshire. He wrote, in 1545, a treatise entitled *Towpschia*, the pure English of which ranks it among the classical pieces of English literature. For this treatise, which was dedicated to Henry VIII., he was awarded a pension. In 1548 he became master of Langley school, and in 1550, after Edward's death, and was subsequently appointed Latin secretary. Died 1568.

**Ascham, Lewis**, British diplomat, English diplomat, was born in 1774, eldest son of the eminent merchant, Sir Francis Baring. Having been employed as a special agent in America, as land to the United States to settle the northeastern boundary question in August, 1842, he concluded the famous treaty with the American government, by which the frontier line was definitely settled. Died 1848.

**Ascham, John**, American surgeon, educator, and author, was born at Philadelphia, Pa., 1839; acting assistant surgeon of United States army, 1862; professor of anatomy and surgery at the University of Pennsylvania, elected in 1877. His two prin-

cipal works are *Injuries to the Spine, and Principles and Practice of Surgery*. Died 1900.

**Ascham, John**, English scholar, was born at Litchfield, England, 1617; held the appointment of Windsor herald, and published the *History of the University of Oxford*. His last manuscript presented to the University of Oxford his valuable collection of coins, specimens, and manuscripts. Died 1692.

**Aspasia** (*as'-pa'-sh'-id*), a beautiful Athenian woman, said to have been a native of Miletus in Asia Minor. In order to marry her, Pericles repudiated his wife. An affront offered to Aspasia is said to have been the cause of the Peloponnesian war.

**Asquith** (*as'-kwith*), Rt. Hon. Herbert Henry, prime minister of England, was born in 1852, and was educated at Balliol College, Oxford, and was admitted to the bar, Lincoln's Inn, 1876. D. C. L., Oxford; D. D., Edinburgh and Glasgow. On the defeat of the Rosebury ministry in 1895, he resumed practice at the bar. He was one of the most effective speakers on the liberal side during 1903 on the education question and the war commission's report, and during 1903, 1904, and 1905, in opposition to Chamberlain's fiscal policy. Chancellor of the exchequer, 1905. He became prime minister 1908.

**Astor, John Jacob**, merchant, founder of the American fur company, was born near Heidelberg, Germany, 1763. After spending some years in the fur trade, he came to New York, where he invested his small capital in furs. By economy and industry he so increased his means that after 1800 he was able to acquire a large fortune. From this period, in spite of the war of 1812 and other temporary obstacles, his commercial connections extended over the entire globe, and his ships were found in every sea. He died in 1848, leaving property amounting to \$200,000,000.

**Astor, John Jacob**, capitalist, author, was born in New York, 1848; son of John Jacob, second, and Charlotte Augusta (Gibbes) Astor; married Mary, daughter of John Jacob Astor, the Astor fortune. Educated by private tutors, finishing in Europe; entered office of the Astor family, 1867; returned to England, 1870; owner *Fall Mill Gazette*, and *Fall Mill Magazine*.

**Atkins** (*at'-kin*), John, English statesman, was born in 1796, and died in 1868. He was a member of the House of Commons, and was chosen bishop of Alexandria in 1826. He is esteemed one of the most eminent among the ancient fathers of the church. He was a violent opponent of Arius; and his earnest advocacy of the Catholic faith, more particularly of the doctrine of the Trinity, subjected him to much persecution from the emperors Constantine and Julian, by both of whom he was several times exiled. Died in 327.

**Athenagoras** (*at'-hag'-er'-as*), a Christian philosopher, born at Athens, who lived toward the close of the second century. His conversion to Christianity had been likened to that of St. Paul. He was a native of Athens, and lived at Athens, at San Francisco, California, 1858, the daughter of Thomas L. Horn. She was educated at St. Mary's College, in Lexington, Kentucky; married George H. Bowen, Atherton, deceased. Author: *The Doctrines of the Bible*, *The Greek Church*, *The Greek Church*, *Patristic Epiphany* and *His Times*, etc.

**Atticus** (*at'-ti'-us*) **Hermodes**, **Tiberius Claudius**, a rich Athenian, born about 104 A. D. He was one of the best masters, having special attention to oratory, in which he greatly excelled. His lame right arm, upon immense expenditures of gold, was cured. Died 160 A. D.

**Atticus, Titus Pomponius**, born at Rome 106 B. C., was educated with Cicero and the younger Marius. He withdrew from the busy life of Rome, and retired to a villa in the Sabine country, where he devoted himself chiefly to study and the composition of treatises. His Latin writings have been preserved. But he has 396 epistles addressed to him by Cicero. Died 32 B. C.

**Atterbury** (*at'-ter-bu-ry*), Hugh, third in the fifth century. He styled himself "the scourge of God," and devastated Lombardy. The city of Rome was devoted by those who followed him. On his death, in 553, his body was buried in three folds, made of gold, silver, and iron. The capture of which his grave was put to death. **Atwater, George**, British mathematician, was born, 1746; died in London, 1807. He was educated at Cambridge University, became tutor of Trinity College, and was afterwards employed to illustrate the relations of time, space, and velocity

in the motion of a body falling under the action of gravity.

**Auber** (*au'-ber*), **Daniel François**, French composer of operas, was born at Caen, in Normandy, 1782. His opera *Maestri* is considered his best work. He has also written several operas, *Fre Diavolo*, *La Donna del Lago*, *Maestro Lasciat*, etc. In 1842, after the death of Cherubini, he was appointed director of the conservatory of music, Paris. Died, 1871.

**Aubigne** (*au'-bin-yeh*), **Jean Henri Merle d'**, See Merle d'Aubigne.

**Audubon** (*au'-du-bon*), **John James**, celebrated American naturalist of French descent, was born near New York, 1785. He was a naturalist devoted to natural history, but it was not until 1830 that the first of the four volumes of his great work, *The Birds of America*, was issued. His magnificent collection of plates, which was sold for \$1,000 a copy, was quickly followed by explanatory letterpress under the title of *American Ornithological Biography*. Died in New York, 1851.

**Auenbrugger** (*au'-en-brug'-er*), **Leonhard**, Austrian physician, was born in 1722. He originated the method of examining the lungs by percussion of the chest, and published the results of his investigations in a treatise which marks an epoch in the history of medicine. He died, 1809.

**Auerbach** (*au'-er-bach*), **Berthold**, German author, was born in 1832, at Weimar. He has abandoned the study of Jewish theology, he devoted his attention to literature. His first publications were *Idyllen* and *Novellen*. He was a translator of the works of Spinoza. By some his *Am der Höhe*, "On the Heights," is regarded as his best novel. He has also written a play, *Die Juden*, by the English title, *The Castle on the Rhine*. Died at Cannes, France, 1882.

**Auerberg** (*au'-er-ber*), **von, Anton Alexander**, famous Austrian naturalist and poet, whose pen-name was "Anastasia Grün"; was born at Laxenbach, Austria, in 1807. He was a member of the Frankfort parliament of 1848, and later of the Austrian Reichsrath. Died at Graz, Austria, 1872.

**Aurelian** (*au'-re-li-an*), **Flavius Aurelius**, duke of Castile, marshal and peer of France; one of the most brilliant and intrepid of the last of great French monarchs. He was gathered around himself; was born in 1751. His services were so conspicuous that he was made a general, and was made general of a division. In 1797 he was appointed to the command of the army of the Rhine; but after a short time he was removed to the command of the tenth division. In 1800 he received the command of the army in Italy, and in 1805 he was made a marshal, and in the following year he commanded a division in the campaign against the Vorarberg. Died in La Haye, 1816.

**Augustine** (*au'-gu'-stin*) **Aurelius Augustinus**, St., a renowned father of the Christian church, was born at Tagaste, in Africa, in 354. His father Monica being a Christian, his father Patricius a pagan. His parents sent him to Carthage to complete his education, but he disappointed their expectations by his neglect of serious study and his devotion to pleasure. A lost book of Cicero's, called *Hortensius*, led him to the study of philosophy; but dissatisfied with this he went over to the Manichaeans. He was one of their disciples for nine years, but left them, went to Rome, and thence to Milan, where he became a teacher of rhetoric.

St. Ambrose, the bishop of this city, converted him to the faith, and his writings on reading of the scriptures wrought an entire change in his life and character. He retired into solitude, and prepared himself for baptism, which he received in his thirty-third year from the bishop of Milan. He returned to Africa, he sold his estate and gave the proceeds to the poor, retaining only enough to support him. At the desire of the people of Hippo, Augustine became the successor of his bishop in that town, and devoted to extraordinary success, and in 395 succeeded to the see. He entered into a warm controversy with Pelagius concerning the doctrines of free-will, grace, and predestination, and wrote treatises concerning them, but of his various works his *Confessions* is most secure of immortality. He died August 28, 430, while Hippo was besieged by the Vandals.

He was a man of great enthusiasm, self-devotion, zeal for truth, and powerful intellect, and though there have been fathers of the church more learned, none have wielded a more potent influence. He has left a large autobiographical, polemical, homiletic, exegetical. The greatest is the *City of God* (*De Civitate Dei*), a vindication of Christianity. His *Confessions* also gained wide popularity. References: *St. Augustine and Post-Nicene Fathers*; Milman's *Latin Christianity*; Mosley's

**Augustinism**, Cunningham's *St. Austin*; Harneck's *Hist. of Doctrines and Movements and Confessions of Augustines*; Hlatfeld's *St. Augustinus*; Hainy's *Catholic Church*; Schaaf's *Life and Labors of St. Augustine*; Baillie's *Augustine and His Age*. For an unfavorable estimate, see Allen's *Continuity of Christian Thought*.

**Augustus, Caius Julius Caesar Octavianus**, Roman emperor, born 63 B. C., was the son of Julius Octavius and Lucia, niece of Julius Caesar, by whom he was adopted when but four years of age. He was in Ephesus when Julius Caesar was assassinated, but speedily returned to claim his inheritance. At the age of thirty-six he became emperor, with the title of Augustus. His reign was fortunate, good laws were framed in it, and the arts flourished under his protection. He died 14 A. D.

**Aurélianus (or-a-li-ä-nus), Claudius or Lucius Domitius**, emperor of Rome, was born in Pannonia, 212 A. D., the son of a senator; entered the Roman army, his exploits in which attracted the notice of the emperors Valerian and Claudius, and on the death of the latter in 270 he was proclaimed emperor. The emperor's severity made him feared even by his friends, who, as they deemed in pure self-defense, conspired against him and put him to death 275 A. D.

**Aurangzeb (or-ang-zeb)**, emperor of India, known as the Great Mogul, was born in 1627, the son of a poor, but his career was brilliant. His son disturbed his latter days by attempting to depose him. He died in 1707.

**Austen, Jane**, English novelist; born in 1775, at Steventon, Hants, England, of which parish her father was rector. Her works are *Pride and Prejudice*; *Sense and Sensibility*; *Emma*; *Mansfield Park*; *Northanger Abbey*; and *Persuasion*. They are all excellent, and distinguished by naturalness, and fidelity of delineation, qualities in which the literature of her time was most deficient. She died at Waterlooville, 1817.

**Austin, Alfred**, English poet, novelist, and journalist; born at Headingly, near Leeds, 1835; took his degree at the University of London, 1858; admitted to the bar, 1857; has published *The Secret, a Satire*; *The Human Tragedy*; *Introductions*; *Decorations*; *English Lyrics*, etc. He has also plays, and various political papers; was made fifteenth poet laureate of England, 1869.

**Austin, John**, eminent English lawyer and legal writer, was born at Cretingham Mill, Suffolk, England, 1790. He was professor of jurisprudence at the University of London from 1825 to 1835, and wrote *Province of Jurisprudence Determined* and *Lectures on Jurisprudence*. Died 1859.

**Aubrey (or-ber-ee), Lord, Sir John**.

**Avverroës (or-er-ä-ä)**, originally Ibn Rohd, or, more fully, Mohammed-Ibn-Rohd, the most famous of Arabian philosophers, was born at Cordova, Spain, 1126.

**Avery, Elroy McKendree**, author, historian, born in Ann Arbor, Mich., July 14, 1844; graduated at University of Michigan, 1867; served in civil war; mustered out at close as sergeant-major of 11th Michigan volunteer cavalry. Member of many historical and economic societies. Author: *Elementary Physics*; *Elements of Natural Philosophy*; *Physical Science*; *History of the United States*, etc.

**Avicenna (or-er-ä-ä)**, properly Ibn Sina or, more fully, Abu Ali Al-Hossein Ibn Abdallah Ibn Sina, a famous Arabian philosopher and physician, whose authority for many centuries passed for indisputable; born 980, at Chirmatane, a village near Meshkadeh. Died 1036.

**Avogadro (or-ä-ä-ä-ä)**, Amadeo, Italian chemist and physicist, was born at Turin, Italy, 1776; died there, 1856. Professor of physics at Turin; formulated his celebrated law concerning the atomic theory in 1811.

**Ayresbush (or-ä-ä-ä-ä)**, the favorite wife of Mohammed, was born at Medina in 610 or 611 A. D. She was only nine years of age when she married the prophet. She bore him three children, Mohammed, by his request, was carried to her house and expired in her arms. After the prophet's death Ayresbush took active part in the plot which deprived Caliph Othman of his power and life, and headed a force to restore the accession of Ali. Died 678.

**Baccio della Porta. See Bartolomeo, Fra.**

**Bach, Johann Sebastian**, (bäk) in some respects the greatest musician that ever lived, son of Johann Ambrosius, was born in 1685, and died July 30, 1750. He was treble singer in a choir at Luneburg until his voice changed, when he became a violinist of the court at Weimar. When he was twelve years of age he became organist at Arnstadt, in 1708 became court organist at Weimar, and in 1714 concert master to the duke, with the additional duty of composing and conducting the vocal music of the churchpeople. After he had served as chapel master to the court at Köthen, the city authorities of Leipzig elected him in 1723 musical director of the Thomas School, where he labored for the remainder of his life. He published few works, but left a great number

in manuscript. The Bach society at Leipzig was engaged from 1850 to 1900 in publishing a complete collection of his compositions, which embrace a great variety of church music, both vocal and instrumental and many other works for the organ, harpsichord, orchestra, and solo instruments. He died a century ago. As a virtuoso upon keyed instruments he had no rival.

**References.**—The most complete edition of his works is that issued by the Bach Society, in 56 folio volumes. See *His Life by Miss Jay Shuttleworth*, and the greatest work on his subject, by J. J. von Baer.

**Bach, Karl Philipp Emanuel**, German composer, second son of Johann Sebastian, was born at Weimar, in 1734; died at Hamburg in 1788. He was probably the most highly gifted of the eleven brothers, and his influence on the development of certain musical forms gives him a prominent place in the history of the art. His most ambitious composition is the oratorio *Israel in the Wilderness*.

**Bache (deh), Alexander Dallas**, president, great-grandson of Benjamin Franklin, was born at Philadelphia, 1806. He was president of Girard College 1836-42, where he established a meteorological and music observatory. Died at New York, R. I., 1867.

**Bachman, William**, physician and chemist, was born at Philadelphia, Pa., 1792; he published *System of Medicine* in 1819; was professor of chemistry at Jefferson College, 1820-21; in 1821 he held same chair in Jefferson Medical College, Philadelphia, in 1841. Died 1864.

**Bachman, William**, novelist, born at Pierpont, N. Y., 1839; graduated from St. Lawrence University, 1862; actively connected with press of New York for many years; for several years, editor of the *New York World*; author of *Eben Holden*; *The Handmaid's Gentleman*; etc.

**Bachman, Alexander Dallas**, president, a famous marine painter of the Dutch school, was born at Emden in Hanover in 1631, and died at Amsterdam in 1708.

**Bacon, Alice Mabel**, author, educator, was born at New Haven, Conn., 1858; educated in private schools, and took the Harvard examinations in 1880; taught at Hampton, Institute, 1880-81; founded Dixie hospital for training colored nurses, 1880. She has also been successful as a lecturer on health, literature, character, and domestic life.

**Bacon, Augustus Octavius**, lawyer, United States senator from Georgia; born in Bryan county, Georgia, 1810; graduated at University of Georgia, 1832; practiced law in 1839; in law practice in Macon, Georgia, since 1860; delegate national democratic convention, 1860; elected to United States senate, 1869; reelected, 1901 and 1907. He is and for many years has been a trustee of the University of Georgia, and one of the regents of the Smithsonian Institution.

**Bacon, Benjamin Wisnack**, biblical writer and critic, professor of Hebrew at the University of Cambridge, England, since 1896; was born at Litchfield, Conn., 1801; graduated from Yale, 1821; B. D., Yale, 1834. Director of the American School of Oriental Research in Jerusalem, Syria, 1905-06. Author: *The Genesis of Genesis*; *Triple Tradition of the Bible*; *Introduction to a Commentary of the New Testament*; *The Sermon on the Mount*.

**Bacon, Francis**, Baron Verulam and Viscount St. Albans, English lawyer, statesman and philosopher, was born at York House, London, 1561. In 1576 he went to France with Sir Amyas Paulet, the English ambassador, and stayed there until his father's death in 1579, when he returned to England, and was sent to study law at Gray's Inn, and in 1584 started on a parliamentary career as member for Melcombe Regis, in Dorsetshire, and soon became distinguished in the House as an orator. The great blot in his career during the reign of Elizabeth was, according to Marquay and others, his prosecution of his friend Essex, which they maintain was undertaken "not for his fault, but for their fault."

After the queen's death, in 1603, Bacon rapidly rose in fortune and favor. He was knighted in 1603, became solicitor-general in 1607, attorney-general in 1613, privy councillor, 1616, justice of the peace, and in 1618 Baron Verulam in 1618, and Viscount St. Albans in 1620.

But his fall was as rapid as his rise. The patent of monopoly, which he secured in 1609, for the obnoxious patents consisting in alehouses and inns, and monopolies of gold and silver thread, in which both the king and Buckingham's family were interested. This led to their abolition, 1616, inducing him to incur his enemies at once started a crusade against "the reformer of abuses." A committee was appointed to inquire into "the abuses of the courts of law, and the abuses of the courts of equity," and he took "rewards to pervert justice," and

maintained that he only "partook of the abuse of the times." It was denounced by his peers.

But the sentence on him was never carried into effect; his imprisonment lasted only four days; his huge fine of £200,000 was remitted; his pardon was passed under the great seal of England in 1625, because he was sent to New York House, the place of his birth, to Buckingham; a pension of \$6,000 a year was granted to him; and he was summoned to resume his seat in the house of commons.

It was after he retired from political life that Bacon practically began his literary career as one of the world's great philosophers. To that time his only acknowledged works had been several editions of *De Augmentis Scientiarum* and augmented on every occasion with infinite care—his *Advancement of Learning*, in 1605, and his *Novum Organum* in 1620. The last five years of his life were full of work. In March, 1622, he produced his *History of Henry VII.*; in November, 1622, his *Historia Venturum*; in January, 1623, his *Historia Vitæ et Morte*; in October, 1623, his *magnus opus*, entitled *De Scientiarum*, a Latin translation, with large additions, of *The Advancement of Learning*; in December, 1624, his *Apophthegmata*; and in 1625 his *Translation of the Four Books of Aristotle's Nicomachean Syllogism* (1627), was published posthumously along with the *New Atlantis*.

Bacon was great as a moralist, a historian, a writer on politics, and a philosopher, but it is as the father of the inductive method in science, as the powerful exponent of the principle that facts must be observed and concluded before theorizing, that he occupies the grand position in the history of the world's great. His moral character, however, was not on a level with his intellectual, self-gratification being the main aim of his life. He was a very selfish character, and his work is James Spedding, who edited *The Letters and Life of Bacon*, in 7 volumes, and his moral character is bold and unscrupulous. It is also worthy of perusal. See also *Church's Life of Bacon*, in the English "Men of Letters" series.

**Bacon, Nathaniel**, lawyer and member of Governor Boscawen's council, was born at Exeter, 1730; took part in the American Revolution; was a member of the Massachusetts legislature; in 1780 he was forced to make many concessions to demands for better government; but he broke his promises, and in 1781 he was elected governor. He was burned, 1776, and the governor took shelter in an English vessel. Died in Virginia, 1777.

**Bacon, Nathaniel**, English politician, was born about 1214. The most learned man of his day, he is reputed to have advocated the change since made in the calendar, to have invented gunpowder, and is known to have manufactured magnifying glasses. Died, 1294.

**Baden-Powell (bä-dén-pö-ä, or pow-ä), Robert Stephenson Smyth**, British general and inspector-general of cavalry, was born 1857, and educated at Charterhouse, London. In 1876 he joined the 13th English hussars, and served as adjutant of that regiment in India, Afghanistan, and South Africa. In the Boer war he was given command of the 5th colonial guards, and with a force of 1,200 men was engaged in Mafeking, which he held against the Boers from a few days following the outbreak of the war until May 1900, and was severely wounded. He was promoted to the rank of major, and recorded in modern warfare; afterwards organized the South African constabulary. He is the author of *Boy Scouts of America*, and *Scout's Vade Mecum*, *Cavalry Instruction*, *The Downfall of France*, *The Malakal Campaign*, and on *Peasants' War*.

**Baedecker (bä-dä-ä-ä), Karl**, German publisher at Coblenz, the originator of a series of admirable editions of German literature, since 1872 at Leipzig. Born 1801; died 1859.

**Baer, George F.**, railway official, lawyer; born in Somerset county, Pa., 1842; educated at Franklin and Marshall College, Lancaster, Pa., 1860; became a lawyer in 1862; elected captain, joined army of Potomac at second battle of Bull Run and took part in all subsequent battles, including Chancellorsville, when he was detailed as adjutant-general second brigade; counsel for Philadelphia & Reading, 1870; became a lawyer in 1871; became a legal adviser in Pennsylvania of J. Pierpont Morgan; elected, 1901, president of Philadelphia & Reading railway; president of Philadelphia Coal and Iron company, and Central Railroad company, of New Jersey.

**Baer, Hermann von**, Russian naturalist, founder of modern embryology, was born in Eshonno, Rumania, 1792; died at Leipzig, 1876. He was educated at Göttingen, and became a professor in the University at Königsberg, where, in 1828, he published *The Development of Animals*, a work of careful observations, and philosophical re-

On the retirement of Lord Salisbury in 1902, he became prime minister and lord privy seal, retaining the office of first lord of the treasury. When Chamberlain made his fiscal proposals, 1903, Balfour, holding that the country was not ripe for the taxation he knew, committed himself and the government only to a policy of reticence. At the end of 1905 he and his cabinet resigned, and he was succeeded by Asquith.

**Balfour, Robert**, English geologist, born at Edinburgh, 1851; educated at Trinity College, Cambridge, 1870 and 1882 he brought forward the theory of the evolution of the different stages of animals in his *Comparative Embryology*, a work of the greatest value to students of comparative anatomy. He was the first to suggest the idea to climb one of the spurs of Mount Blanc.

**Balfour, Robert**, English geologist, born at Balfour, Scotland, in 1832, and died in 1895. He was the first to suggest the idea to climb one of the spurs of Mount Blanc.

crowned king September 24, 1332. But most of the people did not want him, and after a reign of only a few months he was deposed and died in 1363.

**Balio, John**, king of Scotland, was born in 1250. Through his mother who was connected with the royal family, he became a competitor for the throne with Robert Bruce. The question was left to Edward I., who was born in 1272. Balio, who swore obedience to him as his feudal lord. In consequence of his oath, he soon found he had no real power, and in 1294 he was obliged to settle on his Norman estates, where he died in 1314.

**Balmer, Robert Stawell**, British scientist, Lowndean professor of astronomy and geometry, Cambridge, director of the Cambridge observatory since 1845; was born at Dublin, Ireland, 1806; graduated from Trinity College, Dublin. Hon. M. A. Cambridge, 1822; L. L. D., Dublin, Royal astronomer, 1822, 1824, 1826, 1828. Author: *A Treatise on the Theory of Spherics*; works on astronomy.

**Balmaine** (bē'lānē), William, British lawyer, was born in London, 1812; admitted to the bar in 1834, and soon obtained a large practice, chiefly in criminal cases. He wrote *Experiences of a Barrister's Life*, and *Old World and the New*. Died 1887.

**Bailou** (bē'lō), Hoven, American preacher and founder of the Universalists, was born in New England, 1772. He was expelled from his church on declaring his belief in the final salvation of all men. He married in 1801, and in 1819, he was expelled from his church by his grandnephew, began the *Universalist Expositor*, a quarterly publication. Died 1858.

**Balmaceda** (bē'lānē-dē), José Manuel, Chilean statesman, was born in 1840; president of the republic in 1886. He was elected to the congressional party and himself, he was defeated and committed suicide in 1891.

**Balmaine** (bē'lānē), William, British lawyer, born at Kipling, in Yorkshire, about 1580, entered parliament in 1609, was knighted in 1617, and in 1619 became chief justice of the common law. In 1621 he had despatched colonists to a small settlement in Newfoundland, and in 1627 he visited the colony. He was several times induced him to sail southward in search of a more genial climate, but his attempts to settle in Virginia led to disputes with the colony, and he was expelled from the charter. He died in 1632, and the patent was granted in June of the same year to his son, Cecil, second Viscount of Devonshire.

**Balzac** (bē'zāk), Honoré de, a celebrated French novelist, was born at Tours in 1799, died 1850. Before completing his twenty-fourth year he had published a number of novels, and after his marriage he was a frequent success attending all was very indifferent; and it was not till 1829, by the publication of *Le Dernier Chouan*, a tale of La Vendée, and the first novel in which Balzac specified his name, that the attention of the public was diverted to the extraordinary genius of the author. A still greater popularity attended his *Physiologie de Mariage*, a work full of piquant and caustic observations on human nature. He wrote a large number of novels, all marked by a singular knowledge of human nature and distinct delineation of character, but apt to be marred by exaggeration.

Among his best-known works are: *Scenes de la Vie de Province*; *Scenes de la Vie Parisienne*; *Le Père Goriot*; *Eugenie Grandet*; and *Le Médecin de Campagne*. He was the author of this last, in 1835, led to a correspondence between Balzac and the Countess Eveline de Hanaka, a Polish lady whom, after about fifteen years, he visited and married. He collected edition of his works under the title *La Comédie Humaine* began to appear in 1899. Numerous English translations have appeared, of which the best is the series by Miss Worsley (1890-3), with a memoir of Balzac.

**References**—Saintsbury's *French Novelists*, and Balzac's *Life*, written by his sister; Théophile Gautier, *Le Balzac*, which is a collection of literary portraits; Taine's *Essays*; and Salazar's *Notes*.

**Bancroft, George**, American historian, was born in 1800, near Worcester, Mass.; graduated from Harvard College in 1817; preceded in 1818 to Göttingen, Germany, to study law. He was subsequently he traveled through Germany, and formed an acquaintance with Goethe and Schiller. He was then he returned to America as a politician, and was made collector of customs at Boston. When Polk was elected president, in 1845, he was appointed Bancroft secretary of the navy. In the autumn of 1846 he was sent by Polk as ambassador to England, where he remained until 1849. He was the author of *History of the United States*. He published the result of his labors in his *History of the Revolution in*

**Barileone, Oreste** (*bar'le-on-ma-ri*). *Fra* (properly *Baccio della Porta*) one of the most distinguished painters of the Florentine school. He was born in Florence in 1478. His subjects are mostly all religious, and by far the greater part of his pictures belong to the religious class. He was a warm adherent of Savonarola, after whose tragical end in 1500 assumed the Dominican habit. Barileone died in Florence in 1537.

**Barton, Clara**, philanthropist, founder and organizer of national Red Cross Society in the United States, president of the Red Cross for the year 1930; graduate of Clinton liberal institution, New York. During civil war did relief work in battlefield and organized relief for the wounded. She laid out grounds for national cemetery, Andersonville, 1865; secured adoption of treaty of Geneva, 1864; first president American Red Cross; managed American amendment of Red Cross, to provide for greater calamities of peace; distributed relief Johnsons flood, 1892; at request of president of United States carried relief to Cuba, 1898; did personal field work, Spanish-American war; president national first aid association since 1905.

**Bartich** (*bar'ich*), **Karl Friedrich**, German philosopher; born at Spottau, Silesia, 1814; studied at Breslau, Berlin, Halle, Paris and Oxford; professor of philosophy at Rostock, 1858-71; at Heidelberg, 1871-88. Died, 1888.

**Bartoli** (*bar'toli*), **Antoine**, French sculptor, born at Paris, in 1795. He was at first an engraver and metal-worker. His famous bronze is a lion struggling with a man, which is on the cross of the legion of honor. He died at Paris in 1875.

**Bartow, John**, American educator, former president of the University of Wisconsin, was born at Genoa, N. Y., 1827; graduated at the University of the City College, and six years later from Andover theological seminary; was for twenty years professor of rhetoric at Williams College, and was president of Wisconsin University. He retired from Wisconsin, 1887, and accepted the chair of political science at the University of Chicago, resigned, 1901. Author: *Political Economy*; *Aesthetic*; *Philosophy of Rhetoric*; *Principles of Psychology*; *Philosophy of Religion*; *Comparative Psychology*.

First appearance on stage at Stockton theater, San Francisco, 1841; played leading parts in various comedies, 1846-96; appeared in Shakespearean roles Augustus Daly's company, 1850; later starred in *The Great Ruby*, *Madame Butterfly*, and in *The Darling of the Gods*.

**Beck, John Lewis**, governor of Maine; born at North Eaton, Mass., 1859; graduated from

Boston University, 1882, law department of same in 1885. Member Boston common council, 1890; member of the House of Representatives, 1900-1-2; governor of Massachusetts, 1903-4; United States trust company. President of the Maine State Bar Association.

**Bates, Katharine Lee**, author, educator; born Falmouth, Mass., 1859; graduated Wellesley College in 1881; studied in Europe; history literature; 1888-91 associate professor, and in 1891 professor in charge, Wellesley College.

**Baur, Louis**, French philosopher and historical writer, and biblical expositor of the Hegelian school, was born at Eisenberg, Germany, 1817. In 1826 he turned to the study of history, embracing a number of critiques on the gospels and Pauline epistles; one on Strauss's *Life of Jesus*. On theological subjects Baur has been called the "Voltaire of Germany."

**Baur, Louis Agricola**, scientist, magnetist; born in Cincinnati, Ohio, 1865; graduated from University of Cincinnati; astronomer and magnetic computer, United States coast and geodetic survey, 1887-92; inspector magnetic work and chief terrestrial magnetism division, United States coast and geodetic survey, 1899-1906; director department terrestrial magnetism, Carnegie Institution since 1906; editor *Terrestrial Magnetism and Atmospheric Electricity*.

**Baur, Ernst** (*bea'ernst*), **Alexander Gottlieb**, the founder of the science of aesthetics, or the philosophy of the beautiful, was born at Berlin, 1792. He studied in Halle and Berlin, and was appointed professor of philosophy at Frankfurt-on-the-Oder, where he died, 1787.

**Baur, Ernst** (*bea'ernst*), **Karl Heinrich**, German physiologist, was born in Baden, 1708, and died at Berlin, 1886. From 1824 to 1860 he was professor of clinical medicine at Freiburg.

**Baur, Ferdinand Christian**, von, German theologian, born 1792, at Schmiden, near Stuttgart, was the founder of the Tubingen school of theology. In 1826 he turned to the writings of protestant theology at Tubingen, which he held until his death in 1860.

**Baur, Heinrich**, barrister-at-law, Middle Temple; author; born at Lexington, England, 1854; was educated privately in London and Germany. In 1882 he was elected to a professorship in conjunction with the late William Morris, and for some time co-edited with him the weekly London Standard. His chief works are: *Kant's Prolegomena*; *The Problem of Reality*; *Socialism, its Growth and Outcome*; *The Peasants' Revolt*; *On the History of Socialism*, *New and Old*; *The Roots of Reality*.

**Bayard** (*ba'ard*), **Pierre Du Terrail Chevalier De**, French statesman and writer, born at Paris, 1801. He served under Charles VIII., in an expedition against Naples, and in the wars against the English. He was distinguished by his courage, his bravery and nobleness of character. He was killed in a battle at the river Senna, Italy, in 1524. He has been called "the knight without fear and without reproach."

**Bayard, Thomas Francis**, American statesman, was born at Wilmington, Del., 1828. He was privately educated and began the practice of law in his native city in 1851; entered Cleveland's cabinet as secretary of state in the latter year. In 1893 was appointed ambassador to England, the first to hold that rank as a representative of the United States. Died 1908.

**Bayle** (*ba'le*), **Pierre**, French skeptic and critic, was born at Carlat, 1647. In 1675 was elected to the chair of philosophy at Sedan; in 1681 at Rotterdam. In 1684 he started *Nouvelles de la République des Lettres*. The revocation of the edict of Nantes led Bayle to write a able defense of toleration. He died in 1706.

**Basaine** (*ba'zen*), **Fraudeo Achille**, a marshal of France, was born at Versailles in 1811. He died himself in Algeria, the Crimea, and Mexico. Died at Madrid 1888.

**Basile, Louis**, saint, French socialist, born at Paris, 1791; in 1820 founded an association of French Carbonari, and in 1823 he was banished to the school of Saint-Simon. He died in 1832.

**Beach, Rex Killgusd**, author, playwright; born at Atwood, Mich., 1877; educated at Rollins College, Winter Park, Fla., 1891-96, Chicago College of Law, 1896-97. Author: *Pardners*; *The Spider*; *The Silver Sword*; etc.

**Beaconsfield**, **Earl of**, **See Disraeli**, **Benjamin**.

**Beard** (*ba'd*), **Joseph Henry Jr.**, lawyer, educator; born in Dorchester, Mass., 1801; graduated from Harvard Law School, 1822; studied in France; law school, 1828-92; teacher of law, Harvard law school since 1890, assistant professor of law, 1892-93. Author: *Principles of Law*; *On Criminal Law*; *On Damages*; *Cases on Carriage*; *Uninsured*; *Insured Risk Regulation*.

**Beatrice** (*bea'trice*), *bea'trice*, a Florentine noble, remarkably graceful and accomplished. Dated first seen by Dante in 1284, and thereafter in the middle and middle afterwards; but in his vivid imagination she grew to be the personification of divine truth, and so appeared in the *Divine Comedy*. In 1287 she married a citizen of Florence. Born in 1266; died 1290.

**Beattie** (*ba'tie*), **James**, Scottish poet and writer on philosophy, born at Laurencekirk, Scotland, 1735; died 1803. Principal of Glasgow philosophy. In Marischal College, Aberdeen, 1760-97. His name now rests almost wholly on *The Minstrel*, a descriptive poem written at the request of the Marquis of Bute, 1791.

**Beatty, John W.**, director of fine arts, Carnegie Institute, Pittsburgh, Pa., born at Pittsburgh, 1851; student of Munich Academy of Fine Arts; A. M., Western University, 1874; composer of music, and member of many art societies.

**Beaufort** (*bea'fort*), **Henry**, cardinal and bishop of Winchester, born 1411, died 1509. He was the king Henry IV. He was educated in England and Germany, and in 1405 became bishop of Winchester. He was a supporter of the young king, Henry VI., to France, to be crowned in Paris as king of France and England. Died 1447.

**Beaufort, Margaret**, countess of Richmond and Derby, was born 1441, died 1509. She was the daughter of the duke of Somerset, wife of the earl of Richmond (half-brother of Henry VI.), and by his mother of Henry VII. of England.

**Beauharnais** (*bea'har-nai*), **Eugene de**, viceroys of Italy during the reign of Napoleon I., and afterward duke of Leuchtenberg, and prince of Baden, born 1781, the son of the vicomte Beauharnais. After his mother's marriage with Bonaparte, he was married to the daughter of the king of Italy and in the expedition to Egypt; and in 1809, after the erection of the imperial throne, he was made viceroy of Italy. He was killed at the battle of the victory of Lützen was decided by his conduct in that battle. Died 1824.

**Beaucharnais, Henriette Eugene de**, daughter of Josephine, born in 1783; was married against her will to Louis, youngest brother of Napoleon Bonaparte, from whom she separated in 1810. Her son by him was the late Napoleon III. Died 1837.

**Beaucharnais** (*bea'har-nai*), **Pierre Augustin** Carot, French statesman, born at Paris, 1732; married a widow, Madame Franquet, 1776, and by her had a property which he took the aristocratic name of Beaucharnais. Meanwhile devoting himself to literature, he produced several plays, *Le Comte de Saxe*, *Ami, ou le Négociant de Lyon*; *Le Barbier de Séville*; and *Le Mariage de Figaro*. He died in 1799.

**Beaumont** (*bea'mont*), **John**, English dramatist, best known by his literary partnership with John Fletcher, was born at Grace Dieu, Gloucestershire, 1592. Died 1633.

**Beauregard** (*bea'ur-gard*), **Pierre Gustave Toutant**, general of the army of the Confederate States from April 1862 to April 1865, born at New Orleans, La., 1818. At the secession of Louisiana he resigned his commission in the regular army; in 1862 he was elected to the Louisiana legislature, and was named to the command at Charleston, S. C., where, on April 12-13th, he commenced the war by the bombardment of Fort Sumter. He was killed in the battle of Bull Run; after the war he became a railroad president, and in 1875 adjutant general of Louisiana. Died 1893.

**Bebel** (*be'bel*), **Ferdinand August**, German social democrat, was born at Cologne, 1840, and in 1860 removed to Leipzig, where in 1864 he established himself as a master turner. He is an effective speaker and writer.

**Beccaria** (*be'car-ia*), **Cesare, Marchese, di**, Italian economist and jurist, was born at Milan, 1738. In 1764 he published anonymously his work on *Crimes and Punishments*, in which he argued against capital punishment and torture. He was among the first to advocate the beneficial influence of education in lessening crime. In 1768 he was appointed professor of political philosophy at Milan; in 1791 he was made a senator of the empire. He died in 1820.

**Becher** (*be'cher*), **Joseph Joachim**, German chemist, was born at Spire in 1835, and lived successively at Mainz, Vienna, Munich, Würzburg, Haarlem, London, where he died, 1906. His *Physico-Chemistry* was the first attempt made to bring physics and chemistry into close relation.

**Beck, James M.**, lawyer, born at Philadelphia, Pa., 1801; graduate of Moravian college, Bethlehem, 1820; admitted to the bar in 1824. United States attorney for eastern district of Pennsylvania, 1836-1900; assistant attorney-general of United States, 1840-41; United States attorney by United States court, 1902, the *Philadelphia Record* for \$1,000,000—highest price ever brought by an American newspaper for the right to publish a law firm of Shearman & Sterling, New York, 1903, and removed to that city; also member law firm of Beck, McCallum & Co., New York.

**Becker, Wilhelm Adolf**, German author and physiologist, was born at Dresden in 1796, died 1845. He was admitted to the University of Leipzig in 1817 was appointed professor of archaeology at the University of Leipzig. His lively fancy, aided by a knowledge of the Greek and Latin languages, enabled him to make a novel use of antiquity. In his *Charities* he ventured to reproduce the appearance of the Greek goddess *Gaia* to give sketches of the Augustan age at Rome.

metics at Groningen. His forte was pure mathematics in which he had no superior in Europe in his day. He died in 1736.

**Berosus** (*ber'-e-us*), an eminent Babylonian historian, was born in the fourth century B. C.; was a priest in the temple of Bel and wrote, in Greek, upon history and astronomy.

**Bert** (*ber'*), **Paul**, French physiologist and republican anti-religiousist; born at Lyons, 1824; died in 1883, and died at Tongking, 1886. He was minister of public instruction in Gambetta's cabinet, 1881-1882.

**Berthelot** (*ber'-el'*), **Pierre Eugene Marcellin**, French chemist, was born at Paris, 1827, and in 1860 became professor of organic chemistry at the Ecole des Pharmacies; in 1865 in the Collège de France; in 1880 perpetual secretary of the Académie des Sciences. He had very important work in synthetic chemistry, and wrote a history of alchemy. He died in 1907.

**Berthier** (*ber'-tye'*), **Louis Alexandre**, prince of Neuchâtel and Wagram, and marshal of the French empire, was born at Versailles, 1753. He entered the army in 1770 and fought with Lafayette in the American revolutionary war. Berthier was Napoleon's proxy in the marriage of Maria Louise, at Vienna, 1810. In the campaigns of 1812, 1813, and 1814 he was constantly by the emperor's side, and acted both as chief of staff and as quartermaster-general.

**Bertilson** (*ber'-tyon*), **Alphonse**, French anthropologist; head of identification department in the police of Paris; born at Lyons, 1854; died in 1903; founded his system of monourism, known as the *Bertilson System*, in 1880. Author: *L'Anthropologie Moderne*, *Les Races Humaines*, *La Psychopneumologie*, *Le Système de Bertilson*, 1880.

**Berthel**, **James**, American educator, was born in 1870, at Moulins, France, and served with distinction in Hungary, Ireland, and Flanders. In 1900 he was elected to the presidency of the American Association for the Advancement of Science.

**Berzelius** (*ber'-el'-i-us*), **Johan Jakob**, Swedish chemist, was born at Westervik, in East Gothland, Sweden, 1779; died in 1848. He was a baron and senator of the kingdom. He was the author of what is known as the dualistic (or binary) theory of the chemical constitution of compounds, and devised the form of symbolic notation now employed. His reputation as world-wide, and his accurate investigations, gave him great influence on the development of scientific chemistry.

**Besant** (*be'-ant* or *be'-ant*), **Annie**, president British theosophical society; author and lecturer on religious, philosophical, and occult subjects; was born in London in 1847. Founded in 1890 the Central Hindu College at Benares; 1904, the Central Hindu College at Varanasi; and the University of India. Author: *Re-incarnation; The Wisdom of the Vedas*, etc.

**Besant** (*be'-ant*), **Sir Walter**, English novelist, was born at Portsmouth, England, 1836. He studied at King's College, London, and at Christ's College, Cambridge. His first novel, *John Galsworthy*, appeared in 1868. Sir Walter wrote also *All Sorts and Conditions of Men*, *An English Garden Fair*, *Dorothy Fothergill*, *Children of Gibeah*, *Armour of Loyalty*, *The Iron Gate*, *Beyond the Dreams of Avarice*; *The Master Craftsman*, etc. Knighted in 1895, he died in 1901.

**Bessel** (*be'-el*), **Friedrich Wilhelm**, German astronomer, was born at Minden, Prussia, 1784, died at Königsberg, 1846. He attracted the attention of Olbers by his computation of the orbit of the comet of 1807 from observation which had just been discovered; appointed director of the new observatory at Königsberg, where the bulk of his active life was spent; made many additions to the length of the seconds-pendulum and that of standards of length were of the highest importance.

**Besemer** (*be'-em-er*), **Sir Henry**, English engineer and inventor, born at Charlton, England, in 1813; of his many inventions the chief is the process named after him. He converted pig-iron into steel at once by blowing a blast of air through the iron while in fusion until everything extraneous is expelled, and only the definite quantity of carbon is left in combination. He was knighted in 1879, and died in 1898.

**Bessey**, **Charles Edwin**, scientist, professor of botany in the University of Nebraska since 1884; born on a farm in Milton, Ohio, 1843; graduated at Michigan Agricultural College, Ph. D., 1871; L. D., acting chancellor of University of Nebraska 1885-91, and 1899-1900; botanist editor of *American Naturalist*, 1880-97; author of *Higher School Botany*, *The Essentials of Botany*, *Botany of 1897*, *Higher School Botany*, etc.

**Bethmann-Hollweg** (*bet'-man-hol'-weg*), **Dr. Theodor**, von, statesman, philosopher, imperial chancellor of the German empire, and president of the Reichstag, born in Berlin, Prussia, in 1836; of Jewish lineage; educated at the University of Berlin, elected to the Reichstag in 1867, and imperial chancellor in succession to Prince von Bismarck, 1909.

**Benz** (*benz*), **Friedrich Ferdinand**, Count, German statesman, was born at Dresden in 1809. He devoted himself to politics and was employed by his government in different services in Berlin, Paris, and London. He was minister of foreign

affairs of the Austrian empire, and the present constitution was his work. He was Austrian ambassador at London, 1871-72. He died in 1891.

**Beveridge**, **Albert Jeremiah**, lawyer, writer, United States senator from Indiana, 1890-1911, born at New York, 1829; studied law at New York, 1850; read law in office of Senator McDonald, became managing clerk; admitted to bar in 1857; practiced law in New York; elected to the United States senate, 1890, and elected to the United States senate, 1899, and 1905.

**Bichard** (*bi'-chard*), **Charles**, French reformer, was born at Veslay, Burgundy, 1819, and studied Greek and law at Orleans. In 1859-59 was Greek consul at London. In 1860 he was appointed a theological professor and president of the Collège at Geneva; on Calvin's death the care of the Collège fell upon him. He died in 1871. He was sent by Comte on a mission to the court of the papistate. He died in 1865.

**Bichat** (*bi'-chut*), **Marie Francois Xavier**, celebrated French physician and anatomist, was born at Thoiry (Jura), 1771. He devoted himself to anatomy, physiology, and surgery; and established with several of his friends *La Société Médicale d'Émulation*, through the medium of which he gave to the world many highly original and important memoirs, notably those on the tissues of the human body. He was nominated physician of the Hôtel-Dieu in 1797, and died in 1802. His premature death being hastened in great part by his incessant labors, these three great works are the *Trésor des Mémoires*, *La Médecine*, and *Leçons de Médecine*. In 1816 he wrote the *Trésor d'Anatomie Générale*.

**Biddle**, **A. J. Drexel**, author, explorer, and lecturer born at Philadelphia, Pa., 1874. He was educated at the University of Pennsylvania, and at the University of California, Berkeley, 1895, and became its editor; head of publishing house of Drexel Biddle, New York, 1895-1904. Author: *A Dual Role*, *All Around Athletics*, *The Flowers of Life*, *The Modern Islands*, *The World of the Future*, etc.

**Biddle, John**, the founder of English Unitarianism, born in 1616, at Wotton-under-Edge, in Gloucestershire, died in 1682. He was a Unitarian, and suffered for his creed, and even the protector himself, in order to save his life, was compelled to baptize him one of the basty lads. Died in 1662.

**Biddle, Nicholas**, American commander, was born at Pa., 1758. He was a member of the revolutionary war. During the action of his ship, the *Revenge*, with the British ship, the *Columbia*, in 1782, the former was blown up and he was killed.

**Biele** (*bi'-el*), **Wilhelm von**, German astronomer and physicist, was born at Berlin, 1792, died in 1872. He is chiefly noted for his discovery, in 1826, of the comet named for him. **Biele, Albert**, author, journalist; born in Ohio in 1842; served as line officer during civil war; breasted many for distinguished services; went to London in 1867, went to London, 1872, contributing to *Pan* fables, purporting to be translations from Zambri, the Parise, afterward published under the name of an Empty Skull; author of numerous sketches, essays and studies.

**Bierstadt** (*bi'-stad*), **Albert**, landscape painter; born near Düsseldorf, Germany, 1830. Came in infancy to New Bedford, Mass., and married; studied four years in Europe, 1853-57; made repeated visits to the West and to Europe; specialty in pictures of scenes in Rocky Mountains, Sierra, and Switzerland. Died 1902.

**Bigelow**, **John**, author and diplomat, was born at Malden, N. Y., 1817; graduated from Union College, 1835; LL. D., Union and Ruine College, 1840; LL. D., Union College, 1840. He was a member to bar; one of the editors *New York Evening Post*, 1841-45; consul at Paris, France, 1851-64; secretary of the Legation of the United States at Vienna, 1864-67; author of *Hereditary Monarchy*; *Writings and Speeches of Samuel J. May*; *The Life of Benjamin Franklin*, etc. He died in 1891. **Bigelow, John**, born at Boston University law school; born at Eaton Rapids, Mich., 1846; graduated from University of Michigan, 1866, LL. D., Northwestern University, 1896. Author: *The Law of Botany*; *Leading Cases in the Law of Tort*; *The Law of Bills*, *Notes and Cases*; *The Law of Wills*.

**Bigelow, Poutney**, author, journalist; born in New York, 1819; graduated from Yale, 1839; Columbia law school, 1842; admitted to New York bar, 1842; was correspondent for *London Times* during the Crimean War; author of *The German Emperor and his Neighbors*; *Poodles and Politics*; *Down the Danube*; *White Man's Africa*; *The Story of the Nations*, etc.

**Billing, John Shaw**, surgeon, librarian; was born in Switzerland county, Indiana, 1849; graduated from the University of Michigan, 1871; LL. D., D. C. of Oxford, 1880, served in army, 1871-72, surgeon and surgeon, reaching rank of lieutenant-colonel and deputy surgeon; later medical professor at the University of Pennsylvania, 1903-96; since 1906 director New York public library, Astor, Lenox and Tilden foundations; Librarian of the Carnegie Institution, Washington. Author: *Principles of Ventilation and Heating*; *National Medical Dictionary*; and many other works.

**"Blinets, Josh."** See **Bhav, Henry W.** **"Blinets, (bi'-el), Alfred**, French physiologist; born in Lyons, 1827; died in 1897. He was editor of *Année Psychologique*, and director of the psychological laboratory at the Sorbonne, Paris. His work included many studies in physiological psychology.

**Blinns, Charles Fernus**, educator and writer on ceramics; born at Worcester, Mass., 1852; graduated King's Scholar, 1870; studied analytical chemistry, Birmingham, England, and decorative painting, 1871-72; worked in the pottery works, Worcester, England, 1872; superintended successfully chemical laboratory, department of painting, London; spent of sales, department of clay working and pottery; principal technical editor of science and art, Trenton, N. J., 1897-1900; director New York state college of pottery and ceramics since 1900. President American Ceramic society, 1901. Author: *Ceramic Technology*, *The Story of the Pottery*, *The Pottery Craft*, etc.

**Blot** (*blot'* or *blot'*), **Jean Baptiste**, French astronomer, optician, and natural philosopher, was born at Paris, 1774. He is especially celebrated for his researches in the circular polarization of light, and in 1802.

**Birrell** (*ber'-el*), **Mr. Hon. Augustine**, chief secretary to the Lord Lieutenant of Ireland since 1907; born at Liverpool, 1820; graduated at Cambridge, 1872; LL. D., St. Andrews; barrister, 1875; teacher law, 1876; New York state college of pottery and ceramics since 1900. President American Ceramic society, 1901. Author: *Ceramic Technology*, *The Story of the Pottery*, *The Pottery Craft*, etc.

**Bismarck**, **Otto**, German statesman, was born at Lüneburg, 1815; early devoted himself to composition of dramatic music, and in 1840 produced *Die Germanen*, which was a great success. In 1840 his last dramatic piece, *The Germanen*, was produced at the Garden Theatre in honor of the queen of Prussia. He was knighted; and in 1848 became professor of music at the University of Berlin.

**Bismarck-Schonhausen** (*bi'-mark-shen'-hausen*), **Otto Eduard Leopold**, Prince, born of a noble family, at Schonhausen, April 1, 1815; studied at Göttingen, Berlin, and Grewald; entered the army and became lieutenant in the Landwehr. After a brief interval devoted to his estates and to the office of inspector of dikes, he became in 1846 a member of the provincial diet of Saxony, and in 1847 of the Prussian diet.

In 1851 he was appointed representative of Prussia in the diet of the German federation at Frankfurt, where with brief interruptions he remained till 1859. He was distinguished by ability in his efforts to checkmate Austria and place Prussia at the head of the German states. From 1859-62 he was ambassador at St. Petersburg. In 1862 he was appointed ambassador to Paris for five months' duration, became first minister of the Prussian crown.

The lower house persistently refusing to pass the bill for the reorganization of the army, Bismarck at once dissolved it (October, 1862), closing it for four successive sessions until the work of reorganization was complete. When popular feeling had reached its most strained point the Schleswig-Holstein question acted as a diversion, and Bismarck—by the skillful manner in which he added the duchies to Prussian territory, checkmated Austria, and excluded her from the German confederation, which Prussia had been unable to do, became the most popular man in Germany.

As chancellor and president of the federal council he secured the neutralization of Luxembourg in 1867, and the annexation of Alsace and Lorraine to France, and though in 1868 he withdrew for a few months into private life, he resumed office before the close of the year. A struggle between Germany and France appearing to be sooner or later inevitable, Bismarck, having made full preparations, brought matters to a head on the question of the Hohenzollern candidature for the Spanish throne. Having carried out his purpose, he resigned his office as chancellor and prince of the new German empire. Subsequently, in 1872, he alienated the Roman Catholic party by promoting adverse legal action against monastic orders. He then resigned his position for a year, though still continuing to advise the emperor. Towards the close of 1873 he returned to power retaining his position until, in March, 1878, he was again elected and tendered his resignation. In 1878 he presided at the Berlin Congress, in 1880 at the Berlin Conference, and in 1884 at the Congo Conference. He was elected to the Reichstag at Berlin in 1866, and at Kissingen in 1874. He died July 31, 1898.

**Bonnard, de (dè bôn'ân')**, François, French historian and hero of Byron's *Prisoner of Chillon*; was born near Geneva, 1490; educated at Turin, where he became private secretary to the duke in 1510, at the age of fourteen years. Having fallen into the hands of robbers who delivered him into the power of the duke of Savoy, he was imprisoned in 1530 in the castle of Chillon. The Geneva aided by the Bernese effected his liberation in 1536.

**Boone, Daniel**, American hunter and pioneer, was born in Bucks county, Penn., 1733. The boy had no formal education, but was a good hunter and an Indian life. When thirty-four years old he went with five others into the wilds of Kentucky. He was first sent on the Kentucky river, and named Booneborough. The Indians attacked the fort several times, but were driven off. He continued to live there until 1792, then went to Missouri, where he died in 1820.

**Booth, Ballington**, general-in-chief and president Volunteers of America, was born at Bridgeport, England, 1839; son of Rev. William and Catherine Ballington. Commander Salvation Army, Australia, 1885-87; United States, 1887-90; founded 1896, the Volunteers of America, Ordained presbyter, Chicago, 1896. Writer, public speaker, philanthropist.

**Booth, Edwin Thomas**, American actor, son of John Brutus Booth, was born in Baltimore, Md., 1833, appearing first on the stage in 1848 in *Richard III*. He steadily rose in his profession, visited England and the continent of Europe in 1851, 1853, and 1855, and met with great success in his recitations. He opened Booth's theater in New York, 1860, and did more than any other individual to give the tone dramatic art up to a moral and literary standard. Died, 1893.

**Booth, Junius Brutus**, actor, was born in England in 1803, first appearing on the stage in 1818 in *the Honeymoon*, and within four years became famous in London as *Richard III*. His American tour was as a triumph.

**Booth, Maud Ballington** (née Charlesworth), wife of Ballington Booth, general-in-chief, Volunteers of America. Author: *Peter Pan*; *The Curlew*; *The Curse of Septic Shoal Treatment*; *Twilight Tales*.

**Booth, Tracker, Frederic St. George de Lantour**, commander of Salvation Army in the United States; was born at Monaghan, Bengal, India, 1848; inaugurated Salvation Army in America in 1882; had charge there until 1891; secretary for international work, Salvation Army, London, 1891-1900; since March, 1900, in charge of the States; married in 1888 Emma Moss, daughter of General William Booth, of Salvation Army. Name of Booth-Booth, *Life of General William Booth*; *In Darkest India and the Way Out*.

**Booth, William**, general and commander-in-chief of Salvation Army; was born in Nottingham, England, 1829; became a minister of the Methodist Episcopal church in 1852; in 1854 he married the Christian mission in the densely populated east end of London. Out of this grew the Salvation Army, whose manifestations spread throughout the world. He is the author of *Orders and Regulations for Officers and Soldiers*; *Letters to my Soldiers*. Publications: newspapers entitled *War Cry*, *Youth Soldier*, *Social Gazette*, etc.

**Bopp (bop)**, Franz, celebrated German philologist and Sanskrit scholar, was born at Mainz, 1791; was professor of oriental literature and general philology at Berlin. He was in 1842 made a knight of the newly created French Order de Mérite, and in 1857 foreign associate of the French institute. Died, 1867.

**Bora, William Edgar**, lawyer, United States senator, was born in 1855, in Wayne county, Ill.; educated at the Southern Illinois academy, and the Kansas State University; married in 1881; was admitted to practice law in 1880 at Lyons, Kan., and devoted his entire time since then exclusively to practicing law. He was elected to the United States senate in 1907.

**Borden, Sir Frederick William**, Canadian minister of militia and defense, was born at Amherst, N. S., 1847; King's College, Windsor, Nova Scotia, B. A.; Harvard, M. D.; appointed assistant surgeon 1864; settled in King's county, N. S., 1866; new surgeon lieutenant-colonel and hon. colonel of Canadian army medical corps; first elected to office of commander 1874; President of the Association made riding continuously.

**Brown, Calvin Smith**, university professor, was born at Tennessee, studied at the University of Paris and Leipzig, 1891-93; Ph. D., University of Colorado, 1894; Ph. D., University of Chicago, 1895. Professor of English, comparative literature, modern languages, Vanderbilt University, 1895-1900; University of Chicago, 1900-1905. 1880-1905; professor Romance language, 1905-9, acting professor German language and literature 1905-1909. University of Chicago, 1909-1910. Editor: *Tennyson's Enock Andra* and the two *Lockley Hall poems; The Later Shakespeare*, etc.

**Brown, Charles**, educator, was born at Philadelphia, Pa., 1871, and died there in 1910. His two best known stories are *Hiseloid*, and *Andra*.

**Brown, Elmer Ellsworth**, educator, United States commissioner of education; was born at Kingston, New York, 1859; graduated from the University of Illinois State Normal University, 1881; University of Michigan, 1889; Ph. D., University of Michigan, 1890; Ph. D., University of Chicago, 1893; professor same, 1893-1905; United States commissioner of education since 1906.

**Brown, Francis**, educator, was born in 1840; Davenport professor of Hebrew and the cognate languages. Union theological seminary, 1860-61; since 1900; president of the faculty. Union theological seminary, since 1908. Author of *Agriography; Its Use and Abuse*; also many articles on references.

**Brown, Henry Billings**, jurist, associate justice of the supreme court, was born at New York, 1806; born at South Lee, Mass., 1836; graduated Yale, 1856; LL. D., Yale, 1891; United States senator, 1861-69; 1873-75; 1879-81; 1885-89; resigned from United States supreme court bench, 1900. Compiler of *Brown's Admiralty Reports*.

**Brown, Henry Kirke**, American sculptor and painter, great variety; author of the colossal statue of General Washington in Union square, New York; *The Angel of the Resurrection*, in Greenwich cemetery, Brooklyn, and others. He was born in 1814, died 1886.

**Brown, John**, leader of the Harper's Ferry insurgents, designed to lead the rebellion in the southern states to rebellion; was born at Torrington, Conn., in 1800. In 1845 he went to Iowa, where he was elected to the legislature, that state was settled by a general vote, he traveled through the southern and eastern states, declaiming in secret, and eventually he was to organize an armed attack upon it. In 1859, at the head of seventeen white men and five blacks, he commenced a great variety of hostilities by a revolt upon Harper's Ferry. Instead of retreating to the mountains, he was taken hostage, as he was, and was held in Brown's inn in town until exchanged, by which time 1,000 militiamen had arrived. He was captured, tried for treason, and hanged in 1859.

**Brown, Norris**, lawyer, United States senator, was born in 1863, at Naquakota, Iowa; graduated from the University of Iowa, 1885; LL. B., 1887; was later received the degree of M. A.; admitted to practice law in Iowa, 1885; moved to Keosauqua,

Iowa, 1888; attorney-general, 1904-06, was elected to the United States senate for the term 1907-13.

**Browne, Charles Farrar**, American humorist and merriment, known by the pseudonym of "Artemus Ward," was born at New York, 1824. He traveled over America lecturing, carrying with him a whimsical panorama as affording topics for his humorous and frolicsome lectures. He died in England in 1867.

**Brown, Sir Thomas**, English physician and author was born at London in 1605. During the civil war and the protectorate he remained in learned seclusion, indifferent to worldly honors. He was knighted in 1671, and died on his bed in 1682. His chief works are *Reliquie Medice*; and *Prælectiones*.

**Browning, Elizabeth Barrett**, English poetess, was born at London in 1806, died at Florence, Italy, 1861. In 1846 she married Robert Browning. In 1850 Mrs. Browning published her collected works, together with several new poems. *Aurora Leigh*, her longest production, was published in 1850.

*Poems before the Congress* appeared in 1860. **Browning, Oscar**, English historian and critic, was born at London, 1837; educated at Eton, King's College, Cambridge; master at Eton, 1860-75; college and university work at Cambridge since 1876.

**Browning, Robert**, British poet, born at Camberwell, May 7, 1812; died Dec. 12, 1869. After completing his education at the University College, London, he went to Italy, where he made diligent study of its mediæval history and the life of the people. In 1846 he married Elizabeth Barrett Browning, who came to Italy, making occasional visits to England.

His first poem, *Pauline*, was published in 1833; followed by *Paracelsus* in 1835; *Strafford, a Tragedy* (1837), produced at Covent Garden, Macrae and Helen, a daughter, to which office he resigned in 1824. He devoted the remainder of his life almost exclusively to science and literature at his chateau at Cannes, France, Died, 1868.

**Brown, Calvin Smith**, university professor, was born at Tennessee, studied at the University of Paris and Leipzig, 1891-93; Ph. D., University of Colorado, 1894; Ph. D., University of Chicago, 1895. Professor of English, comparative literature, modern languages, Vanderbilt University, 1895-1900; University of Chicago, 1900-1905. 1880-1905; professor Romance language, 1905-9, acting professor German language and literature 1905-1909. University of Chicago, 1909-1910. Editor: *Tennyson's Enock Andra* and the two *Lockley Hall poems; The Later Shakespeare*, etc.

**Brown, Charles**, educator, was born at Philadelphia, Pa., 1871, and died there in 1910. His two best known stories are *Hiseloid*, and *Andra*.

**Brown, Elmer Ellsworth**, educator, United States commissioner of education; was born at Kingston, New York, 1859; graduated from the University of Illinois State Normal University, 1881; University of Michigan, 1889; Ph. D., University of Michigan, 1890; Ph. D., University of Chicago, 1893; professor same, 1893-1905; United States commissioner of education since 1906.

**Brown, Francis**, educator, was born in 1840; Davenport professor of Hebrew and the cognate languages. Union theological seminary, 1860-61; since 1900; president of the faculty. Union theological seminary, since 1908. Author of *Agriography; Its Use and Abuse*; also many articles on references.

**Brown, Henry Billings**, jurist, associate justice of the supreme court, was born at New York, 1806; born at South Lee, Mass., 1836; graduated Yale, 1856; LL. D., Yale, 1891; United States senator, 1861-69; 1873-75; 1879-81; 1885-89; resigned from United States supreme court bench, 1900. Compiler of *Brown's Admiralty Reports*.

**Brown, Henry Kirke**, American sculptor and painter, great variety; author of the colossal statue of General Washington in Union square, New York; *The Angel of the Resurrection*, in Greenwich cemetery, Brooklyn, and others. He was born in 1814, died 1886.

**Brown, John**, leader of the Harper's Ferry insurgents, designed to lead the rebellion in the southern states to rebellion; was born at Torrington, Conn., in 1800. In 1845 he went to Iowa, where he was elected to the legislature, that state was settled by a general vote, he traveled through the southern and eastern states, declaiming in secret, and eventually he was to organize an armed attack upon it. In 1859, at the head of seventeen white men and five blacks, he commenced a great variety of hostilities by a revolt upon Harper's Ferry. Instead of retreating to the mountains, he was taken hostage, as he was, and was held in Brown's inn in town until exchanged, by which time 1,000 militiamen had arrived. He was captured, tried for treason, and hanged in 1859.

**Brown, Norris**, lawyer, United States senator, was born in 1863, at Naquakota, Iowa; graduated from the University of Iowa, 1885; LL. B., 1887; was later received the degree of M. A.; admitted to practice law in Iowa, 1885; moved to Keosauqua,

lensed a minister of the Baptist church, 1857; became a pastor at Los Angeles in 1859, when he was incapacitated by an accident. He is the author of *Hawkeyesmen; Chances from a Jesuit's Study* (London, 1861).

**Burdick, Francis Marion**, lawyer, educator, Dwight professor law, Columbia University, since 1901; member of the Faculty for Social Science, Hamilton College, 1869; LL. D.; professor law and history, Hamilton College, 1882-87; practitioner law, Cornell University, 1887-91; 1887-91. Mayor of Utica, 1882-83. Author: *The Essentials of Business Law; Cases on Torts; The Sales; Insurance*.

**Burgess, Frank Gesselt**, writer, illustrator; born Boston, 1866; graduated at Massachusetts Institute of Technology, B. S., 1887; graduated from Southern Pacific railway, 1887-90; instructor topographical drawing, University of California, 1891-92; designer, 1894-95; writer various magazines in New York, 1897-98; removed to London, 1898, to San Francisco, 1900, to Boston, 1904; associate editor *Esquire*, 1906. Author: *Vivette; The Lovely City Girls; Goops and How to Be Them; A Gape of Teeth; Burgess Novels Book*.

**Burgess, John William**, educator; born in Connersville, Tenn., 1841; attended Cumberland University, Lebanon, Tenn.; graduate of Andrews, 1867; admitted to bar, Springfield, Mass., 1868. Professor political science and constitutional law since 1870, then dean faculty of political science since 1900, Columbia University; Roosevelt professor of American history and institutions, University of Berlin, 1900-07. Author: *The Science and Comparative Constitutional Law; The Period; The Civil War; Reconstruction; Reconstruction and the Constitution*.

**Burkney (bur-ney)**, John, British general, was born 1722; entered the army; and in 1762 displayed much talent and courage in command of a party of the British in the Florida. In the American war, he and the army which was to penetrate into Canada into the revolting provinces. At first, he was successful; but was ultimately compelled to surrender at Saratoga, 1777. He died in 1792.

**Burke, Edmund**, British statesman and orator, was born at Dublin, about 1730; graduated at Trinity College, Dublin, 1748; and he attracted attention by his essays on the *Sublime and Beautiful*, and devoted himself to literature. In 1765 entering parliament, his eloquence in American affairs created a great sensation in the house of commons. Returned for Malton, he became in 1780 his great opponent in the reform; and in 1782 he became paymaster under Lord Rockingham's government. He again took the side of the commons in 1783, when he made his famous speech on the India bill. In the impeachment of Warren Hastings, Burke was a leading part; his speech occupied six days over four days. In 1794 he retired from parliamentary life, though he continued to produce numerous pamphlets and treatises. His chief works are *A Vindication of Natural Society; Reflections on the Revolution in France*; and some others. Died at Beaconsfield, England, 1797.

**Burleigh (bur'li)**, William Cecil, Lord Cecil, English statesman.

**Burleigh, Albert Sidney**, lawyer, member of congress, was born 1863, at San Marcos, Texas; was educated at agricultural and mechanical College of Texas; admitted to the bar in 1884; appointed by the governor of Texas attorney of the twenty-sixth judicial district in 1891; elected to said office 1892-96; elected to the fifty-sixth, fifty-seventh, fifty-eighth, fifty-ninth, sixtieth, and sixty-first congresses.

**Burlingame, Anson**, American diplomatist; born in Chenango county, N. Y., 1826; member of the U. S. House of Representatives, 1861. He was sent as minister to China, and in 1868 he visited this country at the head of a Chinese mission, and concluded a treaty of friendship between the United States and China, which was promptly ratified by the Chinese government; died, 1870.

**Burnard, Edward**, English statesman; born in Woburn, England, 1823. He was educated at Exeter College, Oxford, where William Gladstone was his friend. About 1870 he began to be known as an oil-painter, and his works henceforth are inspired by the earlier art of J. M. W. Turner. He was shown more of grace and less of emphasis than his former paintings. Among his pictures are *The Artist's Creation; The Artist's Studio; The Mirror of Venus*. He furnished striking designs for stained glass at Christ Church, Oxford. He died, D. C., 1887. He was knighted (1883), and a baronet 1894. He died, 1898.

**Burnett (bur-net)**, Frances Hodgson, writer, playwright; born (Frances Follen) in Boston, 1819; died, 1896; began writing for magazines, 1867; married Dr. L. M. Burnett, 1873; resided in Washington, D. C., 1873-75; author: *That Lady's Lover; Dolly, a Love Story; Kathleen; Bury Tim and Other Stories; A Little Princess; Little Lord Fauntleroy; The Little Girl; The Man's Daughter; Emeralds; The First Gentleman of Europe; Nave; A Lady of Quality; The Shutter*.

**Burnham, Daniel Hudson**, architect; born Henderson, N. Y., 1840; removed to Brooklyn, 1860;

educated there and in Massachusetts; A. M., B. S., D. Architects Field's retail store, and many other buildings in Chicago and elsewhere, including the Mills building, San Francisco; Elliott Stock Exchange, New York; the Hotel Waldorf, Third, and Fourth National Banks, Cleveland; chief architect and director of works, World's Columbian Exposition, 1893. He has also been missions for beautifying Washington and Cleveland, Ohio.

**Burns, Robt. John**, labor leader, president of the British local government board since 1903; born London, 1858; since 1892 has represented Britain in the house of commons; member of the British cabinet, 1905. He has published many pamphlets, articles, and speeches.

**Burns, Robert**, Scottish poet, was born at Alloway, near Ayr, Scotland, 1759; died at Dumfries, 1796. He was the son of a small farmer, and was brought up amidst indigence and adversity. He revolted, however, the advantages of a common school education, though his chief advances in general knowledge he owed to the books he read, among which were *The Spectator*, the works of Pope, and the poems of Allan Ramsay. When sixteen years of age he fell in love, and his feelings, at that time, at once burst into song. His first volume of poetry was issued in 1786, from Kilmarnock, and at once became popular. The second volume, issued in 1787, was published in Edinburgh, induced him to take the farm of Millbank, near Dumfries, where he married his wife, Buffie, and he returned to Scotland in 1791, and, having been appointed to a position as excise-man, which had been obtained for him by a friend, he retired to his farm. He was entirely upon his income from that office, which yielded only about \$350 a year. In 1792 he wrote some of his best songs, as *My Bonnie*, and the melodies of Scotland; intemperance gradually gained upon him, while waste threatened him. He died, at the thirty-seventh year, he sank into an untimely grave.

**Burnside, Ambrose Everett**, American general, West Point in 1847. He left the army as lieutenant in 1852, but returned as colonel of volunteers in 1862, commanding a brigade at Bull Run, and in February, 1862, at Roanoke Island. In 1863 he successfully held the city of Suffolk, Va., and was killed through the battles of the Wilderness and Cold Harbor. Rejoining in April, 1865, he was elected governor of Maryland (1866), and United States senator in 1875 and 1881. He died at Bristol, R. I., 1881.

**Burr, Aaron**, American statesman, was born 1756, died 1823. He was a lieutenant-colonel in the revolutionary war; attorney-general of New York 1789; United States senator 1791-97; mortally wounded in 1804 by a duel with Aaron Hamilton, vice-president of the United States 1801-05; tried on a charge of treason, 1807, but acquitted.

**Burr, Abraham**, German-born American, born Graelen, N. Y., 1857; graduated from Cornell, 1881; student Leipzig, Paris and Zurich; LL. D.; Litt. D. Libraries the President's law library since 1878; member Cornell faculty since 1888. Writer on history of superstition and persecution.

**Burr, William Hubert**, engineer, professor civil engineering, Columbia University since 1893; born Watertown, Conn., 1851; graduated Kensington Polytechnic Institute, C. E., 1872; professor engineering, Harvard, 1892-93. Consulting engineer to department of public works, 1893-85, of parks, 1897-07, of docks, 1898-07, and now department of bridges, and aqueduct commission, New York. Appointed, 1900, by President Roosevelt, member United States commission, to consider British naval commission; consulting engineer to board of water works, New York. Awarded first place in national competition, 1900, for the memorial bridge across Fontaine de la Vierge.

**Burrill, Kilbu**, "the learned blacksmith," was born in Milford, Conn., 1810. He was sent to his father's place and at Worcester, Mass., but devoted all his leisure to mathematics and the study of the Greek, Latin, Arabic, and most of the modern European languages. He took a prominent part in advocating an ocean passage from New York to England, and in England, in 1865-70 as United States consul at Birmingham. He died at New Britain, Conn., 1880.

**Burrings (bur'z)**, John, essayist, naturalist, born Roxbury, N. Y., 1827; received an academic education at the University of the City of New York, 1847-53; national bank examiner, 1854-74; since 1874 has lived on a farm, devoting his leisure to the study of natural history. *Notes on Walt Whitman as Poet and Person; Locusts and Wild Honey; Fresh Fishes; Riveries; The Birds of the River; The River Port Bazaar; For and Near; Ways of Nature*.

**Burton, Ernest de Witt**, theologian, critic; professor of systematic theology, University of Chicago, since 1902; born Granville, Ohio, 1856; University of Leipzig, 1887; associate editor of *Practical Theology*, 1892-93; chief since 1900; editor (with others) of the *American Journal of Theology* since 1897. Author:

*Constructive Studies in the Life of Christ (with S. Matthews); A Short Introduction to the Gospels; etc.*

**Burton, Mr. Richard Francis**, English traveler, was born 1821, at Harham House, Herefordshire, and studied at Trinity College, Hartford, Conn. He followed Bonalland and service in the Crimea, he in 1855 set out with Speke on the journey which led to the discovery of Lake Tanganyika, 1858. He afterward traveled in America. He was subsequently consul at Santos in Brazil, at Damascus, and at Constantinople, and he was knighted in 1880. He died at Trieste, 1890.

**Burton, Thomas Erskine**, U. S. Senator, lawyer; born in Jefferson, Ohio, 1851; graduate of Oberlin College, 1872; admitted to bar, 1875; since then practicing law in Cleveland, Ohio. He was elected, 91, and 1895-1900; United States senator, 1900-14. Author: *Financial Crisis and Periods of Industrial and Commercial Depression, and Life of John Sherman*.

**Bury (bur')**, John E., British historian; regius professor of modern history, Cambridge University since 1902; was born 1861; graduate Trinity College, Dublin; M. A., Litt. D.; LL. D.; professor of modern history in Dublin University, 1885-1902; regius professor of Greek, 1896. Author: *History of the Later Roman Empire from Arcadius to Irene; Student's History of the Roman Empire from Augustus to Constantine*.

**Bushnell, Morace**, theologian, was born at Litchfield, Conn., 1802; graduated, Yale, 1827, and was for some time literary editor New York *Journal of Commerce*, 1831-32. He was a Congregationalist ministry 1833; preached at Hartford, 1833-58. He was a member of the American Board of Christian Theology, Vassar Seminary, died at Hartford, 1876.

**Butler, Benjamin Franklin**, American politician, and general, was born in New England. He studied law and settled in Massachusetts, where he became recognized as the leading democrat of New England. He was prominent in the service at the outbreak of the civil war, and had command of the departments of the gulf and of the south. After the acquisition of no military fame but great notoriety for his arbitrary civil regulations; governor of Massachusetts, 1882, Died, 1893.

**Butler, Joseph**, eminent English divine, was born 1602 at Wantage, in Berkshire; died 1752 in London. He was a graduate of Trinity College, Hartford, where he preached those remarkable sermons which he published in 1726. His great work, the *Analogy of Religion*, was published in 1726. In his three sermons, was published in 1736.

**Butler, Nicholas Murray**, educator; born Ellenville, N. Y., 1862; graduated at Princeton, 1884; Ph. D. 1884; admitted to Berlin and Paris, 1884-85; LL. D.; Litt. D.; dean faculty of philosophy, 1890-91; president of the University of Chicago, 1891-92; president since 1902. Editor of the *Educational Review*, the *Great Educators Series*; the *Teachers' Magazine*.

**Butler, Samuel**, English naturalist, was born at Breamham, England, 1612. The experience of his time furnished him with the material for his famous work, *Worms*, the first part of which appeared in 1680, and achieved the widest popularity. Died, 1680.

**Byron, Lord, George Gordon**, English poet, was born in London, 1788. In his eleventh year he succeeded his grandfather, William lord Byron, and took possession of Newton Abbey, the ancient seat of the family, situated a few miles distant from Nottingham. In 1800 he removed to Trinity College, Cambridge, and two years thereafter his first volume of verse, entitled *Hours of Solitude*, was published at New York. The *Idylls of Greece* were published in 1807. He was severely afflicted by Lord Brougham in the *Edinburgh Review*, and his sermons since Byron went to writing *Don Quixote* and *Walden*. In 1812 he published the first two cantos of *Childe Harold*, which, with his subsequent *Don Quixote* at Geneva, produced the first craze of *Childe Harold* and *The Prisoner of Chillon*. *Manfred* and *The Island* were written in 1817. The next year he was at Venice, and he died *Childe Harold* there. During the next three years he lived in the first five cantos of *Don Juan*, and a number of dramas of various merit. In 1822 he removed to Pisa, and worked there at his *Don Juan*. In 1823 he published *The Vision of Judgment*, occupied his pen almost up to the close of his life. In the summer of 1823 he was in Greece, and he died there, 1824.

**Byron, Lord, George Gordon**, English poet, was born in London, 1788. In his eleventh year he succeeded his grandfather, William lord Byron, and took possession of Newton Abbey, the ancient seat of the family, situated a few miles distant from Nottingham. In 1800 he removed to Trinity College, Cambridge, and two years thereafter his first volume of verse, entitled *Hours of Solitude*, was published at New York. The next year he was at Venice, and he died *Childe Harold* there. During the next three years he lived in the first five cantos of *Don Juan*, and a number of dramas of various merit. In 1822 he removed to Pisa, and worked there at his *Don Juan*. In 1823 he published *The Vision of Judgment*, occupied his pen almost up to the close of his life. In the summer of 1823 he was in Greece, and he died there, 1824.

**Byström (boström)**, Johan Niklas, a Swedish architect, born at Filipstad, in the province of Westmanland, 1854. He was educated at the Sætergö of Stockholm, applying himself chiefly to the study of the antique, and gained the academy's prize in 1878. He was employed in the following year, whence he soon sent him *Drunkards and Repeating Buckshots*. He returned to Stock-

holm in 1815, and exhibited his colossal statue of the prince-royal. He died at Rome, 1848.

**Cabanis** (*ka-ba-nay*), **Pierre Jean Georges**, physician and philosophical writer, born at Conans, France, 1757; he furnished his countrymen with material for his speeches on public education; died at Mireusheim during his term. He died near Nieuw, 1808. His chief work is his once-famous *Rapports du Physique et du Moral de l'Homme*.

**Cabet** (*ka-bet*), **Etienne**, French communist, was born at Dijon, 1809; he furnished his countrymen with 1856, having gone out to Texas in 1848 to found an "Icarian commune," so named after his younger son, a "philosophical social reformer," describing a communist Utopia.

**Cable, George Washington**, author, was born in New Orleans, 1844; educated in public schools; M. A., Litt. D., Yale; Bowdoin; served fourth Mississippi cavalry, Confederate States army, 1862-63; since 1879 devoted to literature. Author: *Old Creole Days*; *The Grasses*; *Madame Delphine*; *The Creoles of Louisiana*; *Dr. Serris*; *The Silent South*; etc.

**Cabot** (*ka-bot*), **George**, American shipmaster, afterward merchant, was born 1751, died 1823. He was a member of the Massachusetts state constitutional convention, and of that which ratified the federal constitution; U. S. senator 1790-96.

**Cabot, John**, born 1450(?) **Cabot, Sebastian**, born 1744, two Venetians, father and son, were both celebrated navigators and explorers. John probably died 1498; Sebastian died 1557.

**Cædmon** (*ka-dm-on*), the father of English song, was the first Anglo-Saxon who composed in his own language of whom there is any record. The date of his birth is unknown, but his death occurred about 680 A. D. He was originally a cowherd, attached to the monastery of Whitby, and according to a legend was commanded in a dream to sing "the beginning of created things."

**Cæculpinus** (*ka-sul-pin-us*), Latin physician; born at Arezzo 1519; was professor of medicine and botany at Pisa, physician to Pope Clement VIII, and performed several medical works. He developed several new ideas on the circulation of the blood which are now well recognized. Died, 1608.

**Cæsar, Caius Julius**, a great Roman general, statesman, and historian, was born B. C. 100, died B. C. 44. He was the son of the praetor Caius Julius Cæsar, and of Aurelia, a daughter of Aurelius Cotta, the praetor of Asia. He lost his father, and shortly after he married Cornelia, the daughter of Lucius Cinna, the friend of Marius. This connection gave great offence to Sulla, the dictator, who prohibited him from returning to public life. His friends obtained his pardon with difficulty, and Cæsar withdrew from Rome, and went to Asia, serving his first campaign under M. Minucius Thermidius, the praetor of Asia.

On the death of Sulla, Cæsar returned to Rome, where he distinguished himself as an orator. He afterwards visited Rhodes, when he was taken by pirates, and compelled to pay fifty talents for his release. To revenge himself, he fitted out some vessels at Miletus, overtook the pirates, made the greater number of them prisoners, and had them crucified before Pergamus. He then returned to Rome, where his eloquence and liberality made him very popular. He was pontifex maximus in 63 B. C., praetor in 62 B. C., and governor of Spain in 61 B. C. On his return to Rome he allied himself with Pompey and Crassus in the memorable "first triumvirate," he became consul, and then obtained the government of Gaul with the command of four legions.

His military career was rapid and brilliant. He compelled the Helvetii, who had invaded Gaul, to retreat to their native country, subdued Ariovistus, who had driven a German tribe had attempted to settle in the country of the Aedui, and conquered the Belgæ. In nine years he reduced all Gaul, crossed the Rhine twice (B. C. 55 and 54), and twice passed over to Britain, defeated the gallant natives of this island in several battles, and compelled them to give him hostages. The senate had continued his rule in Gaul for another period of five years, while Pompey was in the command of Spain, and Crassus that of Syria, Egypt, and Macedonia for five years.

The death of Crassus in his campaign against the Parthians dissolved the triumvirate; and about the same time the friendship between Cæsar and Pompey cooled. The senate, influenced by Pompey, ordered that Cæsar should resign his office and command within a certain time, or be pro-

claimed an enemy to the state, and appointed Pompey general of the army of the Republic. Upon this Cæsar urged his soldiers to defend the honor of their leader, passed the Rubicon (49 B. C.), and made himself master of Italy without striking a blow. Pompey retiring into Greece, Cæsar then levied an army with the treasures of the state, and hastened into Spain, which he reduced to submission without coming to a pitched battle with Pompey's generals. He next conquered Mæstia (now Marcellæ), and returned to Rome, where he was appointed dictator. He followed Pompey into Greece, and defeated him at Pharsalia, from which Pompey escaped only to be assassinated in Egypt.

In Rome the senate and the people strove eagerly to gain the favor of the victor. They appointed him consul for five years, dictator for a year, and tribune of the people for life. When his dictatorship had expired he caused himself to be chosen consul again, and without changing the ancient form of government ruled with almost unlimited power. In 46 B. C. he crossed to Africa, defeated the Pompeians, Scipio and Cato, at Thapsus, and returning to Rome he was received with shouts of acclamation. In February, in the term of his dictatorship was prolonged to ten years, the office of censor conferred on him alone; his person was declared inviolable, and a sacred place beside that of Jupiter in the capital.

He soon after was honored with four several triumphs, made perpetual dictator, and received the title of *imperator* with full powers of sovereignty. In February, he declined the diadem which Antony publicly offered him, and next morning his statues were decked with diadems. His soldiers, however, were discontented, and a conspiracy was set on foot by his enemy, Cassius, and joined by many of his own friends, including M. Brutus; and, notwithstanding dark hints had been given to him of his danger, he attended a meeting of the senate on 15th (idea) March, 44 B. C., and fell beneath the daggers of the conspirators.

Cæsar was undoubtedly the foremost man of his age, being great as a statesman, a general, an orator, a historian, and an architect and engineer, and his assassination was brought about more by jealousy and envy than by real patriotism.

*Caesars*.—*Monna's History of Rome*; R. J. Delorme's *Caesar and his Contemporaries*; Napoleon III.'s *Froude's*, and *Fowler's Lives of Caesar*; *Barling-Gould's Property of the Caesars*; and *Holmes's Caesar's Conquest of Gaul*.

**Caiglieri** (*ka-i-gi-ri*), **Paolo Veronese**, an Italian painter of great eminence, was born at Verona in 1527. The church of San Sebastiano, in Venice, contains many of his productions, which are reckoned the most important of his earlier period, i. e., the period before he visited Rome, when he first became acquainted with the masterpieces of Raphael and Michelangelo. He died in 1588. The most celebrated of his productions are the *Marriage Feast at Cana of Galilee*, and the *Presentation of the Family of David to Alexander*.

**Calver, Henry Hall**, British novelist and dramatist; born in 1853, of Manx and Cumberland parentage; was educated at the University of Liverpool; became a journalist, and was for six years an editorial writer on Liverpool *Chronicle*. His first novel was *The Crime of Calver*, which came with *The Democrat*; *The Manxman*; *The Christian*; *The Eternal City*. Published in 1898. *My Story*, an autobiographical narrative of the earlier years of his literary life. He is justice of the peace in the Isle of Man, where, in 1897, he was elected to a large majority to the house of keys for Ramsey.

**Calder** (*ka-dar*), **Edward**, Scottish philosopher, was born at Glasgow, Scotland, 1806; he was educated at Glasgow University; Balliol College, Oxford; LL. D.; D. C. L.; fellow and tutor of Merton College, Oxford, 1831-32; he was professor of metaphysics, Glasgow University, 1846-83; master of Balliol College, Oxford, 1863-1867. Author: *Elements of Logic*; *History of the Inductive Method*; *Critical Philosophy of Emmanuel Kant*.

**Calder, John**, Scottish preacher, born at Greenock, Scotland, 1801; he was educated at Glasgow University (1818). He received the degree of D. D. in 1860, was appointed professor of divinity in 1862, and held the office of minister of Glasgow from 1862 to 1869. He published a volume of *Sermons*; *Spinoza*; etc. He died 1898.

**Calnes** (*ka-dar*), **John Elliot**, British economist, was born at Castle Bellingham, Ireland, 1823; studied at Trinity College, Dublin, where he graduated B. A. in 1848. An accident in his hunting-ground in 1862 led to a breakdown in health;

and, having resigned his chair in 1872, he died at Blackheath, 1875. Cairnes may be regarded as a disciple of Mill, though differing from him on many points.

**Calus Græchus** (*ka-lus-gra-echus*). See **Græchus**. **Calixtus** (*ka-lis-tus*), **Cardinal**, properly Jacopo Casanova, was born in 1605, and was elevated in 1608 became general of the Dominicans, in 1517 cardinal, in 1519 bishop of Gaeta, and in 1523 legate of the Holy See.

**Calderon** (*ka-dar-on*), **don de la Barra, Pedro**, Spanish dramatist, and one of the greatest of all time, was born at Madrid in 1600, and was educated at the University of Salamanca. He entered the army and served several campaigns in Italy and in Flanders, gaining a knowledge of men and things which he afterward made use of in his plays. He became a priest and royal chaplain, and died in 1681, still working at his literary labors. In his later life he wrote many religious plays.

**Calderon, Ignacio**, diplomat; was born at La Paz, Bolivia, 1848; graduate of University of La Paz; secretary of Bolivian legation at Rome, 1868-70. Traveled through United States, and for a time acted as consul-general of Bolivia at New York; returned to Bolivia, 1886, to manage affairs of foreign importing, and sporting companies; minister from Bolivia to United States since March, 1904.

**Calderwood** (*ka-dar-wood*), **Henry**, British philologist and scholar; born at Glasgow, 1800; died in Edinburgh, 1867.

**Calhoun** (*ka-houn*), **John Caldwell**, American statesman and diplomat; born in 1792, he was born in Abbeville county, South Carolina, 1782; graduated at Yale, 1804, and became a successful lawyer and a member of the bar at New York. In 1817 he entered Monroe's cabinet as secretary of war, and did good work in reorganizing the war department. In 1820 he was elected to the senate, and in 1824 he was elected to the senate, and in 1828 he was elected to the senate, and in 1832 he was elected to the senate, and in 1836 he was elected to the senate, and in 1840 he was elected to the senate, and in 1844 he was elected to the senate, and in 1848 he was elected to the senate, and in 1852 he was elected to the senate, and in 1856 he was elected to the senate, and in 1860 he was elected to the senate, and in 1864 he was elected to the senate, and in 1868 he was elected to the senate, and in 1872 he was elected to the senate, and in 1876 he was elected to the senate, and in 1880 he was elected to the senate, and in 1884 he was elected to the senate, and in 1888 he was elected to the senate, and in 1892 he was elected to the senate, and in 1896 he was elected to the senate, and in 1900 he was elected to the senate, and in 1904 he was elected to the senate, and in 1908 he was elected to the senate, and in 1912 he was elected to the senate, and in 1916 he was elected to the senate, and in 1920 he was elected to the senate, and in 1924 he was elected to the senate, and in 1928 he was elected to the senate, and in 1932 he was elected to the senate, and in 1936 he was elected to the senate, and in 1940 he was elected to the senate, and in 1944 he was elected to the senate, and in 1948 he was elected to the senate, and in 1952 he was elected to the senate, and in 1956 he was elected to the senate, and in 1960 he was elected to the senate, and in 1964 he was elected to the senate, and in 1968 he was elected to the senate, and in 1972 he was elected to the senate, and in 1976 he was elected to the senate, and in 1980 he was elected to the senate, and in 1984 he was elected to the senate, and in 1988 he was elected to the senate, and in 1992 he was elected to the senate, and in 1996 he was elected to the senate, and in 2000 he was elected to the senate, and in 2004 he was elected to the senate, and in 2008 he was elected to the senate, and in 2012 he was elected to the senate, and in 2016 he was elected to the senate, and in 2020 he was elected to the senate, and in 2024 he was elected to the senate, and in 2028 he was elected to the senate, and in 2032 he was elected to the senate, and in 2036 he was elected to the senate, and in 2040 he was elected to the senate, and in senate, and in 3968 he was elected to the senate, and in 3972 he was elected to the senate, and in 3976 he was elected to the senate, and in 3980 he was elected to the senate, and in 3984 he was elected to the senate, and in 3988 he was elected to the senate, and in 3992 he was elected to the senate, and in 3996 he was elected to the senate, and in 4000 he was elected to the senate, and in 4004 he was elected to the senate, and in 4008 he was elected to the senate, and in 4012 he was elected to the senate, and in 4016 he was elected to the senate, and in 4020 he was elected to the senate, and in 4024 he was elected to the senate, and in 4028 he was elected to the senate, and in 4032 he was elected to the senate, and in 4036 he was elected to the senate, and in 4040 he was elected to the senate, and in 4044 he was elected to the senate, and in 4048 he was elected to the senate, and in 4052 he was elected to the senate, and in 4056 he was elected to the senate, and in 4060 he was elected to the senate, and in 4064 he was elected to the senate, and in 4068 he was elected to the senate, and in 4072 he was elected to the senate, and in 4076 he was elected to the senate, and in 4080 he was elected to the senate, and in 4084 he was elected to the senate, and in 4088 he was elected to the senate, and in 4092 he was elected to the senate, and in 4096 he was elected to the senate, and in 4100 he was elected to the senate, and in 4104 he was elected to the senate, and in 4108 he was elected to the senate, and in 4112 he was elected to the senate, and in 4116 he was elected to the senate, and in 4120 he was elected to the senate, and in 4124 he was elected to the senate, and in 4128 he was elected to the senate, and in 4132 he was elected to the senate, and in 4136 he was elected to the senate, and in 4140 he was elected to the senate, and in 4144 he was elected to the senate, and in 4148 he was elected to the senate, and in 4152 he was elected to the senate, and in 4156 he was elected to the senate, and in 4160 he was elected to the senate, and in 4164 he was elected to the senate,

in 1802, rose to be general in the war of 1812. In 1831-36 he was secretary of war, and in 1836-42 minister at Paris. Under Louis XVIII. he died in 47, and was secretary of state in 1857-60. He died at Detroit 1860.

**Casini** (*de-sa'-ni*), **Cicciavanti Domenico**, Italian astronomer and savant, born at Ferialino, near Nice, 1625, died 1712. In 1650 he was appointed to the astronomical chair at the observatory of Bologna. His first work related to the comet of 1652.

**Casini, Jacques**, son of the preceding, born at Paris 1677. In 1694 he was elected a member of the academy of sciences. On the death of his father he succeeded to the chair of the observatory at Paris, and died 1756. As an observer Casini was eminently successful.

**Cassius** (*de-ak'-s'us*), **Publius**, **Cassius Longinus**, Roman general and politician, was questor to Cæsar in the Parthian war, 54 B. C. After Pharsalia he was taken prisoner and pardoned by Cæsar. In 44 B. C. as praetor he attacked to himself the aristocrats who resented Cæsar's supremacy, and won over Brutus; and in the same year Cæsar was murdered. Cassius fled to the East, united his forces with those of Brutus, and at Philippi, being routed, compelled his freedman Pindarus to kill him, 42 B. C.

**Casson, Herbert Newton**, editor, socialist writer, born at Ontario, N. H., U. S., 1837, graduated at Victoria College; in 1863 went to Boston and with Morrison J. Swift organized the unemployed, and at head of 10,000 men marched on the city demanding relief. Founded first labor church in America, at Lynn, Mass., 1864; on staff of *Commons* 1865-66; editor of *Commons* 1866-67; of *Credulity*; many socialist tracts, etc.

**Castelar** (*de-ak'-lar*), **Emilio**, Spanish, writer, statesman, and military man, born at Seville 1832; was for some years professor of history and philosophy in the University at Madrid. A satirical humorous dictator, but, when the king, he fled across the frontier. He returned to Spain in 1876, and devoted himself more to literature than to political and social questions. He died in 1899.

**Castellargh** (*de-sel'-ar*), **de-sel'-ar, **Robert Stewart, Lord**, British statesman, eldest son of the marquis of Loosduney; was born in 1769; president of the board of control in 1802; and secretary of war in 1805. During Lord Castlereagh's absence, Lord Castlereagh again became a member of the government and foreign secretary, and concluded the treaty of Paris, 1814. He remained in office the remainder of his life, which was closed by illness in 1822.**

**Catharine I.**, empress of Russia; born about 1685; was the youngest infant of a Livonian peasant-queen, and became nurse in the family of the protestant minister of Maria Sophia, 1701 who married a Swedish general, who soon afterwards died with his regiment. She, and her returned husband, after the capture of Moscow by the Russians, Catharine became the mistress first to General Oster, with whom she met at St. Petersburg, Prince Menschikov, and finally, of Peter the Great, who married her privately near Warsaw in 1711, and publicly the next year at St. Petersburg. She then embraced the Greek religion, and took the name of Catharine. On the death of Peter in 1725, she was proclaimed empress. Her death was the result of intemperance. Died 1727.

**Catharine II.**, empress of Russia; born in 1729. As empress she seized the Crimea, and took part in the dismemberment of Poland. She promoted the welfare of Russia by encouraging literature and commerce, but her reign was sullied by dissolute amours. Died 1796.

**Catharine**, **Saint**, of Burma, is a saint belonging to the fourteenth century, born about 1347. She was said to have been favored with extraordinary revelations, and the people of Burma were said to have been impressed upon her body. Died, 1380.

**Catharine of Aragon**, queen of England; wife of Henry VIII.; born in 1485; daughter of Ferdinand of Aragon and Isabella of Castile. She was beautiful and virtuous, but married in 1501 to a divorcé on the ground that the marriage was unequalled. After much temporizing on the part of the pope, the marriage was pronounced invalid by Cranmer, archbishop of Canterbury, and his sentence was ratified by act of parliament. Died 1536.

**Catharine de Medici** (*de-ma'-di-chi*), born in 1519; great granddaughter of Lorenzo the Magnificent, daughter of Pope Clement VII. and Catherine II. of France, acted as regent during the minority of her second son, Charles IX. She instigated the massacre of St. Bartholomew in 1572.

**Catharine Parr**, born in 1512; daughter of Sir Thomas Parr; was the sixth and last wife of Henry VIII. She survived Henry, and was accused of poisoning his death by poisoning. Died 1548.

**Catharine** (*de-ak'-lar*), **Emilio**, Spanish, politician, born about the year 108 B. C., died 62 B. C. In the year 68 B. C. he was elected praetor, in 67 B. C. governor of Africa, and in 66 B. C. he was desired to stand for the consulship, but was disqualified on account of the accusations brought against him of maladministration in his province. His political conspiracies were frustrated by

Cicero, and he fled from Rome and took refuge with Manlius, who was in command of the army in Sicily. In 63 B. C. he fled to the island of Rhodes, encountered that of Catiline near Pistoia, and after a desperate battle he was defeated and slain. Catiline was executed. He was consul in 61 B. C., 1796; studied law, but soon turned to drawing and painting. During 1832-40 he was in the United States, and in 1840-41 he was in 1832-57, in South and Central America; and again lived in Europe until 1871. He died at Jersey City, N. J., U. S., 1876. He was the author of *North American Indians*, *The North American Indians*, and *Last Rambles in the Rocky Mountains*.

**Cato** (*de-ak'-lar*), **Publius**, **Cato**, Roman statesman, afterward known as Cato Praetor, or Cato Major—to distinguish him from Cato of Utica, the younger, who lived in 184 B. C. Cato was elected censor, and discharged so rigorously the duties of his office that the epithet *Censorius*, formerly applied to all persons in the same station, was made his permanent surname. He repaired the water courses, paved the reservoirs, cleaned the drains, raised the rents paid by the publicans for the farming of the taxes. In the year 178 B. C. he was sent to Carthage to negotiate with the Carthaginians, and the Carthaginians and the Numidian king, Masinissa; but having been offended by the Carthaginians he returned to Rome, where he was again described Carthage as the most formidable rival of the empire, and concluded all his addresses in connection with the military trials to begin with the words, "Ceterum censeo, Carthaginiæ esse delendam." (For the rest, I vote that Carthage must be destroyed.) Died 149 B. C.

**Cato, Marcus Porcius**, named Cato the "younger," or Cato Uticensis, born 95 B. C. From Macedonia, he returned to Rome, and in 68 B. C. he was elected praetor, and in 67 B. C. he was elected consul, and in 66 B. C. he was elected censor, and in 65 B. C. he was elected consul, and in 64 B. C. he was elected consul, and in 63 B. C. he was elected consul, and in 62 B. C. he was elected consul, and in 61 B. C. he was elected consul, and in 60 B. C. he was elected consul, and in 59 B. C. he was elected consul, and in 58 B. C. he was elected consul, and in 57 B. C. he was elected consul, and in 56 B. C. he was elected consul, and in 55 B. C. he was elected consul, and in 54 B. C. he was elected consul, and in 53 B. C. he was elected consul, and in 52 B. C. he was elected consul, and in 51 B. C. he was elected consul, and in 50 B. C. he was elected consul, and in 49 B. C. he was elected consul, and in 48 B. C. he was elected consul, and in 47 B. C. he was elected consul, and in 46 B. C. he was elected consul, and in 45 B. C. he was elected consul, and in 44 B. C. he was elected consul, and in 43 B. C. he was elected consul, and in 42 B. C. he was elected consul, and in 41 B. C. he was elected consul, and in 40 B. C. he was elected consul, and in 39 B. C. he was elected consul, and in 38 B. C. he was elected consul, and in 37 B. C. he was elected consul, and in 36 B. C. he was elected consul, and in 35 B. C. he was elected consul, and in 34 B. C. he was elected consul, and in 33 B. C. he was elected consul, and in 32 B. C. he was elected consul, and in 31 B. C. he was elected consul, and in 30 B. C. he was elected consul, and in 29 B. C. he was elected consul, and in 28 B. C. he was elected consul, and in 27 B. C. he was elected consul, and in 26 B. C. he was elected consul, and in 25 B. C. he was elected consul, and in 24 B. C. he was elected consul, and in 23 B. C. he was elected consul, and in 22 B. C. he was elected consul, and in 21 B. C. he was elected consul, and in 20 B. C. he was elected consul, and in 19 B. C. he was elected consul, and in 18 B. C. he was elected consul, and in 17 B. C. he was elected consul, and in 16 B. C. he was elected consul, and in 15 B. C. he was elected consul, and in 14 B. C. he was elected consul, and in 13 B. C. he was elected consul, and in 12 B. C. he was elected consul, and in 11 B. C. he was elected consul, and in 10 B. C. he was elected consul, and in 9 B. C. he was elected consul, and in 8 B. C. he was elected consul, and in 7 B. C. he was elected consul, and in 6 B. C. he was elected consul, and in 5 B. C. he was elected consul, and in 4 B. C. he was elected consul, and in 3 B. C. he was elected consul, and in 2 B. C. he was elected consul, and in 1 B. C. he was elected consul, and in 0 B. C. he was elected consul, and in 1 B. C. he was elected consul, and in 2 B. C. he was elected consul, and in 3 B. C. he was elected consul, and in 4 B. C. he was elected consul, and in 5 B. C. he was elected consul, and in 6 B. C. he was elected consul, and in 7 B. C. he was elected consul, and in 8 B. C. he was elected consul, and in 9 B. C. he was elected consul, and in 10 B. C. he was elected consul, and in 11 B. C. he was elected consul, and in 12 B. C. he was elected consul, and in 13 B. C. he was elected consul, and in 14 B. C. he was elected consul, and in 15 B. C. he was elected consul, and in 16 B. C. he was elected consul, and in 17 B. C. he was elected consul, and in 18 B. C. he was elected consul, and in 19 B. C. he was elected consul, and in 20 B. C. he was elected consul, and in 21 B. C. he was elected consul, and in 22 B. C. he was elected consul, and in 23 B. C. he was elected consul, and in 24 B. C. he was elected consul, and in 25 B. C. he was elected consul, and in 26 B. C. he was elected consul, and in 27 B. C. he was elected consul, and in 28 B. C. he was elected consul, and in 29 B. C. he was elected consul, and in 30 B. C. he was elected consul, and in 31 B. C. he was elected consul, and in 32 B. C. he was elected consul, and in 33 B. C. he was elected consul, and in 34 B. C. he was elected consul, and in 35 B. C. he was elected consul, and in 36 B. C. he was elected consul, and in 37 B. C. he was elected consul, and in 38 B. C. he was elected consul, and in 39 B. C. he was elected consul, and in 40 B. C. he was elected consul, and in 41 B. C. he was elected consul, and in 42 B. C. he was elected consul, and in 43 B. C. he was elected consul, and in 44 B. C. he was elected consul, and in 45 B. C. he was elected consul, and in 46 B. C. he was elected consul, and in 47 B. C. he was elected consul, and in 48 B. C. he was elected consul, and in 49 B. C. he was elected consul, and in 50 B. C. he was elected consul, and in 51 B. C. he was elected consul, and in 52 B. C. he was elected consul, and in 53 B. C. he was elected consul, and in 54 B. C. he was elected consul, and in 55 B. C. he was elected consul, and in 56 B. C. he was elected consul, and in 57 B. C. he was elected consul, and in 58 B. C. he was elected consul, and in 59 B. C. he was elected consul, and in 60 B. C. he was elected consul, and in 61 B. C. he was elected consul, and in 62 B. C. he was elected consul, and in 63 B. C. he was elected consul, and in 64 B. C. he was elected consul, and in 65 B. C. he was elected consul, and in 66 B. C. he was elected consul, and in 67 B. C. he was elected consul, and in 68 B. C. he was elected consul, and in 69 B. C. he was elected consul, and in 70 B. C. he was elected consul, and in 71 B. C. he was elected consul, and in 72 B. C. he was elected consul, and in 73 B. C. he was elected consul, and in 559 B. C. he was elected consul, and in 560 B. C. he was elected consul, and in 561 B. C. he was elected consul, and in 562 B. C. he was elected consul, and in 563 B. C. he was elected consul, and in 564 B. C. he was elected consul, and in 565 B. C. he was elected consul, and in 566 B. C. he was elected consul, and in 567 B. C. he was elected consul, and in 568 B. C. he was elected consul, and in 569 B. C. he was elected consul, and in 570 B. C. he was elected consul, and in 571 B. C. he was elected consul, and in 572 B. C. he was elected consul, and in 573 B. C. he was elected consul, and in 574 B. C. he was elected consul, and in 575 B. C. he was elected consul, and in 576 B. C. he was elected consul, and in 577 B. C. he was elected consul, and in 578 B. C. he was elected consul, and in 579 B. C. he was elected consul, and in 580 B. C. he was elected consul, and in 581 B. C. he was elected consul, and in 582 B. C. he was elected consul, and in 583 B. C. he was elected consul, and in 584 B. C. he was elected consul, and in 585 B. C. he was elected consul, and in 586 B. C. he was elected consul, and in 587 B. C. he was elected consul, and in 5

talas, and his most popular romance, *De Loeus* or *de Vloerden*, and his most famous, *De Loeus* or *de Vloerden*, and his most famous, *De Loeus* or *de Vloerden*.

**Considérant** (*kôn-si-d'ran'*), **Victor-Froper**, French socialist, was born at Salins, France, 1808; he entered the army, and was wounded at Waterloo; he left to promulgate Fourier's doctrine. On the death of his master, Considérant became head of the school, and, as such, he was accused of high treason, and fled from France. In Texas he founded a community, *Le Rénouveau*, which flourished for a few years. He returned to France in 1850, and died 1863.

**Constable** (*kon-sta-b'l*), **John**, landscape painter, born in East Berkhampstead, Essex, England, 1724 (died suddenly 1781). The national gallery has his best pictures, *The Cornfield*, *The Valley Farm*, and *The Haystack*.

**Constant** (*kôn-stan*), **Flavius Julius**, emperor of Rome, was born about A. D. 330. He was the youngest son of Constantine the Great, and on his death, 337, he received as his share of the empire, Western Illyricum, Italy, and Africa. He was a weak and cruel ruler, and at last Magnentius, his general in Gaul, sent some conspirators to kill him A. D. 350.

**Constant de Beheque** (*kôn-dé' ds vè-èk*), **Henry Benjamin**, author and politician, was born at Lausanne, Switzerland, 1767. Educated at Oxford, Erlangen, and Edinburgh, he in 1793 settled in Paris as a publicist and after the second restoration of the Bourbons wrote and spoke in favor of constitutional reform.

**Constantine I.** (*kôn-stan-fîn*), called the Great; born in 312, at Nisaea. On the death of his father he was crowned emperor of the East, and in 313 he was proclaimed emperor by the troops; he was acknowledged emperor by the senate in 312, and thereafter an edict was issued, on which he granting toleration to the Christians. He had still to extend his empire over the East, and having done so by the death of Licinius, he transferred the seat of his empire to Byzantium, which was thereafter called Constantinople, i. e., Constantine's city. The constantine was adopted by 327 as a Christian, after having three years before proclaimed Christianity the state religion. Died 337.

**Constantine X. Palaeologus**, last emperor of the East, born in 1394. The Turkish sultan, Mohammed II., determined to take Constantinople and laid siege to it with a great army, 1453. Constantine, who had only about 9,000 soldiers, resisted bravely for nearly two months, but at last the Turks battered down the walls, and the emperor and his little band of nobles were all slain.

**Constantinus L.**, called Chlorus, a Roman emperor, father of Constantine the Great, born about A. D. 250. He died at York, England, 306.

**Constantine II.**, a Roman emperor, the second son of Constantine the Great, born 317. His cousin Julian won so many victories that the army proposed him emperor, but he was slain by the army against him, but died on the way, 361. He was succeeded by Julian.

**Cooley, Sir William Martin**, English traveler, artist, and geographer, born at Rochester, England, 1856; was educated at Trinity College, Cambridge. University extension lecturer, 1882-85; professor of art, University College, Liverpool, 1888-89; president of the Alpine club, 1902-04. Author: *Woodcuts of the Netherlands in the fifteenth century*; *Early Flemish Artists*; *Literary Remains of Albrecht Dürer*; *No Man's Land* (history of Netherland); etc.

**Conwell, Russell Herman**, lecturer, educator, Baptist clergyman; born at Worthington, Mass., 1842; captain of infantry 1862-65, in U. S. army; promoted to lieutenant-colonel, 1865; foreign correspondent *New York Tribune* and *Boston Traveler*, 1866-70, now president of the Worcester Association.

**Cook, Albert Stanborough**, educator; born at Newbury, N. H., 1833; graduated at Rutgers college, 1857; N. H. A. S. 1857; associated in English, Johns Hopkins, 1879-81; professor of English, University of California, 1880; professor of English language and literature, Yale, since 1889. Co-editor of *Journal of English and German Philology*, 1897-1905.

**Cook, Captain James**, celebrated English navigator, best known through his *Voyage Round the World*; born in Marton, in North Riding, Yorkshire, 1728. After his death at Hawaii, on the Sandwich Islands, 1779, many honors were paid to his memory, both in his own and in foreign countries.

**Cooke, Josiah Parsons**, American chemist, was born at Boston, Mass., 1827, and was professor of chemistry at Harvard, 1850-51. His scientific works are *Elements of Chemical Physics*, *Principles of Chemical Philosophy*, *The New Chemistry*, etc. Died at Newbury, Mass., 1890.

**Cooke, Sir William Fothergill**, British electrician, born at Ealing, England, 1806; was educated at Durham and Edinburgh universities. He was the first to use the Albert gold medal; Cooke was knighted in 1869. He died 1879.

**Coley, Thomas Melville**, American jurist, was born at Attica, N. Y., 1816; was admitted to the bar 1840, and became professor of law at the university of Michigan, 1859; was associate justice Michigan supreme court, 1864-68, and chief-justice 1868-83. He died 1898.

**Coolidge, Archibald Cary**, historian in history,

Harvard, 1868-99, professor since 1904, born at Boston, Mass., graduated from Harvard university, 1837. With Taft party to Philippine islands, 1905-06; Harvard lecturer at the Sorbonne and University of Berlin, 1906-07; was editor of the *Review* devoted to American historical review, the *New York Nation*, etc.

**Cooper, John Jefferson**, manufacturer, diplomat; born at Boston, 1831; educated at Harvard; LL. D., Harvard, 1902. Embarked in business in New York, and was successful in commerce; largely interested in cotton mills; formerly president of Aetna, Topeka and Santa Fe railroads; United States minister to France, 1892-93.

**Cooper, Anthony Ashley, See Shaftesbury.**

**Cooper, John Montgomery**, novelist, journalist, was born in Burlington, N. Y., 1790. After six years' experience of naval life, he retired from the sea in 1810, and took up his residence at Cooperstown, Otsego county, N. Y. In 1821 appeared his first work, *Pioneers*. In quick succession followed *The Two Admirals*, and once more secured for him a place in the first rank of novelists; his sea stories, his famous "Leather Stocking series," and his tales of the frontier, and his passing some years in Europe, died at Cooperstown, in 1851.

**Cooper, John Montgomery**, priest, educator, was born in Rockville, Md., 1881. He studied at the American College, Rome, Italy, 1899-1905; Ph. D., Rome, 1906. He was ordained Roman Catholic priest, and has been instructor in Christian religion, University of America, Washington, D. C., since 1909.

**Cooper, Peter**, American inventor, manufacturer, was born in New York, 1810. His first invention was an improvement in a machine for shearing cloth. In 1830 he erected iron works at Paterson, N. J., and in 1832 constructed after his own designs the first locomotive engine ever made in this country. But the work of his life was the founding of an institution for instruction of the industrial classes—the Cooper Union, New York, whose corner stone he laid in 1854. In 1872 the independent party nominated him for president of the United States, and he received nearly 100,000 votes. Died, 1883.

**Cooper, Sir Henry Fasten**, a celebrated English surgeon, was born in Brooke, Norfolk, 1768; studied under Henry Cline, surgeon to St. Thomas' hospital, London, and was made a member of the society of anatomy there, 1799. In 1822 he was elected one of the court of examiners of the college of surgeons, and died in 1827, probably of cholera. He was of Oxford, and an LL. D. of Edinburgh. He died 1841.

**Cope, Abby**, **Edward Drinker**, American naturalist, born in Philadelphia, 1840. He early achieved success as an investigator in herpetology, and in 1861 he published his first book, *The Reptiles of the United States*. He resigned because of poor health, 1867. He died at Philadelphia, 1887.

**Cope, Sir Richard D. Alexander**, English naturalist, born at Thorn, then in Poland, 1473, his family being supposed to have come originally from Westphalia. Having studied medicine and theology at Caen, and law at Bologna, he was made a canon of Frauenburg in 1497. In 1500 he went to Rome, where he taught mathematics and astronomy. He studied medicine at Padua, and in 1505 finally left Italy for Prussia to carry out the work of his life.

Doubting that the motions of the heavenly bodies could be so confused and so complicated as to require the aid of a hypothesis, he was induced to consider the simpler hypothesis that the sun was the centre round which earth and the other planets revolve. Besides the experimental truth Copernicus anticipated many other of the principal features of astronomical science, such as the motion of the earth round its axis, the immense distance of the stars which made their apparent position the same from any part in the earth's orbit, etc. His general theory also enabled him to explain for the first time many of the important phenomena of nature, such as the variation of the seasons and the precession of the equinoxes.

The great work in which Copernicus explained his theory, *De Orbium coelestium Revolutionibus* (On the Revolutions of the Heavenly Spheres), was completed at Frauenburg and published at Nuremberg in 1543. He died at Frauenburg, 1543.

**References.**—*Life and Works of Copernicus*, by George F. Swarth, *Prussian House of Representatives*, by A. M. Clerke; and *Lives of the astronomer* by Gascoigne, Von Hipler, and Polkowski.

**Copsey, John**, English landscape painter, was born at Bolton, Mass., 1737. Washington sat to him in 1765, and later, in London, he painted George III. and his children. He became the friend of such men as West and Reynolds. He died at London, 1815.

**Coppeé** (*kô-pé'*), **François**, French poet, was born at Valenciennes, 1804. He was a literary clerk, he early gave himself to poetry, and with *Le Reliquaire* and *Les Jambes*, gained the front rank of the poets of the day. He died in 1860. Some years to *La France*, Coppeé entered the academy in 1864.

**Coppeé** (*kô-pé'*), **Benoit Constant**, French actor, born at Boulogne, 1841, was admitted to the conservatory in 1850, and having gained the prizes for tragedy and comedy, he joined the Théâtre Français, 1860. For a quarter of a century he played here with unbroken success, both in tragedy and comedy, and was especially noted in the broader aspects of comedy standing without a rival. Died 1900.

**Coppeé**, **Paul-Marie**, dramatic critic, born at Chicago, 1870, graduated at Harvard, 1892. A. M., 1893; Balliol college, Oxford, 1894-95. Dramatic critic, *New York Tribune*, 1896. Permeant critic, *New York Sun*, 1905-07; literary manager, *New Theater*, New York, 1908. Author: *An American of Oxford*; *A New Portrait of Shakespeare*.

**Corday d'Armann** (*kô-d'ar-man'*, or *môn'*), **Marie Charlotte**, French heroine, was born in 1768, at St. Saturen, Normandy, of a noble Norman family; sympathized with the ideas of the French revolution; visited Paris in July, 1793, with the purpose of assassinating Robespierre; obtaining an interview with the former while in his bath, she stabbed him with a knife; was immediately apprehended and executed four days after ward.

**Correll** (*kô-rel'*), **Marie**, English novelist; of mingled Italian and Scotch parentage and connections, she came to France in 1810. Her first book, *A Romance of Two Worlds*, was an instant success, and from that time she has devoted her life to writing. She died in 1890. Her husband, Edward Morris, of Chicago, to purchase Harvard University, which she had bought from Harvard University, to which it now belongs.

**Corey, William Ellis**, capitalist, steel manufacturer, was born at Philadelphia, 1804. At sixteen entered the service of the Pennsylvania Railroad, and was chemical laboratory of John Thompson steel works; invented Carnegie reformed armor. Succeeded by Carnegie, M. P. Steel, and has been president of Carnegie steel company, National steel company, and American steel hoop company; president of the United States Steel Corporation, 1911.

**Cornell** (*kô-rnell*), **Pierre**, a French actor, was born in 1806, at Rouen. He studied for the priesthood, but was dissuaded from it, and became the rival of a friend, first prompted him to write verse. In 1855 appeared his *Médée*, a drama, dedicated to Victor Hugo, and which was a success. Cardinal Richelieu, who aspired to be patron of the stage, wished to number Cornell among his favorites, but he was too proud to allow as to alter the plan of a comedy, and thus lost the cardinal's favor. He now returned to his private life, and in 1860 he was elected to the Académie française. He died in 1860, and was buried in the cemetery of St. Saturen. He was a member of the Académie française.

**Cornelia** (*kô-rnell'*), the daughter of Scipio Africanus, was the wife of Tiberius Sempronius Gracchus, who was consul, 97 B. C.

**Cornelius**, **von** (*fon kô-rnell'*), **Peter**, German painter, was born at Düsseldorf 1787, and studied under Lange in the academy of his native town. His chief works are frescoes in the Glyptothek and Ludwigskirche, in Munich. Died, 1867.

**Cornell, Ezra**, American philologist, was born 1807, at Westchester Landing, N. Y.; died 1874, at Ithaca, N. Y. He began life as a mechanic and miller at Ithaca, N. Y. In 1868 he founded Cornell University at Ithaca, with an endowment of \$500,000 to which he subsequently added nearly \$1,000,000. He was elected president of the library at Ithaca, at a cost of \$100,000.

**Corning, James Leonard**, physician; born at Stockbridge, N. Y., 1795. He studied at Andover and Würzburg, M. D., LL. D. Specially distinguished as neurologist; discoverer of spinal anesthesia; member of many medical and scientific societies. Author: *Cerebral Compression*; *Brain Rupture*; *Brain Excitation*; *Local Anesthesia*, etc.

**Cornwall, Barry**, English actor, English statesman and general, was born 1728. He entered the British army in 1745, entered the house of commons 1760, and the house of lords 1763. In 1780 he defeated General Gates at Camden, won the battle of Guilford court house, 1781, and surrendered to Washington at Yorktown, October 19, 1781. Appointed, in 1805, governor-general of India at Calcutta, and in 1806, governor of the province of Benares, while on his way to assume the command of the troops.

**Corot** (*kô-rô'*), **Jean Baptiste Camille**, French painter, pupil of Michelangelo and Bertin, and founder of the impressionist school; was born in Paris, 1796. He was a member of the Académie des beaux-arts, and was the first in the world. He died at Paris, 1875.

**Correggio** (*kô-ré-gio'*), **Antonio Allegri**, celebrated Italian painter, called the "Master of the birth," a small town near Modena, now called Reggion; was born 1493. He was the founder, or rather the initiator, of the school of painters of some Lombard, by whom the Parma school of painting, died, 1534.

**Corsen, Hiram**, professor of English literature, Cornell, 1870-1903; professor emeritus since 1903; born at Philadelphia, 1828; L.L.D., Litt. D., A.M., and editor of *the New York Times* in language, literature, and criticism, including: *Hand-book of Anglo Saxon and Early English*; *The Poems of Geoffrey Chaucer*; *Introduction to the Prose and Poetical Works of John Milton*; etc.

**Cortelyou, George Bruce**, public official, financier, born in New York City, 1846; graduated at the schools of the Georgetown and Columbian (George Washington) Universities, L.L.D. in 1866; was assistant treasurer of the President Cleveland, 1886; executive chief; 1898, assistant secretary to President McKinley; 1900, secretary to the president, and 1901, representative by President Roosevelt; was appointed secretary of the newly established department of commerce and labor, 1903. He entered the new cabinet, as postmaster-general, and 1907 was appointed secretary of the treasury. In 1909 he became president of the New York gas company.

**Cortes, or Cortes (kôr'tez), Fernando**, a Spanish adventurer; born in Medellin in Estremadura in 1485; he went early in the sixteenth century with Vlasquez, to Cuba, and subsequently obtained the command of the expedition sent against Mexico. He advanced to Mexico, where he was at first received with friendly demonstrations; but on the seizing Montezuma, the Mexican king, whom he subsequently put to death by fire, a struggle ensued, in which many thousands of his men were lost. He eventually succeeded in putting down all opposition, and in the conquering of Mexico. He was rewarded with the title of prince, and a grant of land in the new country. On his return to Spain, he found himself very much neglected. He died near Seville, in 1547.

**Corwin, Matthias**, see **Matthew Corwin**.

**Corwin, Thomas**, lawyer and orator, was born in Bourbon county, Kentucky, 1741; removed to Appleton early enough to be president of the county, 1818; was elected a member of congress in 1820, in 1840 governor of Ohio; elected to the senate of the United States in 1848; re-elected secretary of the treasury by President Fillmore in 1850. Died in Washington, D. C., 1866.

**Cosens (kôr'sen), Ellis**, an ornithologist, was born at Portsmouth, N. H., 1842, and graduated at Columbian University, 1861; M. D., Columbian, 1864; his works are: *Field Ornithology*, 1879; *Field Ornithology*, *Dictionary of North American Birds*, etc. Died 1899.

**Coulans (kûl'ân's), Fustel de**. See **Fustel de Coulanges**.

**Coulter (kûl'ter), John Merle**, botanist, head professor of botany at Cornell University, 1868-1896; born at Ningpo, China, 1851; graduated at Hanover College, Indiana, 1870; Ph. D., University of Indiana, 1873; professor of botany, 1893-96. Author: *Manual of Rocky Mountain Botany*; *Manual of Texas Botany*.

**Courbet (kôr'bê), Gustave**, French painter, was born at Ornans, Franche-Comte, 1819. In 1840 he was sent by the government to Rome, in Paris, but the bent of his nature was toward art. In 1841 he took to landscape painting, in the forest of Fontainebleau. In 1844 he began to exhibit at the salon; and his work created a great sensation in 1850; he retired to Tourd-Polite, near Vevay, in Switzerland, where he died in 1877.

**Cousin (kû'sin'), Victor**, French philosopher, was born in Paris, 1792; died at Cannes, 1867. After a literary career extending over many years, he was made, in 1830, under the ministry of M. Guizot, a member of the council of public instruction in France. He published a translation of the *History of Philosophy*, in five volumes, which was his largest original work. His last years were spent in retirement at his chateau, Soreboise.

**Couture (kû'tûr), Thomas**, French painter, pupil of Delacroix, was born in 1815. His chief work is *Remains de la Descente*. Died near Paris, 1879.

**Coverdale, (kûv'rad), Miles**, translator of the Bible, was born in York, England, and died in London, 1569. He was a monk of Norwich, but early devoted himself to the work of the translation. His translation, with Thomas Tymond's translation are still used in the services of the church of England.

**Cowley, Abraham**, with his own day considered the greatest of English poets, was born in London, 1618. From Westminster school he proceeded to Trinity College, Hartford, and afterwards here wrote, among many other papers, a large portion of his epic, the *Dorinda*, his hero King Charles. On Cromwell's return to England he was banished and returned to England at the restoration. He died at Chertsey, 1667, and was buried in Westminster Abbey.

**Cowper, William**, English poet, was born, 1731, died 1800. He was admitted to the bar in 1754, but did not practice. He passed many years at his home, in Buckinghamshire, in the society of Mrs. Unwin, Lady Austen, and the Rev. John Newton, engaged in religious exercises and charities. Lady Austen turned his attention to poetry, and after contributing sixty-eight poems to the *Dorinda* series, he published in 1783 his first volume.

The ballad of *John Gipsy* gave him a wide renown. In 1799 he revised his *Home*, and wrote his last poem, *The Cowway*.

**Cox, Samuel**, English landscape painter, was born at Deritend, a suburb of Birmingham, England, 1783. He studied in London with John Varley. From 1811 to 1814 he lived in London, where he was in 1814 settled at Harborne, near Birmingham, where he died, 1859.

**Cox, Sir George William**, English writer, mythologist, was born 1827, educated at Rugby school and Trinity College, Oxford. In 1877 he succeeded to the post of lecturer. Among his works are: *Tales of Ancient Greece*; *Argan Mythology*; *History of Greece*, etc. Died 1902.

**Coxsanders, Charles**, born in Warren, Ohio, 1850; studied in Cincinnati and Philadelphia; in Paris under Carpeus Duran and Gerome, 1872-82. He settled in New York, he contributed to leading magazines on art subjects. Author: *Myself*; *Myself*; *Old Masters* on New York.

**Cox, Palmer**, artist, born in Cranby, Quebec, Canada, 1840; graduate of Gresham Academy; lived in San Francisco, 1863-76. His specialty is original humorous pictures illustrating his own books. Author: *The Broome at Home*; *The Broome Around the World*.

**Cox, Samuel Sullivan**, American politician and diplomat, was born in Ohio in 1824, and died in 1904. He was elected governor of Ohio, 1859-62; represented an Ohio district in congress; in 1865 he moved to New York, and was returned to congress in 1866. He was minister to Turkey, 1885-88. The present arrangements for taking the national census, the largely of his energy in the treasury saving service, which is one of the most efficient branches of the government service, is almost entirely his work.

**Coxe (kôk), Arthur Cleveland**, American Episcopal bishop, was born at Mendham, N. J., 1818; and was elected bishop of New York, 1868. He was born in 1838, and became well known as a churchman and a writer. He became the rector of St. Paul's church in New York in 1899, and bishop of western New York in 1905.

**Crabbe (krâb), George**, English poet, born 1754, died 1832. He was a surgeon, but abandoned his profession for literary adventure, and went to London in 1780. He was ordained a priest in 1782, and became chaplain to the Duke of Rutland at Belvoir castle. In 1783 he published *The Village*, and in 1807 *The Parish Register*, his best work.

**Cradock, Charles Robert**. See **Murree, Mary Neill**.

**Crambo, Charles**, Mrs. Pearl Mary Theresa. See **Hobbes, John Oliver**.

**Crane (krâd), Mary, Dinah Mary**. See **Mulock**.

**Crane, William**, English Scottish writer and educator, was born at Kenworthy, Wilt, 1798; studied for the church at St. Andrews, but settled in London in 1820, where he became professor of English literature in Queen's College, Belfast. Died at Belfast, 1868.

**Crane, William H.**, German painter, was born near Bumberg, Germany, 1472. In 1520 he bought an apothecary's business at Wittenberg, where he was also a book-seller and paper-maker, became counsellor and chamberlain, and was twice chosen burgo-master of the town. He was an intimate friend of Luther, whose picture he several times painted. Cranch died at Weimar, 1553.

**Cranch (krânch), Christopher Pearce**, American painter, was born at Alexandria, Va., 1813; studied in France and Italy in 1846-63; returned to New York and became a member of the national Academy in 1864. Died 1892.

**Crane, Walter**, English painter, decorator, designer, was born at Bury, Lancashire, 1845; worked in Liverpool, 1845. Apprenticed to W. J. Linton; first illustrated book, *The New Forest*, 1863; *Illustrations of the Works of Shakespeare*, 1864; *Illustrations to Shakespeare's Tempus*, *Two Gentlemen of Verona*, *Merry Wives of Windsor*; *Decorative Art*, *Book of Hours*, etc. Died at London, 1902.

**Crane, William H.**, actor born at Leicester, Mass., 1845; debut Ultra, N. Y., 1863; appeared with the *Harvard House*, 1877, followed by numerous successes, including the two *Dromios* in Shakespeare's *Comedy of Errors*, ending with *The Heretics*.

**Crane, Winthrop Murray**, manufacturer, United States senator, was born at Dalton, Mass., 1858; A. B., Williams, 1877. Lieutenant-governor of Massachusetts, 1897-99; governor of Massachusetts 1902-03; United States senator from Massachusetts appointed in 1904; died in 1905, still term expiring 1907, and re-elected that year for another year.

**Cranmer, Thomas**, archbishop of Canterbury, was born 1489, and educated at Cambridge University. He obtained the favor of Henry VIII, by having studied the divorce from the pope, and was appointed primate in 1533. He favored the reformed doctrines during the reign of Henry VIII, and was the chief of Edward VI. Cranmer was thoroughly established, and the *Book of Common Prayer* compiled, 1549, under his guidance.

He was committed to the Tower on the accession of Mary, condemned at Oxford for heresy in 1554, and, after two years' imprisonment, burned there, openly rejecting the reprieve granted by the queen, which he had been induced to sign. Died, 1556.

**Cranus (krâ'us), Lucius Licinius**, Roman orator and statesman, first consul, 140 B. C. He was consul in 98, and censor in 92 B. C. Died 91 B. C.

**Crausac, Marcus Licinius**, Roman general and statesman, was born about 105 B. C. Pintarch estimates the wealth of Crausac at more than 7,000 talents, and the revenues of the province of Crausac were worth 8,000 talents. About 60 B. C. Caesar, Pompey, and Crausac became members of the first triumvirate. Crausac was killed at the battle of Pharsalus, 48 B. C.

**Crawford, Francis Marion**, American novelist, was born at Bagli di Lucca, Italy, 1854. From 1881 to 1883 he was in America, and subsequently resided at Sorrento, Italy. He published over forty novels, including *Mr. Isaacs*; *An American Politician*; *Brotherhood*; *Survivors*; *With the Immortals*; *The Rulers of the South* (Italy); *Murieta*; *A Maid of Venice*; *Cecilia*; *The Story of Modern Rome*; *The Heart of Rome*; *A Lady of Rome*; and the play *Francesca da Rimini*, produced by Sarah Bernhardt in Paris, 1902. Died 1909.

**Crawford, Thomas**, American sculptor, was born in New York in 1814. His principal works are the bronze statue of Christopher Columbus, in the Boston museum hall, the colossal equestrian statue of Washington at the capitol, Richmond, and the statue of George Washington in the city capitol, Washington. Died in London in 1857.

**Crawford, William Harris**, American statesman, born in York, England, 1792; graduated at the Columbian college, Georgia, was admitted to the bar 1796, and began his practice in Lexington, Georgia, 1800. He was elected to congress, and to the United States senate to fill a vacancy in 1807, re-elected for a full term 1811, and was elected president of the senate, 1812. He received the nomination for president, 1824, and in the election had forty-one electoral votes.

**Creasy (krî's), Sir Edward Shepherd**, English historian, born at Bexley, Kent, in 1812; from 1836 to 1840 he was a lecturer at King's College, London, and in 1840 was elected a fellow; in 1840 was appointed professor of history at London University, in 1860 he was elected to the office of professor of history at Hampton Hill, 1878. He was author of *The Fifteen Decisive Battles of the World*, *Invasions of England*, *History of the Crusades*, etc.

**Creel, Enrique C.**, Mexican diplomatist and statesman, was born at Chihuahua, Mexico, 1854; he was minister to the United States, 1898-1900; speaker of house, 1892; governor of state of Chihuahua, 1903-06; ambassador extraordinary and minister plenipotentiary of Mexico to the United States, 1906-09.

**Creelman, James**, author, journalist, and associate editor of *the New York Times*, 1868-1890. He was born, 1859. Editorial writer and correspondent, New York Herald, 1877-90, was aide on General Sherman's staff, 1862-63, and was shot after he received surrender of Spanish commandant at El Casey, 1898. Author: *On the Great Highway*, *English History*, etc.

**Creighton (krî'gan), James Edwin**, editor, professor of logic and metaphysics, Cornell, since 1896, was born in Paris, Nova Scotia, 1861; Ph. D., Cornell, 1892; L.L.D., Queen's University, 1893. Editor of *Philosophical Review*; American *Factor of Kant Studies*. Author: *Introduction to Logic*.

**Creighton, Mandell**, English historian, born at Carlisle, 1843; graduated at Merton College, Oxford, and was elected a fellow in 1866. He became vicar of the church of Northampton, in 1875, first professor of ecclesiastical history, at Cambridge in 1884, bishop of Peterborough in 1891, and of Exeter, 1896. He was elected in 1871, he was yet sent to carry the news of the victory to the pope and the French king. He abhorred the pope, and the French king, and took part in the siege of La Rochelle in 1573. When the peace with Savoy was concluded, Crillon retired to his native land, and lived the rest of his life in the exercise of piety and penance. Died 1615.

**Crépié (krî'pî), Francesco**, Italian statesman, was born near Rimini, Italy, 1800; he was elected to the bar at Palermo, but, joining the revolutionary movement of 1848, had to flee to France; in 1854 he was elected to the Italian parliament, and his efforts were made to discredit him by connecting him with a series of bank scandals; in 1896 the Abyssinian disaster of Adwa compelled his resignation. Died 1901.

**Critias (krî'â's), a**, pupil of Socrates, but a hearty rather than a doer of his word. He had a high reputation as an orator, also as a writer, poetry.

**Crittenden (krî't'ên), John Jordan**, American statesman, born in Kentucky in 1796. After having studied law at the University of Virginia, he was, in 1816, became a member of the Kentucky house of representatives, and was elected United States senator in 1827. He was elected in 1855. In 1841 he became attorney-general in President Harrison's administration; and in

1848 was elected governor of Kentucky. He opposed the secession movement in 1860-61. Died, 1863.

**Crocker, Francis Bacon**, electrician, physicist, professor of electricity, engineering, Columbia, since 1889; born at New York, 1815; graduated at Columbia, M. E., 1832; Ph. D., 1835. President American Institute of Electrical Engineers, 1897-98.

**Crockett, David**, American pioneer and politician, was born in Tennessee, and was noted for his adventures and eccentric habits, and was a member of congress from 1827 to 1831, and from 1835 to 1836. He was killed in Texas in their revolt against Mexico, was taken prisoner at Ft. Alamo in 1836, and was killed in that celebrated battle.

**Crockett, Samuel Rutherford**, British novelist; born in Dunchrae, Galloway, 1860. Educated at Edinburgh, Heidelberg, and Berlin. Gained the Estera Free church of Scotland, 1886; minister of Penicuik for some years, then became a writer and journalist.

**Croesus** (*kr'ezus*), last of the kings of Lydia, in the sixth century B. C.; celebrated for his wealth, so that his name became a synonym for a man overwhelmed by the favors of fortune.

**Crofts, Ernest**, British painter, keeper of the Royal Academy; born in Yorkshire, 1847; educated at Rugby and Berlin. Studied art at London and Dusseldorf. Pupil of A. B. Clay and Professor Hunter.

**Cromer (kr'mr)**, Evelyn Baring, first Earl, British statesman and diplomat, was born at Cromerhall, Norfolk, 1829; educated at Eton, Harrow, and Rugby; Royal Military Academy, Woolwich. Hon. D. C. L., Oxford; LL. D., Cambridge; financial adviser to the Egyptian government, 1883; financial minister at conference in London on Egyptian finance, 1884; agent and consul-general, Egypt, 1883-1907. Author: *The War Game*, and other military works; *Modern Egypt* (2 volumes); etc.

**Cromwell, Thomas**, revival of the spinning-mule; born near Bolton, England, 1753; for five years he worked at his project, and at last sold it for 50 pounds. It revolutionized the manufacture of British muslin, and brought wealth to all save the inventor, who died in comparative poverty, 1827.

**Cromwell, Oliver**, the great Protector, born at Huntingdon, in 1599, of Welsh descent—one of his ancestors, called Williams, having adopted the surname of his patron, Thomas Cromwell, whose agent he was in the suppression of the monasteries. Early experiencing a 'saving change,' he emerged from his period of gloom and anxiety a stern and convinced Puritan and Calvinist, and determined to determine the religious pretensions in church and state. He sat as a member for Huntingdon in the Parliament of 1628. When the Scottish revolt compelled Charles to summon a new Parliament (1640), Cromwell sat for Cambridge; and again in the Long Parliament as an active supporter of the popular and Puritan cause. He was never a parliamentarian in the ordinary sense of the word.

When the English Civil War began, his opportunity came. He fought at Edgehill (1642), and there perceived the weakness of the parliamentary levies against the spirit and dash of the royalist cavaliers. He saw that a counter-motive was required to meet the gallant traditions inspiring the king's soldiers, and this he found in the stern plainness of the English yeoman. He organized his famous cavalry regiments from this class, and at Marston Moor (1644) demonstrated the superiority of his troops, and stood forth as the greatest English military leader of the time—a fact which he showed again at Newbury (1644), Naseby (1645), Preston (1648), Dunbar (1650), Worcester (1651)—though the Scots general Leslie excelled him in strategy.

Cromwell attached himself early to the extreme and independent party in the army and the state, and was their representative in their struggle with the Presbyterian Parliament, which, after Naseby, wished to disband the army. It is probable that Cromwell was moulded by circumstances rather than that he was himself the moulder of them. The execution of the king shocked all the moderate men; and after Cromwell's return from a ruthless expedition against the royalists in Ireland, he was summoned to Scotland, where Charles II. had been declared king by the whole nation. The 'crowning mercy' at Worcester (1651) followed his victory over the Scots at Dunbar, and the three kingdoms were at his feet.

His first troubles were with Parliament. The 'Rump,' the remnant of the Long Parliament, being recalcitrant, Cromwell wished to prolong its own existence, Cromwell summarily dissolved it. In Sept. 1653 he called a new parliament, which undertook the revival of the constitution and offered Cromwell the title of king. Cromwell refused, he was again installed as Lord-protector, but with his powers now legally defined. Early in the following year, however, he attempted to dissolve the house which had rejected the authority of the second chamber. Abroad his influence still increased reaching its full height after the victory of Dunbar in June, 1658.

But his mastery administration was not effected without severe strain, and upon the death of his favorite daughter, Elizabeth Claypole, in the beginning of August, 1658, his health began to fail him. Towards the end of the month he was confined to his room from a tertian fever, and on Sept. 3, 1658, died at Whitehall, in the sixtieth year of his age. He was buried in King Henry Church, in Westminster Abbey, and after the Restoration his body was taken up and hanged at Tyburn, the head being fixed on a pole at Westminster Abbey, and the remains buried under the gallows.

Cromwell as general, Cromwell was still greater as a civil ruler. He lived in a simple and retired way, like a private man, and was abstemious, temperate, indefatigably industrious, and exact in his official duties. He possessed extraordinary penetration and knowledge of human nature; and devised the boldest plans with a quickness equalled only by the decision with which he executed them. No obstacle deterred him; and he was never at a loss for expedients. Cool and reserved, he patiently waited for the favorable moment, and never failed to make the most of his religious views he was a tolerant Calvinist.

**References.**—Curley's *Cromwell's Letters and Speeches*; Harrison's *Cromwell*; Morley's *Cromwell*; *History of the Protectorate*; *History of the Commonwealth and Protectorate*; *Cromwell's Army*, and Knowsley's *Oliver Cromwell*. Cromwell's Protectorship was the last son of Oliver, but by the deaths of two elder brothers, Robert and Oliver, became his father's successor. The protector had been empowered to nominate his successor, an effort was made to train Richard to the work of government, but in 1659 he had to resign the protectorship when the forces of anarchy, both parliamentary and military, broke loose, finding himself unable to restrain them, and deep in debt, he abdicated in 1659.

**Cromwell, Thomas**, chief of Essex, English statesman, born about 1485. He was in the service of Wolsey for several years before the cardinal's ruin in 1526, and remained his steady friend in adversity. His fidelity to his patron, and his talents commended him to Henry VIII., who appointed him his secretary and spokesman in the house of commons. This made him the leader of the English reformation. He was created earl of Essex, received valuable estates from the spoils of the monasteries, and was the king's most powerful subject. But he had enemies, and in 1540 he was executed by order of his master, Henry VIII., by his promotion of the marriage with Anne of Cleves, with whom Henry was disgusted, he was beheaded.

**Cromwell, William Nelson**, lawyer; now senior of law firm of Sullivan & Cromwell; officer, director, and president of the American Steel Corporation in the United States. He perfected the details of the transfer of Panama canal to United States government.

**Cronje (kr'nj)**, Pietrus Arnoldus, Boer general, 1860-1897. He was a descendant of Huguenots in the western army of the South African republic; frustrated the Jameson raid at Krugersdorp, 1895; defeated the Boers at Paardeburg, the Marshal Lord Roberts, 1900; member of the executive council of the Transvaal republic; chief of the Boer army, 1900.

**Crookes (kr'ooks)**, Sir William, British chemist and physicist; proprietor and editor of *Chemical News*; president of the British association for the advancement of science, 1889; editor *Quarterly Review of Science*; born in 1832. Discoverer of thallium, a new element, 1861; radiant matter, 1870; radiant matter, 1870; discovery of the elements of gadolinite, etc., 1880; genesis of elements, 1887.

**Crosby (kr'sbi)**, Fanny (Mrs. Frances Jane Van Hooker), blind writer; popular hymns; born at Southey, N. Y., 1820. Wrote words to many songs for George F. Root, the composer. Her first hymn was written for William B. Bradbury.

**Crosby, Howard**, American clergyman and scholar, born at New York, 1841; graduated at the University of New York, 1861; 1862; of Greer, then, 1861-69; and at Rutgers College, New Brunswick, 1869-71; 1871-72; of the University of New York, 1872-81. In 1877 he was the leading organizer of the society for the prevention of crime.

**Crothers (kr'uthrs)**, Samuel McChord, Unitarian clergyman, author, was born at Oswego, Ill., 1857; a Military Academy, 1876; began his ministry at Union Theological Seminary, D. D.; Litt. D.; since 1904 at First Parish, Unitarian church, New York City, since 1907. With the University, Author: *The Gentle Reader*; *The Understanding Heart*; *The Pardoner's Wall*; *The*

**Crozier, William**, army officer, was born at Carrollton, Ohio, 1853; graduated from United States Military Academy, 1876; began his service in the United States army as an artillery officer, 1876; brigadier-general and chief of ordnance of United States army since 1907. With General Buffington invented the Buffington-Crozier disappearing gun carriage; invented the gun.

**Cruikshank (kr'ukshank)**, George, English artist, was born in London, 1792. His father and elder brother were both caricaturists. Like Hogarth, he was a moralist as well as an artist, and as a total abstainer he consecrated his art to length to the reformation, 1875; died at Garsington, Oxfordshire, 1878.

**Crumphacker, Edgar Dean**, lawyer, congressman, was born at New York, 1840; admitted to the bar in 1876, and has been in the practice of law at Valparaiso, Ind., since; member of the lower house of congress, 19th Indiana district, since 1897.

**Cruwvell, Charles Thomas**, English clergyman and scholar, son of a welder, Oxfordshire, was born at Peterborough cathedral, born in London, 1847; graduate of St. John's College, Oxford. Ordained to the ministry, 1873; died at Garsington, Oxfordshire, 1900-06.

**Cujas (k'ujas)**, Jacques, eminent French jurist, born in 1502, studied under Araud, a jurist at the University of Toulouse because professor of the Roman law at Bourges and Valence. Among his works are *Commentarius ad Justinian's Institutes*, and on the *Pandects and Decretals*. Cujas has been styled by Hallam the greatest of the French jurists.

**Culberson, Charles A.**, lawyer, United States senator, was born in Dadeville, Ala., 1855; studied law in New York; admitted to the bar, 1878; Virginia in 1876-77; elected attorney-general of Texas in 1880 and 1892; elected governor of Texas in 1890-91; elected United States senator, 1899, 1903 and 1911.

**Cullom, Shelby Moore**, lawyer, United States senator, was born at Carmichael, Pa., 1830. In 1853, was admitted to the bar, and began to practice law at Springfield, Ill.; was governor of Illinois in 1874-83; elected United States senator in 1883; and reelected in 1888, 1894, 1899, 1903 and 1911.

**Cummins, Albert Baird**, lawyer, United States senator, was born at Carmichael, Pa., 1830. LL. D.; studied law in office of McClellan & Hodges, Chicago. Admitted to Illinois bar, 1874. Member of Iowa legislature, 1883; governor of Iowa, 1902-04, 1904-06, 1906-08; elected 1908 to United States senate to serve out term of Illinois. Mr. Allison, deceased, reelected 1909 for the term 1909-15.

**Cunard (kr'nard)**, Sir Samuel, chief engineer, founder of the Cunard Line, born at Limerick, Ireland, 1793; came to America, 1817; acquired early as a merchant and shipowner, and removed to New York, 1820. He was born at Limerick, Ireland, 1793, the Royal Mail steam packet company, between Liverpool and Halifax, Boston, and Quebec. The first passage, 1840, was the *Briancon*, a fourteen days night homeward. Iron steamers were introduced in 1855, and paddle-wheels gave way entirely to the screw after 1862. Since then the Cunard line has been kept at the head of the leaders in transatlantic travel. Died 1865.

**Cunningham, Daniel John**, British physician, scientist, professor of anatomy in the University of Edinburgh, 1803, and of comparative anatomy; born at Crieff, Scotland, 1830. M. D., D. Sc., D. C. L., D. P. F. R. S.; has been examiner on anatomy, 1860, and anatomy, 1861. Editor of *London, Cambridge, Oxford, and Victoria*. Author: *Manual of Practical Anatomy*; *The Microscopic*

**Cunningham, William**, English clergyman, educator, archdeacon of Ely, was born at Edinburgh, 1849; received his B. A., and M. A., from the University, 1869; chaplain in Trinity College, 1880-91; Hulsean lecturer, 1885; visitor of Great St. Mary's, Cambridge, 1887-90. Editor of *Outlines of English Industrial History*; *Cure of Souls*; etc.

**Curie (Mad'rs), Madame**, see Marie Sklodowska. Polish chemist, and physicist, was born at Warsaw, Russia, 1867; educated at Warsaw, and at the Sorbonne, Paris; see D. Paris; she discovered the element polonium with her husband, Pierre Curie, the element radium.

**Curie, Pierre**, French chemist, was born in Paris, 1861; he discovered the element radium, a member of the French Academy of Sciences, 1903. He was killed by an accident, 1906.

**Curran (Cur'ran), John**, Irish legal and parliamentary orator, was born in County Cork, Ireland, 1756. He was educated at Trinity College, Dublin, and in 1773 went to London, and entered the Middle Temple. In 1782 he obtained a seat in the Irish parliament as member for Killybeggs, 1817.

**Curtin, Jeremiah**, American author, ethnologist, and linguist, was born at Milwaukee, Wis., 1841; graduated from Harvard, 1863; was secretary of legation at St. Petersburg, 1864-70; connected with the United States bureau of ethnology, 1883-91. Died 1906.

**Curtis, Benjamin Robbins**, American jurist, born in Massachusetts, 1809; graduated at Harvard, 1830. On the impeachment of Andrew Johnson, he appeared as one of the counsel for the defendant.

**Curtis, Charles**, American United States senator, was born at Topeka, Kan., 1860; member of Congress, 1887-91; elected to the United States senate from Kansas, 1907.

**Curtis, Cyrus H. K.**, publisher, was born in 1850, and was educated in the public schools of New England. He is now the head of the Curtis publishing company, publishers of the *Ladies' Home Journal* and the *Saturday Evening Post*.

**Curtis, George Thomas**, American lawyer and critic, was born in Massachusetts, 1812, graduated at Harvard, and began law practice in Boston, afterward returning to New York. He was several times in the Massachusetts legislature, and was for a time United States commissioner. His main books are *Rights of the Merchant Seaman*; *Treatise on the Law of Copyright*.

**Curtis, George William**, American journalist, newspaper publicist, was born at New York, R. I., 1824. He commenced the *Editor's Easy Chair* papers in *Harper's Monthly* in 1853, and was editor of the *Century* on its establishment in 1857. He died at New York, 1892. He wrote *Lotus-Eating*; *Postscript Papers*; *True and It*; etc.

**Curtis, William Elmer**, journalist, born in Akron, Ohio, 1850; graduate of Western Reserve College, Cleveland, 1872; *Record-Herald*, Cleveland, 1872-73; commissioner of Columbian exposition to Madrid, and special envoy to the queen regent of Spain, 1876; *Cape Lee*, 1891; *India*, 1891; *India*, 1891; *Zachariah Chandler*; *Bygones*, *Burma*, and the *British India*; etc.

**Curtius (Kurt'us-ernst)**, Ernst, German historian and archaeologist, was born 1814, at Lübeck; studied at Bonn, Göttingen, and Berlin. From 1853 a member of the academy of sciences; he was one of its permanent secretaries 1871-93. He died 1896.

**Curtius, Georg**, one of the greatest Greek scholars, was born at Lübeck, Germany, 1820, and studied at Bonn and Berlin. After teaching at Dresden and Berlin, he became in 1849 extraordinary, in 1851 ordinary, professor of classical philology at Prague, at Kiel in 1854, at Leipzig in 1862. He died 1885.

**Curtis (Kurt'us) of Kedleston, first Baron**, George Nathaniel, English statesman, author, was born to Kedleston, 1859; graduate of Oxford college, 1881; member of parliament, Lancashire, 1886-98; vicerey and governor-general of India, 1899-1904; lord warden of the Cinque Ports, 1904-05; *India*, 1905; *Central Asia*; *Peria* and the *Persian Question*.

**Cushing (Kush'ing), Caleb**, American lawyer and diplomatist, was born in 1813. He was a member of Congress, 1835-38. He signed the first treaty of the United States with China; in 1874 he was one of the counsel for the settlement of the "Albion" claims, a boundary dispute; and in 1874-75 was minister to Spain. Died 1879.

**Cushing, Frank Hamilton**, American ethnologist, was born at New Bedford, Mass., 1834; was the national museum of Washington, and in 1875 began making collections of Indian relics for the department of ethnology. Among his books, *Petiches*, etc. Died at Washington, 1900.

**Cushman (Cush'man), Charlotte Saunders**, American actress, was born at New Bedford, Mass., 1816-1876.

**Custer (Kus'ter), George Armstrong**, American soldier, was born at New Rumsey, near Boston Point in 1831, and served with distinction through the Civil war. As a cavalry commander in the West he was several times defeated in battle. He died on the 19th of May, 1876, he attacked 9,000 Sioux on the Little Big Horn, in Montana, and had his 1,100 men were all destroyed.

**Cuvier, Georges Chretien Leopold Dagobert Baron**, (Koo'vée-an), one of the greatest natural-

ists the world has produced, was born at Montbéliard, France, 1769. After finishing his education at Stuttgart, young Cuvier accepted the situation of tutor in a Protestant family in Normandy. The Abbe Texier, whom the troubles of the time had driven into exile, from the capital, attracted him by letter to Jussieu and Geoffroy. Several memoirs, written about this time, and transmitted to the latter, established his reputation, and procured his admission to two or three of the learned societies in Paris.

In 1800 he was appointed successor to Daubenton as professor of natural history at the college of France, and in 1818 he succeeded Cuvier in the chair of comparative anatomy at the Garden of Plants. From that time he devoted himself steadily to the studies which have immortalized his name. His *Leçons d'anatomie Comparée*, and the *Règne Animal*, in which the whole animal kingdom is arranged according to the organization of the beings of which it consists, have raised him to the pinnacle of scientific fame, and established him perhaps the first naturalist in the world after Linnaeus. His numerous works upon these subjects show a master mind in the study of nature, and extending that study to the study of paleontology, he has been enabled to render immense service to geology.

In 1842 he became president of the Academy of Sciences, and in the same year a correlation of forms in organized beings—that all the parts of each individual have mutual relations with each other, tending to produce one end, that of the existence of the being; that each living being has in its nature its own proper functions, and ought therefore to have forms appropriated for that function and that consequently the analogous parts of all animals have received modifications of form which enable them to be recognized—he was able to ascertain from the inspection of a single fossil bone, not only the family to which it ought to belong, but the genus to which it must be referred. Even the very species of animal was thus to be made out, and the restoration of its external form as it might have lived and died, became in his hands an object of serious scientific precision. His *Règne Animal* has been frequently translated, and forms the basis of all arrangements followed at the present time. It has been an object of great importance in the state; particularly those connected with educational institutions. Napoleon treated him with much consideration; Louis XVIII. and Charles X. advanced him to honor; and Louis Philippe raised him to the rank of a peer of the realm. He died 1832.

**Cyrus the Great**, founder of the Persian monarchy, commonly called Cyrus the Elder, was born about 590 B. C. Putting himself at the head of his Persian troops, he advanced into Media and overthrew the forces of Astyages, 559 B. C. After consolidating his dominions, which was a work of some time, he proceeded to subvert the surrounding nations. The kingdom of Lydia first yielded, 546 B. C., and its king, the famous Croesus, fell into his power. Ultimately the whole of Asia Minor was subdued. But the crowning triumph of Cyrus was his capture of the city of Babylon, the seat of the Chaldean empire, 539 B. C.

Cyrus was young when he was in 424 B. C., son of Darius, and governor of the western province of Asia. He died after successfully fighting against his elder brother, Artaxerxes, he raised a large army, including about 12,000 Greek soldiers, and fought against him, but was defeated and slain at Cunaxa. His death conducted the retreat of the 10,000 surviving soldiers, 425 B. C.

**Dabney, Charles William**, educator, president of University of Cincinnati since 1904, was born in 1835; graduated from the University of Hampden-Sydney College, 1853; Ph. D., LL. D., 1855; was first to discover the phosphate deposits in North Carolina; was the first to make the present plan in establishing an industrial school at Raleigh, president of University of Tennessee, 1865-67; first assistant to the president of the State, 1865-67; member of many scientific and educational societies.

**Dal'gren (doh'gren), John Chalmers**, American surgeon, was born in Philadelphia, Pa., 1863;

graduated from University of Pennsylvania, scientific department, 1882; assistant surgeon, Jefferson hospital, 1887; demonstrator of surgery, Jefferson medical college, 1891; clinical professor of surgery, same college, 1903; professor of surgery, 1900. Surgeon to Philadelphia hospitals since 1893, to St. Joseph's hospital since 1900. Author of *Practical Surgery*. Edited *English edition of Zuckerkandl's Operative Surgery*, and new American edition of *Practical Surgery*.

**Daedens (doh'den), Herman Willem**, Dutch general, was born in 1762, died in 1818. He became colonel of a corps of 1,000, professor of surgery, 1793, and afterward brigadier-general. After the fall of Napoleon he was intrusted with the organization of the army of the Netherlands.

**Daguerre (dah'gair')**, Louis Jacques Mande, French inventor, was born in 1788. He discovered the daguerotype process of photography. He was also celebrated as a diorama painter; was named by the French government as an officer of legation of honor, 1863.

**Dahlgren (doh'gren), John Adolf**, American admiral, was born in Philadelphia, Pa., 1809. He became a midshipman, 1826, and lieutenant, 1837. Ten years afterward he began to experiment in the casting of heavy cannon for naval warfare, and finally devised the Dahlgren gun. He died in Washington, when in command of the navy yard, 1870.

**Dahlgren (doh'gren), Friedrich Christoph**, German historian, was born at Wismar, 1785; studied at Copenhagen and Halle, and in 1813 became a professor of history at the latter city. He received a professorship at Göttingen, where he published his valuable *Quellenkunde der deutschen Geschichte*. In 1842 he became professor at Bonn, and in the movement of 1848 headed the constitutional liberals. Died 1860.

**Dahn (doh), Ernst**, German publicist, historian, poet, was born at Hamburg, 1834, the son of the actor, Friedrich Dahn. He studied at Munich and Berlin. In 1872 became professor of German jurisprudence at Königsberg, and in 1888 at Breslau.

**Dal'gren (doh'gren), John**, was born at Harper's Ferry, Va., 1839; studied drawing and painting in New York with private teacher and at art student's league. First exhibited at National academy of design, 1880; studied in Europe, 1897; commenced to paint the Lady Chapel of the church of St. Mary and New York, 1900.

**Dalberg-Acton (doh'ber-act'oon), Sir John Emerich Edward**, first Baron Acton, English statesman, was born at London, 1814. In 1895 he was made professor of modern history at Cambridge University, and in 1902 he became a peer of the realm. He died 1902.

**D'Albert (doh'al'bert), Eugene Francis Charles**, dramatist and novelist, was born at London, 1857; studied first in London, afterward under Franz List in Weimar. Visited the United States several times, and was in 1891 in New York. He was made professor of modern history at Cambridge University, and in 1902 he became a peer of the realm. He died 1902.

**Dale, Alan**, pseudonym of Alfred J. Cohen, dramatist, critic, author, was born in Birmingham, England, 1867. He was educated at the University of London, and Oxford University. Came to United States, and resided in journalism in New York; dramatic critic of *New York Evening World*, 1897-98; dramatic critic of *New York Journal* since 1898. **D'Alembert**. *See* **Alembert**.

**Dalhousie (doh'hoose), James Andrew Broun Ramsay**, Marquis of, British statesman, was born at Middleton, Scotland, 1812. He distinguished himself in parliament, and won credit many important posts, and in 1847 proceeded to India as the youngest governor-general ever appointed to that country. He died in 1860.

**Dall (doh), Caroline Healey**, author, was born in Boston, Mass., 1822; daughter of Mark and Caroline Foster; married in 1841 to the Rev. Dr. L. L. D. Alfred University, 1877; vice-principal of Miss English's school, Georgetown, D. C., 1842-43.

**Dallas (doh'das), Alexander James**, American statesman, was born in the island of Jamaica in 1759; died in 1817. He was secretary of the treasury and acting secretary of war, and superintended the reduction of the army after peace had been declared.

**Dallas, George Millin**, American statesman and diplomatist, was born at Philadelphia, Pa., 1792. During 1831-32 he represented Pennsylvania in the United States senate; and minister to England, 1856-61. He died in 1864.

**Dalton (doh'ton), William**, British chemist and physicist, was born near Cockerham in 1766. He was famous for his experiments on the elastic force of steam. Died 1844.

**D'Alembert (dah'el-ber'te), Count Gombert**, member and secretary of the Prussian senate; professor at the University of Brussels, 1780; minister of Brussels, 1846; educated at Brussels and Paris. Late rector of the University of Brussels; long time director of the *Revue de Belgique*.

**Dalzell (dah'zell), John**, congressman, lawyer, born in New York City, 1826; graduated at Union College, 1846; admitted to bar, 1867; member of congress since 1867.

**Damen de (dah'men de), Joseph**, Roman Catholic missionary, was born near Louvain, Belgium, 1840. He long worked single-handed for the cause of the oppressed, and was joined by other priests. For twelve years he

escaped the contagion; but in 1585 the malady appeared in him, yet he continued his labors until his death in 1589.

**Damrosch** (*dám'rosh*), **Walter Johannes**, composer and musical director, was born in Breslau, Prussia, in 1852; received his musical education under his father and Riechert, Urspruch, and Hans von Bülow; came to United States with his father, 1871. Succeeded his father as conductor of the New York symphony society, 1885; founded the Damrosch opera company, 1894; elected conductor of New York Philharmonic Society, 1897. He wrote *The Scarlet Letter*, opera in three acts; *Cyranus*, opera in four acts, songs, etc.

**Dana** (*dá-ná*), **James**, American journalist, was born at Hindsdale, N. H., 1819. From 1846 to 1862 he was managing editor of the *New York Tribune*, and from 1862 to 1870 he was managing editor of the *New York Sun*. In 1867 he founded the *New York Sun*, and began the successful management of the paper on democratic lines. He died on Long Island, 1897.

**Dana**, **Edward Salisbury**, mineralogist, educator, was born in New Haven, Conn., 1849; graduated from Yale, 1870; Ph. D., 1876; professor of physics, Yale, since 1890; trustee of Peabody Museum since 1883; editor *American Journal of Science* since 1875. Author: *Text-book of Mineralogy*; *Text-book of Elementary Mineralogy*; *Dana's System of Mineralogy*; *Mineralogy for Students*, etc.

**Dana, Francis**, American poet and diplomat, was born in Massachusetts; studied at Harvard; graduated, and admitted to the bar in 1767; was a member of the congress of 1777, which formulated the articles of confederation; was a member of the senate supreme court, 1785; chief justice, 1791-1806.

**Dana, James Dwight**, essential geologist, educator, was born at Uxbridge, N. H., 1813; graduated at Yale, 1833; professor of natural history and geology at Yale College, 1845-95. Died at New Haven, Conn., 1895.

**Dana, John Cotton**, librarian, was born at Woodstock, Vt., 1855, and graduated from Dartmouth, 1878; studied law, Woodstock, 1878-81; became a lawyer, Colorado, 1881-83; admitted to New York bar, 1883; President of American library association, 1896.

**Dana, Paul**, editor, was born in New York, 1852; graduated from Harvard, 1874; Columbia law school, 1878. Became assistant editor of the *New York Sun*, 1880, of which his father was editor, and on the death of the latter, 1897, succeeded him as editor, retired in 1903.

**Dana, Richard Henry**, American poet and prose writer, was born at Cambridge, Mass., 1787. In 1818 he became associated with the *North American Review*, to which he contributed largely. His *Dying Raven*, *The Buccaneer*, and some other of his poems were warmly praised, but Dana's best work was in criticism. He died at Boston, 1879.

**Dana, Richard Henry, Jr.**, lawyer and author, son of the preceding, was born at Cambridge, Mass., 1818. He entered Harvard college in 1836, but suspended his studies on account of the weakness of his eyes in 1834. He then shipped as a common sailor on a voyage to California, of which he wrote a narrative entitled *Two Years Before the Mast*. He was one of the founders of the free soil party in 1848. Died in Rome, Italy, 1862.

**Dandolo** (*dán'dó-lo*), **Enrico**, doge of Venice, was born about 1108 or 1108 A. D. When the emperor Alexius, who had been raised to the throne by the exertions of Dandolo, was murdered by his own subjects, Dandolo laid siege to Constantinople, and took it by storm, 1204. He died in 1208 in Constantinople, and was buried in the church of St. Sophia.

**Dane** (*dán*), **Nathan**, American lawyer, was born in Massachusetts, 1752. He served in the continental congress, 1785-88; framed the ordinance for the Northwest territory, 1789; was prohibited slavery, and was United States senator, 1794-98. Died at Haverly, Mass., 1835.

**Daniel**, **John Warwick**, English statesman and senator, was born in Lymington, W. S., 1812; educated at Lymington College and Dr. Gesner Harrison's university school; studied law, University of Virginia, 1865-66; admitted to bar, 1866. Member of Virginia house of delegates, 1869-72; of state senate, 1875-81; member of congress, 1885-87; United States senator 1887-1910. Died 1910.

**Danewacker** (*dán'ek-ter*), **Johann Heinrich von**, German sculptor, was born near Stuttgart, 1758, and educated by the duke of Württemberg, who had become his patron; he became the first sculptor in the academy at Stuttgart; his earlier subjects were from the Greek mythology, and his later Christian. Died 1826.

**D'Annunzio** (*dán-nú'n-zio*), **Gabriele**, Italian poet, novelist, and dramatist, born in Pescara, Italy, educated at the College of Frosinone, University of Rome; studied law in Pisa, but in 1885 took up literature. Author: *The Child of Pleasure*; *The Voyage of Eros*; *The Triumph of Death*; *The Dead City*; *The Flame of Life*, etc.

**Dante, Alighieri**, foremost among Italian poets, and one of the greatest that the world has ever produced, was born at Florence in 1265. He was educated at the Universities of Bologna and Padua, and at a later period,

while in Paris, applied himself to the study of theology. He fought in the victorious battle of Campaldino against the Aretines in 1300, and took an active part in storming the fortress of Capraia 1290.

Having been twice entrusted with an embassy, he was chosen one of the prior, or chief-magistrates of Florence, in 1300, when the struggle between the Guelphs and the Ghibellines was at its height. Dante espoused the cause of the Guelphs, or Imperialists, who, being the weakest numerically, were overthrown by the Ghibellines, and the Guelphic leaders were banished and their property confiscated. Dante shared their fate and left his native city, never to return. For many years he was doomed to bear the sorrows and hardships of an exile. In 1304 he left Verona, and went to Paris.

When the Emperor Henry VII. invaded Italy, Dante returned to Verona, and employed his powerful pen to further the imperial cause. It was probably at this time 1310 that he wrote the work *De Monarchia*. The fruitless struggle between the emperor and the pope, and the Emperor 1313 demolished his last hope, and he spent the remaining years of his life under the kind protection of Guido Novello da Volterra, one of the foremost statesmen of Italy. Many cities of Northern and central Italy claim the honor of having harbored Dante within their walls. His remains were buried in a chapel of the *Frati Minori* in Ravenna. They were, however, subsequently removed, and in 1865 were discovered in the Braccioforte Sepulchral Chapel of the same city. In 1830 only, a marble cenotaph was consecrated to his memory in the church of Santa Croce at Florence.

When about 9 years old, Dante beheld, for the first time, Beatrice Portinari, then 8 years of age, and the love then kindled in the heart of the tender boy remained forever the inspiration of his life. How pure and chaste this passion was, may be seen from the poet's first work, *Vita Nuova*, which is consecrated to a collection of poems referring to his early love; each of these poems is accompanied by a history of its origin, and accurate analysis. Beatrice was married to the noble Florentine Simone de' Bardi, and died at an early age. A few years after her death, Dante married the daughter of an old and noble family, by whom he had six or seven children.

In his work *De Monarchia* he advocated the supremacy of the emperor in temporal, and that of the Pope in spiritual affairs. He wrote several other works in Latin, besides many canzonets, sonnets, and lyrics in Italian; most of the latter were collected in his *Convito*. But his greatest work is the *Divine Comedy*. The best English translations of the complete poem are those of Cary, and of Longfellow.

**References**.—Symonds's *Introduction to the Study of Dante*; Rossetti's *A Shadow of Dante*; Gardner's *Dante Primer*; Butler's *Dante*; *The Works of Dante*; *Handbook of Dante*; *His Times*; Toyne's *Dictionary of Proper Names and Noble Matters in the Works of Dante*; *Fay's Dante*, and *Quint's Dante*.

**Danon** (*dán'ón*), **Georges Jacques**, French revolutionist, was born at Arcis-sur-Aube, France, in 1759. A zealous devotee of naturalism, he used all his influence to hasten the execution of the king; and subsequently, as the president of the *Revolution*, appeared anonymously in 1792, and other revolutionary leaders to establish that fatal tribunal under whose authority so many sanguinary judgments were pronounced. He was cruel, however, with *Rubespierre*, and by that very tribunal which he himself had established, he was executed, and guillotined in 1794.

**D'Arbly** (*dán'blá*), **Frances Burney**, English novelist; born at Lynn Regis, England, 1752. From the age of eighteen to twenty-six she worked as a governess, appeared on the stage, and won her fame. In 1793 she married General D'Arbly, a French refugee. Her last works are *Camilla*, *The Wanderer*, and the *Memoirs of her father*. Died at Bath, England, 1840.

**Darius** (*dán'us*), king of Persia, was born in the city of Hyrcanus, and was the son of the usurper, and became king of Persia in 521, in succession to Cambyses. He captured Babylon after a siege of twenty months, and destroyed the city, and defeated the Scythians. He died in 486 B. C.

**Darius III., Codomannus**, the last ruler of the Persian empire, 336-330 B. C. At the battle of Arctium, in 334, he was defeated by Alexander, who had a host of more than 1,000,000 men, was completely routed. Darius fled to Ecbatana, where he collected a new army. Alexander pursued him thither, but before he came up with him Darius was assassinated by Bessus, satrap of Bactria, 330 B. C.

**Darley** (*dár'li*), **Felix O. C.**, American artist, was born in New York, 1824. Though a painter in water, he is especially known for his work as an illustrator. Some of the finest figures and scenes in the *Fortunio* series, and the *Longstone* lithograph on the men of the *Farm Islands*, are recollections of the survivors of the wreck of the *Fortunio* steamer, September 7, 1868.

**Darling, Grace**, born, 1818; died, 1842. With the exception of Fuller, no other woman has been in the Longstone lithograph on the men of the *Farm Islands*, are recollections of the survivors of the wreck of the *Fortunio* steamer, September 7, 1868.

**Darley** (*dár'li*), **Lord, Henry Stuart**, husband of Mary, queen of Scots, the eldest son of the earl of Lennox by Lady Margaret Douglas, was born in England, 1545, where also he was educated. He is interesting chiefly on account of the position which he occupied with respect to his wife, and his tragic end in 1567. He was father of James I. of England.

**Darrow, Clarence S.**, lawyer and socialist, was born in Kingston, N. Y., 1834. He was admitted to the bar, 1875. Elected to Illinois legislature, 1902. Active in political campaigns as independent candidate for governor, 1892, and 1900. He has a large number of labor injunction and labor conspiracy cases on side of labor.

**Darwin, Charles**, English naturalist, was born at Shrewsbury in 1809, died at Down, near Beckenham in Kent 1882. He was educated at the Universities of Edinburgh and Cambridge.

He early devoted himself to the study of natural history, and, in 1831, was appointed naturalist to the surveying voyage of H.M.S. *Beagle*. The vessel sailed in 1831, and did not return till 1836, after having circumnavigated the globe. Mr. Darwin came home with rich stores of knowledge, part of which he soon gave to the public in various works. In 1839 he married his cousin Emma Wedgwood, and succeeded to the position of country gentleman, engrossed in scientific pursuits—experimenting, observing, recording, reflecting, and generalising.

He published his *Life and Writings of Resources during a Voyage round the World*; in 1844 *Structure and Distribution of Coral Reefs*; in 1844 *Geological Observations on Volcanic Islands*, etc.; in 1845 *Geological Observations on the Mountains of Scotland*; in 1845 his first *Sketch of the Zoonoidea*, and soon after the *Fossil Lepidosaurs and Batrachians of Great Britain*. In 1859 his name attained its great celebrity by the publication of *The Origin of Species by Means of Natural Selection*. This work, scouted and derided though it was at first in certain quarters, may be said to have worked nothing less than a revolution in biological science. In it for the first time was given a full exposition of the theory of evolution as applied to plants and animals, the origin of species being explained on the hypothesis of natural selection.

The rest of his works are largely based on the material he had accumulated for the elaboration of this great theory. His principal works are: *The Power of the Fertile Soil* (1842); *Descent of Man and Variation in Relation to Sex* (1871); *The Expression of the Emotions in Man and Animals* (1872); *Movements and Habits of Climbing Plants* (1875); *Insectivorous Plants* (1875); *Cross and Self Fertilization* (1876); *The Power of Movement in Plants* (1878); *The Power of Growth of Vegetable Mould* (1881); the last containing a vast amount of information in regard to the common earth-worm. Mr. Darwin was buried in Westminster Abbey.

**References**.—Widdowson's critical annotations by T. H. Huxley, A. A. Gray, J. G. Thompson, St. G. Mivart and E. D. Cope; and *Life and Letters of Darwin*, by Charles Fox Parry.

**Darwin, Erasmus**, English poet and physician; born in Eithan near Newark, England, 1731. He studied at Cambridge, obtained a degree in medicine at Edinburgh, in 1755, and settled at Lichfield as a physician. He died in 1802.

**D'Arbly** (*dán'blá*), **Frances Burney**, see *D'Arbly*.

**Daubigny** (*dáub'ny*), **Charles**, **Francçois**, French landscape painter, was born in Paris, 1817. He was made chevalier of the legion of honor, 1857. Died 1878.

**Alonso, France;** he accompanied Lafayette to America in 1777. He was then appointed a major-general by congress in 1780. He died in New Jersey and Maryland, and was killed in command to General Gates. He was killed in the battle of Camden, 1780.

**De Koren (dā-kō'ren), Henry Louis Reginald,** American composer, was born in Middletown, Conn., 1861; graduated at Yale in 1885. He has served as musical critic on various New York publications. His operas are: *The Beguine*; *Don Quixote*; *Robin Hood*; *The Rose Tree*; *Swan Song*; *Student King*; *The Snowman*; etc. He has written also a large number of songs and various music for the stage.

**Delacroix (dā-lā'kroix), Ferdinand Victor Eugene,** French painter, chief of the romantic school, was born near Paris, 1798. He studied at the École des Beaux-Arts in Paris. In 1822 his first work, *Death and Victory*, attracted much attention. In 1830 he was elected by the institute to fill the place of Paul Delarocche. He died in 1855.

**Delambre (dā-lā'mbr'), Jean Baptiste Joseph,** famous French astronomer, was born at Amiens, 1749, and studied first under Delisle, and afterward under Lalande. After the discovery of the planet Uranus in 1781, he composed tables of its motion. In 1802 he was appointed inspector-general of education. He died in 1822.

**Deland (dā-lā'nd), Margaretta Wade, nee Campbell,** American writer, was born at Allegheny, Pa., 1837; educated at private schools, and married, 1860, Loria F. Deland. Her books are: *Arthur Ward, Preacher*; *The Old Garden and Other Verses*; *Dr. Lander's People*; *The Common Way*. The *Illustration of Helen Rector*.

**De la Rampe (dā-lā-rā'mp'), Louise** (better known by her pen name "Gaula"), English novelist of French extraction, was born at St. Edmunds, England, in 1840. Her first novel, *Granville d'Ugna*, appeared in book form in 1863, and was followed by numerous others. She has written many plays of European society. Among her stories are: *Under Two Flags*; *Held in Bondage*; *Shadows*; *The Little Duke*; *The Duke's Daughter*, and *Santa Barbara*. She died in Italy, 1908.

**Delarocche (dā-lā'rō'che), Paul,** French historical painter, was born at Paris in 1797; died in 1856. He studied under Watteau and Gros. Many of his subjects are drawn from French history, and they are usually of a somber character.

**Delarocche (dā-lā'rō'che), Theophile,** French statesman, was born in Pamiers, France, 1832; educated in Paris, and began his career as a journalist. He was elected to the Chamber of Deputies in 1859, for Foix. He has always been a consistent advocate of colonial expansion; foreign minister when M. Waldeck-Rousseau succeeded M. Dupuy, and when M. Combes, in 1902, succeeded M. Waldeck-Rousseau; visited England with the president in 1903, and with Lord Lansdowne prepared the Anglo-French agreement, signed in 1904. The difficulty with Germany about Morocco caused his retirement in 1905.

**Deille (dā-lā'ill), Jacques,** French poet, was born in Auvergne, France, 1738. He was educated at the College de Mazarin in Paris, and obtained a professorship in Amiens. The revolution compelled Deille to leave France, and he traveled in Switzerland and Germany, and then in London occupied eighteen months in translating *Paradise Lost*. Blind in his old age, he died in 1813.

**De Marigny, Charles,** French statesman, was born at Paris, 1793. He was elected to the Chamber of Deputies in 1830, for Foix. He has always been a consistent advocate of colonial expansion; foreign minister when M. Waldeck-Rousseau succeeded M. Dupuy, and when M. Combes, in 1902, succeeded M. Waldeck-Rousseau; visited England with the president in 1903, and with Lord Lansdowne prepared the Anglo-French agreement, signed in 1904. The difficulty with Germany about Morocco caused his retirement in 1905.

**De Meille (dā-lā'ill), Jacques,** French poet, was born in Auvergne, France, 1738. He was educated at the College de Mazarin in Paris, and obtained a professorship in Amiens. The revolution compelled Deille to leave France, and he traveled in Switzerland and Germany, and then in London occupied eighteen months in translating *Paradise Lost*. Blind in his old age, he died in 1813.

The revolution compelled Deille to leave France, and he traveled in Switzerland and Germany, and then in London occupied eighteen months in translating *Paradise Lost*. Blind in his old age, he died in 1813.

He labored to get all the Greeks to combine against the encroachments of Philip, but their want of patriotism and Macedonian gold frustrated his efforts. He was present at the battle of Chaeroneia (380 B. C.), in which the Athenians and Boeotians were defeated by Philip, and Greek liberty crushed.

After the death of Alexander in 336 Demosthenes tried to stir up a general rising against the Macedonians, but Alexander at once adopted measures of extreme severity, and Athens sued for mercy. It was with difficulty that Demosthenes escaped being delivered up to the conqueror. In 324 he was imprisoned on a false charge of having received a bribe from one of Alexander's generals, but managed to escape into exile. On the death of Alexander near the year he was recalled, but the defeat of the Greeks by Antipater caused him to seek refuge in the temple of Poseidon, in the island of Calauria. He was taken from there, and being himself to escape from the emissaries of Antipater (322 B. C.).

The character of Demosthenes is by most modern readers considered as one of the greatest in history. His fame as an orator is equal to that of Homer as a poet. Cicero pronounces him to be the most perfect of all orators. He carried Greek prose to a degree of perfection which has never before been reached. Everything in his speeches is natural, vigorous, concise, symmetrical. We have under his name sixty-one orations, some of which are admitted to be the greatest of the kind indeed enemy—of Demosthenes as an orator was Aeschines.

**Deane, Charles Samuel,** lawyer, public official, was born in Edwardsville, Ill., 1830; graduated from McKendree College, 1852; studied law, and was admitted to the bar in 1855. He moved to Illinois house of representatives, 1852; served one term as attorney for sanitary district, 1857; state attorney, 1858; U. S. attorney, 1860-1864; governor of Illinois, 1904-13.

**Dewey, Chauncey Mitchell,** lawyer, United States senator, was born in Albany, N. Y., 1834; was graduated at Yale College in 1850; studied law, and was admitted to the bar in 1855; L. D., 1857. He was member of the New York Central railroad in 1860; general counsel of the United States senate, 1869, and reelected, 1905. He has an international reputation as an expert.

**De Quincy, Thomas,** English essayist, born in Manchester, England, in 1755. In 1803 he entered Worcester College, Oxford, which he left without a degree, and soon after became acquainted with Coleridge and Wordsworth, took a notice at Grasmere, and became a member of the famous "Lake school." He had acquired the habit of taking opium by using it to cure an attack of neuritis, and so greatly did it grow upon him that he was known to take as many as 12,000 drops, equal to ten wineglasses, in a day. He was engaged in preparing fourth volume of his works for the press within a few days of his death. Died 1830.

Alexander I. In 1903 he retired to private life, and gave himself up to poetry. Died 1916.

**Descartes (dā-kā'rtes), René,** great French philosopher and mathematician, was born, 1596, at La Haye, in Touraine. He was educated at the Jesuit College of La Fleche, where he showed great talent. He entered the military profession, and was killed in the battle of La Bataille in 1621. In 1621 he left the army, and after a variety of travels finally settled in Holland, and devoted himself to philosophical inquiries.

Descartes, seeing the errors and inconsistencies in which other philosophers had involved themselves, determined to build up a new system of philosophy, by divesting himself first of all the beliefs he had acquired by education or otherwise, and resolving to accept as true only what could stand the test of reason. Proceeding in this way he wrote *Meditationes Prima Philosophiae* in which he first enunciated that he could not doubt or divert himself of belief in himself as a thinking being, and this ultimate certainty he expressed in the celebrated phrase *Cogito, ergo sum* "I think, therefore I am."

Here, then, he believed he had found the true truth. Starting from this point Descartes sought the same kind of truth in such propositions as these; that the thinking being or soul differs from the body (whose existence consists in space and extension) by its simplicity and immateriality and by the freedom that pertains to it; that every perception of the soul is not distinct; that it is so far an imperfect finite being; that this imperfection of its own leads it to the idea of an absolutely perfect being; and from this last idea he deduces all further knowledge of the truth.

Descartes also contributed greatly to the advancement of mathematics and physics. The higher departments of geometry were greatly extended by him. His system of the universe attracted great attention in his time, though long since exploded. It rested on the hypothesis of a vortex, and immense currents of ethereal matter, by which he accounted for the motion of the planets (*Principia Philosophiae*, 1644). His work excited a great revolution in the principles and methods of philosophizing. In 1647 the French court granted him a pension of 3000 livres, and two years later, on the invitation of Christian of Sweden, he went to Stockholm, where he died, 1650.

New York, since 1896; Schiff professor of social economy, Columbia University, since 1903. Author: *Economics: Their Principles and History*; *The Principles of Relief*; *Economic and Political History*.

**De Vinne (dē vin'), Theodore Low**, printer, and designer, was born in New York, 1829; learned printer's trade. He has been in the improvement of typography, and received an honorary M. A. from both Columbia and Yale Universities.

**Dewar (dē'ar), Sir James**, British scientist, Fulbright professor of chemistry, University of London; was born in Kinross, Scotland, 1842; D. Sc., Oxford. With Sir Frederick Abel he investigated the properties of gunpowder and of solidly hydrogen. Received French Academy's Lavoisier gold medal in 1894. Knighted, 1904.

**De Wet (dē wēt), Christian Rudolph, Boer general**, was born in 1858. He had acquired fame as a hunter before he became conspicuous in the Transvaal war of 1895-97, and in the Boer war of 1899-1902 he was one of the Boer commanders the most audacious, swift in movement, and fertile in expedients.

**De Witte (dē wīt'), Wilhelm Martin Leberecht**, German biblical critic, born at Ulla, near Weimar, 1780. He studied from 1799 at Jena, and became professor at Heidelberg in 1807; in 1810 at Berlin, and in 1822 at Basel, Switzerland, where he died. His reputation rests on his *Introduction to the Old Testament*.

**Dewey, George**, admiral in United States navy; born in Montpelier, Vt., 1813; appointed to naval academy, September 22, 1834; was promoted to sea passed midshipman, L.L.D., 1836; in Farragut's fleet, and served the Pacific. He was promoted to the rank of captain in 1862. He was afterward on several vessels in the North Atlantic blockading expedition, then in European squadron, and later on various duty stations, being promoted to commodore, 1872; captain, 1873; commodore, 1874. In January, 1898, assumed command of Asiatic squadron. On May 1, 1898, in Manila bay, destroyed the Spanish Asiatic squadron, and captured the Spanish fleet, destroying eleven and capturing all the vessels and all the land batteries, without the loss of a man on the American side. He received the receipt of official news of victory he was promoted to rear admiral, and thanked by resolution of congress promoted to admiral in 1900.

**Dewey, John**, educator, professor of philosophy, Columbia University, since 1904; was born at Burlington, Vt., 1859; graduated, University of Vermont, 1879; Ph.D., Johns Hopkins University, 1882. Was professor of University of Minnesota, 1882-89; University of Michigan, 1889-94; and professor of philosophy and psychology, Columbia University, 1894-1904. Author: *Psychology*; *Logic*; *Critical Theory of Ethics*; etc.

**Dewey, Melvin**, librarian, was born in Adams Center, N. Y., 1881; graduated, Amherst, 1874; librarian, 1902. Acting librarian, 1903. Was chief librarian and professor of library economy, Columbia College, 1898-98. Founder and director, New York state library school, 1897-1900; state director of libraries, New York, 1904-06. Author: *Library School Rules*; *Descent Classification and Relative Index*.

**De Witt (dē wīt'), Jan**, Dutch statesman, was born at Durt, 1625. He was a friend of De Witt, a vehement opponent of William II. Prince of Orange, in 1654, on the conclusion of the war with England, a secret article was inserted in the treaty drawn up between De Witt and Cromwell. In virtue of which the house of Orange was to be deprived of all state offices. The Orange party carried their point in the elevation of William to the family and dignity of stadtholder. His brother, John, successor, accused of conspiracy with the king of the stadtholder, was imprisoned and tortured. De Witt went to see him on his release. As they were coming out of prison they were attacked and murdered, 1672.

**De Young, Michael Barry**, journalist, was born in St. Louis, Mo., 1848; removed to California with parents when five years the younger brother Charles he established, 1865, *The Dramatic Chronicle*, later changing it to the *San Francisco Chronicle* and projector and director, at the California mid-winter exposition, 1893-94; member of executive committee for relief and red cross funds.

**Diaz (dē'az), Blas**, Spanish explorer and navigator, flourished in the fifteenth century. Driven by a violent storm, he sailed round the eastern extremity of Africa, and discovered the Gulf of Guinea, without immediately realizing the fact, and discovered Africa bay. Was lost in a storm, May, 1500.

**Diaz, Porfirio**, Mexican statesman, president of Mexico, was born at Oaxaca in 1830. He studied law and was an officer in the Mexican army and the United States. In 1876 he rebelled and overthrew the president, Lerdo de Tejada, and he himself made president. He was twice elected. He was elected again in 1894, 1898, 1899, 1899, 1904, and his administration was greatly popular under his administration, and he was elected for a high place among the world's great reformers. Foreworded in *Spain*, 1901.

**Diaz de la Peña (dē'az dē la pē'ñā)**, Narcisse Virgile, French statesman, was born at Bordeaux

of Spanish parentage, 1807. Left dependent, he was educated by a Protestant pastor at Bellevue, near Paris. In 1831 he began to exhibit in the French Academy. He died at Meudon, 1876.

**Dickey (dī'kē), Albert Venn**, British lawyer and writer, (literary professor of English law at Oxford since 1892) was born in 1825; graduated in the Balliol College, Oxford; M.A., hon. D.C.L., Oxford; hon. LL.D., Cambridge, Glasgow, and Edinburgh; was a student law and was made a barrister of the Inner Temple, 1863.

**Dickens, Charles**, English novelist and humorist, was born in England, he died at Meudon, 1876. He began a literary apprenticeship on *The True Sun*. He attached himself to the staff of the *London Chronicle*, and he was the first to visit the United States. He published, in 1842, his *American Notes for General Circulation*, but a much more admirable result of his visit to the United States was his *Sketches*, particularly the greatest of his humorous works since the *Pickwick Papers*; *Black House*; *Hard Times*; *Little Dorrit*; *The Tale of Two Cities*; *Great Expectations*; *Our Mutual Friend*, and other novels equally celebrated succeeded one another with almost periodical punctuality, and an audience larger than any English author ever had awaited each. In 1850 he commenced a weekly periodical entitled *Household Words*, afterward merged in *All the Year Round*. In 1857 he again visited the United States, gave numerous readings, and met with a brilliant reception. He was again the last engaged in writing a new novel, *The Mystery of Edwin Drood*, which was left unfinished at his death in 1870.

**Dickinson, Dea M.**, lawyer, was born at Port Ontario, N. Y., 1846; removed to Michigan in 1862. Graduated from the law department of the University of Michigan in 1866, and since 1867 has been a practicing lawyer in the West, and a Wisconsin circuit judge, and was master-general of the United States, 1887-90. Member of many legal, municipal, financial, and other associations.

**Dickinson, Jacob McGovick**, lawyer, secretary of war, was born in Columbus, Mass., in 1851; studied law at the University of Michigan, and studied law at Columbia College, New York, in Paris, and at the University of Leipzig; LL.D., University of New York, 1890. He was professor of law at the University of Illinois; was assistant attorney-general of the United States, 1895-97. He became secretary of war in 1900.

**Dicksee, Francis Bernard**, English painter and royal academicien, was born in London in 1853. He studied at the Royal Academy, London, 1870. First exhibited at academy, 1876.

**Diderot (dē'drō), Denis**, celebrated French encyclopedist, was born at Langres, France, 1713. His great work was the *Encyclopedie*, begun in 1740, of which he and 150 members were the joint editors. He died in 1784.

**Diekmann (dē'kman), Frederick**, American artist, was born in New York, 1857. He was admitted to United States in childhood; graduated at Calvert College. He has been president of the National Academy of Design since 1899; member of art commission, New York, 1901-03; etc. Since 1903 he has been professor of descriptive geometry and drawing in the College of the City of New York.

**Dike (dīk), Lt. Hon. Sir Charles Wentworth**, English statesman and writer, was born at Chelsea, near London, 1843. He was graduated at Cambridge, studied law and is a barrister of the Middle Temple. Was under-secretary of state for foreign affairs, 1880-82; chairman of royal commission for housing of the working-class, 1884-85; chairman of a committee on lunacy, 1885-86.

**Dill, James Brooks**, lawyer, jurist, was born at Spencerport, N. Y., 1854; graduated at Yale University, 1876. He was admitted to the bar, 1878; for many years a noted corporation lawyer; since 1905 judge of court of New York, New York.

**Dillmann (dū'lman), Christian Friedrich August**, German orientalist and theologian, was born in Wurtemberg, 1823. He studied in Tübingen. In 1854 he accepted a call to Kiel, where he became professor of oriental languages in 1860, but was transferred in 1864 to the chair of old testament exegesis at Gießen, which in 1869 he resigned to become Hagenberg's successor at Berlin.

**Dillon, John**, Irish politician and leader, was born in New York in 1831, and was educated at the National Academy, 1852. He studied in Tübingen. He distinguished himself by the violence of his language. From 1883 to 1885 he was absent from his life on account of ill-health, but in the latter year he was elected for East Mayo, and has since represented that constituency in parliament.

**Dimwiddle (dī-wid' or dī-wid'-d'), Robert**, governor of Virginia, was born in 1758, was born in England about 1690. His rule was despotic and was not successful, his ill-temper and avarice led to his overthrow in 1776. He was a Quaker. He was the first to suggest to the British board of trade the taxing of the colonies. He discerned the necessity of making liberty the basis of his adjustment-general of one of the four military districts of Virginia. He died in England in 1770.

**Diocletian (dē'okl'-at's), Valerius Diocletianus**, Roman emperor, was born in Dalmatia in 245, and reigned from 284 to 305. After the death of Numerian he was proclaimed emperor by the troops at Chalcidion. In the year 305, Diocletian, being born out of rank, resigned his position as emperor and was banished to Dalmatia, where he died eight years later. His reign has been memorable for the persecution of the Christians.

**Diogenes (dē'og'-ē's), philosopher of the school of cynicism**, was born at Sinope in Pontus. Becoming a citizen of Athens, he made himself notorious by his abnegation of all social laws, and lived in a tub, and was called a cynic, from his abode in a tub. He died at Corinth, 323 B. C.

**Dionysius (dē'ion'-i-s), the Elder**, tyrant of Syracuse, was born in Sicily, about 408 B. C. Not content with his military renown, he wrote poems and tragedies, and at one time gained a prize at Athens for the tragedy *The Rosamond of Hector*. He died at Syracuse in 367 B. C.

**Dionysius of Halicarnassus**, critic, historian, and rhetorician, was born about 130 B. C., went to Rome in 79 B. C., and died there about 7 B. C. His *Greek Antiquities*, a history of Rome down to 264 B. C., is a mine of information about its constitution, religion, history, laws, and private life of the Romans.

**Dismal (dē'zmal, dē'z-māl), Benjamin**, earl of Beaconsfield, eminent statesman and novelist, was born in London in 1804. He entered the House of Commons in 1829, and remained there until his elevation to the house of lords in 1876. In 1852, and again in 1858 and 1866, he was chairman of the select committee on the Derby, and carried the reform act of 1867. In 1868, on the retirement of Lord Derby, he was made premier, and in 1874 he was once more in office, which he held until again defeated by Gladstone in 1880. Lord Beaconsfield's career as an statesman and novelist was a brilliant career. His first novel, *Fusion Grey*, appeared in 1829, when he was little more than twenty-one years of age. His last novel, *Lord Dunsany*, appeared only a few months before his death. He died in London in 1881.

**Dix, John Adams**, American statesman and general, was born at Beacon, N. H., 1781; entered the army in 1812, and rose to the rank of adjutant-general in 1815. From 1835 he was successively secretary of state, United States senator, and secretary of the treasury. He became minister to France, 1860-69, and to Spain, 1870-71. He died in 1870.

He was engineer of the New England Rock Island road; brigadier-general of volunteers, 1864, and major-general of volunteers, 1864. He was a member of the Pennsylvania Railroad Pacific railway, 1871-81. Member of congress, second Iowa district, 1867-69. Succeeded General Sherman as president-in-chief of military order of United States Army.

**Dodge, Mary Abigail**, American writer, was born in Massachusetts, 1830; wrote several books of merit, and was the author of *Miss Maudslowi*. Died under the name de *plume* of "Gail Hamilton."

**Dodson, Alfred Robert Louis**, manufacturing chemist, was born in Baltimore, Md., 1867; graduated from Johns Hopkins University, 1886; Ph.D., 1890. He was a member of the Johns Hopkins University, medical department, 1901. In business as manufacturing chemist

entitled *The Ideal Life, Was the Ascent of Man*, in which he placed an altruistic element in the progress of evolution.

**Drummond, James**, British biblical scholar, principal of Manchester College, Oxford, 1880-1890; was born in Dundee, Scotland. He studied at Trinity College, Dublin, and Manchester New College, London; L.L. D., Litt. D., M. A., D. D., professor of theology, University of London, 1890; succeeded Dr. Martineau as principal, 1885; removed with the college to Oxford, 1890; retired, 1900. His chief works are: *Sermons on Christian Faith and Life*; *The Jewish Messiah*; *Introduction to the Study of Theology*; *Vindicta*; *Vindicta*.

**Druas (drü'au), Nero Claudius**, commonly called Druas Senior, stepson of the emperor Augustus, and younger brother of Caligula. He was born in 38 B. C. In 13 B. C. he was sent into Gaul, then in revolt, and, after crushing the rebels there, pushed across the Rhine to assist the German allies. From this time he made the business of his life to establish the Roman supremacy in Germany, partly by conquest, and partly by the execution of great military works. A fall from his horse cut short his brilliant career in 9 B. C.

**Dryden, John**, English poet, was born in Northamptonshire, 1631. After graduating at Cambridge, he entered upon a literary career. He succeeded Sir William Davenant as poet laureate in 1700. His essay on Dramatic Poets, according to Dr. Johnson, was the best of its kind in criticism. Dryden, by his dramas and political satires—especially his *Absalom and Achishole*—secured a high place among the poets of his time. He made numerous translations from the classics—especially Vergil, Juvenal, and Ovid—and wrote an elaborate treatise on the art of writing. Died, 1700.

**Du Barry (du bá'rí), Marie Jeanne Gonnard de**, French, Comtesse, favorite of Louis XV., was born in 1746, at Vaucouleurs, the daughter of a dragoon. Her influences reigned supreme until the death of Louis in 1793, when she was dismissed from court. She was tried before the revolutionary tribunal for having granted the measures of the state an undue influence for the late king, and was guillotined, 1793.

**Du Bois-Reymond (du böis'réymond), Emil**, German physiologist, was born in Berlin in 1818. His name is chiefly identified with animal electricity, the subject of his chief work, which won him a commandeur of the most modern scientists. Two volumes of his collected memoirs address a high place among the scientific works of his age.

**Du Bose, William Forcher**, Protestant Episcopal clergyman, was born in South Carolina, 1836. He was educated at the University of Virginia, S. T. D., D. C., L. D., and a while a student for the law. He entered the Episcopal ministry in the confederacy, 1861; became chaplain and professor, University of the South, 1871; after continuous service in the university, he resigned, 1880, and resigned active duties in the summer of 1908.

**Du Challu (du shá'lu), Paul Belloni**, American traveler, was born in Louisiana, 1835. In 1855 he sailed to West Africa, where he spent four years. His *Explorations in Equatorial Africa* gave important contributions to geographical, ethnological, and sociological science, but was received at first with much distrust. Died, 1903.

**Dodevant (dod'évánt), Aurora**, See **Madame de Buffon**.

**Dufferin (duf'érin), Frederick Temple Hamilton Blackwood, Marquis of**, British statesman, was born in Florence, Italy, 1826. He graduated from Christ Church, Oxford, and in 1841 succeeded to his father's title. In 1860 he became British commissioner in India. He served as under-secretary of state for India from 1864 until 1866, and later, for a short time, was under-secretary of war. From 1868 until 1872 he was ambassador of the duchy of Lanes; governor-general of Canada, 1878-79; ambassador to Russia, 1879-80; governor-general of Italy, 1880-81; ambassador to Italy, 1881-91; and ambassador to France, 1891-96. He was made an earl in 1871. Died, 1902.

**Du Guéclin (du g'éclin), Bertrand**, See **Guesclin**.

**Dumas (dú'má), Alexandre**, the Elder, French novelist and dramatist, was born in Villers-Cotteret, 1800, son of General Dumas, a Croix. His romances are numerous but he reached the climax of his fame in *Monte Cristo*, in 1844, and the *Three Musketeers* the year after.

He lived at Dieppe, broken in health and impaired in intellect, ministered to by his son and daughter. Died, 1870.

**Dumas, Alexandre, the Younger**, was born in 1824. He was a son of the preceding, and, like him, a novelist and dramatist. He accompanied his father on a voyage to the Mediterranean in 1846, and in 1845 produced the work which made his reputation *Le Dernier des Comédiens*. He quickly his work was chiefly dramatic, and includes such plays as *Le Demi-Monde*, *La Cécile*, *Georges*, *Le Dernier des Comédiens*, and *Le Dernier des Comédiens*. He was admitted to the French Academy. Died, 1883.

**Dumas, Jean Baptiste**, distinguished French chemist, was born in 1782. He was appointed tutor in the polytechnic school, at Paris, and then

professor of chemistry in the Ecole de Médecine. His researches in organic chemistry, on atomic weights, and on the action of acids on organic substances attracted the attention of all Europe. In 1848 he was a member of the legislative assembly, and in 1849 he held the office of agriculture and commerce. Died, 1864.

**Du Maurier (du mó'rí), George Louis Palmella**, French novelist and dramatist, was born in Paris in 1834; educated in London, Belgium, and the Netherlands. For many years a valuable contributor to the French press, he published a novel, *Pater Isidore*, followed by *Trilby* in 1894. Died, 1900.

**Du Moutier (du mó'tí), Charles François**, French general, was born at Cambria, 1739; entered the army in 1757, and served in Germany during the Seven Years' war. In 1792 he overthrew the Austrians under the duke of Saxe-Teschen and Clairault at Jemappes; but as Napoleon was sustained a severe defeat from the Austrians under Coburg, with whom he entered into a plot to restore the monarchy. He fled to his military treason, however, reached the government at Paris, and an order of arrest was issued against him. This he succeeded in evading, and escaped across the border. He died an exile at Turville Park, near Henley-upon-Thames, 1823.

**Duncker (dún'kér), Maximilian Wolfgang**, German historical writer, was born at Berlin 1811. He became professor of history at Halle in 1842; was a member of the Prussian Academy of Sciences in the Prussian chamber, 1849-52; was called to a Tubingen chair in 1857, and thence recalled in 1860 to fill a post in the ministry of state. Died, 1880.

**Dundonald (dún-dón'ad), Thomas Cochrane**, British naval officer, was born in England in 1775. Entering the navy when a boy, he early distinguished himself by the destruction of the Spanish fleet in the Bay of Cádiz, 1805. In 1823, having offered his services to Brazil in her war against Portugal, he swept the Portuguese Brazilian waters in 1824, and was afterwards named the Greek navy in the war of independence. He died in 1860.

**Dunlop (dún'lóp), Robert**, medical professor and author, was born in England in 1768. Was professor of materia medica and therapeutics in the University of Edinburgh, 1806-18, and of the institutes of medicine in Jefferson Medical College, Philadelphia, 1830-68. He translated the number of the *Encyclopædia Britannica* published about twenty original volumes. Died, 1869.

**Dunlop (dún'lóp), Finley Peter**, journalist, author, was born in Chicago, 1867; educated in Chicago public schools; entered newspaper life as reporter, was editor of the *Chicago Tribune*, 1890-91; *The Herald*, 1892-97; editor *Chicago Journal*, 1897-1900. Author: *My Dooley in France* and *My Dooley in Italy*. Editor of *The Dooley's Opinions*; *Observations* by *Mr. Dooley*, etc.

**Dunlop (dún'lóp), Archibald**, Scottish educator, professor of history, Columbia University, since 1891, was born in Plainfield, N. J.; graduated from Columbia, S. T. D., L. D.; was managing editor of *Political Science Quarterly*, 1894-1903.

**Dunois (dún'wá), Jean, Count of Dunois and Longueville**, was born in Paris, 1402, the natural son of Louis d'Orléans, brother of Charles VI. His first great achievement was the defeat of the English at Montargis, 1427. In 1429 Dunois and the maid of Orléans won the battle of Patay. Shortly after Joan's tragical death, Dunois took Chartres, the key of Paris, forced Bedford to raise the siege of Lagry, chased the enemy from Paris, and soon deprived them of all their conquests except Normandy and Guernsey. He was killed at the battle of Tewkesbury, 1471.

**Duns Scotus (dún'skót), John**, famous Franciscan monk and divine, was born about 1265. He appears to have been educated at Oxford, where in 1301 he became professor of theology. Duns Scotus was one of the most important of the Franciscan school, and was a chief opponent of the teachings of the Dominicans, the two parties representing at that time two opposite schools of theology.

**Dunstan (dún'stón), Saint**, English prelate, was born in 925, died in 988. Under saint's name he wielded great influence. He was made archbishop of Canterbury in 959 by Edgar, whom he crowned, ruled the kingdom with Edgar, and Edward to the throne, but on the accession of Edward his power was broken.

United States senate as a republican from Vermont, 1861. He was re-elected 1875, 1881, 1887, and succeeded Vice-president Arthur as president pro tem. of the senate after the death of Charles Sumner, 1881. He was a member of the movement of associate justice of the United States supreme court, 1882; elected president pro tem. of the senate, 1882, and was a member of the committee on the manner in which electoral votes for president should be counted, 1886. His recognized authority in 1891, and has since practiced law in Philadelphia.

**Edward, or Edward**, "the confessor," king of the English, was born in 1042, and succeeded his father, Edward the Confessor, in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

**Edward I**, king of England, was born in 1239, succeeded his father, Henry III, in 1272. Imbued with high notions of feudal sovereignty, he sought to establish his supremacy throughout the island of Britain. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

**Edward II**, king of England, was born in 1307, the son of Edward I, was born at Carnarvon, 1327. In 1301 he was created prince of Wales, being the first prince of Wales to be created as such. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

**Edward III**, king of England, eldest son of Edward II, and Isabella of France, was born in 1312. He succeeded his father, Edward II, in 1327. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

**Edward IV**, king of England, was born in 1469, the son of Richard, Duke of York, led a force into London during the reign of Henry VI, and was crowned king by parliament while Henry VI was still alive. In 1474 Edward formed an alliance with the duke of Burgundy, and made preparations for the war in support of his claim to the throne of France. He passed over to Calais, but the expedition proved fruitless through the devotion of his ally Charles the Bold of Burgundy, with whom the kingdom was to have been divided. During the latter part of his life Edward was sunk in indolence and pleasure. He left five daughters, of whom Elizabeth was afterward married to Henry VIII, and two sons, the ill-fated prince Edward and Richard. Died, 1483.

**Edward VI**, king of England, son of Henry VIII, and Jane Seymour, was born at Greenwich, 1537. He succeeded to the throne at his father's death in 1547, his uncle, the cardinal of Hertford, being regent and protector. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

**Edward VII**, king of the united kingdom of Great Britain and Ireland, was born at Windsor, 1841. He succeeded to the throne at his father's death in 1901. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

**Edward, the Black Prince**, eldest son of Edward III, was born at Windsor, 1312. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

he fought at Crécy, and is said to have won from him his last enemy, the Duke of Burgundy, and married his cousin, Joan, the "fair maid of Kent," who bore him two sons, Edward and the future Richard III. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

**Edwards, Amos**, born in London, 1831. He published a volume of *Ballads*, and another of *Love Songs*, and was a member of the Dolomite, *A Thousand Miles up the Nile*, in 1877. He died at Weston-super-Mare, 1892.

**Edwards, Julian**, American composer, was born in Manchester, N. H., 1854. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066.

**Edwards, Julian**, American composer, was born in Manchester, N. H., 1854. He was a pious and just ruler, and his reign was marked by the "unready" was brought up at the Norman court, and after his accession, on the death of his father, he was crowned king in 1066. **Freytag (fré'tak), Gustav**, German novelist and dramatist writer, was born in Silesia, 1816. He studied at Breslau and Bonn. He was a pioneer in German literature in the University at Breslau. He wrote poems, successful plays, and novels. His best-known work is *Die Hochzeiten*. He has appeared in several English translations. He died at Wiesbaden, 1895.

**Friedrich (fré'drich), Heinrich**, philanthropist, was born in West Overton, Pa., 1849. Was president, and since 1897 chairman of board of directors of H. C. Frick coal company; organized coke producer in the world, operating nearly 40,000 acres of coal and 12,000 coke ovens, with capacity of 25,000 tons of coke weekly.

**Frobisher (fró'tshir or fró'tshir), Sir Martin**, famous English navigator, was born near Doncaster about 1535. He was a seaman, and was persuaded that there was a northwest passage to the Indies, and after many fruitless efforts to sell the merchandise in his cause, he obtained in 1576 from the government of Queen Elizabeth three vessels, explored portions of the Arctic coast, and, passing through the strait which has since borne his name, he returned to England and was knighted. Died 1594.

**Froebel (fró'bél), Friedrich Wilhelm**, founder of the famous kindergarten system, was born at Oberweisbach Germany, 1782. He founded a kindergarten at Blankenburg in 1827. His system was founded on that of Pestalozzi—under whom he worked from 1807 to 1809—which combined religious, moral, and domestic training, beginning with the years of childhood. Died 1852.

**Frohman, Charles**, theatrical manager, was born at Sandusky, Ohio, 1850. He was educated in the public schools of New York. In 1885 he saw *Hamlet* at Boston, and brought it to the city, and bought rights to that play, outside of Boston; made a great success with that and several venturing to London. Died 1900.

**Frohman, Daniel**, theatrical manager, was born at Sandusky, Ohio, 1853. Manager of Fifth Avenue theater and Madison Square theater, New York, 1879-80. He was in 1887. He entered since 1885; manager of Daly's theater, New York, and Daniel Frohman stock company. President of Actors' fund of America.

**Fromentin (fró'mén'tin), Eugène**, French painter and author, was born at La Rochelle, France, 1820. He was a pupil of Rémond and Cabat; studied in 1842-43 in Algeria. He painted in the East, and was made an officer of the legion of honor, 1859. Died 1878.

**Fromont (fró'món't), Eug.**, (fró't-mál), Louis de Boudé, Comte de, French colonial officer, governor of Canada, was born in 1621. He was in the French army, and was appointed governor of the French possessions in North America. He died at Quebec, 1693.

**Frost (fró'st), Arthur**, dramatist, was born at Philadelphia, Pa., 1851. He was self-taught in art, and exhibited at the Paris exposition, 1900. Author: *Red Call and Other Tales*, *Golfers' Alphabet*; etc. He lives chiefly in France.

**Frothingham, Arthur Lincoln, Jr.**, university professor, was born at Boston, 1839. Educated at the Royal University, Rome, 1875-81; M. A., Ph. D., University of Leipzig, 1883. Professor of archaeology and history of art, 1887-98, ancient history and archaeology, since 1898, Princeton University. Author: *A History of Sculpture*; *Medieval Art*; *Introduction of the Papyrus*. Author and reviewer of the departments of architecture, art and archaeology in the *New International Encyclopedia* and many contributions to the *Journal of American*, *English*, French and Italian periodicals.

**Frothingham (fró'thíng'm), Octavius Brooks**, clergyman and author, was born at Boston, Mass., 1810. He was graduated at Harvard in 1833, and became pastor of a Unitarian church in Salem, Mass. In 1855 he removed to New Jersey, and came to New York City, where he was minister of an independent religious organization for twenty years. Died 1895.

**Frothingham, Paul Stevens**, clergyman, author, was born at Jamaica Plain, Mass., 1864. He was graduated from Harvard, 1886, Harvard divinity school, 1890; pastor at Harvard in 1893, and University, 1899-1902; minister of Arlington Street church, Boston, since 1900. Author: *What Every Christian*; *The Christian's Life*, etc. **Frode (fró'd), James Anthony**, eminent English historian and general writer, professor of history at Oxford from 1874; he died, was born at Darlington, England, 1818. He was educated at Balliol College, Oxford. In literature his best known works are those of the *Crutwell* family, and *Bræmese*. His accuracy has been greatly underrated in detail, but his style is terse and simple, and power of presenting broad facts have secured for his histories great influence and popularity. Died 1901.

**Fry, Sir Edward**, English lawyer and jurist, was born at Bristol, England, 1827. He was educated at Bristol College, and at the Inner Temple, and lord justice of appeal, 1883-92; presided over the royal commission on the Irish land acts, 1892; appointed a Privy Councillor, 1893; and first British plenipotentiary to The Hague peace conference, 1907.

**Fry, Elizabeth**, English philanthropist, was born near Norfolk, 1790, daughter of John Gurney, a Quaker. She was married to a Quaker, and was part of Great Britain and on the continent, everywhere effecting ameliorations. She died at Bath, England, 1845.

**Fry, William Fries**, lawyer, United States senator from Maine since 1881, was born in Lewiston, Me., 1828. He was graduated from Bowdoin college, 1850; LL.D., 1889; LL.D., Bates, 1881; member of congress, 1871-81; elected United States senator in 1881, and re-elected in 1887 and 1889-1912. President pro tem, during Roosevelt's administration, and reelected in 1907.

**Fryer (fré'yer), John**, professor of languages and literature, University of California since 1896, was born at Hythe, Kent, England, 1859; graduated from Bowdoin College, 1882; LL.D., LL.D.; general editor and chairman of executive committee of educational association of China, 1887-96; hon. secretary of Chinese Polytechnic institution, Shanghai, since 1870. Author: *Educational Directory for China*; *Translator's Vocabulary*; or *Vocabulary of Scientific Terms in Chinese and English*, etc.

**Führich (fré'k), Joseph von**, Austrian painter, was born at Krattitz, Bohemia, 1800. He became professor of painting in the academy of Vienna, and painted many scriptural subjects. Died 1869.

**Fukushima (fú'kú-shí-mé), Baron**, Japanese general, was born at Matsuzono, 1853. General of the 1st division, 4th division, and chief of administrative bureau of territory occupied by Japan during war with China, in command of the 1st division, until 1904. He was attached to General Yamaguchi, then to Field-Marshal Oyama, and was chief of staff during Boxer troubles, 1900-04; general staff officer during Russo-Japanese war, 1904-05; general staff officer, General Kojima's army, 1906; second staff of the army, 1906.

**Fulford (fú'fórd), John**, portrait, and landscape painter, was born at Derrifield, Mass., 1822. He studied in Boston, New York, London, and Paris. He painted his first picture in 1837. Had notable exhibits at Boston and New York, 1876 and 1878, respectively. Died 1880.

**Fuller, Melville Weston**, chief-justice of the United States supreme court, was born in Augusta, Me., 1793. He was graduated from Bowdoin college in 1815, and attended a course of lectures at Harvard law school; LL.D. He became chief-justice of the United States supreme court, and chancellor of Smithsonian institution; chairman of trustees of Peabody education fund; member of the board of directors of the Smithsonian institution; member of the board of directors of the Museum of Natural History, 1905. Died 1910.

**Fulton (fú'lton), Robert**, inventor, was born at Little Britain, Pa., 1765. He was received as a civil engineer in 1798, and wrote a work on canals in which he developed his ideas. Accepting an invitation from the United States minister at Paris, he proceeded to that city in 1790, and remained there for seven years, during which he made his project a reality. In 1803 he constructed a small steamboat, and his experiments with it on the Seine were attended with success. He returned to America in 1807 and pursued his experiments there. In 1807 he launched his steam-vessel, the *Clermont*, upon the Hudson, which made a successful voyage in the presence of thousands of astonished spectators. In 1815 he launched the war-steamer *Fulton*, and died the same year.

**Funk, Isaac Kaufman**, author, publisher, clergyman, was born at Clifton, Ohio, 1839. He was graduated at Wittenberg College; D. D., 1886; LL.D., 1890; editor-in-chief of *Standard Dictionary*; entered into partnership with A. W. Nagels in 1876, merged into the Funk and Wagnalls company, 1900. Author: *The Next Step in Evolution*; *Practical Bible*; *Mite and Gnat*; *Psychic Science*, etc. **Funston, Fred**, brigadier-general United States army, was born in Ohio, 1865. He studied in the United States army; was captain, major, and lieutenant-colonel in the infantry; was in Cuba, 1896; served eighteen months; was wounded; was in the United States army; was in the 20th Kansas volunteers, 1868; went to Philippines; took part in several battles; for crossing the strait between Luzon and Mindanao, he was made in face of heavy fire and establishing rope ferry, by means of which the United States troops were sent to Mindanao, and was promoted to brigadier-general of United States volunteers, 1898. Continued in active service in the Philippines, and was promoted to major, and died in the Philippines, and was appointed brigadier-

general of United States army, 1901; commandant army service school, Ft. Leavenworth, Kan., 1906. **Furness (fú'furness), Edward**, writer, editor, Shakespearean scholar, was born in Philadelphia, Pa., 1833; graduated from Harvard, 1854; Ph.D., University of Halle, 1856; LL.D., University of Cambridge (England); LL.D., University of Pennsylvania, Harvard, Yale, 1901. Died, 1910. **Furness (fú'furness), John**, Shakespearean scholar, author, and lecturer, was born at Westford, 1824. Settled in London at nineteen; many years contributor to *Illustrated London News*, *Illustrated Black and White*; *Illustrated Sporting and Dramatic News*; and the principal magazines in England since 1850.

**Furnivall (fú'ni-vál), Frederick James**, English philologist, was born at Egham, Surrey, England, 1831. He was educated at the University College, London, and Trinity Hall, Cambridge, where he took his degree, 1854; M.A., Ph.D., Litt D. He devoted himself to English philology, and founded the Early English text society, 1843; the Chaucer society, 1868; the ballad society, 1868; and the New Shakespeare society, 1874; was active in starting the Browning society, 1881, and the Wycliffe society, 1882. He personally edited many works, chiefly through the medium of some one of the above societies; the most important being *Saint Gertrude*; *Roberts of Brunne's Handlyng Synne*; *Walter Scott's Minstrelsy of the Scottish Border*; *Reliquiae*; and *Loose Poems*; Bishop Percy's *Folio MS. of Ballads and Romances*. His most valuable work is *Early English Text Society's Canterbury Tales*, and the *Century Shakespeare*, in 10 volumes. Died 1910.

**Furze (fú'z), John**, English poet, was born at Zurich in 1741. He was at first a clergyman and writer of Zurich, visited England, afterward studied law in London, and died in 1778, and executed pictures for Boydell's *Shakespeare gallery*, 1800. Died 1823.

**Fuseli de (fú'sel), Lucien de d'Alençon**, Numa Denis, French historian, was born at Paris, 1830. He filled a number of offices at Alençon, Paris, and from 1875 at the Ecole Normale. He was the son of 1870 he turned his attention to history, though he had written previously *Chateaubriand* and *Fichte*. His first historical work, *La Cite*, was made to author famous. Member of the French Institute. Died 1889.

**Fyfe (fí), Charles Alan**, English historian, was born at Blackheath, England, 1848. In 1867 he took classical honors at Balliol college, Oxford, and was elected a fellow of University College. During the Franco-German war he was war correspondent for the *Standard*, and was in Paris during the commune. Died, 1892.

**Gabelius (gá'bél-ús), Hans Conon von der**, German philologist and linguist, was born at Göttingen, 1818. He was educated at the Universities of Leipzig and Göttingen. He furnished contributions to periodicals on the Moravian and Samoyed languages. Died 1874.

**Gade (gá'd), Niels Wilhelm**, Danish composer, was born at Copenhagen, 1817. He was a composer of many choral and solo productions. He was court organist at Copenhagen, and wrote several symphonies, overtures, and cantatas, as well as many choral and solo productions.

**Gadsden (gá'dsén), Christopher**, American patriot was born in Charleston, S. C., 1774. He was a member of the first continental congress, 1774, became brigadier-general during the revolution, and was lieutenant-governor of South Carolina at the time of the surrender of Charleston to Sir Henry Clinton in 1780. He died in 1805.

**Gadsden, James**, grandson of above, was born at Charleston, S. C., 1788. He served in the war of 1812 and against the Seminoles. In 1853 he was appointed minister to Mexico, and negotiated the purchase of the Gadsden land, and was known as the "Gadsden purchase." He died in 1858.

**Gage, Simon Henry**, biologist, educator, was born at New York, 1810. He was educated at Cornell; studied at Cornell; instructor, assistant professor, and full professor of Cornell from 1878; studied in Europe, 1889-90. He was one of the editors of *American Journal of Anatomy*.

**Gage, Thomas**, English general, last royal governor of Massachusetts, was born in 1721. He was made commander-in-chief of the British forces in America. In 1774 he was nominated governor of Massachusetts at the height of the difficulties. On June 17th the battle of Bunker Hill was fought, which resulted in a costly victory to the English, but numerous complaints being lodged against Gage, he was recalled by British government in October, 1775. Died, 1787.

**Gagern (gá'gér), Heinrich Wilhelm August**, German statesman, was born at Balwerg, Germany, 1799. He was a member of the diet of Bavaria at Munich. In 1821 he entered political life under the government of the Duke of Bavaria. In 1832 he was elected to the diet of the state governments and of the federal diet. In 1846 he published a book against the government of Rome. Died 1880.

**Gailor, Thomas Frank**, prelate, bishop of Tennessee, was born at Nashville, Tenn., 1810. He was graduated at Racine College, and the General theological seminary, New York; D.D., S.T.D. He became a prominent member of the University of the South, 1882, and chaplain 1883; vice-chancellor of university, 1890-93.

**Galsbolghor (gar'v'v'v)**, Thomas, eminent English landscape painter, was born at Sudbury, England, 1727. His later genius found adequate expression in the delineation of the rich and quiet scenery of his native valleys, but he can be said to have mainly devoted himself after settling in London in 1774. At the creation of the Royal Academy he was chosen one of the first. He died in 1780.

**Gairdner (gair'ner)**, James, British historian, was born at Edinburgh, England, 1828. He was educated at the University of Edinburgh; L.L.D., Edinburgh, 1867; edited the *Panion Letters*, 1872-73; has edited also several volumes for the Cambridge Society; author of *England in the series Early Chronology of Europe*.

**Gaius (gai'us)**, Caius, Roman jurist, flourished in the second century of our era. He was the author of more than fifteen works, of which the *Institutes* was the most important. He died in 180.

**Gaib (gai'ib)**, Servius Sulpicius, Roman emperor, was born B. C. 3. He was commander of the army in Spain when the emperor Nero died, in 69 A. D., and was so popular with the soldiers that they made him emperor when seventy-one years old. He was murdered after a reign of only seven months, in 69 A. D.

**Gaizide (gai'zide)**, Benito Pérez, Spanish novelist and dramatist, was born in the Canary Islands, 1853, but was brought up at Madrid. His *Clave de la Perfección*, 1876, and *El Comendador*, 1877, have been translated into English, and entitle him to be classed among the most noted modern writers.

**Galen (gai'len)**, or Claudius Galenus, celebrated Greek physician, was born at Pergamus, in Mysia, 120 A. D. He first studied at his native city, and afterward at Smyrna, Corinth, and Alexandria. In his thirty-fourth year he went to Rome, where he stayed for about a year, and then returned with a reputation that he was offered, but declined, the post of physician to the emperor. The place and time of his death are uncertain, though the latter is believed to have been 201.

**Galilei, Galileo (gai'li-ai)**, celebrated Italian astronomer and physicist, born at Pisa, 1564. While a student he had constructed the nature of vibrations or swings of a pendulum—i. e., its isochronism. In 1588 he was provided with a lectureship at Pisa University. At this period he constructed the first accurate balance. Owing to veiled suspicion and hostility and the loss of court favor, he quitted Pisa, and obtained the professorship of mathematics in Padua University in 1592. In 1609 he constructed the telescope on the model of that of Hans Lippershey of Middelburg, Holland, and with it discovered four satellites of Jupiter, as well as the fact that they were not stars, but planets actually revolved around the bright planet. The uneven configuration of the surface of the moon was demonstrated; and he detected sun-spots. The astronomer was invited to Florence, in 1610, by his patron, Cosimo, Grand Duke of Tuscany, and established as his philosopher and mathematician. Continued advocacy of Copernican principles, and their Scriptural significance, brought him under the ban of the church.

In 1632 appeared his *Dialogues on the Systems of the World*, after which he was peremptorily summoned to Rome by Pope Urban VIII. Stricken in years, and dread-ing imprisonment, Galileo publicly abjured his own philosophy. Accused of heresy, he was, among other penalties, to suffer detention, while he recanted his statements. At the close of 1633 he was permitted to return to Arcetri, Florence, where he thereafter lived in seclusion. An edition of Galileo's works, with correspondence, including what is perhaps his most important production, *Dialogues of the New Sciences*, was undertaken by the Italian government in 1890. Died in 1642.

**References.**—*Galileo*, by Viviani; T. Henri Martin; Favaro; and Fahr. Also Lodge's *Portraits of Science: Shelley's Literary and Scientific Men of Italy*; Bell.

**Gail (gai; Gar, gail)**, Franz Joseph, German physician, founder of phrenology, was born at Tiefenbrunn, on the border of the Tyrol, 1758. In 1785 he established himself as a physician in Vienna, where for many years he carried on a series of elaborate investigations of the nature of the brain and its relation to the outer cranium. Died 1823.

**Gallait (gai'ait)**, Louis, Belgian historical painter, was born at Tourney, 1810, became famous by pictures on subjects from the history of the low countries. He died in 1880.

**Galland (gai'land)**, Antoine, French orientalist, was born at Rodos in Icarus, 1646. Attached in 1670 to the French consulate at Constantinople, he traveled in Syria and the Levant, 1673-79.

In 1709 he became Arabic professor in the Collège de France. He is best known by his translation of the Arabian Nights. Died 1715.

**Gallatin (gai'd-ni)**, Albert, American financier and statesman, was born at New York, 1781. He graduated there in 1779 came to the United States in 1789, taught French at Harvard, became an editor of the *North American*, and entered political life in 1789. In 1795 he entered Congress from Pennsylvania, and in 1801-14 was secretary of the treasury, and the first president of the American Philosophical Society, his writing to historical and ethnological researches, his time on finance, politics, and the Indian tribes. He was one of the founders of the first president of the ethnological society of America. Died 1849.

**Gallaudet, Thomas Hopkins**, educator, philanthropist, was born in Philadelphia, Pa., 1787. He was graduated at Yale college, 1805; taught in 1810; founded and became superintendent of the American asylum for deaf mutes at Hartford, Conn., 1815.

**Galle (gai'li)**, Johann Gottfried, German astronomer, was born in Prussian Saxony in 1812. He studied at Berlin, 1830-33, became director of the Berlin observatory, and shared with Leverrier the honor of discovering the planet Neptune. He afterward became professor of astronomy at Breslau. Died in 1910.

**Gallinger, Jacob Harold**, physician, United States senator from New Hampshire, was born at Wall, N. H., 1837. He received an academic education, graduated in medicine, 1858, and practiced for several years. He was elected to Congress, 1858-59. Elected to United States senate, 1891, and reelected 1897, 1903, and 1909.

**Gallie (gai'lee)**, Alexander, English statesman, was born at Chelsea, England, 1817, and emigrated to Canada when a boy. From 1840 to 1850 he was secretary of the first president of the Dominion. After 1857 he allied himself with the liberal-conservative party, and was elected one of the lords of the council in 1861. He was the author of *Canada from 1549 to 1869*. Died 1893.

**Galt, Sir Thomas**, Canadian jurist, brother of the former, was born in England in 1815, and educated in Scotland. He removed to Canada in 1842, and was admitted to the bar in 1845. He was elected to the legislature of Ontario, and of the common pleas, and in 1857 chief justice of the court of common pleas. He was knighted in 1861. Died 1901.

**Galtion (gai'ton)**, Francis, English scientist and traveler, was born near Birmingham, England, 1810. He was educated at King Edward's school, Birmingham, and King's College, London, studied medicine, and graduated at Trinity College, Dublin, 1834; D.C.L., Oxford; Sc.D., Cambridge. He has been an officer and member of many scientific societies. For his *Journal of his Expedition to Tropical South Africa* received the gold medal of the Royal Geographical society.

**Galyant (gai'ant)**, Lelio, Italian physician and physicist from whom "galvanism" derived its name, was born in Bologna, 1737. He made those discoveries, partly by means of experiments on the muscles of frogs, which he published to the world in 1791 in his treatise entitled *De Viribus Electricitatis in Motu Musculari Communi*. The now fully-established doctrine of animal electricity owes its origin to the patient and laborious investigations of the Bologna professor. Died 1798.

**Gama (gai'ma)**, Vasco da, Portuguese navigator, was born about 1469. He was a merchant, and early distinguished himself as an intrepid mariner and was selected by King Emanuel to discover the route to India around the cape of Good Hope, the cape, despite hurricanes and mutinies he made Melinda early in the following year. For twenty years he commanded the Portuguese fleet, while the extended Portuguese conquests were presided over by five viceroys. The fifth was so unfortunate that John III. in 1524 despatched Da Gama to India, where he succeeded in making Portugal more respected, but soon after his arrival he died at Cochim, 1524.

**Gammaliel (gai'ma-li-ai)**, St. Paul's teacher, was a prominent Pharise, and taught "the law" early in the first century. He was crucified in 1870. It seems to have placed Christianity on a par with other sects; and he claims to have long-suffering on his part.

**Gambetta (gai'm-be-ta)**, Léon Michel, French lawyer, statesman, and orator, was born at Cahors, France, 1832. He studied law at Paris, and came to Paris bar. It was not until 1868 that his name came prominently before the public. When the first revolutionary war broke out in 1870, Gambetta sought by deeds to give it an exclusively republican character. The decree was issued by the legislative body, and Gambetta resigned office as minister. He subsequently entered the assembly as a member for the first time in 1881, but in 1881, for a few months resigned. Died 1882.

**Gannett (gai'net)**, Henry, geographer and statistician, was born at New York, N. Y., 1825. He was born at Beth Me, 1846. He was

graduated from Lawrence scientific school, Harvard University, L.L.D., Howard university, director census of Cuba, 1907-08. Author: *Statistical Atlas of Algeria*; *Commerce*; *Statistics of the United States*.

**Garcia (gar'd-ai)**, Manuel, musical genius, was born at Seville, Spain, 1778. After acquiring a European reputation in Seville, he came to Madrid, he went to Paris in 1808, where he obtained great success at the Italian opera; and in 1811 he came to London, where he was received with equal favor in Turin, Rome and Naples. Died at Paris, 1817.

**Garcilaso (gai'ar-d-ai)**, *Don* *Alonso* *de la Vega* (gai'ar-d-ai *de la Vega*), Spanish soldier and poet, was born at Toledo about 1500. He wrote a number of sonnets and other poems, and was called the "Spanish Petrarch." Died at Nice, 1536. **Garcilaso (gai'ar-d-ai)**, *Don* *Alonso* *de la Vega* (gai'ar-d-ai *de la Vega*), Peruvian historian, known as "the Inca," was born at Cuzco, in Peru, about 1540. At the age of twenty he proceeded to Spain, and never again visited America. His first work was a *History of Florida*, containing an account of the conquest of the country by Hernando de Soto. Died 1616.

**Gardener, Helen Hamilton**, author, was born at Winchester, Va., 1858. She was graduated at Cincinnati high and normal schools; married Col. S. A. Day, United States army, of 1901. She has done much magazine work as editor and contributor, and has written many stories, essays and scientific articles.

**Gardiner, Samuel Rawson**, English historian, was born at London, 1827. He was educated at Christ Church, Oxford. In 1854 he was elected fellow of All Souls; and was for many years professor of history at Oxford, and he was made a baronet. His historical works include *England Under the Duke of Buckingham and Charles I.* *The Persecution of the Catholics in the reign of James II.* *The Monarchy of Charles I.* Died 1902.

**Garfield, Harry Augustus**, educator, was born at Hiram, Ohio, 1831. He was educated at Williams College, 1850; studied law at Columbia Law School one year, and at Andover, Mass., and he was elected president of Williams College, 1860, and assumed duties in June, 1860.

**Garfield, James Rudolph**, lawyer, former secretary of the interior, and son of James Abram Garfield, was born in Orange, Cayuga county, Ohio, 1831. He entered Williams College, 1849, and graduated in 1853. He studied and practiced law, and was a member of the Ohio senate, 1859-60; entered the army in 1861, and was promoted to the rank of lieutenant in southeastern Kentucky, and was promoted to be brigadier-general of volunteers, 1862; promoted major-general of volunteers, 1863. He was assigned to occupy a seat in the thirty-eighth congress; elected United States senator in the spring of 1865, and was sworn in as senator in the close of 1865, and entered upon office in the spring of the following year; but on the 2d of July he was shot by the assassin Guiteau, while at the Washington station of the Baltimore and Potomac railway, and died at Elberon, N. J., after lingering for nearly three months. His untimely death was mourned, not only by his own countrymen, but by the whole civilized world. Died 1881.

**Garfield, James Rudolph**, lawyer, former secretary of the interior, and son of James Abram Garfield, was born in Hiram, Ohio, 1865. He was graduated at Williams College, 1883, studied at Columbia Law School; was admitted to the bar in 1885; practiced law in Ohio, 1886-1890; was member Ohio senate, 1886 to 1890; was secretary of the interior, 1907-09.

**Garibaldi (gai'ar-d-ai)**, Giuseppe, Italian patriot, was born at Trapani, Sicily, 1807. He was himself enthusiastically with Mazzini for the liberation of his country. He took part in the defense of the city of Palermo, 1848, and was elected, led to New York, to return to the island of Capri, biding his time. He joined the Piedmontese against Austria, and in 1860 set himself to assist in the overthrow of the kingdom of Naples and the union of Italy under Victor Emmanuel. Landing in Calabria, he defeated the king and drove the royal forces before him, after which he returned to his retreat at Capri. In 1870-71 he commanded the French force in the Franco-German war. Died 1882.

**Garland, Hamlin**, American novelist and short-story writer, was born at Scotch-Irish descent, Salem, Wis., 1860. Since 1890 he has devoted himself to lecturing and writing. Besides a collection of short stories, he has written and published the following books: *Rosie of Dutcher's Cove*; *A Little Rover*; *Jason Edwards*; *A Member of the House*; *The Frenchman*; *The Frenchman's War*; *Dr. Hester*; *The Tramping of the Dark*; *The Shadow World*, etc.

**Garnier (gai'ner)**, Louis Charles, French architect, was born at Paris, France, 1825. He studied at the school of fine arts, and began to exhibit in 1845, and after coming to Paris, he traveled in Italy and Greece. In 1854 he set up as an architect in Paris, and in 1861 completed for the first time the new opera house in Paris. Died 1898.

**George I.**, king of Greece, was born at Copenhagen, 1845. He is a brother of the dowager empress of Russia, Queen Alexandra, and King Frederick of Denmark.

**George, saint**, the patron saint of England. His life history is not known. He is believed to be the saint George who was a soldier in the army of Diocletian, 303 A. D., and that he suffered death for the Christian faith in 303. His name was made home his fame from the East, and Edward III. made him patron of his new order of the garter.

**Gerard** (*ger'ard*), **Kilian**, German, distinguished marshal of France, was born in Lorraine, 1773. He especially distinguished himself at Austerlitz, Jena, Eylau, Friedland, and Borodino. He died the morning after this last battle he received the title of baron of the empire. In 1833 he was made grand-chancellor of the empire. He died in 1852.

**Gérard, François Pascal, Baron**, French painter, was born in Rome, 1770. Nearly the whole of his life was spent in Paris. His famous portraits were those of Napoleon, Talleyrand, Lamour, and Blücher. He died in Paris, 1837.

**Gerhardt** (*ger'hart*), **Karl Friedrich**, German chemist, was born at Strassburg in 1816. At the time of his death he was professor of chemistry in the University of Strassburg. Gerhardt and Laurent were the joint authors of the system of chemical notation now in use. All his suggestions and discoveries are embodied in his *Traité de Chimie Organique*. Died, 1856.

**Gerhardt, Paul**, Lutheran hymn-writer, was born at Grifflinghausen in Saxony, 1791. He was a assistant pastor at St. Nicholas in Berlin in 1857, but for opposing the elector's attempted union of the Lutheran and Reformed churches was banished in 1866. Died, 1876.

**Germanicus, Caesar** (*jer-man'-i-kus*), son of Nero Claudius Drusus and Antonia, daughter of Augustus. Mark Antony and niece of Augustus. In 12 A. D. he was consul, in 13 was appointed to the command of the eight legions on the Rhine, and in 14 quater a great victory. Died, 19 A. D.

**Gérôme** (*jer-om*), **Jean Léon**, distinguished French painter, was born at Paris, 1824. After studying at Paris and traveling in the East he was appointed professor of painting in the school of the Louvre at Paris. Among the best known of his works are *Phryne before Her Judges*; *Cleopatra and Caesar*. Died, 1904.

**Gerry, Elbridge**, American statesman, fifth vice-president of the United States, was born in Massachusetts, Mass., 1744. He graduated at Harvard College, 1762. In 1776 he was elected a delegate to the continental congress, signed the declaration of independence, and was one of the most important committees. He was a member of congress, 1789-93, and in 1797-98 special agent to France. He died, 1846.

**Gerson** (*jer'son*), **Charles de**, French theologian, was born at Gerson, in the diocese of Rheims 1263. He became chancellor of the University of Paris, 1298, and from that time was active in church unity and ecclesiastical reform. Died at Paris, 1298.

**Gervais** (*jer'veis*), **Honoré Hippolyte Achille**, member of Canadian house of commons for city of Montreal since 1904, was born at Richelieu, Quebec, 1864. Promoter of technical education at Montreal and Quebec and high school of agriculture at Oklahoma; administrator of Laval University; corresponding member of the Académie de législation comparée de France; member of council of Montreal bar; bâtonnier of the bar of Montreal, 1908; bâtonnier of the bar of the province of Quebec, 1908.

**Gervinus** (*jer-vee'nus*), **Georg Gottfried**, German critic and publicist, was born at Darmstadt, 1805. He became in 1836 professor of history at Göttingen. In 1844 he was appointed honorary professor in Heidelberg, and from that time worked in the field of constitutional liberty. His great commentaries on Shakespeare were translated into English in 1892. He died in 1871.

**Gezausius** (*jer-ge'us*), **Friedrich Heinrich Wilhelm**, German Hebraist and oriental scholar, was born at Nordhausen, 1806. He became professor of theology at Halle in 1841. His greatest work is his *Hebrew and Chaldean Lexicon* left unfinished at his death. He died in 1876.

**Gessner** (*jer'sner*), **Salomon**, German pastoral poet, who also painted and engraved landscapes, was born at Zürich, 1733, where he was a book-seller. His landscape-paintings are all in the conventional classic style, but his engravings are of real merit.

**Grevier** (*jer'vair*), **August Friedrich**, German church historian, was born at Würzburg, 1803. In 1830 he became librarian at Stuttgart. In 1846 he became professor of history at Freiburg. Died at Freiburg, 1864.

**Ghiberti** (*jer-bee'ti*), **Lorenzo**, Italian sculptor, was born in Florence about 1378. He was the sculptor of the bronze doors of the cathedral of Santa Giovanni, Florence. He died in Florence in 1455.

**Ghika** (*jer'ka*), **Helena**, or "Dora d'Istrie," daughter of Prince Michael Ghika, was born at Constantinople, 1828. Her works include *La Vie Méroïenne dans l'Égypte Orientale*; *La Suisse Allemande Les Deux*; *Druse Mendée*. Died, 1888.

**Ghibellinajo** (*jer'lan-da'y-jo*), otherwise called **Corradino**, or **Sigifredo**, **Domenico** died, Florentine painter, was born in 1445. He was active in the decoration of the Sistine chapel in Rome, and executed a series of frescoes in the Sassetti chapel in the church of Santa Maria Novella.

**Gibbon, Edward**, celebrated English historian, was born at Putney in 1737. He was sent to Magdalen College, Oxford, where he became a convert to the Roman Catholic Church, and finally a Jesuit. He was a man of great talents, and a man of great energy, but he renounced the Catholic faith, without embracing any other, and became a skeptic.

On returning to England, he entered upon the duties of active life, but read much, and prepared himself for authorship. In 1763 he went to Italy; and while sitting amidst the ruins of the Capitol at Rome, he conceived the idea of writing the history of the decline and fall of that city. In the meantime, he joined M. Deyverdun, a Swiss scholar, in publishing a journal called *Mémoires Littéraires de la Grand Bretagne*, which met with no success.

In 1770 he began his celebrated history of the Decline and Fall of the Roman Empire, the first volume of which appeared in 1776, the second and third in 1781, and the three remaining volumes in 1788. In 1763 he undertook, Gibbon was chosen member of Parliament for Liskeard; and when hostilities commenced between England and France, in 1778, he was employed to draw up the manifesto on that occasion, after which he was made commissioner of the board of trade, but lost his place on the change of administration in 1783. He then went to Geneva, where, in 1784, he met the French Revolution obliged him to return to England; and died in 1794.

Gibbon's great history abounds with proofs of immense learning, of a penetrating and sagacious, and of almost unrivaled talents for ridicule. No other proof of the substantial trustworthiness of the Decline and Fall is needed than the fact, perhaps unargued, that this history has been a great advance made in historical studies and criticism during the present century, it still holds its place as preeminently the history of the period it embraces.

**Gibbon, John**, *William's Life and Correspondence of Gibbon*, the *Mémoires*, ed. by Emerson, and Morison's Gibbon in English Men of Letters Series.

**Gibbons, Grinling**, English sculptor and wood-carver, was born at Rotterdam, 1648. Died in London, 1735.

**Gibbons, James**, Roman Catholic cardinal, was born in Baltimore, Md., 1834. Entered St. Charles College, Maryland, 1853; transferred, 1857, to St. Mary's Seminary, Baltimore; ordained priest, 1861; later private secretary to Archbishop Spalding and chancellor of the arch-diocese; assistant chancellor, second plenary council of American Catholic church, Baltimore, 1866; vicar apostolic of North Carolina; odd-jut archbishop of Baltimore, 1877; succeeded to the see, 1877; was nominated as cardinal; invested with the princely insignia, 1888.

**Gibbs, Oliver Wolcott**, American chemist, was born in New York city, 1822; was graduated at Columbia, 1844; studied in Germany at Berlin. In 1849 he was chosen professor of physics and chemistry in the College of the City of New York. Died, 1895.

**Gibson, Charles Dana**, illustrator, was born in Roxbury, Mass., 1867. He was educated at Fitchburg, Mass., and at the art students' league, New York, 1884-85. He has done much illustrating in principal magazines; also illustrated Quaker's book, 1890; brother of law society of upper Canada, 1890; president of Dominion portrait and trading company.

**Gibson, William Hamilton**, American painter and sculptor, was born at Sandy Hook, Conn., 1850. He was a student of the art students' league, the Brooklyn Polytechnic Institute. He was early attracted to the study of flowers and insects, and his work in drawing was of these natural objects. Died, 1906.

**Giddings, Franklin Henry**, sociological writer, professor of sociology, was born at New York, born at Sherman, Conn., 1855. He graduated at Union College, 1877; Ph.D., L.L.D.; professor of sociology at Union College, 1889-94. Member of Authors' and Century clubs.

**Giddings, Joshua Reed**, American statesman, was born in Athens, Pa., 1795. He removed with his parents to Ohio, where he was born in 1820, and selected to the Ohio legislature in 1826. He sat in congress, 1838-59, and was an anti-slavery advocate.

**Giers** (*jer's*), **Nikolai Karlovich**, de Russian diplomat and statesman, was born in Russia, of Swedish origin, in 1814. He was graduated at the University at eighteen years of age. In 1876, and again in 1877, during the war with Turkey, M. de Giers directed the Russian diplomatic mission in Constantinople, and when Prince Gortchakoff attended the Berlin congress M. de Giers was his interpreter.

**Gieseler** (*jer'se-ler*), **Friedrich Wilhelm Benjamin von**, German historian, was born in Berlin, 1814. He was graduated at the University at Königsberg in 1837, and in 1862 at Munich.

**Gieseler** (*jer'se-ler*), **Johann Karl Ludwig**, German church historian, was born near Minden, 1792. In 1813 served in the war against France. On the conclusion of the war he held educational appointments at Minden; was nominated in 1819 to the chair of theology at Bonn, and in 1831 was appointed to a like professorship in Göttingen. Died, 1864.

**Gifford, Robert Swain**, American painter, was born in Massachusetts, 1840. He studied painting under Albert van Beest, and opened a studio in New York city, 1864. He was elected a member in New York city, and became an academicien in 1878. Died in New York, 1905.

**Gifford, Robert**, American sociological painter, was born in Greenfield, N. Y., 1823. In 1854 he became a member of the National Academy, New York city.

**Gifford, William**, English critic and poet, was born at Ashburton, 1795. Gifford's editorship of the *Anti-Slavery* procured him favor with the Tory magnates, but disappointed to offices that brought him 900 pounds a year. He died in 1826.

**Gilbert, Grove Karl**, geologist, was born in Rochester, N. Y., 1815. He was graduated at the University of Rochester, 1832; L.L.D. United States geological survey, since 1879. Past president of American association for the advancement of science. Author: *Geology of the Henry Mountains*.

**Gilbert, William Schwenck**, English dramatist, was born in London, 1836. In conjunction with Sir Arthur Sullivan, besides *Tasmani* and *Trial by Jury*, he wrote *The Pirates of Penzance*, *The Mikado*, *Ruddiger*; *The Yeoman of the Guard*; *The Gondoliers*.

**Gilbert, William**, English journalist, critic, was born at Flushing, N. Y., 1849. With brother, Joseph B. Gilchrist, started, 1881, *The Critic*, which the next year was merged in *The Nation*. His pen-name "Brunswick." New York correspondent for *Boston Saturday Evening Gazette* and *Boston Herald*. Since 1890 regular correspondent of *Chicago Tribune*.

**Gilder, Richard Watson**, author, editor, was born in Boston, 1842. He was graduated at Harvard, 1864. He was editor of *The Nation*, 1864. His father's name at Flushing, L.I.; L.L.D., A.M. L.H.D., Yale, L.L.D.; managing editor of *Scribner's Monthly*, 1870; editor-in-chief, 1881, under its present name *The Century Magazine*. President of public art league of United States; member of council of national civil service reform league. Author: *Isaiah*; *The Celestial Passion*; *Lyrics*; *Isaiah*. Died, 1909.

**Gildersleeve**, **Rail Lammear**, professor of Greek in Johns Hopkins since 1876, was born in Charleston, S. C., 1831. He was graduated from Princeton, 1849; Ph.D., L.L.D., 1860; Harvard, 1890. D. C. L., L.H.D. Editor of *American Journal of Philology* since it was founded, 1880. Author: *Latin Grammar*.

**Gill, Theodore Nicholas**, zoologist, educator, was born in New York, 1837. Assistant librarian, Smithsonian Institution, 1860-61. Columbia University. Adjunct professor of physics and natural history, 1860-61; head department of zoology, 1861-62. George Washington University. President of American association for the advancement of science, 1897. Author: *Principles of Zoology*; *Science and Popular Views of Nature*; *Contrasts*, etc.

**Gillette**, **Charles**, actor, playwright, was born at Hartford, Conn., 1856. Began theatrical work, 1877. Author of the following plays (unpublished): *The Professor*; *The French Society*; *Hold by the Enemy*; *Because She Loves Him* *Boy*; *Settled Out of Court*; *Secret Service*, and *Sherlock Holmes*.

**Gilray, James**, English caricaturist, was born, a Lamerstocker's son, at Chelsea in 1757. He painted and engraved caricatures.

**Gilman, Daniel Colt**, educator, was born in Norwich, Conn., 1831. He was graduated at Yale, 1852; studied in Germany, and was professor of geography, Yale, 1856-72; president of University of California, 1873-75; first president of Johns Hopkins University, 1876-77; president of Carnegie Institution, 1901-04; editor-in-chief, *New International Encyclopedia*. Died, 1908.

**Gilman, William Brewster**, American naturalist, zoologist and ethics of Maryland Theological Seminary since 1898, was born at Quincy, Ill., 1849. He graduated at the University of Chicago, 1871. Settled as Unitarian clergyman for three parishes,

tion of his long and valuable services in the Dominion of Canada." In 1855 he founded the

**Graaf (graaf), Regnier de.** Dutch physician and anatomist, was born in Schoonhoven, 1641. He was specially distinguished by his discovery that all animals are oviparous. The Graafian vesicles were discovered by him some time after him, though he mistook their functions. He rendered great service to anatomy through his use of the injections into the blood-vessels which Swammerdam and Knyen afterward brought to a state of comparative excellence. Died at Delft, 1673.

**Græchus** (*grak'us*), name of a distinguished Roman family, to which belonged the two celebrated tribunes, Tiberius Sempronius Græchus (163-133 B. C.) and Caius Sempronius Græchus (159-121 B. C.). The former was tribune of the plebs 133 B. C., and the latter 123-122 B. C. They were both the sons of Tiberius Sempronius Græchus (who had been tribune of the plebs in 184 B. C.) and Cornelia, the daughter of the famous Scipio Africanus the elder. Both the brothers fell victims to their zeal in attempting to contend with the growing corruptions of the Roman state.

**Grady, Henry Woodfin**, journalist, orator, was born at Athens, Ga., 1851. He was educated at the state university at Athens, and took a post-graduate course at the University of Virginia. He became editor of the *Rome, Ga., Daily Constitution* and edited the *Atlanta Constitution* from 1886 to 1890 and in 1890 became part owner and managing editor of the *Atlanta Constitution*, which he conducted until his death. He was an eloquent speaker, a man of broad and liberal views; and, during his brief public life, did as much as any one man could to secure the rights of the colored people in the South. Died Atlanta, Ga., 1899.

**Grand, Sarah**, assumed name of Frances Eliza,

Clarke, British novelist, was born in Ireland, of English parents; daughter of Edward John Bellen-den Clarke, lieutenant royal navy. She married at sixteen, brigade-surgeon Lieutenant-Colonel McFall, who died in 1898. She traveled for five years in the East, China, and Japan; wrote *Ideals* at twenty-six, and has since interested herself in the woman's movement. She is vice president of the Central and Western society for woman's suffrage, vice-president of the Scottish association for the promotion of women's public work, vice-president of Garden City association, etc.

**Grand, Frederick Dent**, United States army officer, was born at St. Louis, Mo., 1850, son of President U. Simpson Grand. He was graduated from the United States military academy, 1871, commissioned second lieutenant 4th cavalry, 1871, and served on the frontier, 1873-81. Appointed United States minister to Austria by President Harrison, 1883; police commissioner, New York, 1894-98; military governor, United States army, 1906. Served in Puerto Rico one year, and after war commanded military district of San Juan; in Philippine islands, 1899-1902; commanded department of Texas, 1902-04, department of the Lakes, 1904-06, and department of the East, 1904-08.

**Grant, James**, British military novelist, was born in Edinburgh, 1822. Having contributed copiously to the *United Service Magazine* and the *Dublin University Magazine*, he published in 1846 his *Romance of War*, the first of a long series of novels and histories, illustrative mainly of the achievements of Scottish arms abroad. He died in London, 1887.

**Grant, Robert**, author, judge probate court and court of insolvency for Suffolk county, Mass., since 1893, was born at Boston, 1852. He was graduated at Harvard College, 1875; Ph. D., 1876; Harvard Law School, 1879; was water commissioner, Boston, 1888-93. Author: *The Confessions of a Providence Art*; *Confessions of a Heretic* (verse); *The Lawless* (verse); *Yankee Doodle* (verse); *The Oldest School in America* (verse); *An Average Man*; *The Art of Giving*; *Search-Light Letters*; *Unlearned Bred*; *The Undercurrent*; *The Orchid*; *The Law-Breakers*, etc. He has been an overseer of Harvard College since

1840.  
**Grant (Hiram) Ulysses Simpson**, eighteenth president of the United States, was born at Point Pleasant, Clermont county, Ohio, 1822; graduated at the military academy of West Point in 1843; served in the Mexican war, and was in the war with Mexico, 1846, up to the capture of Monterey. In 1852 he served in Oregon; but in 1854 resigned his commission and acted as a private soldier in the 69th New York regiment, and was promoted to captain in 1859, moved to Galena, Ill., and engaged in the leather trade. At the beginning of the civil war in 1861, he volunteered as a private in the 21st Illinois regiment, and was promoted to major in 1862. In August he was appointed brigadier-general, commanding the important post of Cairo, occupied Paducah, and led an expedition to Fort Donelson. In February, 1862, he distinguished himself in the capture of Fort Donelson, on the Tennessee river, and

and the opening of the Mississippi. He then in 1864, was appointed lieutenant-general and commander-in-chief, and personally directed the operations of the army in the West, in which the northern forces, though often repulsed with heavy losses, finally compelled the evacuation of the rebel forces from the Mississippi valley by the surrender of the confederate army under General Lee, and soon after of the entire confederate army. In 1865, he was appointed lieutenant-general, passed an act reviving the grade of "general of the army of the United States," and in 1866, he was elected to the office of major-general. In 1868 he was elected, on the republican platform, president of the United States; and having in 1869, been elected to the office of lieutenant-general, Horace Greeley of the *New York Tribune*, he retired in 1877 after his second term of office. In 1878, he was elected to the office of major-general of the world. In England and France he received an enthusiastic welcome. Simple, reticent, earnest, and unassuming, he was a man of great military success not so much to strategy as to superior numbers and resources, and having fighting qualities, he was not a man who could be easily able to resist. Having lost his moderate fortune in an unfortunate speculation, Grant was not a man who could be easily able to resist, to some extent relieved him. He died of

**Gratianus** (grá'ti-á'nú), **Augustus**, Roman emperor from 373, was born in Sirmium, Pannonia, 359. Gratianus was pious, temperate, amiable, eloquent; but his fondness for frivolous amusements and his persecution of pagans and heretics alienated his subjects; so that when Maximus was proclaimed emperor crowds flocked to his standard. Gratianus was defeated by him near Paris, and fled to Lyons, where he was put to death, 383.

**Britton** (*grá'm*), **Henry**, Irish orator and statesman, was born in Dublin in 1746. He was educated at Trinity College, Dublin; in 1772 was admitted to the Irish bar, and in 1775 was returned to the Irish parliament. Mainly to him was owing, among other things, the partial abolition of the heavy restrictions on Irish commerce. As an orator he stands in the first rank. His style is full of point, rapidity, antithesis, and poetic suggestiveness. His eulogy on Chatham and his invective against Bonaparte are not surpassed in British eloquence. Died, 1820.

**Traves, John Temple**, journalist and orator, was born at Willington Church, Abbeville county, S. C., 1825; was editor of *Daily Florida Union*, Jacksonville, 1881-83; *Atlanta (Ga.) Daily Journal*, 1887-88; *Tribune of Rome (Ga.)*, 1888-90; editor-in-chief and co-proprietor of *The Daily News*, New York, 1890-91; editor of *New York American* since 1907. Presidential election at-large, Florida, 1884; was colonial on staff of Governor Northern of Georgia. Author: *History of Florida of To-Day*, *Twelve Standard Men of Florida*, *Florida's Representative Institutions for Schools*; *The Negro*. Contributor to various American periodicals as advocate of

separation of black and white races, etc.

**Gray, Asa.** American botanist, was born at Paris, N. Y., 1810. He was graduated in medicine at Fairfield College, and in 1843 received the appointment of botanist of the United States exploring expedition. He was afterward appointed professor of botany in the university of Michigan; but before he had entered upon the duties of that office he was elected, in 1842, Fisher professor of natural history at Harvard University. In addition to his lectures at Cambridge he delivered some lectures at the Lowell Institute in Boston. He was married in 1841, and had three children.

In Boston. He ranked among the leading botanists, not only of America, but of the age. He wrote: *Elements of Botany; Flora of North America; How Plants Grow; Field, Forest and Garden Botany; Darwiniana; Synoptical Flora of North America; Natural Science and Religion*, etc. Died, 1888.

**Gray, George**, jurist, was born at New Castle, Del., 1840. He was graduated at Princeton, 1860; LL. D., 1889. Studied law at Harvard, and was admitted to the bar, 1863; attorney-general of Delaware, 1879-85; United States Senator, 1883-99; member of peace commission, Paris, 1898; appointed by the President a member of the joint high commission to Queen Liliuokalani, 1898; member of the international permanent court of arbitration under The Hague convention, 1900; judge of United States Circuit Court, third judicial circuit, since 1899; chairman of anthracite coal strike commission, 1902.

**Gray, Horace** American jurist, was born at Boston, 1825; was graduated at Harvard, 1845, and its law school, 1849; was admitted to the bar, 1851; Associate-justice of the Massachusetts supreme court, 1864-73, and chief-justice, 1873-81, when he was appointed successor to Judge Clifford in the United States supreme court. He remained a member of this tribunal until shortly before his death, 1902.

**Gray, John Chipman**, lawyer, educator, was born at Brighton, Mass., 1839; graduated at Harvard, 1859; LL. B., 1862; LL. D., Yale and Harvard. Admitted to bar, 1862, but in same year entered army and served, 1862-65, from Lieutenant to major and judge-advocate of United States

volunteers. Since the war he has continuously engaged in the practice of law in Boston. Lectured at Harvard Law School, 1869-71; Story professor of law, 1875-83, and Royal professor of law since 1883, in same school. Author: *Restraints on Alienation; The Rule Against Perpetuities; Select Cases and Other Authorities on the Law of Property* (6 vols.), etc. Died 1909.

**Jay, Thomas**, English poet, was born in London, 1716. He was educated at Cambridge, and appointed professor of history and modern languages there in 1769. He had a just appreciation of the natural beauty of his native country, made notes wherever he went, and wrote copious descriptions of what he had seen to his literary friends. He published his *Ode to Eton College* in 1747, and his *Ways Written in a Country Churchyard*, by which he is best known, several years later. On the death of Cory Gibber he was offered, but declined, the post of poet laureate. Died, 1771.

**Reely, Horace**, American journalist, was born at Amherst, N. H., 1811. He started a printing office as an apprentice at East Prudence, Vt., in 1828, and in 1830 he came to New York, where he worked for some time as a journeyman printer, and in 1834 founded the *New Yorker*, a literary and political journal, which he edited for years, and other articles. After one or two other attempts at editorship he founded, in 1841, the *New York Tribune*, and became the leading journalist of the country. He was one of the earnest advocates of temperance, woman's rights, the abolition of slavery and capital punishment, and of the rights of the colored race. He was the organ of the extreme or radical party. His aspirations to political position were defeated by the conservative party leaders, and he, in turn, issued the *Journal of Liberty* in New York, Ireland, in 1860. On the secession of several of the southern states from the Union, he was one of the first to declare his opposition, in accordance with the principles of the declaration of independence; but, when the war began, he became a supporter of the Union, and was one of those who caused the premature advance that resulted in the defeat at Bull Run, 1861. In 1873 he was an unsuccessful candidate for the

**Grady, Adolphus Washington**, American general, was born at Newburyport, Mass., 1844. Entering the volunteer service, he attained the rank of captain during the civil war, and at its close was transferred to the regular army with the rank of major. He was assigned to the 1st Cavalry, the signal service, and in 1881 was assigned to the command of the Lady Franklin bay expedition to northern Greenland. After suffering extreme and terrible hardships, Grady, a few days before his death, was rescued by a relief party. He was the father of his country in 1884, by an expedition sent to his relief from the United States Government. He published an account of the expedition in 1886, under the title of *Arctic Expeditions*. In 1890 he became chief of the United States signal service, and was head of the weather bureau from that time until it passed under control of the department of agriculture. He was made major-general in 1898.

**Green, Betty Howland Robinson,** American financier, was born in New Bedford, Mass., 1835, daughter of Edward Mott Robinson, who died in 1865, leaving her a large fortune. She is said to be the richest woman in America, and probably the greatest women financier in the world. She personally manages her large property in stocks, bonds, and real estate in Chicago, New York, and elsewhere.

and elsewhere.

**Green, John Richard**, English historian, an born at Oxford, England, 1837, and educated at Magdalen College, Oxford, and Jesus College, Cambridge. He took orders in 1860, and was for some time vicar of St. Philip's, Stepping, becoming in 1868 Librarian at Lambeth. Author: *A Short History of the English People; A History of the English People; The Making of England, and The Conquest of England*. The latter was published after his death by his wife, who assisted him in various works, and herself wrote *Henry II.* in the Twelve English Statesmen series. Died, 1883.

**Green, Thomas Hill**, English philosopher, was born in Yorkshire, 1836. Educated at Rugby and Balliol College, Oxford, 1859, he in 1860 was appointed to a lectureship in metaphysics at Oxford, and in 1877 Whyte professor of moral philosophy, and died in 1882. Green a noble character, contagious enthusiasm, philosophical profundity, and strong interest in moral questions, were the chief features of his life and work. His *Prolegomena to Ethics*, left incomplete at his death, was edited by A. C. Bradley, and two "lay-sermons" by Arnold Thynne in the same year. His sentences are in vogue. See *Green*, by R. L. Nettleship.

**Green, William Henry**, American Presbyterian theologian, was born at Groveville, N. J., 1825. He was graduated from Lafayette College, 1840, and at Princeton theological seminary, 1846. In 1851 he was made professor of biblical and oriental literature at Princeton, and was chairman of the committee which revised the old

of ethics and education Leland Stanford Jr. University; public lecturer since 1899. Author: *The New Humanism*; *Principles of Education*; *Moral Education*; *Human Equipment*, etc.

**Griggs, John William**, lawyer, United States attorney-general, 1871, was born at New York, N. Y., 1848. He was educated at Lafayette College, 1868; admitted to the bar, 1871; practiced at Paterson; member of the New Jersey bar, 1874; admitted, 1877; became attorney-general, 1882-88; president of New Jersey senate, 1886; governor of New Jersey from January, 1890, until re-elected, January, 1896. He was chief of attorney-general in President McKinley's cabinet; member of Hague conference of arbitrators. **Grillparzer (Grillparzer), Franz**, Austrian dramatist poet, was born at Vienna, 1791. He was educated, jurisprudence, 1818; entered the imperial civil service, in which he remained until 1856. He first attracted notice in 1817 by a tragedy, *Der Ahnfrau*, which followed by *Sappho*, *Das goldene Vließ*; *Des Meeres und der Liebe Wälder*; *Der Traum ein Leben*, etc. He produced in lyric poetry much meritorious work; and one good prose novel, *Der arme Spielmann*. Died at Vienna, 1872.

**Grimm, Friedrich Meisler, Baron von**, German-French critic and writer, was born at Ratisbon, 1723. He became acquainted with Rousseau in 1749, and through him, with Voltaire and Madame d'Épinay. His connection with the encyclopedists, added to his own acquisitions, opened up to him a wide literary horizon. He was made a baron by the duke of Gotha, and appointed minister-plenipotentiary at the French court. At the outbreak of the revolution he fled, and afterward to the court of Catherine II., whence he was sent in 1793 as Russian minister to Hamburg. He died at Berlin in 1807.

**Grimm, Jakob Ludwig Karl**, German philologist and antiquary, was born at Hameln, in Hesse-Cassel, 1785. Though holding at various times important public offices, his life was devoted to philological and antiquarian studies. His German Grammar, in four volumes, is perhaps the greatest philological work of the century. In 1814, in company with his brother, Wilhelm, he published numerous works of a more popular character, the best known of which were *Deutsche Sagen und Hausmärchen*, nursery and fable stories. The greatest joint undertaking of the two brothers was the *Deutsche Wörterbuch*, begun in 1825. Jakob Grimm died in 1863. Wilhelm was born in 1786 and died at Berlin in 1859.

**Grimston (Grimston), R. See Kendal, Mrs.**

**Grimston, William B. See Kendal, Mr.**  
**Grisey (Grisey), Antoine Jean, Baron**, French historical painter, was born at Paris, 1771. He studied in the school of David, and acquired celebrity by several pictures of Napoleon, and in 1805, by *L. and Charles V. at Saint Denis*. "Departure of Louis XVIII. for Ghent," "The Plague at Jaffa," "Embarkation of the French in the Anjouin." He drowned himself in the Seine, 1833.

**Gross, Samuel David**, American surgeon, was born in Feenayville, 1828. He was graduated from Jefferson medical College, 1828; was professor of pathological anatomy in Cincinnati medical College, 1833-39; professor of surgery in University of Louisville, 1839-50; and at university of New York, 1850-61; professor of surgery in Jefferson Medical College, 1864-64. He wrote: *System of Surgery* (3 vols.); *American Medical Biography*, etc. He was the founder and chief editor of the *North American Medical-Chirurgical Review*, and was president of the American Medical Association, 1867. Died at 1884.

**Grubb (Grubb), F. D.**, American jurist, judge of United States circuit court of appeals, 7th circuit, since 1899, was born at Ashland, Ohio, 1822. He was graduated from Western Reserve Law School, 1847; practiced law at Ashland, Ohio, 1847-48, where he was city solicitor for six years; practiced from 1850-52 at United States judge of northern district of Illinois, 1892-99. He has been president of the John Reuben library, Chicago, since 1901.

**Grosvenor, Edwin Augustus**, educator, historian, was born in Newburyport, Mass., 1845. He was educated from Amherst, 1867. Andover theological seminary, 1872; LL. D., Wabash, 1903. Professor of modern governments and their administration, 1898-1907. Modern government and international law since 1901, Amherst College. Author: *The Hippodrome of Constantinople*; *Contemporary History*, etc.

**Grote (Grote), George**, English historian and politician, was born at Clay Hill, Kent, England, 1794. He published many pamphlets on reform, and contributed to the *Westminster Review*. In 1833 he was elected to parliament for the constituency of London, for which he continued to sit until 1841, as one of the "philosophical radicals." His history of Greece appeared in 1846. His *History of Greece* followed by *Plato and Other Companions of Socrates*. He died in 1871, and is buried in Westminster Abbey.

**Grotius, or De Groot, Hugo**, eminent Dutch scholar and statesman, was born at Delft, Holland, in 1583. He was descended from

a noble family, received an excellent education, and gave early manifestations of surprising talents.

In 1599 he commenced his career as advocate, and succeeded in being appointed historiographer, advocate-general of Holland and Zealand, a member of the states-general, and envoy to England. Hitherto his life had been marked by splendor, but it began to be clouded by the part which he took in the Arminian controversy. In 1613 he became syndic, or pensionary, of Rotterdam, and declaring himself on the Calvinist side, he incurred the wrath of the cause of the Arminians by his pen and influence. For this he narrowly escaped the fate of Barneveldt, (who suffered on the scaffold, and received sentence of imprisonment for life in the fortress of Loewestein. He remained in prison 18 months, which he had employed in writing his celebrated *Treatise on the Truth of the Christian Religion*, and then succeeded in escaping. This was effected by the management of his wife, who contrived to have him carried out of the castle in a chest that had been used for the carriage of books and linen.

Grotius at first sought an asylum in France; and it was during his residence there that he composed his great work, *De Jure Belli et Pacis*, on the Law of War and Peace. After an absence of 12 years, he returned to his native country, relying on the favor of Frederick Henry, prince of Orange, who had written him a sympathizing letter. But by a misapprehension of his enemies he was sent to perpetual banishment. He passed the remnant of his life in the diplomatic service of Sweden, and died at Rostock, in 1645.

He is the author of the most valuable treatise on international law, and extensive carrying. He was a profound theologian, a distinguished scholar, an acute philosopher, a learned jurist, and an erudite historian. Among his numerous works are: *De Imperio*, 1607; *De Antiquitate Reipublice Batavice*; *A History of the Goths*, etc.

**References.—Burgh's Life of Hugo Grotius.**  
**Gruchey (Gruchey), Emmanuel**, Marquis de, distinguished French marshal, was born in Paris, under the name of Gruchey, in 1752. He was lieutenant in the royal body-guard, 1787-93; served with Lafayette, was promoted brigadier-general, 1793; was afterwards employed in the Alps, aided in the conquest of Savoy, and after fighting in La Vendée, 1794, was cashiered as being unworthy of the office of general. He enlisted as a private soldier, and after the fall of Robespierre was reinstated and promoted general of division by a special decree. Defeated the Prussian cavalry at Zebendorf, 1806; was governor of Madrid, 1806; took part in the battle of Wagram, 1809; distinguished himself at Borodino, 1812; and commanded Napoleon's body-guard on the retreat from Moscow. When Napoleon repulsed the Elba, Gruchey was given a command and made a marshal of France for his successes in the north. He then marched into Belgium, defeated the allied English and Prussian armies at Fleurus and Liège, and by following Napoleon's orders to the letter to pursue Bücher is believed to have saved the French army from annihilation. He was again banished by the Bourbons, lived five years in Philadelphia, was recalled to France, 1818, in consequence of the revolution, was restored to rank as marshal and created a peer. Died, 1847.

**Grove, Sir George**, British engineer and writer on steam, was born at Clapham, 1820. He was trained as a civil engineer, erected in the West Indies the first two cast-iron lighthouses, and acted as the Britannia tubular bridge, and the United Kingdom and Wales. He was made D. C. L. by Durham, LL. D. by Glasgow, and was knighted in 1883 on the occasion of the Royal College of Medicine, of which he was director until 1895. He died in 1900.

**Grove, Sir Walter Robert**, English lawyer and physician, was born at Swansea, 1811. He studied at Oxford, was admitted to the bar, and called to the English bar, 1836. He was 1875-87 was a judge in the high court of justice. He greatly distinguished himself in the subjects of electricity and optics, and in 1839 he gave the powerful voltaic battery known by his name. He published very important lectures, in which he propounded the theory of the universality of the natural forces; the *Correlation of the Physical Forces*; *Volcanic Eruption*, and the *Electricity of the Atmosphere*. **Grundtvig (Grundtvig), Nikolai Frederik Severin**, Danish poet and theologian, was born at Udby in Denmark. He first learned his Latin in *Northern Mythology*, published in 1808, and *Decline of the Heroic Age in the North*, in 1809.

These were followed by the *Rhyme of Roskilde* and the *Heimskinde Saga*, and by a collection of patriotic songs. In 1815 he had begun the translation of the *Heimskinde Saga*, a masterpiece, in 1820 published a Danish translation of *Beowulf*, after 1861 he had the title of bishop, though he had not been since 1872.

**Grundy (Grundy), Fells**, American jurist and statesman, was born in Berkeley county, Va., 1777. In 1799 he was elected to the Kentucky constitutional convention, and from that time until 1806 served as a member of the legislature. He was elected to the supreme court of errors and appeals in 1806; in 1807, became chief-justice. In 1811 was sent to Congress, and re-elected in 1812. In 1813, as United States senator, to fill the unexpired term of John H. Eaton. Later he was elected to fill that place for a portion of another term. In 1838 he served for a few months as United States attorney-general, during the administration of Martin Van Buren; resigning the office he was immediately reelected to the United States senate. Died at Nashville, Tenn., 1840.

**Grusky, Carl Ewald**, civil engineer, was born in San Joaquin county, Cal., 1854. His first professional work was as a topographer with a surveying party of state engineering department of California, 1878; member of San Francisco Engineers' Association, 1880; member of the canal commission, 1904-05; consulting engineer, 1905-1907; and, since 1907, consulting engineer, New York.

**Guarini (Guarini), Giovanni Battista**, Italian poet and diplomat, was born at Ferrara, 1537. He was instructed by Duke Alfonso II. with diplomatic honors, and appointed ambassador in Venice, and Poland. His chief work was the famous pastoral play, *Il Pastor Fido*, really an imitation of his countryman, Jacopo Sannazaro. **Guericke (Guericke), Otto von**, German physicist, was born at Magdeburg, in Prussian Saxony, 1602. As a chemist he was distinguished by his discoveries relative to nature and effects of air. The experiments of Galileo and Pascal on the weight of air led him to attempt the creation of a vacuum. This resulted in the first air-pump, invented about 1650. Guericke's invention soon became famous, and in 1654 he was summoned to the presence of the emperor Ferdinand III. of Germany at Ratisbon, at which time he made the famous experiment of the vacuum. This was the "Magdeburg hemispheres," in demonstration of atmospheric pressure. Died at Hamburg 1686.

**Guggehem, Simon**, captain, United States Major-General, was born at New York, 1792. He was graduated from public schools of Philadelphia, after which he studied languages in Paris. He studied under Cuvier, and subsequently followed the more refined and ideal school of the Caracci, previous to finally striking out a style for himself. In 1808 he went to Rome where he remained for twenty years, and was a rival of Caracciolo. The "Aurora" of Guido was the best Italian painting of the Resurrection palace, a fresco of world-wide fame, is considered the greatest of his works. Died 1642.

**Guggehem, Carl**, German painter, was born at Munich, 1805. He was graduated from public schools of Philadelphia, after which he studied languages in Paris. He studied under Cuvier, and subsequently followed the more refined and ideal school of the Caracci, previous to finally striking out a style for himself. In 1808 he went to Rome where he remained for twenty years, and was a rival of Caracciolo. The "Aurora" of Guido was the best Italian painting of the Resurrection palace, a fresco of world-wide fame, is considered the greatest of his works. Died 1642.

**Gutierrez (Gutierrez), Juan**, soldier, and son of Tancared d'Hautville, was born in 1913. He defeated Leo IX. at Civitella, and, with his

brother Humphrey, became count of Apulia. Subsequently he rescued Gregory VII, from the emperor Henry V, invaded Italy, and died, 1055, when on another expedition against it, having defeated the fleets of the eastern emperor and Vladimir.

**Guise (gü-zé')**, a ducal family of Lorraine, was so named from the town of Guise. The most prominent members were Claude, duke of Lorraine (1490-1550), fifth son of René II, duke of Lorraine, was born at the chateau of Guise, in the Ardennes, and died, but after that campaign remained at home to defend France against the English and Germans. He suppressed the revolt of the duke of Lorraine, 1527, Francis created him duke of Guise.

Mary of Lorraine (1515-60), his daughter, in 1547 married Louis XII, duke of Orleans, and in 1553 James V, of Scotland, at whose death, in 1542, she was left with one child, Mary, Queen of Scots. During the troubles years that followed, the queen-mother acted with wisdom and moderation; but after her accession to the regency in 1554 she allowed the Guises to excite a rebellion, which continued to her death in Edinburgh castle.

Francis (1510-63), her brother, second duke, became one of the greatest generals of France. He and his brother Charles, duke of Guise, were conspicuous at the council of Trent, aimed to become all-powerful during the reign of Francis II. Heading the Roman Catholic party, they were triumphantly repulsed by the Protestants. Montmorency won a victory over the Huguenots at Dreux, 1562, and Guise was his murderer. He was assassinated by a Huguenot.

Henry (1550-88), third duke, fought fiercely against the Protestants in Flanders and Normandy, 1569, and forced Coligny to raise the siege of Poitiers. He was ambitious to succeed to the throne of France. His grandson, III, procured his assassination at Blois.

Henry (1614-64), his grandson, fifth duke, at fifteen became archbishop of Rheims, but in 1640 succeeded the dukeship. Having joined the league against Richelieu, he was condemned to death, but fled to Flanders. He was killed by the hand of Mazarin's revolt in Naples as the representative of the Anjou family, but was taken by the Spanish, 1647, and carried to Madrid where he remained a prisoner. After a second attempt to win Naples, 1654, he settled at Paris.

**Gutierrez, Juan**, physician, professor of general medicine and tropical diseases at the University of Havana, since 1900, was born at Matanzas, Cuba, 1852. He was educated at La Empressa, Madrid, 1870. M. D., University of Havana, 1875. P. D.; was professor of pathology, university of Pennsylvania, in charge of General Hospital as fellow expert in Sanitary Department, 1890. Member of *La Revista de Medicina Tropical*, and member of many medical and scientific associations.

**Gustaf (gü-stäf')**, **Frederick Guillaume**, French statesman and historian, was born at Nîmes, France, 1757. His first work, the *Nouveaux Mémoires Historiques de Sismogènes de la Langue Française*, appeared in 1809. He contributed to the dissolution of the *Chambre Inviolable* by writing a memorial which was placed in the hands of Louis XVIII, by Derogues. The latter committed to him the direction of the administration of the communes and departments in 1819. After the revolution of 1830, he became successively minister of public instruction, and minister of the interior, an office which he held, with two interruptions, until 1836, in 1847 he became the official leader of the cabinet, which maintained its ground in the policy of Louis Philippe's policy, until the revolution of 1848. Among his works are his *History of the English Revolution*; *Life of Oliver Cromwell*; *History of Civilization in Europe*; and *History of Civilization in France*. He died in 1874.

**Gustavus (gü-stä-vüs')**, **Frank Wakley**, Congregational clergyman, educator, was born at Cheshireville, Ohio, 1856. He was graduated at Wesleyan University, 1875. B. D., Beloit College, Wisconsin. Pastor of Memorial Congregational church, Baltimore, 1885-87; Plymouth church, Chicago, 1887-90; Central church, Chicago, 1890; president of Armour Institute of technology, since 1893; lecturer at Yale theological seminary 1882; general secretary of the Board of Christian Education, 1890; author of *Phidias and Other Poems*; *Stories of Night and Day*; *Transfiguration of Christ*; *Truth and Knave*; *Life of Jesus*; *How to Be a Stone*; *Metamorphosis of a Creed*; *November at Eastwood*; *Loaves Leaves of The Man of Galilee*; *Paula to Power*; *Paula to Power*; *Paula to Power*; *Ministries of Recent English Poetry*, etc.

**Gunter (gü-ntér)**, **Edmund**, English mathematician, was born in 1628 at Wotton, near Oxford, was educated at Westminster and Christ Church, Oxford. He invented the sector, with the lines drawn as Gunter's scale, and was the first in the invention of the surveying-chain, and the first observation of the variation of the compass. Died, 1626.

**Gustavus Vasa (gü-stä-vüs' vä-sä')**, king of Sweden, was born of a noble house at Lindholmen in Upland, 1496, and in 1518, during the patriotic

struggle with Christian II, of Denmark, was treacherously carried off to Denmark as a hostage. As a year was required to take him back to Sweden, where he strove in vain to rouse a spirit of resistance against the Danes. Retreating to the island of Åbo, he was confined to a room set on his head, and worked on floors and in mines. At last the infamous "blood-bath" of 1520, which was required for his release, Gustavus had an army large enough to attack the enemy. His capture of Stockholm in 1523 secured him the crown of Sweden, and he became king. He found the whole country demoralized. Yet after a forty years' rule he left Sweden a united and well-organized army. He died in 1560, and was succeeded by his eldest son, Eric.

**Gustavus VII.**, king of Sweden, was born at Stockholm, 1594. He was the grandson of Gustavus Vasa by his youngest son, Charles IX., at whose death, in 1611, he succeeded the throne of Sweden. He was acquainted with eight languages, five of which he spoke and wrote fluently, was well read in the classic and ancient history. He was proficient in music, and excelled in all warlike and many exercises. Having made various administrative reforms, and availing himself of the short interval of peace to promote the material prosperity of the country, he remitted the charge of the government to his son, Charles, in 1630, and set sail, in the summer of 1630, with an army of about 15,000 men, to aid the Protestants of Germany. He was a member of the League of Catholic League, which was backed by the power of the empire. With and for the Germans he fought at the death on the battlefield of Lützen, 1632. He made Sweden a power in northern Europe.

**Gustavus III.**, king of Sweden, was born at Stockholm, 1746, and succeeded his father, Adolphus Frederick, in 1771. In 1792 he was mortally injured at the theatre, and died in the opera house which he himself had built. Gustavus was a man of varied learning, and the author of several dramatic works and poems of considerable merit.

**Gustavus V.**, king of Sweden, was born in 1858, married, 1881, Princess Sophia, who was the first cousin of the German emperor, and a descendant of the old Swedish royal family of Vasa. He succeeded his father, Oscar II, on December 8, 1907, having several times previously acted as regent. The king's eldest son, Gustavus Adolf, was born at Stockholm, 1906. Margaret of Connaught, June, 1903. His majesty is a knight of the garter of Great Britain, and a knight of the Victoria Order, since April, 1906.

**Gutenberg, Johann**, or **Henne (gü-ten-bürd)**, the inventor of printing, was born in Mainz, Germany, about 1400, died 1468. His father's name was Gensfleisch. Gensfleisch, Gutenberg being the name of his mother, or of an estate belonging to his family, which was of noble lineage.

Gutenberg was a citizen of Mainz about 1420, where he appears to have devoted many years to mechanical experiments, and as early as 1438 he had a press, movable types, forms, and other appliances for printing. After 1444 all trace of him is lost till 1448, when he was again in Mainz. In 1450, he entered into a partnership with Johann Faust of Mainz for the purpose of carrying on the business of printing, the latter undertaking to furnish the funds. The partnership terminated at the end of five years, most of the materials being taken by Faust for his advance. Faust and Gutenberg agreed to have afterward carried on printing, with considerable activity alone.

In 1465 he abandoned the business, and entered the service of the archbishop-elect, Adolphus of Nassau. In his own words in modern times he has been obliged to share with Faust and Peter Schöffer the credit of his invention; but in the preface to a German translation of Livy (Münster, 1505) it is distinctly declared by Johann Schöffer that the "admirable art of printing was invented in Mainz in 1450 by the ingenious Johann Gutenberg." The opinion of modern writers seems to be that Gutenberg not merely invented the art, but practiced it long before he became associated with Faust.

**Gutzkow (gü-tä-kö')**, **Karl Ferdinand**, German novelist and dramatist, was born at Stettin. He started a newspaper in 1831; went to Stuttgart to assist in editing *Münner's Literaturblatt*; was there three months, and then his writings expressed for the atheistic and scientific views upon religion in his novel, *Wally, die scerifera*, 1835, and in his name year elaborated *Die Wally, die scerifera*, a dramatic work. To escape the surveillance of the Prussian government he went to

Hamburg in 1837, thence to various German cities, and in 1870 made his permanent residence in Berlin. He was author of many novels, tragedies, dramas, and plays, which attained with popularity. Died, 1878.

**Guyot (gü-yot')**, **Arnold Henri Bouvier de la Motte**, French mystic, was born at Montargis, 1648. She was married at sixteen to Jacques Guyon, a man of twenty-eight, who was named to devote her life to the good and pious, and to the cultivation of spiritual perfection. At Paris, in 1670, she met the Marquis de Mouchy, where she finally settled in 1686, she became the center of a movement for the promotion of "holy wives" made their chief attraction. Her opinions, and for having been in correspondence with Molinos, the leader of the movement in Spain, she was arrested, and the authorities inquire into her teachings arose from controversy between Fénelon and Bossuet. Released by the intervention of Madame de Mouchy, after a detention of nine months, but again imprisoned in 1695, she was not released from the Bastille until 1702. She died at Paris in 1717.

**Guyot (gü-yot')**, **Arnold Henri**, Swiss geographer and geologist, was born at Neuchâtel, 1807. He came to America in 1848, and devoted his life to science; was professor of geology and physical geography at Princeton College, 1855-84. He formed an intimacy with Agassiz, and made numerous geological explorations, and wrote books. His greatest works were *The Meteorological and Physical Tables*, issued by the Smithsonian Institution, and his *Essays on Mass*, 1884.

**Haakon VII.** (gü-hä-kön'), king of Norway, was born at Christiania, 1872. He was a prince of Denmark, and a nephew of Queen Alexandra of Great Britain. His baptismal name was Charles, but he assumed the royal title on becoming king November 18, 1905, on the separation of Norway and Sweden. King Haakon and Queen Maud made their formal entry into Christiania November 25, 1905, and the king took the oath before the Storting on the 27th, and was crowned at Trondheim on June 22, 1906. He married Princess Maud Alexandra, daughter of King Edward VII., July 22, 1896. His son and heir apparent is Prince Alexander, born July 2, 1903, and renamed Prince Olaf on his father's accession to the throne.

**Hackett, William**, actor, was born at Wolf Island, Ont., 1869. He was graduated at the college of the city of New York, 1891, and studied at the University of Toronto, 1891-92. He appeared on the stage in Palmer's stock company, 1892; was leading man at New York Lyceum at twenty-nine, and at the Victoria Theatre, 1893-94. He was a successful actor-manager in America.

**Hading (hä-ding')**, **France**, stage name of Jeanne Hading, French actress, was born at Marcellines, France, 1859. At the age of three she played *Bianche de Cuytus* in *Le Boeuf*, her father at the same time playing the leading character. Some years later she was sent to the Marcellines conservatory, where she won considerable distinction. On leaving she entered upon an engagement at the Algiers theater, and when but fourteen played *Zouine* in *Le Fausset*, Stefano in *Claf d'argent* in *Coma*, the blind girl in *Les Deux Orphelines*, and Pedro in *Girofle-Girofla*. At the Palais Royal she played *La Châtre* in *Le Capitaine Corcoran*. She was the original Jolie Perrane and Belle Lurete, and the heroine in *Helène* and *Abelard*. She again appeared in *Claf d'argent*, *Pauline*, *Le Maître de Forges*. She subsequently appeared in London, 1894, and in 1895, 1896, and 1897, 1898, 1899, 1900, 1901, 1902, 1903, 1904, 1905, 1906, 1907, 1908, 1909, 1910, 1911, 1912, 1913, 1914, 1915, 1916, 1917, 1918, 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 2680, 2681, 2682, 2683, 2684, 2685, 2686, 2687, 2688, 2689, 2690, 2691, 2692, 2693, 2694, 2695, 2696, 2697, 2698, 2699, 2700, 2701, 2702, 2703, 2704, 2705, 2706, 2707, 2708, 2709, 2710, 2711, 2712, 2713, 2714, 2715, 2716, 2717, 2718, 2719, 2720, 2721, 2722, 2723, 2724, 2725, 2726, 2727, 2728, 2729, 2730, 2731, 2732, 2733, 2734, 2735, 2736, 2737, 2738, 2739, 2740, 2741, 2742, 2743, 2744, 2745, 2746, 2747, 2748, 2749, 2750, 2751, 2752, 2753, 2754, 2755, 2756, 2757, 2758, 2759, 2760, 2761, 2762, 2763, 2764, 2765, 2766, 2767, 2768, 2769, 2770, 2771, 2772, 2773, 2774, 2775, 2776, 2777, 2778, 2779, 2780, 2781, 2782, 2783, 2784, 2785, 2786, 2787, 2788, 2789, 2790, 2791, 2792, 2793, 2794, 2795, 2796, 2797, 2798, 2799, 2800, 2801, 2802, 2803, 2804, 2805, 2806, 2807, 2808, 2809, 2810, 2811, 2812, 2813, 2814, 2815, 2816, 2817, 2818, 2819, 2820, 2821, 2822, 2823, 2824, 2825, 2826, 2827, 2828, 2829, 2830, 2831, 2832, 2833, 2834, 2835, 2836, 2837, 2838, 2839, 2840, 2841, 2842, 2843, 2844, 2845, 2846, 2847, 2848, 2849, 2850, 2851, 2852, 2853, 2854, 2855, 2856, 2857, 2858, 2859, 2860, 2861, 2862, 2863, 2864, 2865, 2866, 2867, 2868, 2869, 2870, 2871, 2872, 2873, 2874, 2875, 2876, 2877, 2878, 2879, 2880, 2881, 2882, 2883, 2884, 2885, 2886, 2887, 2888, 2889, 2890, 2891, 2892, 2893, 2894, 2895, 2896, 2897, 2898, 2899, 2900, 2901, 2902, 2903, 2904, 2905, 2906, 2907, 2908, 2909, 2910, 2911, 2912, 2913, 2914, 2915, 2916, 2917, 2918, 2919, 2920, 2921, 2922, 2923, 2924, 2925, 2926, 2927, 2928, 2929, 2930, 2931, 2932, 2933, 2934, 2935, 2936, 2937, 2938, 2939, 2940, 2941, 2942, 2943, 2944, 2945, 2946, 2947, 2948, 2949, 2950, 2951, 2952, 2953, 2954, 2955, 2956, 2957, 2958, 2959, 2960, 2961, 2962, 2963, 2964, 2965, 2966, 2967, 2968, 2969, 2970, 2971, 2972, 2973, 2974, 2975, 2976, 2977, 2978, 2979, 2980, 2981, 2982, 2983, 2984, 2985, 2986, 2987, 2988, 2989, 2990, 2991, 2992, 2993, 2994, 2995, 2996, 2997, 2998, 2999, 3000, 3001, 3002, 3003, 3004, 3005, 3006, 3007, 3008, 3009, 3010, 3011, 3012, 3013, 3014, 3015, 3016, 3017, 3018, 3019, 3020, 3021, 3022, 3023, 3024, 3025, 3026, 3027, 3028, 3029, 3030, 3031, 3032, 3033, 3034, 3035, 3036, 3037, 3038, 3039, 3040, 3041, 3042, 3043, 3044, 3045, 3046, 3047, 3048, 3049, 3050, 3051, 3052, 3053, 3054, 3055, 3056, 3057, 3058, 3059, 3060, 3061, 3062, 3063, 3064, 3065, 3066, 3067, 3068, 3069, 3070, 3071, 3072, 3073, 3074, 3075, 3076, 3077, 3078, 3079, 3080, 3081, 3082, 3083, 3084, 3085, 3086, 3087, 3088, 3089, 3090, 3091, 3092, 3093, 3094, 3095, 3096, 3097, 3098, 3099, 3100, 3101, 3102, 3103, 3104, 3105, 3106, 3107, 3108, 3109, 3110, 3111, 3112, 3113, 3114, 3115, 3116, 3117, 3118, 3119, 3120, 3121, 3122, 3123, 3124, 3125, 3126, 3127, 3128, 3129, 3130, 3131, 3132, 3133, 3134, 3135, 3136, 3137, 3138, 3139, 3140, 3141, 3142, 3143, 3144, 3145, 3146, 3147, 3148, 3149, 3150, 3151, 3152, 3153, 3154, 3155, 3156, 3157, 3158, 3159, 3160, 3161, 3162, 3163, 3164, 3165, 3166, 3167, 31

**Mancock, John**, American patriot, was born in 1727. He was one of the leaders in the revolution in Massachusetts, the seizure of his sloop, *Liberty*, being the occasion of a riot in Boston. He was very active in denouncing the "Boston massacre" and was one of the persons whose seizure was attacked by the British expedition which led to the battle of Lexington. He was president of the continental congress from 1775-77, and governor of Massachusetts, 1780-83, 1787-93, and the first signer of the declaration of independence. He presided at the constitutional convention of 1780 and signed the constitution of the proposed federal constitution. Died, 1793.

**Hancock, Winfield Scott**, American general, was born in Pennsylvania, 1824. After graduating at West Point in 1844, he served with great gallantry during the Mexican war. Appointed brigadier-general of volunteers in 1861, he took part in the campaign on the Potomac, fought at Antietam, and commanded a corps in the battle of Gettysburg, where he was wounded. In 1863, in 1864 he became brigadier-general in the regular army, in 1866 a major-general. At his death, in 1886, he was in command of the department of the East.

**Handel, George Frederick**, noted German musician, was born at Halle, Saxony, 1685. At ten years of age he composed a set of sonnets. In 1703 he went to Hamburg, where he played a violin in the orchestra of the opera. He was soon its director, and composed his first opera, *Almira*, which was rapidly followed by *Nero*, *Florinda*, and *Daphne*. His violent temper involved him in a quarrel with a brother-composer, which resulted in a duel; the sword of his adversary was stoned by a button or a music score.

He next visited Italy. In Florence he composed *Rodrigo*, 1709. His *Agrippino*, composed in Venice, had a run of 30 nights. At Rome he produced his *Il Trionfo del Tempo*. At Naples he composed *Acis and Galatea*, and in 1710 returned to Germany, where he was appointed chapel-master to the Elector of Hanover, afterwards George I.

Editor of *Insoliver*, after which George Handel moved to England and there he was patronised by Queen Anne and her nobility. He composed *Rinaldo*, *Giulio Fido*, *Theseus*, and in 1715, *Amadis de Gaul*, in which Nicolini and Valentini first sung in England. The opera was an exotic hit in England, and a plant of slow growth. A royal academy of music was formed, and after some competition was placed under Handel's management; but his overbearing temper could not cope with musical jealousies. An opposition house was started, and both

He now began the composition of his oratorios. *Israel* was produced in 1735 and is followed by *David*, *Samson*, *The Feast, and Esther in Egypt*; and in 1740 appeared *L'Allegro e Pensoso*, and *Samson*. These were produced in the Lincoln's Inn Fields theatre, but with no profit. Even the *Messiah*, the most sublime of his compositions, was at first a failure. Tired of this titanic struggle, Handel went to Dublin, where he remained nine months, and received a generous support. On his return to London he composed his *Samson*, and produced his *Messiah* for the benefit of the Foundling Hospital. It was repeated annually for the same purpose, and from 1749 to 1777 brought to that society £51,500.

Handel became blind, but he still composed and played on the organ, being led to his seat, and forward to receive the plaudits of the audience. Died 1759.

**Manly, J. Frank**, lawyer, ex-governor of Indiana, was born in St. Joseph, Ill., 1863. He was educated in common schools, Champaign county, Ill., taught school for nine years in Warren county, Ind., and was admitted to the bar in 1889. He practiced at Williamsport, Ind., 1889-96; was elected to the state senate, 1890-92; elected to congress, 1894, serving one term, and was a candidate for the United States senate in 1896.

1899. He was governor of Indiana, 1905-09. Hanna, Marcus Alonso, American politician and legislator, was born in New Lisbon, Columbus county, Ohio, 1837. He began his career in his father's wholesale grocery house. In 1867 entered the firm of Rhodes and company, dealers in coal and iron, and ten years later the firm name was changed to M. A. Hanna and company. He was appointed to the United States senate as a republican by Governor Ruebush, 1897, to fill vacancy caused by the resignation of John Sherman, who resigned to accept the position of secretary of war.

tary of state in President McKinley's cabinet, and took his seat March 5, 1897. His term of service under the appointment expired in January, 1898, and he was elected for a full term, and served until his death in 1904. He proved a remarkable political organizer, was a man of excellent judgment, and an effective debater.

**Hannibal**, Carthaginian general, the famous son of Hamilcar Barca, was born in 247 B. C. At the age of nine years he accompanied his father on his expedition to Spain, and therefore starting from an early age he was imbued with the spirit of hatred to the Roman name. He attacked Saguntum, a city in alliance with Rome, for making agreements on the Torbotoles, subjects of Carthage. After eight months' siege, the city was taken, and the Romans, after unsuccessfully demanding the surrender of the general who had thus wantonly violated the treaty, declared war in 218 B. C. Hannibal started from New Car-

211B 215 B. Marius killed Varro and about 12,000 of his men. Varro was killed by the Pyrenaees he marched to this Rhone without opposition, since Scipio was at Massilia (Marseilles), four days' march from the Pyrenaees. He sent a detachment of 10,000 men of the Celtic horde who aided with their Romans. He collected the passages of the Alps in five days, in spite of the attacks of the mountaineers. He then moved on to the Pyrenaees. Scipio, having returned from Massilia, took command of the army in the north of Italy, and first met Hannibal on the plain near the river Trebia. Scipio, severely wounded, retreated across the Po. Hannibal next inflicted a severe defeat near Lake Thymene, on the consul Flaminius. He then moved on to the Alps, and in the autumn, in October, in August, 216 B. C., almost annihilated the Roman army of 90,000 men under Terentius Varro and Aemilius Paulus. In this battle about

50,000 are said to have fallen, including Hannibal's own army. The Roman survivors were few. The Romans, surprised the Roman general, defeated their army, captured their towns. The defeat of Hannibal, which was the end of the Punic Wars, and the loss of his army, compelled Hannibal to confine himself to the mountainous peninsula of Iberia, where he remained for the rest of his life. He made the Romans to dialogue him. At length, after having maintained himself in Italy for upward of fifteen years, he was recalled to Rome, where he was put to death. Hannibal was notwithstanding his utmost exertions and the bravery of his veteran troops he was defeated. The surrender of Hannibal was one of the conditions of peace; but, foregoing such a result, he committed suicide by taking poison. 183 B. C.

**Capgood, Isabel Florence**, author, was born in New York City, 1855. She was educated at Worcester, Mass., and at Miss Porter's school, Farmington, Conn., 1865-68. Author: *The Epic Songs of Ruano; Russian Reminiscs; A Survey of the Russian Literature; The Russian People*. Translations of standard works from Spanish,

**Haggood, Norman**, editor, author, and critic, was born in Chicago, Ill., 1868. He was graduated at Harvard, 1890; LL.B., Harvard law school; A. M., 1893. Author: *Literary Statesmen*; *Daniel Webster*; *Abraham Lincoln*; *The Stage in America*, etc. He was dramatic critic of New York *Commercial Advertiser*, and *Bookman*, 1897-1902.

and has been editor of *Collier's Weekly* since 1903.

**Harahan, James Theodore**, president of Illinois Central railroad company 1906-1911, was born at Lowell, Mass., 1843. He rose step by step in the service of the Orange and Alexandria railroad, the Nashville and Decatur, and the Louisville and Nashville, from 1864 until he became general manager of the latter, 1885. He was then succe-

sively assistant general manager of the Lake Shore and Michigan Southern railway, general manager of the Chesapeake and Ohio, and later of the Louisville, New Orleans and Texas railway until 1890, when he became second vice-president of the Illinois Central railroad.

**Harben, William Nathaniel.** American novelist, was born at Dalton, Ga., 1858. He was educated at high schools and privately. He has traveled extensively, and was associate editor of the *Youth's Companion*, Boston, 1891-92. Author, *W.A.'s*

Companion, Boston, 1891-93. Author: *Walt  
Marie; Almost Persuaded; A Mute Confessor;  
The Land of the Changing Sun; From Clue to Climax;  
The Caruthers' Affair; Northern Georgia Sketches;  
The Woman Who Trusted; Westerfelt; Abner Daniel;  
The Substitute; The Georgians; Pats Baker; Ann  
Boyd; Mam' Lindy; Gilbert Neal, etc.*  
**Hardenberg** (har-den-berk), Karl August, Prince  
son, Dusseldorf, 1818-1890. Works: *Die Kunst des*

rod, Prussian statesman, was born at Kessenrode in Hanover, 1760. In 1791 he became a Prussian minister, and in 1802 Prussian minister of war. In 1810 he was appointed chancellor, and addressed himself to the task of completing the reforms begun by Stein. In the war of liberation he played a prominent part, and after the treaty of Paris, in 1814, was made a prince. He took part in the congress of Vienna, and in the treaties of Paris. To Hardenberg Prussia is mainly indebted for the improvements in her army system, the abolition of serfdom, and the release of the nobles, the encouragement of municipalities, and the reform of education. Died, 1822.

**Jardine** (har'-di), **James Ketr**, British labor leader, member of parliament for Merthyr-Tydvil since 1900, was born in Scotland, 1856. In 1895 he was an unsuccessful candidate for East Bradford. He was appointed editor of the *Cummock News* 1882, but resigned in 1886. He visited India and Australia, 1907; founded the *Labor Leader*, and has been a frequent contributor to magazines and reviews.

**Reading, Samuel Bannister**, university professor, born in Indianapolis, 1866; graduated from Indiana University, 1890, Ph. D. Harvard, 1895. His history, *Indiana University, since 1895*, (collaborated with wife), *The City of the Seven Hills* (with name); *The Story of the Middle Ages: Essentials in Medieval and Modern History*; *Select Orations; The Story of England* (with W. F. Hardison); etc.

**Henry, Viscount**, English general, governor-general of Madras, India. He was born at Wrotham, Kent, 1785. Gained an ensign in 1798, he served through the Peninsula war. From 1803 to 1805 he was in the East India Company's service, and in 1805 he was promoted to the rank of general of the Portuguese army. From 1826 to 1844 he took an active share in parliamentary life, being secretary of war under Wellington in 1828, and afterward chief secretary for Ireland. He was married to a daughter of the Duke of India. After the peace of Lahore in 1845 he was created a viscount, and granted a pension of 5,000 pounds by the East India company, as well as a baronetcy. He was sent to the continent to England in 1848, he succeeded Wellington as commander-in-chief in 1852, and in 1855 was made field-marshal. He died at South Park, Tunbridge Wells, Kent, 1862.

**Wells, Arthur Sherburne**, diplomat, author, was born at Andover, Mass., 1847. He was graduated at Harvard, 1869, served two years in 36<sup>th</sup> United States artillery; was professor of civil engineering, Iowa college, 1871-73; was editor of the *Cosmopolitan Magazine*, 1893-95; United States minister and consul-general, Teheran, Persia, 1897-99; minister of United States to Greece, Roumania, and Servia, 1899-1901; to Switzerland, 1901-03, and to Spain, 1903-05. Author: *Elements of Quaternions; Elements of Conics; Elements of Algebra; Geometry; New Methods in Topographical Surveying; Imaginary Numbers*; etc.; several novels, etc.

**ALBY, Thomas**, English novelist, though educated as an architect, was born in Dorsetshire, 1840. The scenes of his novels are chiefly laid in the West-Indian colonies. His principal works are: *Indiscreet*; *The Greenwood Tree*; *For Ever the Madding Crowd*; *The Return of the Native*; *The Trumpet Major*; *The Woodlanders*; *Tess of the D'Urbervilles*; *Jude the Obscure*; *Middlemarch*; *The Weymouth Estate*; *Poems*; *A Poem of the Past and the Present*; *The Dynasts*, a drama, etc., are by Augustus John Cuthbert, English author, born in Rome, 1862. He studied at Balliol College, Oxford. He wrote the famous and often reprinted *Walks in Rome*; *Wanderings in Spain*; *Days near Rome*; *Cities of Northern Italy*; *Italy: From Florence to Naples*; *Southern Italy and Sicily*; *Rome and Environs*. Other works are his delightful biography of Maria Edgeworth; *Memorials of a Quiet Life and Letters of Thomas Burnam*; *Two Noble Lives*.  
Died, 1934.

Ed. Johns, 1905.  
 John, English actor, was born in London, 1844. He was educated at Giggleswick grammar school, Yorkshire, and obtained an engagement at a London theater, 1865. In 1875 he became manager of the Court theater, and 1879-88 maintained a partnership with W. H. Kendal. From 1889 to 1895 his tenancy of the Gaiety theater was important for his production of *La Tosca* and *A Pair of Spectacles*, the latter possibly his greatest success. He visited the United States, 1890-97.

and again in 1900.  
**argaves** (*adr'-grès*), **James**, English mechanio and inventor, was born probably at Blackburn, England, about 1748. He was an illiterate weaver and carpenter of Stanhill near that town. In 1760 he invented a carding-machine, and about 1764 the spinning-jenny. He removed to Nottingham, where he secured a spinning-mill, but his patent proved invalid. He continued to carry on his business as a yarn manufacturer until 1827.

**arkness** (ark'-ness), **Albert**, American classical scholar, was born at Mendon, Mass., 1822. He was graduated at Brown University in 1842, studied at Berlin, Bonn, and Göttingen, and became professor of Greek in Brown University in 1855. He published a series of Latin classics, and a standard *Latin Grammar* which has been widely used. Died 1907.

widely used. Died, 1907.

**arion** (*Ar-ee-on*). **John Marshall**, jurist, associate justice of the United States Supreme Court, born in Virginia, 1753; died, 1835. He was graduated at Centre College, Ky., 1830; LL.D., Bowdoin, 1883. Studied law at Kentucky University, practiced at Frankfort, Ky., removed to Louisville in 1807 and practiced law there. Colonel of 10th Kentucky regiment in Union army, 1861-63; attorney-general of Kentucky, 1863-67; his name was presented for vice-presidential election in Kentucky for vice-president of United States in 1872; member of Louisiana commission, 1877; one of American arbitrators

remarkable equanimity and even good-humor, until the day of his death, which took place in Paris, 1866.

**Heraeus**, comedienne, was born in Paris, 1877, daughter of Maurice Heide. She was educated in an academy at Rouen, France, and married in 1897. *Le Figaro* and *Le Monde* reported her debut as comedienne in Paris, 1890; since then in many roles; began starring, 1896, in *French Music*; *Papier's* *Revue des Variétés* (the first way theater, New York); in *Parisian Model*, *Drury Lane theater*, London; in United States in *The Little Duckies* (London) and *The Little Duckies* (London), New York, etc.

**Heinrichs, Herman von**, German scientist, born at Bielefeld, 1827. He was a professor of physiology at Königsberg in 1849, at Bonn in 1855, and at Heidelberg in 1858. Although his earlier researches were mainly physiological, he took rank as a physicist and mathematician in 1847, when he published his striking tract on the *Conservation of Energy*.

Naturally gifted with a powerful mathematical mind and a profound physical intuition, he gave a new direction to physiological research in optics and sound. His *Sensations of Tone* and his *Physiological Optics* were epoch-making works. Moreover, he had created a new field in hydrodynamics by his famous investigations on vortex motion; and his inquiry into the connection between sensation and knowledge led him to the study of the foundations of geometry.

He was called to Berlin in 1871, to fill the chair of physics. His contributions to the theory of electro-dynamics, in which he aimed at greater generality than in 1847, when he was his theory, are of great importance; and it was at his instigation that Hertz demonstrated the existence of Maxwellian electromagnetic waves. He enriched the theory of thermo-dynamics by his discussion of "monocyclic" systems, and in his later papers endeavored to get at the real essence of the principle of least action. Although the idea was first put forth in Maxwell's writings, Heinrichs was the first to work out explicitly the notion of the electric atom or electron, as it is now called. From 1887 until his death, in 1894, he was director of the technological institute at Charlottenberg, near Berlin.

**References**.—M'Kendrick's *Life in Masters of Science Series*, in German by Heinrichs; and article by Prof. Rucker in the *Forthrightly Review* for Nov., 1884.

**Hennippen** (*Hen-nip-pen*), *Belgian* chemist, was born at Brussels in 1877. In 1909 he settled at Vilvorde, near Brussels, where he practiced medicine gratuitously for the poor. He was the first to point out the imperative necessity for employing the balance in chemistry. He paid much attention to the study of the gases, and is supposed by some authorities to have been the first to apply the term gases to elastic aërial fluids. Of these gases he distinguished several kinds. His works were published under the title *Opera Medica*. Died, 1644.

**Holpe, Sir Arthur**, English essayist and historian, was born at Streatham, 1813. He was graduated at Cambridge in 1836, and on leaving the university obtained a post in the East India Company, then resigned and retired to Bishop's Waltham, in Hampshire, where, in the possession of ample leisure, he enjoyed literary and historical pursuits. His most important work, *History of the Consequence* was entitled *History of the Consequence of the Consequence*. Died, 1876.

**Martheussen**, Dutch painter, was born at Haarlem or Dordrecht, between 1611 and 1614. He was joint-founder in 1654 of the painters' guild of the city of Amsterdam, where he attained great celebrity as a portrait-painter. His best-known work is *The Death of the Prince of Orange*, now in the Amsterdam gallery. He died in 1670.

**Melville** (*Mel'-shu-n*), *Claude Adrien*, French philosopher, was born at Paris, 1718. He appeared his celebrated work *De l'Esprit*, in which he endeavored to prove sensation to be the source of intellectual activity, and that the shorter lever of all human conduct is self-satisfaction. He visited England in 1764, and the year following was entertained by Frederick the Great at Berlin. His complete works were published after his death. Died, 1771.

**Hemans** (*He-mans*), *Felicia Dorothea*, English poetess, was born at Liverpool, 1789, daughter of George Browne, a Liverpool merchant, and became the wife of Captain Hemans. Her best poem is *The Power of Solitude*, but her shorter pieces, published under the title of *Songs of the Affections*, etc., are by far the most popular. Many of these shorter pieces have become standard English lyrics, and upon them, almost exclu-

sively, depends her claim to remembrance. She died in Dublin, 1835.

**Henderson, Charles Richmond**, American educator, sociologist, professor of sociology at the University of Chicago, since 1892, was born at Covington, Ind., 1848. He was graduated at the University of Chicago, 1870; B.D., 1873; Ph.D., 1882. Served as Union theological seminary; Ph.D., Leipzig, 1901; Associate editor of *American Journal of Sociology*, 1897-1902; Editor of *American Journal of Sociology*, 1902-1903. Author: *Introduction to Study of Dependents*; *Social Spirit in American Social Settlements*; *Edited: Studies and Lectures: Elements of Sociology*; *Modern Methods of Charity*; *Modern Social Hygiene*, etc.

**Hendricks, William James**, American writer, musician, was born at New York, 1802, was born at Newark, N. J., 1858. He was graduated at Princeton University, 1876. Was a member of staff of *New York Tribune*, 1876; *Times*, 1883; *Music critic*, 1887-1902. Author: *Story of Music*; *Trifles and Studies*; *Elements of Music*; *What is Good Music? How Music Developed*; *The Orchestra and Orchestral Music*; *Richard Wagner*; *Modern Musical Drift*; *Pipes and Tambors*; *Piano*; *The Art of the Singer*, etc. Associate editor, *Standard Dictionary*.

**Hendricks, Thomas Andrews**, vice-president of the United States in 1885, was born in Muskegon county, Ohio, 1819. Graduated at Hanover College, Ind., and was admitted to the bar in 1842. He was a democratic member of the house of representatives, 1851-55, served as United States senator, 1868-69, and as governor of Indiana, 1873-77. In 1876 he was nominated for the office of vice-president of the United States by the democratic party, but was defeated. In 1880, and 1884 he was a prominent candidate for the nomination for the presidency, and in 1884, after the election, was nominated as vice-president and was elected. He died at Indianapolis, Ind., 1901.

**Henry, Francis Joseph**, lawyer, was born in Lima, N. Y., 1859, and has been a resident of San Francisco since 1884. He was engaged in cattle business in Arizona, 1885-89; practiced law, Tucson, Arizona, 1889-90; and was general counsel of the city of San Francisco, 1890-91. He was removed to San Francisco, 1895, and continued cases to civil business until discharged by United States marshal, 1896. Known to many as a lawyer, he was removed to Portland, Ore., to investigate conspiracy of United States Attorney John H. Hall to protect himself in consideration of a bribe for removal; secured removal and indictment of Hall, and indictment of Senator Mitchell, George C. Peck, and others. He was removed to San Francisco, 1896, and was defeated for reelection in 1900.

**Hennippen** (*Hen-nip-pen*), English poet, playwright, critic, and editor, was born at Gloucester, 1849. Months of illness in Edinburgh infirmary, 1873-75. Author: *Heavenly Bodies*; *Heavenly Bodies of Venus*, which won much attention, and was followed by *Venus and Beries*; *The Song of the Sword*; *For England's Sake*; *Howland's Lover*, etc. He edited the *Magazine of Art*, the *Sports Observer*, and the *New Review*, besides an edition of Burns. He also collected with R. L. Stevenson in four plays, *Deacon Brodie*; *Dean Austin*; *Robert Macaire*, and *Admiral Guichen*. He died in 1903.

**Hennippen** (*Hen-nip-pen*), *Louis*, French priest, missionary and traveler, was born in Belgium about 1840. When La Salle undertook his exploration of the Mississippi valley, Father Hennippen was assigned to his command. They discovered the mouth of the river, and then returned to La Salle, and thence to Peoria, on the Illinois river. Here La Salle was obliged to leave the party, and Father Hennippen was left in command. He followed the Illinois river to its mouth, and thence north to the Mississippi, a journey of some six weeks, when he died of a fever. He was buried at Peoria. His Father Hennippen spent nearly a year among the Indians, and was finally rescued by Du Luth, after which Du Luth was named. His return to Europe, Hennippen published a history of his travels, which is of the greatest value in dealing with the early explorations of the Mississippi valley. Died at Utrecht about 1708.

**Henry I., king of England**, youngest son of William of Conqueror, was born in 1068. He was crowned fully held the crown against his brother Robert, at first negotiating with him, and granting him a charter, but then he was forced to fight, and making war against his badly governed duke. Robert was defeated in a bloody battle before the siege of Merton, 1106, taking the duke's life, and shut up in Cardiff castle during the remaining twenty-eight years of his life. The acquisition of the throne by Henry I. was a great triumph, had been a point of ambition with Henry, but he had some trouble in keeping it, as the French king, Philip I., was the constant enemy of his, and Flanders took part with William, Robert's youthful son, whose virtues and misfortunes secured him the sympathy of Henry, however. Henry, himself the count of Anjou; he rendered neutral, by his eloquence and fair promises, Pope Calixtus II. and the archbishop of Canterbury, and his mailed knights in the almost bloodless battle of Brun-

vill, 1119. Next year his successes in arms and intrigues were darkened for life by the death of his only son William, who was drowned at sea on his journey to the Holy Land. Henry's reign was styled *Becket's*, or "the scholar." In honor of his learning, which, for a king in his age, was not unduly common, he was called "the scholar."

**Henry II., king of England**, grandson of Henry I., was born in 1133. He was crowned with his queen, Eleanor, at the age of 15. He was the duke of Aquitaine in her own right. Henry inherited from his father Anjou, Touraine, and Maine, and his mother and his father's half-sister, Matilda, kept and taking possession of Normandy for themselves and him; so that, by one method and another, he came to be possessed of a large portion of France as well as England. His chief rivals in power were the clergy. To add him in reducing the church to subjection, the civil power he appointed his trusted chancellor, Thomas a Becket, to the see of Canterbury, and compelled him, and the other ecclesiastics, to agree to the constitutions of Clarendon. Becket, however, proved to be a true churchman, and the long and obstinate struggle between him and his monarch was only terminated by his murder. During his reign occurred the conquest of Ireland. This was a nominal conquest, for the majority of the Irish tribes and chieftains continued to be independent. However, Henry's son, Richard I., rebelled against him, and their cause was supported by the pope. Henry was defeated, and the course of this filial rebellion Henry, the eldest, died of a fever, and Geoffrey was killed in a tournament at Paris. Henry's son, Richard I., was crowned at Lion, with King Philip of France, obtained some advantages over his father. A treaty of peace was concluded between them, by which the stipulations were for an indemnity for all the followers of Richard. Died, 1189.

**Henry III., king of England**, son of Henry II., and eldest son of King John, was born in 1207. He came to the throne in 1216 when a minor, and in the course of his reign he showed much hostility by his foreign favorites and his submission to papal exactions. This discontented the nobles, and they rebelled against him, and he was defeated and compelled to submit to control of the government by De Montfort and his friends. During his reign the great charter, with important clauses omitted, was frequently renewed and Westminster abbey was almost entirely built. Died, 1272.

**Henry IV., king of England**, first king of the house of Lancaster, was born in 1367, and succeeded Bolingbroke in 1399. He was crowned in 1400 he was made earl of Derby, and married Mary de Bohun. In 1397 he supported Richard II. against George of Clarence, who was banished. Upon the death of his father, John of Gaunt, his estates were forfeited. In July, 1399, he was crowned king. He was banished in 1400 on September 29th he obtained from Richard, then a prisoner in the Tower, an abandonment of his claim to the throne. He was crowned in 1400 Henry arose in parliament and claimed kingdom and crown. In 1412 he sent two expeditions into France, but in his closing years he was afflicted with epileptic fits, in one of which he died at Westminster, 1413.

**Henry V., king of England**, was born at Monmouth, 1387, eldest son of Henry IV. by Mary de Bohun. He was crowned in 1413, and at the outset of his reign liberated the young earl of March, his heir to the crown, restored Hotspur's son to his father's lands and honors, and had Richard II. buried in Westminster. The great effort of his reign was an attempt to conquer France; and in 1414 he defeated the French crown, to which he was believed to have gained a valid claim through his great-grandfather, Edward III. He was crowned in 1419, and in 30,000 men and in September took Harfleur. In October, at Agincourt, he gained a battle against the French, and in 1420 he was crowned at Reims. In 1420 was concluded the "perpetual peace" of Troyes, under which Henry was recognized as king of France, and married the French king's daughter, Catharine of Valois. In 1421 he took his young queen to England, but he died in 1422, and was recalled by the news of the defeat at Beaugé of his brother, the duke of Clarence. Henry's contest with France was a great success, and he died with illness, and died at Vincennes, 1422, leaving an infant to succeed him.

**Henry VI., king of England**, was born about 1457, first of the Tudor dynasty. He was the son of Edmund Tudor and Margaret Beaufort, a descendant of John of Gaunt, and was crowned in 1469, and defeated Richard III. at Bosworth, after which he married Elizabeth, daughter of Edward IV. He was a weak and feeble monarch, and was defeated by the measures he enforced against the nobles, by his system of marriages with French princesses, and by the enactment of Foyning's law. Died, 1509.

**Henry VIII., king of England**, second son of Henry II., was born at Greenwich, 1491. He was crowned at twelve, he was married to 1500, shortly after his accession, to Catharine of Aragon, his first bride, and he was a weak and feeble monarch, his ministers wisely, and, leaving much to their

discretion, and leaving much to their

verities at Cambridge, London, and Birmingham. Author: *Chronicle of Henry VIII*; *Calendar of Spanish State Papers*; *Bluebook*, 4 vols.; *The Loss of the Fair of Mary Queen of Scots*; *Calendar of the History*, vols. iii. and iv.; *Queens of Old Spain*; *The Court of Philip IV.*, etc.; and many historical articles in the *British* and *English* and *Spanish* magazines and reviews.

**Stumpelrieder** (*ahn-pir-ah-dor*), Engelbert, German composer, was born at Cologne, Prussia, 1854. He studied music at Cologne, Frankfurt, Munich, and Berlin. In 1890-96 at the latter he was director of the orchestra of the musical fairy play, *Hansel und Gretel*, which was phenomenally successful, compositions that have earned for him the name of "the Wagner of the North Sea." In 1900 he became professor of music at Berlin.

**Stumpelrieder** (*ahn-pir-ah-dor*), Milton Wylie, American educator and scholar, professor of Greek, University of Virginia, since 1887, was born in Greenbrier county, Va. (now W. Va.), 1844. He was graduated at Washington and Lee, A. M. 1869; Ph.D., Leipzig, 1874; LL.D., Vanderbilt, 1893. He was professor of Greek, Vanderbilt University, 1875-83, and professor of Latin and Greek, University of Texas, 1883-87. President in 1882-83 of the American philological association, and was ten years American chief editor to *Revue de Philologie*, Paris. Edited, with notes: *The Clouds of Aristophanes*, The Athenians, The Frogs, etc.

**Stuckey** (*ahn-ster*), James Gibbons, journalist, music critic, was born in Philadelphia, Pa., 1860. He was graduated at the University of Pennsylvania, Philadelphia, 1873; studied law and conveyancing at law academy, Philadelphia, five years. Music and dramatic critic at *Philadelphia Ledger*, 1886-96, and of the *Morning Advertiser*, 1896-97. He was formerly music and dramatic, now art editor, of the *New York Times*. He has written *Modern Music*; *Vocalists*, etc. He also wrote the article on music, *New International Encyclopedia*, and has been contributor to leading magazines.

**Stunt, James Henry Leigh**, English poet and essayist, was born at London, England, 1818. In 1813, as editor of *The Examiner*, he wrote some articles severely criticizing the prime minister, Edward George Peacock, and for them he was prosecuted by order of the government, and sentenced to two years' imprisonment in the Surrey jail. While in jail he wrote *The Plebeian's Letters to Masefield*; *The Story of Rimini*, an Italian tale in verse; and *The Feast of the Poets*. In 1828 he published *Lord Byron and some of his Contemporaries*, in which, having quarreled with Byron during a visit to Italy, he indulged in some severe animadversions upon the character of the poet, and his last work was his *Autobiography*. He died at London, England, 1865.

**Stunt, Thomas**, British, American chemist and geologist, was born in Connecticut, 1825. In 1847 he became assistant to Professor Williamson in his chemical laboratory at Yale College, and in 1847 was appointed chemist and mineralogist on the geographical survey of the United States. He held this post more than two-and-a-half years, resigning in 1872 to accept the chair of geology in the Massachusetts institute of technology. He furnished many important articles in his specialty to Appleton's *American Cyclopaedia*, and was a member of the leading scientific bodies of both continents. He died in New York, 1892.

**Stunt, Walter**, English painter, was born in Middlesex, England, 1811. He has been a constant exhibitor at the royal academy since 1831. The following are among his best pictures: *A Boy's Play*; *A Father-Mother*; *An Orphan*; *Our Father—He Finds*; *Maternal*; *An Old Offender*; *Home from Work*, etc.

**Stunt, William**, painter, creator of the English school of water-color painting, was born in London, 1760, the crippled child of a upholsterer worker. He was ranked by Ruskin as the greatest painter of the school. He generally painted very simple subjects for his pictures, such as: *Fishes and Reptiles*; *Old People*; *Wild Animals*; *The Red Fox*; *Asleep*, etc., but they are conceived in a finely poetical spirit, and present the perfection of finish. Died, 1844.

**Stunt, William Holman**, English painter, was born in London, 1827. In 1845 he was admitted a student of the royal academy, and a next year exhibited his first picture. He shared a close study with D. G. Rossetti, and the two, along with Millais and a few others, inaugurated the Pre-Raphaelite brotherhood, which aimed at a detailed and uncompromising truth to nature. Among the first of the *Pre-Raphaelite Brotherhood* was *The Light of the World*, which he painted at Oxford. In 1865 he was nominated to the order of merit, and was made a D. C. L. by Oxford. Died 1910.

**Stunt, William Morris**, American genre and portrait painter, was born in Brattleboro, Vermont, 1824. He was educated at Dummerston, and came to France; but he never became a member of the French school studied by his own original ideas, and was one of the first to introduce the representation of the French school into the United States. Among his productions are: *The Lost Kid*; *The Characters*; *Bugle Call*, etc. He painted *The Fight*

of Night and other decorations in the state capital at Albany, N. Y. Died, 1879.

**Swain**, James, noted British surgeon, anatomist, and physiologist, was born at Broom's Barn, Kent, 1728. He spent five years at the University of Edinburgh, and went to London and studied at St. George's hospital. His specialty was surgery was so rapid that in the second month he was able to undertake the directing of the amputation of the arm of a patient who was discharging from his health gave way, and in 1759 he applied for an appointment in the British army, and was sent to Belle Isle, and afterward to the Peninsula. In 1767 he was elected a fellow of the royal society, and the following year he was appointed surgeon to St. George's hospital. In 1770 he was appointed surgeon-extraordinary to the king. He was famous for the cure of aneurism, the result of simply tying the artery at a distance from the tumor, and between it and the heart, has been most fruitful and important results than any since Ambrose Pare's application of ligatures to divided arteries. He died in 1793.

**Swainston** (*ahn-steen-don*), Melina, Countess of, daughter of Earl Ferrers, was born in 1707. She married the earl of Huntington, 1725, and became a widow in 1745. Joining the Methodists in 1739, she made Whitefield her chaplain in 1749, and assumed a leadership among his followers, who called her as "the Christiana of a Unitarian's connection." She died in London, 1791, bequeathing to four persons her sixty-four chapels, which have become identical with the Congregational churches.

**Swainston, Daniel**, American painter, was born in New York, 1816, and was educated at the College. In 1835 he began to study art under Moreau, and still later with Inman. In 1859 he visited Europe, and became a resident of New York, and painted the portraits of many of the leading men of the time. He was best known by his picture, *The Republican Court in the White House*, in which there are more than sixty figures. Died, 1900.

**Swanyad** (*ahn-yad-d*), János, Hungarian general, was born at Hunyad, Transylvania, about 1837. He was governor of Transylvania in 1845, and distinguished himself against the Turks, who at that time were the terror of the whole of Christian Europe. He was killed at the battle of Kistelek, near the city of Belgrade, where the monk John Capistrano, carrying the holy cross, raised the enthusiasm of the Christians, and it was his belief that a most complete victory brought that fortress again into the possession of the Hungarians. He was killed at the battle of Kistelek, near the city of Hunyad, after a short illness, fell a victim to the disease, 1856.

**Swann, John**, English physician, superintendent Johns Hopkins hospital since 1889, was born in Union City, Mich., 1843. He was graduated at the University of Michigan, 1865; A. M., 1866; A. M., 1871; LL.D., 1895. Was superintendent eastern Michigan asylum, Pontiac, 1876-90. Professor of medicine, Johns Hopkins University, 1890-1900. Editor *American Journal of Insanity* 1890-1900. Editor *Johns Hopkins Hospital Reports* since 1890. Author: *Hints to Hospital Visitors*, with Dr. John S. Billings; also editor, with same, *Hospital, Dispensary and Nursing*, etc.

**Swart, Jesse Lyman**, Methodist Episcopal clergyman, editor, was born in New York, 1843. He was graduated at Wesleyan University, Connecticut, 1865. Was pastor Methodist Episcopal churches, 1865-67. Editor of Sunday school literature and secretary of Sunday school association and tract society, 1868-1900. Author: *Outline Narrative*; *Studies in the Bible*; *Four Points*; *Our Church*; *Harbors of the Bible*, etc.

**Swart (Swart)**, John Fletcher, American clergyman and writer, was born in Massachusetts, 1811. He was educated at Dickinson college, and became a Methodist Episcopal clergyman. In 1871 he was president of the American Methodist conference, Madison, N. J., and from 1873 until 1880 was president of that institution. At Cincinnati in 1880 he was elected moderator of the General Conference of 1891 he was made chancellor of the American University at Washington. He died at Washington, 1904.

**Swart, Hns (Hns; Ger. hns)**, John, Bohemian religious reformer, was born at Hussinec, in Bohemia, about 1570. He studied at the University of Prague, was appointed dean of the philosophical faculty in 1601, and rector of the university, 1603. As a preacher he was popular, and by the students, while as confessor to Queen Sophia he obtained access to the court, and was acquainted with the writings of Wycliffe, which exercised a great influence over him. In 1612 he was elected to the office of rector of the university. In order to organize a crusade against indulgence, the ecclesiastical king of Naples, who was a papal legate, he was expelled from the city. He was boldly raised his voice against the whole procedure as sacrilegious, while Jerome of Prague was in the city, and the emperor, in a manner, both the bull and the venders of indulgences. An interdict against Hns in 1612 was the consequence. Hns, however, appealed from

the pope to a general council and to Christ, and wrote a book *On the Church*, in which he condemned the abuses of the papacy, and denied the unconditional infallibility of the pope. He was expelled from a 1614 he went to Constance to the general council, under a self-conduct from the emperor, but his opposition to the pope's policy was so strong that he was ordered to retreat, he was burned at the stake, 1615.

**Swainston** (*ahn-steen-don*), Harry Burns, American educator, president of the University of Michigan, since 1910, was born at Lebanon, N. H., 1847. He was graduated at the University of Michigan, A. B., 1871; LL.D., University of Wisconsin. He was professor of law, 1884-87; professor of law, Cornell University, 1887-90; professor of law, University of Michigan, 1897-98, and since 1900. He revised and annotated five volumes *Michigan Supreme Court Reports*, 1887-90; and edited *American edition of Williams on Real Property*, and contributes to legal periodicals.

**Swainston** (*ahn-steen-don*), Anne, religious enthusiast, was born about 1590, and emigrated from Lincolnshire, England, to Boston, Mass., 1634. Banished from the colony for heresy she and her friends now obtained from the chief of the Narragansett Indians to reside in Rhode Island, where they set up a community on the highly commendable principle that no one was to be accused of a crime until he had been proved guilty. She died in 1660, at the age of thirty; executed wood carvings and other decorations in relief for the picture gallery at Hospital-Island, London, 1851, and studied in Edinburgh and in Rome. Principal works: *King Robert Bruce*; *King John*; a colossal bronze statue in Edinburgh.

**Swainston, John**, Scotch sculptor, was born in Edinburgh, Scotland, 1832. He was apprenticed to a wood-carver in Edinburgh at the age of thirteen; executed wood carvings and other decorations in relief for the picture gallery at Hospital-Island, London, 1851, and studied in Edinburgh and in Rome. Principal works: *King Robert Bruce*; *King John*; a colossal bronze statue in Edinburgh.

**Swinton** (*ahn-steen*), Ulrich von, German reformer and humorist, was born in 1488. When he was twenty years of age he was placed in the monastery at Fuld; but, disliking this mode of life, he fled to Erfurt in 1506, where he associated with scholars and poets. In 1510 he became abbot of the archbishop of Mainz, to the diet of Augsburg, where Luther had his famous conference with Cardinal Cajetan. He was persecuted by his enemies, and evaded himself of the protection of Franz von Sickingen, but was captured by the emperor's troops, and compelled to adopt a wandering life, and died in 1532 in the lake of Ufenau, in the lake of Zurich.

**Swinton, Thomas**, English geologist, professor of Greek since 1887, and principal since 1901, University College, Toronto, was born in England, 1825. He was educated at Magdalen College school and Worcester College, Oxford; M. A., 1847; LL.D., Toronto, 1890. He was professor of classics in the University College, Oxford, 1879-86; lecturer on marine and ancient history at Firth College, Sheffield, 1880, and professor of classics in the University College, Toronto, 1880. He is the author of *Swinton and various articles*, and is a popular lecturer on the classics and on Oxford.

**Swinyer** (*ahn-ster*), Thomas Henry, noted English biologist and comparative anatomy, was born in England, 1825. He was graduated at London University, 1845. Imbued with a passion for natural history, Swinyer devoted himself with zeal and intelligence to the study of numerous marine animals collected from time to time and from various sources. He published in 1851 papers on other branches of the same subject were printed in the *Philosophical Transactions of the Royal Society*. In 1854 he was appointed professor of natural history in the royal natural history museum, and in 1856 that institution he delivered courses to working-men with beneficial results. In 1874 he was made a member of the Royal Society. He was Rede lecturer at Cambridge in 1883, and president of the royal society, 1883-85. Among his many papers on subjects to which he was devoted are: *Oceanic Hydrozoa*; *Evidence as to Men's Place in Nature*; *Phylogeny*; *Science and Culture*; *Evolution*, etc. He died in Eastbourne, England, 1895.

**Swinyer** (*ahn-ster*), Dutch (ah-steen), or Huygens, Christian, was born at The Hague in 1629. He improved the telescope, and derived new methods for grinding and polishing the lenses. He was the inventor of the first pendulum clock; defined the rings of Saturn; and developed the wave theory of light. He was made a knight of the order of the Lion of Friesland at the invitation of Louis XIV. lived for a number of years in Paris where he produced many of his scientific papers.

**Swinyer, William De Witt**, American educator and writer, president of Bowdoin College since 1885, was born in New Brunswick, N. J., 1829. He was graduated at Harvard, 1879; D. D., Harvard; LL.D., Syracuse. Author: *Practical Ethics*; *Social Theology*; *Practical Idealism*; *The Evolution of*

the evolution of the human mind, etc.

the evolution of the human mind, etc.

the evolution of the human mind, etc.

but also of the reality of the highest virtues that lay beyond the appearance of things. In 1819, **Jacobi, Karl Gotthard Jakob**, celebrated German mathematician, was born in Prussia, 1804. In 1831 he became a professor of philosophy and published his celebrated work, *Fundamenta arithmeticae Functionum Ellipticarum*, for which he received the great mathematical prize of the Sciences of Paris. He also wrote a great number of memoirs on the different branches of the higher mathematics, chiefly on *Sechs* and *Sechsen*, *gratia*, and was a regular contributor to the celebrated *Journal für reine und angewandte Mathematik* of Berlin. Died, 1859.

**Jacotot (aka 82/67), Jean Joseph**, inventor of the universal method of education, was born at Dijon, France, 1770. The principle of his system is that the mental capacities of all men are equal; the unequal results of education depend almost exclusively upon will, and he is able to educate himself, provided he is once started in the right way; knowledge should first be acquired through instinctive experience, or by the memory. He expounded his views in *Enseignement Universel*, 1820.

**Jacquot (aka 82/67), Joseph Marie**, French inventor, was born at Lyons, 1752. He attempted to establish a manufactory for weaving figured fabrics, planned several ingenious improvements in machinery, and brought to perfection the apparatus for figured weaving, which now perpetuates his name—the Jacquard loom. He remained at Lyons for many years, encountering much opposition from a prejudice against artificial machinery, but eventually triumphed. He lived the last years in tranquil retirement, and died in 1834. During his life he received the cross of the Legion of Honor, and in 1840 was named senator for his memory at Lyons.

**Jahn (aka 82/67), Ludwig**, the "Turnvater" or father of gymnastics, was born at Lüne in Prussia, 1778. In 1811 he started the first gymnasium in Berlin, and his system, meant to revive patriotism, attracted the French. But the gymnastics began to witness political stirrings, too liberal to please the Prussian government, and they were closed. He left the country, he had taken a prominent part in the movement, was arrested in 1819 and suffered five years' imprisonment. He was elected a member of the national assembly in 1848. Died, 1852.

**John, Otto**, German philologist, archaeologist and historical editor, was born at Leipzig, 1815. He lectured at Kiel, Griefswald and Leipzig. He deprived of his chair in 1851 for his part in the nationalist movement of the 1840s. He was in 1855 professor of archaeology at Bonn. He published works on Greek art, representations of ancient life on Egyptian monuments, and Greek classics, besides a *Life of Mozart*, and a number of masterly essays on music. Died, 1869.

**John, L. of England VII. of Scotland**, son of Mary, queen of Scots, and Henry, Lord Darnley, was born in Edinburgh, 1566. When his mother was forced to flee to England, he was proclaimed king of Scotland, 1567. In 1578 the earl of Morton, then regent, was driven from power, and James assumed full control. In the winter of 1589 James went to Denmark, where he married Princess Anne, daughter of Frederick II., king of that country. By the death of her father in 1603, James succeeded to the throne of England. He soon became unpopular with his new subjects. He really got on with his favorites, Kerr and Buckingham, both of them unpopular; and England's prestige as a power, which had been raised under Elizabeth, soon disappeared. The so-called King James Bible was completed during his reign. He was banished as a tyrant in 1617, and fled to France, where he read scholar, who wrote, disputed and harangued, and a nervous, driving little who acted. Died, 1625.

**James II. of England and VII. of Scotland**, son of Charles I. and Henrietta Maria, was born in 1603. In 1648, during the civil war, he made his escape to France. He then entered the military service of Spain. At the restoration he was made a high admiral of England, and in 1670 Charles II., 1685, James succeeded to the crown without opposition. On becoming king he promised to maintain the church and to respect the liberties of the people, but his government, nevertheless, was arbitrary and tyrannical; he persecuted the Catholics, and his policy was to subordinate English interests to French, permitted the "bloody assize," suspended the test and violated the rights of the dissenting churches, church officers to Roman Catholics, and by these and many other acts of despotism made his position necessary. He was deposed by William of Orange to assume the throne, and James fled to France; an invasion of Ireland in 1689 resulted in his defeat at the battle of the Boyne. He retired again to France, and lived at St. Germain until his death, 1701.

**James IV. of Scotland**, son of James III. and Margaret of Denmark, was born in 1473. His rule gave promise of being both vigorous and popular, but the personal ambition he possessed to rule as an open frankness won the hatred of his people. In 1503 the king married Margaret, eldest daughter

of Henry VI. of England, an alliance which led to the union of the two crowns just twenty years later. Henry VIII. came to the English throne in 1509, and in the disputes which followed, James, the eldest English king, was killed. He was met by the earl of Surrey, and in the battle which took place at Flodden, 1513, the king and many of his nobles were killed. James was twenty years old, and had reigned twenty years.

**James, Edmund James**, American educator, was born at University of Illinois, 1861. He was educated at the Illinois state normal school and at Northwestern and Harvard Universities; Ph. D., 1887. He was professor of public administration, and director of extension division of the University of Chicago, 1906-1901; president of Northwestern University, 1902-04; and president of the University of Illinois since 1904. Author: *Relation of the Modern Municipalities to the Gas Supply*; *The Legal Tender Decisions*; *Commerce of Chicago*; *Growth of Great Cities in Area and Population*; *Governments of a Typical German City—Halle*; etc.

**James, Payne**, Rainerford, English historical novelist, was born in London, 1801. He was educated at Putney and in France, and by exception wrote some Eastern tales, and was found favor with Washington Irving. In all he published seventy-seven works, historical romances mostly, but also biographies, poems, etc. Died, 1860.

**James, Henry**, American author, was born in New York, 1822. He was educated at Princeton, Switzerland, and at Harvard law school. He began his literary career as contributor to periodicals, and in 1859 published his first novel, *Author's Confession*; *Diary of a Man of Fifty*; *Washington Square*; *The Portrait of a Lady*; *Seigneur of the World*; *Flaubert's Story*; *The Little Totee in France*; *The Author of Biographies*; *The Bontemps*; *The Lesson of Bolinas*; *American* etc.

**James, William**, eminent American psychologist and philosophical writer, was born in New York, 1809. He was educated in private schools and by tutors, and at Lawrence scientific school, 1831-33; M. D. Harvard medical school, 1837; Ph. D., 1839. He was elected a member of the American Academy of Sciences, 1868. He was professor of psychology, 1880-91, and professor of philosophy, 1891-1902. He was elected a member of the British Academy, 1891. He was Gifford lecturer on natural religion, University of Edinburgh, 1890-1901. Corresponding member of the French Academy of Sciences, 1891. Prussian academy of sciences; member National Academy of Sciences, etc. Author: *Principles of Psychology*, 1890; *The Principles of Psychology*, 1890; *Other Essays in Popular Philosophy*; *Human Immortality*; *Two Supposed Objections to the Doctrine of the Immortality of the Soul*; *Doctrines of a New Name for some Old Hopes of Man*, etc. Died, 1910.

**James, Mary**, wife of John, (Anna Browne Murphy) British writer, was born in Dublin, 1794. She was the daughter of an artist, and many of her books are about pictures, painters, and other art matters. In 1823 she married Robert Jameson, and went with him to Canada, where he held government office. Among her books are: *Memoirs of Celebrated Female Sovereigns*; *Characteristics of Women*; *Memoirs of Italian Painters*; *The History of Sacred and Legendary Art*; and *Lovers of the Madonna*. She died in London, 1850.

**Jameson, John Franklin**, American educator, historian, was born in Boston, 1859. He graduated at Amherst College, 1879; Ph. D., Johns Hopkins, 1882; LL. D., 1902. He was head of department of history, University of Chicago, 1901-08, and director department of history, University of California, 1908-1910. Since 1905, he has been managing editor of *American Historical Review*, 1905-1901 and since 1905; *Author: William Usellin, Founder of the American Historical Review*. He edited the *Correspondence of John Jay*, and has been editor of the historical publications of the American historical association.

**Jameson, Leander Starr**, South African politician, was born at Edinburgh, 1853. He studied medicine at Edinburgh, and began practice at Kimberley in 1878. Through oil resources he engaged in pioneer work, and was in 1891 made administrator of the South African company at Fort Salisbury. He won enormous popularity during the troubles at Johannesburg between the Uitlanders and the Boers, and was elected, with by force of Rhodesia at Mafeking on the border frontier, and in 1895, in the Transvaal, to support the Uitlanders. At Krugersdorp they were overpowered by an overwhelming force of Boers, and Jameson and his forces were compelled after a short battle to surrender, January 2, 1896. Handed over to the British authorities, he was in custody for some time in London to fifteen months imprisonment, but was released in December. In 1900 he was elected member of the House of Commons, and from 1904 to 1908, premier of Cape Colony.

**Janet (aka 82/67), Paul**, French philosopher, was

born in Paris, 1823. In 1864, he became professor of the history of philosophy, at the Sorbonne, and a member of the Academy of Moral and Political Sciences. Among his works are: *History of French Philosophy*; *History of French Modernity*, etc. He was an officer of the legion of honor. Died in Paris, 1890.

**Janeway (aka 82/67), Daniel**, Dutch American physician, was born in New Jersey, 1841. He was graduated at Rutgers College, 1860; was graduated at the University of Pennsylvania, 1864; New York, 1864; LL. D. Since 1864 he has been in practice in New York, and has been president of the College of Physicians of New York College since 1868, first as curator, then in 1873 as professor of pathological anatomy, and now president of the college.

**James (aka 82/67), D. (aka 82/67), Cornelius**, sometimes called Janesius, bishop of Ypres, in the Netherlands, and founder of the Janesians. He was born at Acoqui, near Leerdam in Holland, 1566. In 1638 he was made bishop of Ypres. He died in 1638, just as he had become his great work, the *Augustinus*, in 3 vols., which sought to prove that the teaching of St. Augustine against the religious and semi-Pelagians on grace, free-will, and predestination was directly opposed to the teaching of the Jesuit schools. On the publication of his studies in 1640, he was received with loud clamor, especially by the Jesuits, and was prohibited by a decree of the Inquisition in 1641, in the following words: "Prohibited by Urban VIII. in the bull *In Eminenti*."

**Jastrow (aka 82/67), Joseph**, American educator, was born at Warsaw, Poland, 1863. He was graduated at the University of Pennsylvania, 1889. He was a member of the *Time-Relations of Mental Phenomena*; *Epitomes of Time Science*, part author; *Past and Future in Time*, etc.

**Jastrow, Morris, Jr.**, American orientalist, professor of Semitic languages, and librarian, University of Pennsylvania, 1881. He was graduated at the University of Pennsylvania, 1881; Ph. D., University of Leipzig, 1884. He was a member of the universities of Germany and France. He is a recognized authority on Semitic religions, languages, and literature. Author: *Religion and Philosophy in Assyria and Assyria*; *Author: Jewish Encyclopedia*; *Encyclopedia Britannica*; *Handbook of the History of the Jewish People*; *Dictionary of the History of the Jewish People*; and various other technical publications.

**Jay, John**, American statesman and jurist, was born at New York, 1745. He was admitted to the bar in 1768. In 1774, as a member of the first continental congress, he formed one of the committee of three that framed the celebrated address to the people of Great Britain, and in 1775, in framing the constitution of the new state, he was one of the chief-justice of New York, and in the following year he was elected chief-justice of the state. He took part in negotiating the treaty of peace entered into at Paris, 1783, between Great Britain and the United States. He was secretary of foreign affairs and in 1790 chief-justice of the United States supreme court. In 1794 he proceeded on a special mission to England, where he concluded a treaty which met with violent opposition from the anti-federalist party. He afterward held the governorship of New York state, and after refusing a second nomination to the chief-justice, died, 1829.

**Jobb, Sir Richard Cavendish**, British Greek scholar, was born at Dundee, Scotland, 1841. He was graduated from Trinity College, Cambridge, in 1862, and was elected fellow. In 1869 he became public orator of the University, in 1875 professor of Greek at Glasgow, and in 1881 he was elected member of parliament for Cambridge University. His books include: *The History of the Greek Language*; *Orator*; *Fraser of Greek Literature*; and his *Bacchylides*. But his greatest work is his translation of the *Works of Pindar*.

**Jeejeebhoy (aka 82/67), Sir Jamsetjee**, Hindu philanthropist, was born at Bombay, India, 1783. He was a member of the Legislative Council, and a Bombay merchant, in 1800. By 1823 he had amassed 2,000,000 pounds, and began to exhibit a magnificent liberality. He expended generously to various educational and philanthropic institutions in Bombay, and spent upward of a quarter of a million pounds in benevolence. Queen Victoria knighted him in 1842, and in 1857 he was made a baronet. Died, 1859.

**Jersey, Charles**, American Congregational clergyman, was born at Cambridge, 1801. He was graduated at Ohio Wesleyan University, 1821; a school of theology, Union University, 1823; D. D., Oberlin, 1849. He was ordained in 1827. He was ordained to the Congregational ministry, 1827, and was pastor of Broadway tabernacle, New York, author: *Our Heavenly Father*; *Barnet People in My Study*; *The Minister as a Preacher*; *The Minister as a Pastor*; *The True: The Old Year and the New; The New Crusade*, etc.

**Jersey, Joseph**, American actor, was born at Philadelphia, Pa., 1829. He came from a family of actors, and made his first appearance as a

**Johnston, Sir Harry Hamilton**, English traveler and writer, was born at Kennington, London, 1858. He was graduated at King's College, London, was a student at the royal academy of arts, and in 1882 accompanied a British expedition to explore Portuguese West Africa and River Congo, 1882-83; commanded a scientific expedition of the royal society to Mount Kilimanjaro, 1884; made a tour of the Congo basin, 1885-86; and a tour of the Nile valley, 1887-88, which led to the founding of the British Central Africa protectorate, 1890; commissioner and consul-general, 1891; consul-general of agency for the Nile valley, 1891-92; commissioner and commander-in-chief and consul-general for Uganda protectorate, etc., 1899-1901. Author: *Essays on the Tatarian Question; The Uganda Protectorate; British Central Africa; The Nile Valley; The Congo; Grenfell and the Congo*, etc.

**Johnston, Joseph Eggleston**, American soldier, was born in Virginia, 1807. He was graduated at West Point, 1829; served in the Mexican war, 1846-47; and was commissioned quartermaster-general of the United States army, 1860. He joined the confederate army as a brigadier-general at the outbreak of the civil war, served with distinction throughout that conflict, and in 1865 was commander of the army of the Trans-Mississippi. He published a volume of memoirs, chiefly military, in 1874. Died, 1891.

In 1879, Joseph W. Foster, lawyer, United States senator, was born in North Carolina, 1843. He left school to join the confederate army as a private in 1861; served during the war, was wounded four times, and rose to the rank of captain. After the war he was admitted to the bar; practiced law seventeen years; was a banker ten years; and was elected governor of Alabama in 1890, reelected in 1894, serving two terms. He was unanimously elected to the United States senate from Alabama to fill out the unexpired portion of the term of Hon. E. W. Pettus, deceased, ending 1909, also for the term 1909-15.

**Johnston, Mary**, American novelist, was born at Buchanan, Botetourt county, Va., 1870, daughter of John William Johnston. She was educated at home, and exhibited literary talent at an early age. Author: *Prisoners of Hope; To Have and To Hold; Audrey; Sir Mortimer; The Goddess of Romance*.

**Jainville** (shawn'vil'), Jean, *Sire de*, French historical writer, was born in 1224, and became seneschal to the count of Champagne and king of Navarre. When almost eighty he undertook his delightful *Vie de Saint Louis*. His style conforms closely to his character; it is veracious, flowing, naive, often singularly expressive. Died, 1317.

**30kal** (yó'ko), Maurice, Hungarian novelist, was born at Komorn, Hungary, 1825. He published his first book in 1845, and took part as a journalist in the revolution of 1848. In 1863 he entered the Hungarian parliament, and during his long career there was one of the principal supporters of Koloeman Tisza, 1875-90. He wrote about 200 novels. Died, 1904.

**Joliet** (Fr. *Joliet*; Eng. *Joliet*), **Louis**, French-Canadian explorer, one of the early explorers of the Mississippi, was born at Quebec, 1645. He was sent to France to be educated, and returned to Quebec. With Marquette he was selected to explore the western country and to push through to the mouth of the Mississippi. They started on their journey in June, 1673, and after a long and arduous journey, they reached the Mississippi at the mouth of the Wisconsin in June. They floated down the Mississippi, passing the mouth of the Illinois, and then the Ohio, far enough to be sure that the river flowed into the gulf of Mexico. Joliet upset his canoe on his way back, losing all his maps and papers. He returned to Quebec, and his expedition was Marquette's. A few men have contributed more to the geography of that time than

**Joly de Lotbinière, Sir Henry Gustave**, Canadian statesman, b. 1829. He was educated at the Sorbonne, Paris, France, and admitted to the bar of Quebec, 1855; queen's counsel, 1878; premier of Quebec, 1878-79; leader of opposition, 1883-85; vice-chairman, Dominion liberal convention, 1883; minister of inland revenue for Dominion of Canada, 1896-1900; and lieutenant-governor of British Columbia, 1900-08. He has always taken an active interest in forestry, and was vice-president of the Canadian forestry congress, 1885. He has published various writings on forestry and on the metric system.

**Joachim (Johann) de Heer**, Baron, noted Swiss noble and military writer, was born at Fayerswil, Switzerland, 1779. When very young he entered the Swiss guard of Louis XVI., but when it was disbanded returned to his own home, and before he was twenty years of age was one of the first to participate in the French revolution. He was invited by Napoleon to join the campaign against Russia, and was appointed historian of the grand army. When the cause of Napoleon was almost lost he became an ardent supporter of the emperor, and fought for the allies. Napoleon bore him no ill-will for this course, saying, "He was not a Frenchman, and there was no love of country to retain him." He is known now chiefly by his works on military history and the art of war. He died at Passy, near Paris, 1859.

**Jones, Henry Arthur**, English dramatic author, was born at Grandborough, England, 1851. He was educated at Winslow, Bucks; hon. M. A. from (40)

**B Harvard University, 1907.** Author: *A Clerical Error; The Rogue's Comedy; The Physician; The Lovers; The Manufactures of Jane; Carmine Sabel; The Last Days of Pompeii; The Two Kings; The Princess's Nose; The Idol; Waterwreath; Juiva; The Great Magician; The Jew; The Jew's Daughter; The Hypocrite; The Economist; The Successes of the English Drama; comets, leavertus, etc., etc.*

From 1867 to 1873, at Venice his attention was drawn to the works of Palladio, which awoke in him a desire to erect archaic buildings. His style was thereforwarder wholly directed. Having been appointed first architect to Christian IV., of Denmark, he began to build in Copenhagen. In Copenhagen, James attended him, remained there, and became architect to the queen. In 1620 he was sent to Rome by Christian IV. to study the architecture of St. Paul's cathedral, and in the following reign he ordered the banqueting-house at Whitehall, London, after the model of St. Paul's.

**John, Jenkin Lloyd**, independent minister, editor, and lecturer, was born at Cardiganhire, South Wales, 1813. He served as a private in the 6th Wisconsin hattery for three years in the civil war; was graduated from Meadville, Pa., theological seminary, 1870; nine years pastor of a Baptist church, Greenville, Wis.; secretary of western Unitarian conference for nine years; organized and was first secretary of western Unitarian Sunday-school society; in 1878, with others, established *Unity*, a weekly paper, now organ of the congress of religions, and has been its editor since 1879; in 1883 he was elected pastor of All Souls church, Chicago.

**Jones, John Paul**, American naval commander, was born at Arbikland, in Scotland, 1747. His original name was John Paul. He settled in Virginia, assuming the name of Jones. When the congress, in 1776, resolved to fit out a naval force, he offered his services; and, visiting the British coast in a brig of eighteen guns, performed some remarkably bold exploits, and took advantage of

remains bold, exploits, and took advantage of the British weakness to make a hostile visit to the shores of the Solway Firth. In 1770 he was appointed to the command of a small squadron of French ships displaying the American flag. He sailed again against the British, causing great alarm and taking some prizes. Off Flamborough he fell in with a fleet of forty-one British merchantmen, convoyed by a fleet of four frigates. He captured the *Cousins*, *Serapole*, *Bomborough*. Jones lashed his *Ben Hanne* *Richard* to the *Serapole* and after three hours of desperate fighting compelled her surrender. He took his own ship and the *Serapole* transferred his crew to the *Serapole*. In 1787 he accepted an appointment in the Russian service, and the command of a fleet at the mouth of the Danube, in which he was to take part in the Turkish war. He died Paris, 1792.

The Turkish War. He died at Park, 1795.

**Rees, Samuel Golden.** American political reformer, and one of the founders of the American Society of Unitarianism. He was a persistent advocate of that practice in politics and in business, was born in Wales, 1846. Brought to America in 1849, he worked as a boy in the oil fields. He established large manufacturing plants at Toledo, Ohio, and gained an immense fortune and a splendid reputation in business. Elected as a republican member of Toledo in 1897, he was re-elected on an independent ticket in 1899, 1901, and 1903, using his office to defeat graft and dishonesty and to secure the rights of the common citizen; Died, 1904.

son, Wesley L. Sawyer, United States senator, was born near Bethany, Ill. 1863. He was a lawyer in Chicago, and moved to the territory of Washington just before its admission as a state. He began law practice, 1880. He took part as speaker in Blaine campaign, 1884, and Harrison campaign, 1888. He was elected to congress from Washington. He was member of congress from the state-at-large, 1899-1906, and was elected to congress, 1907-1909. He was elected to congress, 1911-1913. He was elected to congress, 1915-1917. In 1774 he was called to the bar, and in 1776 became commissioner of bankrupts. In 1778 he was appointed judge of the supreme court of judicature in Bengal, and was knighted. He at once devoted himself to Sanskrit, whose study he continued until his death. He was the first to print one in 1787. He established the Asiatic society of Bengal in 1784, and was its first president. A monument to his memory, erected by the East India company, stands in Calcutta.

India company, in St. Paul's cathedral.  
**Jonson, Benjamin, or Ben**, English dramatist, was born at Westminster, about 1573, and was educated at Westminster school. The first piece that he wrote was a comedy, called *Every Man in his Humour*, published in 1598. The best of his subsequent productions are *Volpone*, or *the Fox*, *The Silent Woman*, and *The Alchemist*. He also composed two tragedies, *Sejanus* and *Catharine's Conspiracy*. His *Masques*, written for the courts of James and Charles, are very graceful. Jonson died in 1637, in the thirty-ninth year of his age. His misfortune in these monarchies, and his imprudence involved him in difficulties, and he died in poverty, 1637.

**Jordaens** (yôr'dâns), **Jakob**, Flemish painter, was born at Antwerp, 1593. He ranks next to Rubens

among Flemish painters, and was master in the guild of St. Luke. He excelled in humorous scenes of Flemish life, also painted scriptural and mythological subjects. Among his numerous works are: *Jesus in the Midst of the Doctors*; *The Adoration of the Shepherds*; *The Satyr and the Man*; *St. Michael and Satan*. D. 1679.

who *Blow Hot and Cold*, etc. Died, 1878.  
**John W. Dard** 1839, American naturalist and ornithologist, president of the New York Jr. University, was born at Gaioville, N. Y., 1851. He was graduated at Cornell University, M. R., 1873; Ph. D., 1875. He was professor of Zoology at Cornell University, 1878; LL. D., Cornell, 1884; Johns Hopkins, 1902; president of Leland Stanford Junior University, 1903-1904; and State commissioner in charge of fur seal investigations, etc. Author: *A Manual of Vertebrate Animals of Northern United States*; *Standard God* (1884); *Standard Fishes of the United States*; *The Blood of the Nation*; *Food and Game Fishes of North America*, with B. W. Evermann; *A Guide to the Study of the History of the Scholar*; *The Call of the Twentieth Century*.

Joseph, favorite son of Jacob by his wife Rachel, who excited the envy of his elder brothers and was by them sold into Egyptian slavery, was born in Haran and died in Egypt. He flourished about the nineteenth century B. C. Having acquired the mastery of Egypt, Joseph, through his successful interpretation of dreams, obtained a high position at the head of the arrangements for provisioning the kingdom during seven consecutive years of famine, and was thus enabled to preserve, in the persons of his father and brothers, with their families, the future Israelitish nation. His body was embalmed and taken up into Canaan by his brethren, and thence to Egypt.

**Joseph I.**, emperor of Germany, was born at Vienna, 1678, and was crowned king of Hungary in 1687. He then succeeded his father, Leopold I., as emperor of Germany in 1705. He granted privileges to the Protestants, and, in alliance with Britain, prosecuted successfully the war of the Spanish succession against France, under command of Prince Eugene and the duke of Marlborough. He died in 1711.

He died in 1711. The emperor of Germany, son of Francis I and Maria Theresa, was born in 1741. In 1764 he was elected king of the Romans, and after his father's death, in 1765, emperor of Germany. As emperor, he was the last ruler of the Holy Roman Empire. He was the first ruler of the Austrian government of Austria he declared himself independent of the pope, and prohibited the publication of any new papal bulls without his placet. He was the first ruler to abolish the sale of the regular clergy from \$3,000 to 27,000, prohibited papal dispensations as to marriage, and in 1781 published the edict of toleration for the Jews. He was the first ruler to abolish serfdom, reorganised taxation, and curtailed the feudal privileges of the nobles. In 1788 he engaged in an unsuccessful war with Turkey; and the same year he was forced to give up his claims in his dominions, hastening his death, 1790.

**Josephine, Marie Josephine** *Teacher de la Pagerie*, first empress of the French, was born in Martinique, 1763. She married first the Vicomte de Beauharnais, and after his death, in 1796, Eugene Beauharnais, and Hortense, mother of Napoleon III. Her husband perished during the Reign of Terror, and she fled to England in 1794. In 1804 she married Napoleon, then Emperor Bonaparte, the newly-appointed master and chief of the army of Italy. Sharing her husband's fortunes, she became in time the occupant of the throne of France. She was noted for her beauty, grace, and womanly virtues. Failing, however, to afford an heir to the monarchy, she was obliged to abdicate in 1815, and she was consummated in 1839. Josephine, thereupon retired to her chateau at Malmaison, Dec. 1814.

**Josephus** (Jōs'fus), **Flavius**, celebrated Jewish historian, was born at Jerusalem, 37 A. D. As a dependent of the Flavian family, he assumed his name of Flavius. His *Antiquities of the Jews*, in twenty books, gives an account of Jewish history from the creation of the world to 66 A. D. A remarkable passage in this work relating to Jesus Christ is now believed to be spurious. His other works are: *History of the Jewish War*, and an *Autobiography*. He died about 100 A. D.

an *Autobiography*. He died about 100 A. D. Joshua (*Josh 6-8*), celebrated Hebrew warrior and leader of the Israelites, who was defeated and conquered, was the son of Nun, of the tribe of Ephraim, and was born in Egypt. The so-called book of *Joshua*, in its present form, containing an account of the conquest and division of the "land of promise," is of composite structure. The compiler made copious use, especially in the earlier chapters, of documents drawn up during the period of the conquest. He died about 1225 B. C.

**Jehoiachin** (*Jo-a'-o*), king of Judah, succeeded his father Amon at eight years of age, and flourished about 609-608 B. C. He reestablished the worship of Jehovah, and instituted the rites in the newly-discovered "book of the law." He fell at Babel attempting to check Pharaoh-Necho's advance

**Hubert** (you'berf), **Petrus Jacobus**, Boer general and statesman, was born in Cape Colony, 1831. He was a farmer and ranchman; became a member of the Volksraad; was attorney-general in 1870; and in 1874 was acting-president. He was one of the triumvirate who organised a Transvaal

of the new museum at Berlin with a cycle illustrating the progress of civilization. His last graphic painting was the *Sea-Fight of Salamis* at Berlin, 1874.

**Kaunitz (kō-ni't), Wenzel Anton, Prince von**, Austrian statesman, born at Vienna, 1711. He distinguished himself in 1748 at the congress of Aix-la-Chapelle, and as Austrian ambassador at the French court in 1750. He was friendly to the French, and in 1753 he was appointed chancellor, and for almost forty years had the principal direction of Austrian policy. He took an active part in the liberal reforms of Joseph II., and was a liberal patron of arts and letters. Died, 1794.

**Kean, Charles John**, British actor, was born in Waterford, Ireland, 1811, son of Edmund Kean, who was educated at Eton and acted as actor at Drury Lane, 1827, but did not establish his reputation until 1838, when he acted as Hamlet, Richard III., and Sir Giles Overdone. In 1842 he married Miss Ellen Tree, a celebrated actress. His last appearance was as Louis XI. at Liverpool in 1867. Died, 1868.

**Kean, Edmund**, English actor, was born in London, 1767, son of Nance Carey, a strolling actress. A stage cupid and a cabin-boy to Madeira, he himself about sixteen turned a "stroller," and after ten years in the provinces made his first appearance at Drury Lane in 1792. He was at Drury Lane for the first time on the day of the period of wonderful success followed. He was finally received as a permanent member of the company, but both mind and body gave way, and, breaking down hopelessly in 1835, he died at Richmond in 1839.

**Kean, Augustus Henry**, British ethnologist and geographer, meritorious professor of Hindustani, at University College, London, and of Dublin, Ireland, 1833. He was educated in Jersey, Italy, Dublin, and Hanover, Germany, and traveled extensively in Europe and Asia. Author and editor of: *Stanford's Asia, Africa, Central and South America*; *Ethnology*; *Physical Geography of the World*; *Gold of Ophir*; *The Boer States*; *The World's Peoples*.

**Kean, John Joseph**, American scholar and educator. Roman Catholic archbishop of Dubuque, Ia., since 1900, was born in Ballyshannon, Ireland, 1836. He came to the United States in 1846; was educated at St. Mary's seminary, Baltimore, Md. Ordained priest, 1866. Was active in organizing Roman Catholic societies, and in 1870 was elected to the University of America, at Washington, 1868-69, when he resigned and went to Rome. Upon his return to America he was elected to the chair of his present see. Author: *Onward and Upward*, etc.

**Keary (kē-ā'), General Philip**, American soldier, born in New York, 1793. He was attached to the staff of General Scott, 1841-44, and distinguished himself in the Mexican war. Commanded the cavalry of the United States in the peninsula campaign during the civil war, in which he won an enviable reputation for courage and gallantry. He took part in the collision at the second battle of Bull Run and also at Chancellery, Va., where he was killed in 1862 by a Confederate soldier while reconnoitering in front of his command.

**Kens, John**, English poet, was born in London, 1795. He was apprenticed to a surgeon at Edmonton, near London, and found time to cultivate that taste for poetry which he had inherited from his boyhood; in 1817 he published a volume of juvenile poems, having already made several contributions to the *London Examiner*, then under the editorship of Leigh Hunt. In 1818 appeared his *Endymion*, a poetic romance founded in part on the model of Fletcher's *Faithful Shepherdess*. This work, though the production of a youth of little more than three-and-twenty, was warmly criticized in the *Quarterly Review*, and in *Blackwood's Magazine*, the wrath of the reviewers being probably inspired by their hatred of the collateral party with which Kens had identified himself, and which was represented by Keat's friends, Hazlitt and Hunt. He professed, however, by the criticisms of his reviewers; and in 1820 published his *Essays of St. Asaph*; his odes to *The Nightingale* and *The Grecian Girl*; and *On Fragments of Hypocrite*, taken, like *Endymion*, from mythological sources, and written in an airy strain of classic poetry, characteristic of Keat's style, and quite as beautiful. But already consumption had taken hold of the poet; he went to Naples, from there to Rome, where he died, 1821.

**Keble (kē-bē'), John**, English clergyman and poet, was born in 1792. At the age of fifteen he entered Corpus Christi College, Oxford, where he won several prizes and otherwise distinguished himself. In 1827 he published his volume of sacred poetry entitled the *Christian Year*, which attained a very large circulation and an influence that can hardly be overestimated. He was one of the leading spirits in what was known as the "Tractarian movement" in the English church, and for several years was actively engaged with Pusey, Newman, and others in its efforts. He died at Bourne-mouth, 1866.

**Keen, William Williams**, American surgeon, was born in Philadelphia, Pa., in 1821. He was educated at Brown University, 1839; M. D., Jefferson Medical College, Philadelphia, 1862; L. D.,

Brown, 1891, Northwestern, Yale, 1906. He was assistant surgeon of 5th Massachusetts regiment, 1861; since 1866 he has been in practice as a Philadelphia. He was professor of anatomy at Pennsylvania academy of fine arts, 1879-90; and has been professor of surgery at Jefferson Medical College, since 1889. He is author of many medical and other bodies. Author: *Keen's Clinical Cases*; *History of the Philadelphia School of Anatomy*.

**Keifer (kē-fer), Joseph**, German congressman, co-speaker of United States congress, was born in Philadelphia, Pa., 1826. He was educated at Antioch College, Ohio, and since 1858 has practiced law at Springfield, Ohio. He served in the Ohio volunteers in the field, 1861-65; for Ohio G. A. R., 1866-70; member of congress, 1877-85, and several times speaker of the house. He was appointed in 1890, 1896-99, as major-general of volunteers in the war against Spain. Author: *Stones and Four Years of War*.

**Keith (kēth), George Keith-Elphinstone, Viscount**, British admiral, son of the tenth Lord Elphinstone, was born at Elphinstone Tower, Stirling, 1746. He commanded the expedition in 1790-97 which took Cape Town, and the fleet landed at Abercromby in the P. of the Bay. In 1801. He was made Baron Keith in 1797, and a vicount in 1814. Died, 1823.

**Keller (kē-lér), Hermann**, German author, was born at Tusculum, Ala., 1850, daughter of Captain Arthur H. Keller. She is descended on her father's side from a family of Swiss origin, and on her mother's side from a family of German origin. She was educated in Virginia, and through her mother related to Adams and Everett families of New England. She died of consumption in 1892, after a long illness of some months as result of illness. At the age of seven she was placed under the instruction of Alexander D. Bulfinch, who was her teacher, and the beginning of her education to the present time. She entered Radcliffe College, 1900, and graduated in 1904. She has published several occasional papers to *Century Magazine*; *Youth's Companion*; *Ladies Home Journal*; *McClure's Magazine*, and is the author of *The Story of My Life*; *Optimism*, an essay, etc.

**Kellerman (kē-lér-mān), François Christopher**, French soldier, born at Paris, 1776. He entered a regiment of French hussars at the early age of seventeen. When the revolution broke out he joined the army to the revolution. For his services in Italy, he was made duke of Valmy and marshal of the empire by Napoleon. He was killed at Waterloo, 1815, during the restoration, confirmed his title of duke, and also created him a peer of France. He died in 1820.

**Kelllogg, Clara Louise**, American prima donna, was born at Newburyport, N. C., 1844. She made her debut in opera, 1861-62, as *Giulia in Rigoletto* at the academy of music, New York; and from that time she has been steadily and successfully in the estimation of the public. She sang repeatedly in London, and once or twice before Queen Victoria, at the palace. She sang in London for several years and organized her own English opera company, and has appeared principally at concerts of late years. She married, 1867, Carl Strakosch, nephew of the well-known impresario, Max and Maurice Strakosch.

**Kelllogg, Frank R.**, American lawyer, was born at Potsdam, N. Y., 1856. He went to Minnesota with his parents in 1865; studied law, and was admitted to the bar. He returned to St. Paul in 1887. He was general counsel of the Chicago Great Western railway company, Duluth and Iron Range railroad company, Duluth, Mesabe and Northern railway company, Minneapolis Iron company, Oliver Iron mining company, etc.; special counsel for United States in the case against the paper and Standard oil trusts, and special counsel for interests commerce commission in the investigation of the Chicago and Northern railroad company.

**Kelly, Howard Atwood**, American physician, was born at Camden, N. J., 1858. He was graduated at the University of Pennsylvania, 1877; M. D., 1883; L. D., Aberdeen, 1908. Washington and Jefferson University of Pennsylvania, 1907; F. R. C. S., Edinburgh. He was founder of the Kensington hospital, Philadelphia; now professor of gynecology, Johns Hopkins University, and gynecological hospital, Johns Hopkins hospital. He is a member of many scientific and scientific societies, both foreign and American. Author: *Operative Gynecology*, 2 vols.; *The Vervum Appendix and its Diseases*, etc.

**Kelly, John Howard**, American sculptor, was born at New York, 1855. His studied art at the National Academy of design. His first piece of work was the *Shelby's Ride*, a statue of General Sherman, Sheridan, and Hancock, gave him sittings for a series of bronzes, *Memorials*, *Monuments*, *Monuments*, *Call to Arms*, *Troy*, N. Y.; equestrian figures of General Sherman, Colonel Roosevelt at San Juan and General Sherman at the battle of Gettysburg, and C. E. Clark, and President Roosevelt as colonel of the Rough Riders; panels from life of the American statesman, Samuel Jackson, and one of the founders of the art students' league.

**Kevin, William Thomson, Lord**, was born at Belfast in 1824. After graduating at

Cambridge, he was appointed, 1846, to the chair of natural philosophy in Glasgow University, a post he retained till 1869.

His research work includes all branches of mathematical physics, and particularly heat, his principal work has been in extending thermodynamical principles—notably in devising a method of arriving at an absolute scale of temperature, and in discovering the "Joule-Thomson effect," and in enunciating the principle of the dissipation of energy. In general physics, he has done much to apply mathematical methods of expressing the relations of observed facts, and he has worked out most fertile ideas as to the nature of the ether, of inertia, and the application of vortex motion to explain the properties of atoms.

His principal work, however, is probably in the field of electricity and magnetism, the first fruit of which appeared in the paper he published in 1846 on the laws of electrostatics, and which was greatly developed in his researches on electrostatics and submarine telegraphy. These theoretical investigations he applied to the Atlantic and other cables from 1858 to 1866, and in his invention of many instruments of the highest precision for the use both of the investigator and of the practical man.

Among the best of these appliances are the reflecting galvanometer, the siphon recorder, several forms of electrometer, the ampere balance, electrostatic voltmeter, and electric supply meters. He has also done much interesting work in navigation, and in this connection invented an improved form of mariner's compass and an invaluable sounding-machine, besides working out methods for compass correction, and for the investigation of tidal phenomena. In addition to three series of monographs—(1) *Electrostatics and Magnetism*, (2) *Mathematical and Physical Optics*, and (3) *Acoustics*—he has also published *Baltimore Lectures on Molecular Dynamics and Wave Theory of Light*, and, in collaboration with Professor P. G. Tait, *A Treatise on Natural Philosophy*. He was knighted in 1890.

**References.**—*Figuralist*: Lord Kelvin; S. P. Thomson's *Life of Lord Kelvin*.

**Kemble, John Philip**, English tragedian, was born at Brecknock, in South Wales, 1776. In 1794 he made his first appearance at Drury Lane, London. He is a descendant of the famous actor, who visited the United States in 1832. Appointed examiner of plays in 1865, he performed the duties of his office until 1880, when he relinquished the stage in 1840. Died, 1854.

**Kemble, Frances Anne**, English actress and Shakespearean reader, was born in London, 1809. She was the daughter of the celebrated Charles Kemble, and was commonly known by the name "Fanny." She made her debut at Covent Garden in 1829, and in 1832 came to the United States with her father, where she met with great success. In 1860 she left America, and from that time her residence was partly in England and partly in the United States. Died, 1894.

**Kemble, John Philip**, English tragedian, was born at Prescott, 1757. His first appearance was at Wolverhampton in 1776. The success of his acting in *Macbeth* and *Richard III.* was remarkable. He was married in 1780, and in 1783 he played Hamlet at Drury Lane, and around the nearest interest. In 1802 his reputation as a tragedian began to decline, and he became manager, and made his first appearance there in 1803 as Hamlet. He retired in 1817, and spent his last years at Lausanne, where he died, 1823.

**Kempke, Thomas A.**, German mystic and writer, so called from Kempen, a town in the Prussian Rhine province, where he was born about 1759. He was educated at Drenthe, and in 1400 entered an Augustinian convent in the diocese of Utrecht. He drew little place in 1817, at which time he certainly had attained his nineteenth year, and most probably his ninety-second. The character of Kempke for sanctity and holiness of the world very high among his contemporaries, but his historical reputation rests almost entirely on his writings, which include many sermons, treatises, pious biographies, letters, and hymns. Of these, however, the only one which deserves notice is the *Imitation of Christ*, a work that is certainly had attained his nineteenth year, and most probably his ninety-second. The character of Kempke for sanctity and holiness of the world very high among his contemporaries, but his historical reputation rests almost entirely on his writings, which include many sermons, treatises, pious biographies, letters, and hymns. South Africa, 1899-1900; commander-in-chief, 1900-02; later was promoted lieutenant-general and general, and created Viscount.

**Kitchin, George William**, English historian, was born at Naughton rectory, Suffolk, 1827. He was educated at Ipswich, King's College, London, and Christ Church, Oxford. He became dean of Winchester in 1863, and of Durham in 1894. His chief work is his *History of France*.

erliest work is his *History of France*.  
 Knight (Edg.) *John*, biblical writer, was born at  
 Plympton, Devon, England, in 1817. He became  
 stone-deaf through a fall, and learned shoe-making.  
 The rest of his life was spent in the service of  
 Charles Knight and other publishers. In 1850  
 he received a pension of 100 pounds. His works  
 include *The Pictorial Bible*; *Pictorial History of*  
 *Palestine*; *History of Palestine*; *The Lost Senses—*  
*Deafness and Blindness*. In 1884 the University  
 of Gießen made him a D. D. He died at Cann-

**Klaw, Mare**, theatrical manager, was born at Paducah, Ky., 1858. He was educated in the public and high schools of Louisville, Ky.; studied law and was admitted to the bar. Since 1881 he has been engaged as theatrical manager, and is now a member of the theatrical firm of Klaw and Erlanger of New York.

**Kilber** (Alm'dér), Jean Baptiste, French general was born at Strasbourg, 1700, and in 1776 obtained a commission in the Austrian army. In 1794 he was sent to the West Indies, and in 1795 to the Rhine district; in 1796 he gained the victory of Altenkirchen. He accompanied Bonaparte to Egypt, was wounded at Alexandria, and the latter left him in the hands of the Turks. Bonaparte left Egypt he entrusted the chief command to Kilber, who concluded a treaty with Sir Sidney Smith for its evacuation, but was afterwards obliged to sue for pardon. He refused to reconquer Egypt and destroyed the Turkish army at Heliopolis. In the course of an attempt to conclude a treaty with the British he was assassinated by a Turkish fanatic at Cairo, 1800.

**Klein (kline), Charles**, playwright, was born in London, England, 1867, and was educated at North London College. He was formerly censor of plays for Charles Frohman. Author: *A Mile Minute*; *El Capitan*; *Heartsease*; *The Hon. John Grigsby*; *Dr. Belgraff*; *A Royal Rogue*; *The Music Master*; *The Lion and the Mouse*.

**Klopstock** (*klop'shtok*). **Friedrich Gottlieb**, German poet, was born at Quedlinburg, 1724. Inspired by Virgil's *Aeneid* and Milton's *Paradise Lost*, he resolved to write a great epic, and as a student at Jena, in 1745, he began *The Messiah*. The last volumes of *The Messiah* were published in 1773. Regarded in his own time as a great religious poet, he helped to inaugurate the golden age of German literature. *The Messiah* was translated into both English verse and prose. Died, 1803.

**Kapp, Morris Augustine**, American lawyer and jurist, chief justice of the U.S. Court of Commerce was born in Stafford, N. Y., 1843. He was graduated from Wesleyan University, Connecticut, 1868; LL. D., 1892; hon. A. M., Syracuse University, 1892. He was laterate state commerce commissioner 1891-1910; chairman of the commission, 1896-1910, and appointed chief justice of the new U. S. Commerce Court, created 1910. For a number of years he lectured on mercantile law at the University of Wisconsin.

commerce law at George Washington University. Kneisel (k'ni'sel), **FRANZ**, German-American musician, director of Kneisel quartette, was born in Roumania, of German parentage, in 1868. He studied violin instruction under Grün and Hellmesberger; was concertmaster of Hofburg theater orchestra, Vienna; later of Bilse's orchestra, Berlin, and concertmaster of the Boston symphony orchestra. He is especially prominent as violin soloist. Since 1905 he has been head of violin department in the institute of musical art, New York.

**Kneiler** (w/3r). **Str Godfrey**, noted portrait painter, was born at Lobeck, 1646. He studied at Amsterdam and in Italy, went to London, 1675 and in 1680 was appointed court-painter. In 1693 William III, knighted him, and in 1711 George I. made him a baronet. His best-known works are the *Beauties of Hampton Court*, painted for William III.; his portraits of the Ku-Cut Club and of fourteen sovereigns. He died at Twickenham, 1722.

**Knight, Charles**, English publisher and author, was born at Windsor, 1791. He early turned his attention to publishing, and in 1823 he started the *Quarterly Magazine*, and continued it in some time in London. The whole of his notable worthy career was devoted to popular literature of which he was one of the earliest and most accomplished advocates. Among the works which he published or edited are the *Penny Magazine* which was started only a month or two after

**Knight, William Angus**, Scotch educator and writer, professor of mental philosophy, University of St. Andrews, 1876-1902, was born in Scotland, 1836. He was graduated from the University of Edinburgh; B.L.D., Glasgow. Author: *Science and Philosophy* (1869); *Psychology* (1870); *Logic* (1871); *Essays in Philosophy* (1872); *Old and New: Selections from Wordsworth; Coleridge and Wordsworth in the West Country, their Friends and Surroundings*, etc.

**Knowles, James Sheridan**, British dramatist, was born at Cork, 1794. His *Crime Graciosa* was first produced at Belfast. *Veronica*, his most successful play, had been a success in Glasgow before Maeredy in 1820 produced it at Covent Garden. Besides *William Tell*, in which Maeredy achieved one of his greatest triumphs, Knowles' other best plays are *Love, The Hunchback, The Love Chase*, and *The Wives*. He appeared with fair success in his own plays. He died in 1845 because of a Baptist preacher drew a large audience to Easter hall, and published two anti-Roman Catholic works. He died at Torquay, 1862.

**Major Henry**, American general, was born in Boston, Mass., 1750. He was an officer in a military company, and, when the revolution broke out, he escaped from the city with his wife, who hid his sword in the folds of her dress, and took part in the battle of Bunker Hill. He soon attracted the attention of Washington by his skill in planning fortifications and his knowledge of artillery, and throughout the war he commanded the artillery in various battles. Congress made him a major-general, and from 1785 to 1795 he was secretary of war. Died, 1806.

John, John, 1606, divine and reformer, was born at Giffordgate, in Haddingtonshire, 1613. He became a priest and a clergyman in the year of 1635. And he afterwards had a wife at the age of twenty-five. He renounced Catholicism about 1643, and then he was married to a woman named Mary. Mary, he retired to Frankfurt, and then to Geneva, where he became acquainted with Calvin. He was a man of great energy and courage, and he denounced the priesthood, and especially the mass and image-worship, and declaimed against the superstitions of the Roman Church. His tireless perseverance and vehement eloquence he labored until his death for the establishment of a reformed religion in Scotland. His influence was diminutive, and his frame wasted and feeble, but his energy was inexhaustible. He was the first of a series of reformers who were active in the Reformation of Religion in Scotland. But the influence he exerted was by the tongue rather than by the pen.

**Knox, Phileander Chase**, American lawyer and statesman, was born in Brownsville, Pa., 1853. He was graduated at Mt. Union College, Ohio, 1872; LL. D. at University of Pennsylvania, 1901; Y. B., 1907. He was admitted to the bar, 1875; was assistant United States district attorney, Western district of Pennsylvania, 1876-77. He was attorney-general of the United States, 1901-04; United States senator from Pennsylvania, 1904-09, and secretary of state since March A, 1909.

1904-05, and secretary of state since March 3, 1909.  
 Kobbe, 'Bob' J., a noted musical author and  
 journalist, was born in New York, 1854. He  
 graduated at Columbia University, 1877; Columbia  
 Law School, 1879. He engaged in newspaper and  
 magazine work, chiefly on musical and dramatic  
 subjects. Author: *The Ring of the Nibelung*;  
*Wagner's Life and Works*. 2 volumes: *Opera Singers*;  
*Signora, a Child of the Opera House*, a novel;  
*Wagner's Music Dramas Analyzed*; *Wagner and*  
*His Tools*; *How to Hear Wagner's Music*; *How to*  
*Understand Music*; *The Pianist*, etc.

Coen (Höx), Robert, German physician and bacteriologist, was born at Klausthal, in the Harz mountains, 1843. He studied medicine at Göttingen, and during his student life in 1865 made his first substantial achievement was the result of the penetration, skill, and thoroughness of his researches. In 1867 he discovered the bacillus of cholera. In 1870 he had begun his investigations into the cause of consumption, and in 1882 he announced the discovery of the tubercle bacillus. He was a member of the physiological society of Berlin. He discovered the comma bacillus, or cholera germ, in 1884. He was decorated with the Iron Cross by the German government, and Imperial titles and honors were showered upon him. In 1885 he was appointed professor in the University of Göttingen. His theories of hygiene being created for him, and was made director of the hygienic institute. In 1905 he was awarded the Nobel prize for achievements in bacteriology. Died 1910.

**Kohlsaat** (*Kol'sat*), **Herrmann Henry**, capitalist, journalist, was born in Alibon, Ill. 1853. He was educated in the common schools of Gale County, Mo. He was a traveling man for two other firms, and, 1875-80, for Blake, Shaw and company, wholesale bakers; became junior partner, 1880, and was in charge of the Chicago branch of the firm. He bought that branch of the business 1882, greatly enlarged it, and the firm of H. H. Kohlsaat & Co. was organized. He was devotedly and exclusively devoted to the wholesale bakery business. He was part owner of the *Chicago Inter Ocean*, 1891-93; was editor and publisher of *Chicago Record-Herald*, 1893-1901, and *Chicago Record*, 1894-1901. He retired from the *Record-Herald* 1902, and has been largely identified with local

**Komura (kōmōrō), Count Jutaro, Japanese** statesman, minister for foreign affairs since 1908. He was born at Hyuga, 1855. He was educated at the University of Tokyo, and at Harvard University Law School. Was *chargé d'affaires* in China, 1893-94; minister to United States, Russia, China, 1898-1901; minister for foreign affairs, 1901-06; senior plenipotentiary to the peace conference and signed, with Mr. Takahira, peace treaty at

Portsmouth, N. H., 1905; and Japanese ambassador to Great Britain, 1906-07.

**Kämpfer** (kämp'fer), **Theodor**, German lyricist, was born at Dravden, 1791. He studied at Freiburg, Leipzig, and Berlin, and in 1811 settled at Vienna. Here he was dramatist for a Vienna theater, and wrote some light comedies, among them *Der Grüne Domino* and *Der Nachschacker*, and some tragedies, of which *Zriny* was the most successful. His most famous song, *Das Schwert-Lied*, was dashed off in a verse battle only a few hours before the author fell at Gadebusch near Schwerin, 1813.

**Kosciusko** (Kos'cho'sko'), **Thaddeus**, Polish general and patriot, was born in Minsk, West Russia, 1746. He became a captain in the Polish army, and went to America to fight for American independence, and returned to Poland in 1786, with the rank of general. With 20,000 regular troops and 40,000 ill-armed peasants he resisted for months the undefeated Russian army of 150,000 men. Outpowered by superior numbers in the battle of Masejowice, 1794, he was captured and kept a prisoner until after the accession of the emperor Paul. When Napoleon, in 1806, formed a plan for the restoration of Poland, he encouraged himself restrained from taking an active part in it by his promise to the emperor Paul. He released from servitude, in 1817, the peasants on his own estate, and took place in 1831, in consequence of a fall from his horse.

Kossuth (Kósh'oor), Francis, son of Louis Kossuth, leader of the independence party in the Hungarian parliament, was born in 1841. He suffered exile with his father, was partly educated in England, and lived in France and Italy. After his father's death in 1894 he went back to Hungary, took the oath of allegiance as a Hungarian subject, and soon became leader of those aspiring to national independence. When the revolution came into office in 1906 he became minister of commerce in the Wéberik cabinet.

**Leószent, László**, Hungarian patriot, orator and leader, was born at Monok, 1802. In 1832 he commenced his political career as editor of a liberal paper. To the revolution of 1848 he was devoted not only the Hungarian revolution, but the insurrection in Vienna in 1848. To put an end to all the bloodshed he proposed the formation of a diet, which induced the national assembly at Debreczin, in 1849, to declare the independence of Hungary, and to elect Kossuth as its president and emperor of the throne. He was then appointed provisional governor of Hungary. In 1849 he was compelled to leave his position and to flee to the United States, where, however, he was made a prisoner. In 1851 he landed in the United States, where he met with the most enthusiastic reception. He returned in 1853 to England, and in 1854 he visited Italy, where the Italian war broke out against Austria, where he organised on Hungarian legion in Italy. Later he returned to Paris, where he died in 1867.

**Karl Ludwig August von Frederic Ferdinand von**, German dramatist and historic writer, was born at Weimar, 1761, and was educated at Jena and Duisburg. In 1801 he again left Russia when the French invaded the country, and spent the remainder of his life in innumerable literary productions, and in politics. The emperor Alexander subsequently employed him in various posts, and in 1817 he was appointed Russian correspondent in Germany. This invidious office, however, is said to have filled in a manner hostile to the freedom of his native country; and for this purpose he wrote a number of articles, and a few youthful satirical comedies and Sand. His dramas number nearly three hundred. Among his other works are: *History of the German Empire, History of Ancient Prussia*, and various narratives and recollections.

**Krehbiel** (*kré-bé*), **Henry E.**, musical critic, was born at Ann Arbor, Mich., 1854; studied law in Cincinnati, 1872-74; musical critic, Cincinnati *Gazette*, 1874-80; musical critic, New York *Tribune*, since 1880; chevalier of legion of honor, 1901. Author: *Studies in Wagnerian Drama; How to Listen to Music*, etc. Editor: *Annotated Bibliography of Fine Arts*.

**Kronkoff** (*kron's'koff*), **Joseph**, rabbi, lecturer, and author, was born in Ostrowo, Prussia, 1858. He came to America in 1872, worked as clerk at the Fall River, Mass. He was graduated at the University of Cincinnati, 1883, and as rabbi from Hebrew Union College, 1883; D. D., 1885. He founded the Jewish publication society of America; founded, and has been president since organization of the National farm school, in which Jewish boys are trained in practical and scientific agriculture. Author: *The Jews and Moslems in Spain*; *Evolution of the Jews*. *From the*

**Kropotkin** (kro-pót'kin), **Prince Peter**, Russian socialist, writer, was born at Moscow, 1842. In 1871 he explored the glacial deposits of Finland and Sweden; in 1872, while on a visit to Belgium and Switzerland, he associated himself with the extreme section of the International. In 1874, after returning to Russia, he was arrested, but in 1876 effected his escape to England. In France at Lyons he was condemned, in 1883, to five years' imprisonment for anarchism, but was released in 1886 and returned to England. Author: *Ja*

and pre-Darwinian evolutionist, was born at Raszewitz, 1744. In 1778 he published a *Fleur de France*. In 1779 he became a member of the French academy and keeper of the royal gardens. He studied the anatomy of plants and there he lectured for twenty-five years on invertebrate zoology. About 1801 he had begun to think about the subject of organic evolution. His conclusions in his famous *Philosophie Zoologique*, in 1809. His *Histoire des Animaux sans Vertèbres* appeared in 1815-22. He broke away from the old idea of species as fixed and unchangeable; of species, sought to explain their transformation and the evolution of the world, and proposed that the way the now accepted theory of descent. Died in 1829.

Lamarline (*de mdr'itrn*). Alphonse, French author, politician, was born at Mâcon, 1790. His work exerted a most important influence upon the republicans of France, and he is especially noted for his of the exercise into which they might otherwise have been led. The greater part of his career was devoted to the study and promotion of the political eminence. His *History of the Girondists*, published in 1847, undoubtedly did much to hasten the republicanism of France. His *History of the Girondists*, which appeared in the following year, is a deeply interesting account of a movement which, if it had not been turned into a revolution, would have been a most successful one. His *History of Louis Napoleon*, might have gained for France at once that free government which she gained only after the death of the Emperor.

Lamb, Charles, English essayist and poet, was born in London, 1775. He was the son of a clerk to one of the benches at the Inner Temple, and was educated at the same school. He was the schoolfellow and friend of Samuel Taylor Coleridge, and was employed by the latter as an accountant's office of the East India Company, retiring at last on a pension; but, during most of his life, he devoted himself, in a spirit of noble self-sacrifice, to the cause of his friend, who, like himself, inherited the instinct of immortality. His earliest literary efforts were in verse. In 1807 he published a volume of *Poems*, and in 1811 a series of *Tales from Shakespeare*; and in 1818 two volumes of *Specimens of English Dramatic Poets from the Elizabethan to the Eighteenth Century*. He wrote many short but felicitous notes. On the establishment of the *Quarterly Review*, in 1824, he contributed a series of essays, signed *Elia*, in which are the chief foundation of his fame. He died in 1834, his last words being "I am a poor fellow."

**Lander, Arnold Henry Savage**, English artist and traveler, was born at Florence, Italy, 1865, and was educated there and at Paris. He traveled in the East several years, also in America. As traveler he explored the sources of the Nile, and was the first white man to reach both sources of the great Brachnaputra river and establish their exact position; to do this was a geographical problem of some rank higher than the Himalayas and the north of the Brachnaputra river; He holds the world's record in mountaineering, having reached at least 22,000 feet in the Himalayas, and in 1899. Author: *Along with the Heavy Asau*, or 3,800 Miles on a Pack-saddle; *Corcor*, or The Land of the Living Dead; *Along the Mouth of the Euphrates*; *Nisroch*; *Across the Foothills of the Himalayas*.

**Landor, Walter Savage**, English poet and prose writer, was born at Ipsley Court, Warwickshire, 1775. He studied at Oxford where he won high reputation as a scholar, and in 1808 raised the literary standard by his *Imaginary Conversations*. He was a friend of the English patriots under Blake. He was made colonel in the service of Spain, but resigned his commission on the restoration of King Ferdinand. He first became known as the author of a poem, *Imaginary Conversations*, in 1808. In 1824-29 appeared his *Imaginary Conversations of Literary Men and Statesmen* in 5 vols. He was a thorough classical scholar and his Greek and Roman characters speak a language which should be understood by all who speak English. "He has," says Emerson, "an English appetite for action and heroes." Died in Florence, 1864.

**Landseer, Sir Edwin**, English painter, was born in London, 1802. The first work that brought him prominently before the public was *Dogs Fighting*, exhibited in 1819. It was succeeded by the *Dogs of St. Gothard*, the popularity of which was very great. In 1830 he was elected a royal academician, and in 1850 was knighted. Among his most celebrated achievements are: *The Return from Deer-stalking*; *The Illicit Whisky-shill*; *Night-Morning*; *The Children of the Moor*; *Saved*; *Flowers in the Highlands*; *Window Park*; *Squirrels*; *Flowers*.

ing Aya. He was elected president of the Royal Academy in 1865, but declined the honour. He was the most superb animal-painter of his time. **Lane, Edward William**, English orientalist and Arabic scholar, was born at Hereford, 1801, the son of a prebendary. The result of Egyptian visits was his *Manners and Customs of the Modern Egyptians*, still a standard authority. This was followed by the annotated translation of *The Thousand and One Nights*, which was the first accurate rendering. His later years in Egypt were devoted to the great work of his life, the *Arabic-English Lexicon*. Died 1876.

**Lane-Poole, Stanley**, English historian and archaeologist, professor of Arabic at Trinity College, Dublin, 1898-1904; was born in London, 1856; M.A., Oxford, and Dublin; Litt.D., Dublin, 1907; worked in Egypt for the British Museum and government on archaeological research at Cairo, 1895-97; lecturer at the royal institution, 1900-97; member of the Society to the study of the history of Wales, 1901-02. Author: *The Customs of the Arabs and Indian coins as in British Museum*, 10 vols.; *Social Life in Egypt: Studies in a Mosque*; *The History of Mohammed*; *Studies in Oriental Numismatics*, 3 vols., etc. Edited: *Lane's Arabic Lexicon*; *Journal of the Royal Asiatic Society*; *Lane's Koran*; *Transactions of the Middle East Society*.

**Lafrance** (la-frang'), prelate [and scholar, archbishop of Canterbury, was born in Pavia, Italy, about 1005, and 1046 he was chosen prior of the Benedictine abbey of Bec. William of Normandy appointed him a councillor of state, and in 1066 he was elected abbot of a monastery in Caen, where he established a school. Afterward William caused him to be elected to the see of Canterbury, and he was consecrated in 1070. His works consist of commentaries, letters, and sermons. Died 1096.]

[illegible]

Canadian priest, author, and archbishop. He was born in Bonifacio, Manitoba, since 1893, was born at St. Mary's, Ladore, La Prairie, province of Quebec, Canada. He completed his course of theological study at St. Mary's College, Montreal; entered the order of Oblates of Mary Immaculate, 1881, and was ordained a priest in 1884. He was later assigned to the Catholic University of Ottawa, where he became vice-dean of the theological faculty in 1891. He was in Rome in 1892, 1893, 1894, 1895, 1896, 1897, 1898, 1899, 1900, 1901, 1902, 1903, 1904, 1905, 1906, 1907, 1908, 1909, 1910, 1911, 1912, 1913, 1914, 1915, 1916, 1917, 1918, 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 25

**Langston, William**, one of the great figures in early English literature, was born about 1330 near Malvern. He lived most of his life in London in poverty, a clerk and singer of masses for the dead in the churches. An allegorical poem, *The Vision of Piers Plowman*, possibly written by him, containing such a picture of abuses in the church and the state, is one of the earliest and most eloquent cries from an oppressed people. He died about 1400.

**Langton, Stephen**, English prelate, was born about 1160. He studied in Paris, and became the chancellor of Notre-Dame and rector of the university. In 1207 was consecrated archbishop of Canterbury. In 1213 he joined the barons who opposed to the misgovernment of John, and his name stands first among the subscribing witnesses to magna charta. He again placed himself at the head of the barons, in 1223, to demand from Henry III. the confirmation of their liberties. His writings have perished; but to him is due the division of the Bible into chapters. Died 1228.

1228.  
**Lanier (La-ner), Sidney**, American poet, was born in Macon, Ga., 1842. He was graduated at Oglethorpe College, Ga., 1860, and served in the Confederate army during the war. From 1865 to 1872 he practiced law in company with his father at Macon. In 1876 he prepared an ode for the inauguration of Ulysses S. Grant, which in 1877 settled in Baltimore, where he delivered lectures on English literature. In 1879 he was appointed lecturer on English literature at Johns Hopkins University. In the summer of 1880 he returned to his home in Georgia, and in the mountains of North Carolina, where he died 1885. His two notable books are his *Science of English*

**LANKESTER** (*lan-'ke-s-tr*). **Sir Edwin Ray**, English zoologist, was born in London, 1847. He was educated at Downing College, Cambridge, and at Christ Church, Oxford; D. Sc., Oxford and Leeds; LL.D., Cambridge. He was fellow and tutor of Exeter College, regius professor of natural history, Edinburgh, 1882; Lancaster professor of comparative anatomy, Oxford, 1891-92, and director of the natural history department of the British Museum, 1898-1907. Author: *A Monograph of the Cephalopodous Fishes*; *Degenerations*; *The Advancement of Science*. Editor of *A Treatise*.

on Zoology; Extinct Animals; The Kingdom of Man, etc.

**Launee** (lan), **Jean**, duke of Montebello, French marshal, was born at Lectoure, 1769. He entered the army in 1792, and by his conspicuous bravery in the Italian campaign fought his way up to the rank of brigadier-general, 1795. He rendered Napoleon important service, and on the 9th of June, 1800, won the battle of Montebello. In 1809 he commanded the center at Aspern, where he was mortally wounded, and died in that year.

**Landonwe** (*dina'doun*). **Henry Charles Keith** was a statesman. He was born in 1845. He was educated at Balliol Hall, Oxford, England. He was a member of the Oxford. He succeeded to the Liberal Party in 1866, from 1868 held minor offices in the Liberal administration, and in 1872-74 was under-secretary of war. In 1880 he became under-secretary of war, but was ousted by Lord Salisbury. He was Gladstone for the compensation for disturbances in the bill. He was governor-general of Canada, 1883-1888, of India, 1888-94, was secretary in 1895-1900, and in 1900-1905. He held secretary, promoting the trade with the United States and France, and the treaties with Japan.

**Taoise** (16<sup>th</sup>-17<sup>th</sup>), Chinese sage, founder of Taoism, was born in the province of Honan about 604 B.C. He was a contemporary of Confucius, and wrote the celebrated *Tao-te-King* canon, that is, the *Way of the Supreme Being*, the first of the sacred books of China. He was the founder of one of the principal religions of China. His followers formed a sect of mystics, called, as now degenerated into a set of jugglers and magicians. (French), Pierre Matisse, Marquis de Matisse, was born at Beaumont-en-Auge, in Normandy, in 1869. He studied at the Lycée of Caen, and then at the military school there, and afterwards went to Paris. He was gifted with wonderful powers of observation, and was particularly keen on what had for many years defined the attempts of the scientific world to explain the origin of the universe. He was the author of the nebular hypothesis, and together with his friend Laplace, to verify Newton's theory. His *Traité de Mécanique Céleste* was published in 1829, and was the first to meet to Newton's *Principia*, the greatest of astro-

**Lardner, Nathaniel**, English divine, was born in Hawkhurst, Kent, England, 1684. He studied at Utrecht and Leyden; became a minister in his twentieth year; died, having been a chaplain and tutor in the family of Lady Topham, 1757. He was a man of great talents, and acquired equal reputation as a preacher and writer. His most celebrated work is *The Credibility of the Gospel History*. He was also the author of *A Collection of Jewish and Heathen Testimonies*. These two works—the value of which in Christian apologetics can hardly be over-estimated—occupied him for the greater part of forty-three

**Larned, Josephus Neilson**, author and journalist, was born in Chatham, Ont., 1836. He was educated in the public schools of Buffalo; was on editorial staff of *Buffalo Express*, 1859-72; on editorial staff of *Buffalo Courier*, 1872-73; and superintendent of Buffalo library, 1877-87.  
 Author: *A Multitude of Counselors: Friends of Right and Wrong: History of the United States Free Secondary Schools; Seventy Centuries—a Survey*.  
 Editor: *The Literature of American History*.

**La Rocheffoucauld** (la rash'foo'kô'), **François**.  
**Duc de**, French moralist, was born at Paris, 1613.  
 He joined the Frondeurs and was wounded at  
 the siege of Paris. In 1652, wounded again, he  
 retired to the country. On Mazarin's death in  
 1661 he repaired to the court of Louis XIV. A  
 surreptitious edition of his *Mémoires*, written  
 in retirement, was published in 1662; as it gave

wide offense he disavowed its authorship. His *Réflexions, ou Sentences et Maximes Morales* appeared in 1665. His last years were brightened by his friendship with Mme. de La Fayette which lasted until he died, in 1680.

LARRY (*sd*). Dominique Jean, Baron, French surgeon, was born at Bapaume in 1766 and went to Paris, and entered the navy as a surgeon's mate. He served in the wars of 1805-1815, fought in Germany, Spain, and was wounded several times. He married under Napoleon in the war of 1815, and he had a son, who was killed in a campaign. Once he killed his own brother-in-law to make soup for the wounded men under his command. Napoleon said of him: "If the army ever lacks food, I will have soup made from the bones of Larry," and in his will said: "I leave 100,000 francs to Larry in Paris, in which he is now residing in honor and holding Napoleon's will in his hand, once it has been signed." The man who was killed by Larry was also called Larry.

**La Salle** (la sal'), **Kene Robert Cavellier**, **Sieur de** noted French navigator, was born in Rouen in 1633. He came to America in 1667. After a voyage of exploration from Lake Erie to Lake Superior and down the Mississippi, he took possession of the lower portion of the Gulf of Mexico, called Louisiana, after the French king, and great efforts were made to persuade him to colonize it. But quarrels arose between him and the commanders of the fleet, which ended in the return of the ships with fifty of the people, to France. With the others, **La Salle**, bent on his way, but failed to find

in 1779, led to a lasting friendship with the queen. She painted numerous portraits of the royal family. In London she painted portraits of the prince of Wales, Lord Byron, and others.

**Lecky** (*lek's*). **William Edward Hartpole**, British historian and philosopher, was born near Dublin, Ireland, 1838. He was graduated in 1859 at Trinity College, Dublin. In 1861 he published anonymously *The Leaders of Public Opinion in Ireland*, four brilliant essays on Swift, Flood, Grattan, and O'Connell. His later works were *Rationalism in Europe*, *History of European Morals*, *History of England in the 18th Century*, and *Democracy and Liberty* with a volume of poems in 1891. He was elected to parliament for Dublin University in 1895 and again in 1900. *Died*, 1903.

He died in 1865 and again in 1900. DIED. 1900.  
 Dr. Leakey was born in 1827 at Liberty, N.Y., a geologist  
 and physicist; he was born in Liberty county, Ga.  
 He graduated at Franklin College, University of Georgia,  
 in 1841, and the New York College of Physicians and Surgeons  
 in 1845, and practiced medicine in New York City until 1847.  
 He went to Cambridge, Mass., where he studied under  
 Agassiz. He subsequently held several professorships,  
 and in 1869 became professor of geology and natural history  
 in the University of Michigan. His publications include  
 education and the fine arts: *The Mutual Relations of Religion  
 and Science*; *Elements of Geology*; *Sight*; *A Compend of Geology*; *Evolution*, etc. He

born in the Yosemite valley, California, 1801. He died in 1892 at San Francisco, California. E. Lee, was born in Fairfax county, Va., 1835. He was graduated at West Point military academy and held a commission as second lieutenant in the United States cavalry. At the opening of the civil war he resigned and entered the confederate service as a captain in the 1st Virginia cavalry. In 1865 he was elected governor of Virginia, serving until 1890. He was appointed consul-general at San Francisco in 1891 and was later retained at that post by President McKinley. He administered his office with signal ability during the investigation of the explosion of the battleship Maine, and throughout the trying incident preceding the Spanish-American war, in that he was served as major-general of volunteers and his war record was brilliant. He was governor of the province of Havana. He was later appointed brigadier-general in the regular army, April 1901.

Lee, Henry, distinguished American general, was born in Virginia, 1756. He was one of the most daring, vigilant, and successful cavalry officers of the American Revolution. He was probably the most effective and courageous body of troops raised in America. At the battle of the Clouds he routed the British under Francis Watson, Mott, and Granby and Augusta, and at the storming of Fort Mifflin, Lee particularly signalled himself. After the battle he was elected governor of Virginia, and in 1792 was chosen governor of Virginia. His main business was to bring the Indians to great to write a eulogy of him; in it occurs the famous words "First in war, first in peace, and first in the hearts of his countrymen."

**the hearts of his countrymen." Died, 1818.**

**John Jay**, 1737-1829, statesman, patriot, and signer of the declaration of independence, was born in Virginia, 1737, and received his education at King's College, New York, where he became a member of the Phi Kappa Psi chapter in his nineteenth year. In 1764 he was appointed to draft an address to the king, and a year later the same address was adopted by the best state papers of the period. The memorial of congress to the people of British America, and the address to the king, were both drafted by Great Britain, were both from his pen. In June, 1776, he introduced the measure that declared the colonies free and independent, and which was reported it by a speech of the most brilliant eloquence. He continued to hold a seat in congress until 1780, when he was elected a resident minister to France. He returned to his native land in 1784. In that year he was chosen president of congress, but retired at its close, and in 1786 was again chosen a member of the original committee of the convention, the convention which adopted the present constitution of the United States, and one of the first ratifiers of it. In 1792 he resigned from public life, and died in 1829.

**Lee, Robert Edward**, American general. was born in Westmoreland county, Va., 1807. At eighteen he entered West Point, was graduated second in his class in 1829, and received a commission in the corps of engineers. In the Mexican war he distinguished himself by his valorous conduct, and at the storming of Chapultepec was severely wounded. In 1852-55 he was superintendent of the Washington Arsenal, and his administration greatly improved its efficiency. He was in command of the Department of the Columbia at Washington in March, 1861, when seven states had formed the southern confederacy. Virginia seceded April 20, 1861, and he was ordered to prove that his allegiance was due to his state, sent in his resignation. Within two days he was made commander-in-chief of the army of the Potomac. At Richmond he superintended the defense of the city until April 1862, when he was ordered to oppose General Rosecrans in West Virginia. His mastery strategy in the seven days' battle of Manassas, August 31, 1862, was the cause of the

ties and strategy in opposing General Pope, his invasion of Maryland and Pennsylvania, and other achievements are cardinal to the history of the war. On April 9, 1865, Lee surrendered to General Grant at Appomattox, Virginia. The war was practically ended. After the close of the war he frankly accepted the result, and, although deprived of the presidency and the army, he remained in the White House on the Family, he declined proffered offers of pecuniary aid, and accepted the presidency of what came to be called the Washington and Lee University at Lexington, Va. His noble head be remained untarnished in 1870. Numerous military critics regard Lee as the greatest military leader produced by the civil war, and one of the very first produced by

born in Liverpool, England, 1866. He was educated at Liverpool College, and engaged in business seven years, but abandoned it for literature. He was introduced to the poetess by Mr. Wilson Barrett, then became literary critic for several papers, and settled in London. For some years he was journalistic and literary work has been his chief occupation. His works are: *My Ladies' Sonnets*; *Volumes in Folio*; *George Merdith*; *The Book-Bills of Narcissus*; *English Poems*; *The Religion of a Literary Man*; *From the East to the West*; *From the West to the East*; *The Beautiful Life of Rome*; *Rudyard Kipling, a Criticism*; *The Life Romantic*; *Sleeping Beauty*; *Mr. Sun and Mr. Moon*; *Odes from the Dream of the Night*; *Painted Shadows*; *Little Dreamers with the Spring*, etc.

**Legat, (sic), Hugh Swinton**, American statesman, was born in Charleston, S. C. 1797. He studied law, traveled in Europe, and was a member of the South Carolina legislature, 1820-22 and 1824-30. In 1830 he was elected attorney-general. He was *chargé d'affaires* at Brussels, 1832-36, and took his seat as a member of congress during the session of 1837. After the accession of President Tyler in 1841, Legat was appointed attorney-general, and in 1842 he was in the cabinet. In 1843 he succeeded Webster as secretary of state. He was distinguished as a scholar, and contributed largely to periodicals. Died, 1843.

**Leibnitz, Gottfried Wilhelm**, von perhaps the most extraordinary example of universal scholarship upon record, was born 1646 at Leipzig. In 1672 he submitted to Louis XIV. an essay entitled *Consilium Aegyptiacum*, containing a plan for the invasion of Egypt, which is by some supposed to have led to the Egyptian expedition of Bonaparte in 1798.

He was the chief organiser of the academy of Berlin, of which he was the first president and originated both the Prussian and the Vienna project for the establishment of similar bodies. It was to him, likewise, that Peter the Great owed the plan of the since celebrated academy of St. Petersburg. He was eminent in languages, history, divinity, philosophy, political studies, experimental science, mechanical science, and even belles-lettres. But it is through his philosophical reputation that he lives in history.

The principal metaphysical speculations of Leibnits are contained in his *Theodicee*, *Nouveaux Essais*, *Système nouveau de la Nature*, *De Ipsa Natura*, *Monadologie*, and in portions of his correspondence. He contended that the soul is an innate substance holding that there are necessary truths which cannot be learned from experience, but are innate in the soul, not, indeed, actually forming objects of knowledge, but capable of being brought to light by reflection. Authorities seem generally agreed that Leibnits discovered the differential calculus independently of any knowledge of Newton's method of fluxions, so that each of these great men of reality attained the same result for himself.

**Leighton** (lô'tun), **Frederick, Lord**, English painter, was born at Scarborough, England, 1830. His early years were spent in the study of art. He was a pupil of the masters in Rome, Florence, Frankfurt, Paris, and Brussels. His famous picture, "Cimbuë's Madonna carried in Procession through the Streets of Florence" was his first appearance in the Royal Academy in 1755, and was at once purchased by the queen. Among his other paintings are "Madonna and Child" and "John the Baptist." In 1878 he became president of the Royal Academy, was made a baronet in 1885, and raised to the peerage in 1896. In his life.

time he received almost every honor possible to an artist. Died, 1896.

**Levesque, Melphie**, French statesman, post-master-general, and minister of labor of Canada since 1906, was born at Montreal, 1866. He was educated at the seminary of Nicolet, and at Laval University, Montreal; barrister, 1891; Q. C., Quebec, 1898, and K. C., Ottawa, 1904. He was a member of parliament for Gaspé, 1896; re-elected, 1900 and 1904; represented Canada before the privy council in England, 1904; solicitor-general of Canada, 1904-06; fellow of the royal society of Canada, 1908. He is the author of several works on law, and a number of addresses.

**Knabach** (see *Box*). **FRANZ** von, noted German portrait painter, was born at Schrebenhausen, Bavaria, 1836. He studied at the Munich Academy under Gräfe and Piloty, and in 1858 went to Rome. In 1860 he became professor of art at Weimar, but resigned in 1862 and went to Italy. In 1863 he returned to Munich but devoted himself exclusively to portraiture, but after 1872 spent much time in travel and work in Vienna, Morocco, and Egypt. His portraits of Bismarck are specially famous. Died, 1904.

**Leo I., the Great**, pope of Rome 440-461, was born about 390. He succeeded Sixtus III. in 440; zealously opposed the Manichaeans and Pelagians, and secured the condemnation of the Eutychian heresy at the general council of Chalcedon; extended the Roman see, and induced Attila to spare Rome. He published several volumes of letters and sermons. Died at Rome, 461.

**Leo X, Pope** (Cardinal Giovanni de' Medici), son of Lorenzo the Magnificent, was born in Florence, Italy, 1475. He was banished with his family in 1497; traveled in Germany and Flanders, and formed a friendship with Erasmus. On his return to Italy he became legate to Julius II.; was taken prisoner in 1511, and released, and then became pope in 1513. In 1515 he signed the famous concordat with Francis I. His pontificate is one of the most brilliant periods in the history of art and literature, and is also memorable as the time when the reformation began. Died, 1521.

XIII. Pope (Giosuèpe Pecci), son of Count Ludovico Pecci, was born in Carpineto, in the Kingdom of Naples, on 18 June 1812. He studied in the Collegio Romano and the Academy of Noble Ecclesiastics; appointed by Gregory XVI, in 1847, Bishop of Perugia and later sent to Belgium as Legate in 1848. He was elected Pope in 1846. In 1853 created a cardinal by Pius IX. Upon the death of Pius IX in 1878 he was elected Pope and reigned until 1891. In 1870 he restored the hierarchy in Scotland and composed the difficult with Germany. He was a prisoner at the Vatican, and persecuted the Protestants. He was a defender of the Jesuits. He protested against heresy and "godless" schools, and in his encyclicals affirmed that the influence of the papacy. In 1894 he constrained the French clergy and the Italian bishops to return to Rome and he opened the archives of the Vatican for historical investigations, and made the first encyclical on the tongue. The jubilee of his episcopate in 1893 was marked by pilgrimages, addresses, and gifts. He issued an encyclical pronouncing Anglican orders invalid. He died on 20 July 1903. One of his last acts of his death was one of the foremost figures of modern times, and a potent force in religion.

Leonardo da Vinci (lě'ōndr'dō, dā vĕn'chō). See Vinci.

**Leonidas I.** (*480-476 B.C.*), king of Sparta, succeeded Cleomenes I. in 491 B.C. When the Persian monarch, Xerxes, approached with an immense army, Leonidas opposed him at the narrow pass of Thermopylae, 480 B.C., with a force of 300 Spartans and more than 5,000 auxiliaries. The treachery of one Ephialtes having made it impossible to bar any longer the progress of the foe, Leonidas and his little band threw themselves on the swarming myriads, and found

**Lepsius** (lep'is-oo), Karl Richard, noted German Egyptologist, was born at Naumburg, 1810. He came to Rome for study in 1836, and remained there until 1842, when he returned to Naumburg to treat his father's affairs. In 1842-45 he was at the head of an antiquarian expedition sent to Egypt by the king of Prussia, and in 1846 was appointed professor in Berlin. His *Chronologie der Aegypter* laid the foundation for a scientific treatment of early Egyptian history. His other works consist of letters from Egypt, Ethiopia, and Sinal, 1852; the *Antiquities of the Egyptians*, 1855; or the *Egyptian Book of the Dead*, 1858.

**Lesage (d' died), Alain René**, French novelist and dramatist, was born in Sarzeau, in Brittany, 1668, and studied at the Jesuits' College at Veneux. After having held a situation under the farmers-general in his native province, he went to Paris in 1692, tried the bar for a short time, and then adopted the profession of an author. For some years he continued to be little known as a writer;

but in 1707 he rose at once into popularity by his comedy of *Croquis, the Rival of his Master*, and his romance of *Le Diable*. The comedy of *Turcaret*, in 1709, added to his fame, which subsequently was rendered imperishable by his remarkable *Gil Blas*, which, upon the twenty-fourth dramatic pieces, had and a share in the composition of seventy-six others. He died in Paris, 1741.

**Leassap (Usarp), Ferdinand, Viscount de**, French engineer and diplomat, was born at Versailles, 1805. He held the post of chief of staff in 1854 proposed to the viceroy of Egypt the cutting of the Suez canal, and completed the same in 1869. He was engaged in the construction of the canal across the isthmus of Panama, since taken over by the United States. The sentence of imprisonment pronounced upon him by the French government in 1893, as one of the officers of the French Panama canal company, was never enforced. Died 1894.

**Lessing, Gotthold Ephraim**, German critic, dramatist, and scholar, was born 1729 at Kaments, in upper Lusatia. He entered the University of Leipzig in 1746 to study theology, but his love of the drama and his intimacy with Schlegel, Mylius, Weisae, and other young men of literary tastes, led him to abandon this intention.

After a short stay in Wittenberg he went, in 1748, with Mylius to Berlin, where he wrote for magazines and booksellers. He also undertook, with Mylius, in 1750, a publication entitled *Beiträge zur Historie und Aufklärung der Theatralischen Kunst*. He was the History and Improvement of the Theater," published some poems under the title of "Kleinigkeiten" ("Trifles") translated a work of the Spanish philosopher, Suarez, and wrote some articles in *Voss's Gazette*. He entered at this time into friendly relations with Moses Mendelssohn and the bookseller Nicolai, in conjunction with whom he established the critical journal, *Brandenburgische Literaturzeitung* ("Letters on the Newest Literature").

In 1755 appeared *Miss Sara Sampson*, a tragedy dealing with English life. In 1757 Lessing became secretary to General Tauentzien in Breslau for five years, when he returned to Berlin and published the *Laokoon oder über die Grenzen der Malerei und Poesie*, or *On the Limits of Painting and Poetry*, and his comedy *Minna von Barnhelm*. About 1767 he became director of the National Theater at Hamburg. While here he wrote *Emancipation*, his first drama, which had enemies, and having been compelled to quit Hamburg, the Duke of Brunswick appointed him his librarian at Wolfenbüttel.

In 1775 he visited at Vienna, and accompanied Prince Leopold of Brunswick to Italy. He married in 1776, but his wife died in little more than a year. At this period he was involved in fierce theological disputes, with his philosophical drama *Nathan der Weise* did nothing to ally. Besides those mentioned, he wrote another drama, *Emilia Galotti*. He died at Brunswick in 1781.

**Leutze (Lutts), Emanuel**, German-American painter, was born at Gernsdorf in Württemberg, 1815. He was brought up in America, and in Europe, 1841-59, then settled in New York. Among his works are: *Washington crossing the Delaware*; *Washington at Annapolis*; *Landing of the Norwegians*; *Cromwell and his Daughter*, etc. Died at Washington, D. C., 1868.

**Lewis (L'Évê), Charles James**, Irish novelist, was born at Dublin, 1806. He was graduated at Trinity College in that city, 1827; studied medicine at Göttingen, and then at Leiden. He was his most popular work, *Charles O'Malley*, is a reflex of his own college life at Dublin, and many of the incidents in this novel are not far from his own experience in the world. He died at Trieste, Italy, 1872.

**Lewis (L'Évê), Henry**, English philosopher and critic, was born in London, 1817. He was educated partly at Greenwich under Dr. Burney, and partly in a school in the Strand. He was early to enter first a notary's office, and then the house of a Russian merchant. In 1838 he proceeded to Germany, and remained there for about two years, studying the life, language, and literature of the country. He was married unhappily and had children when he was twenty-four. Eliot began in 1854; it ended only with his death at their house in Regent's Park, 1878. Lewis was one of the best of the English novelists, and a popularizer of philosophy he was inferior to none, as a popularizer of science he was inferior

to few. His works, besides a tragedy and two novels, include: *Biographical History of Philosophy*; *History of the Philosophy of Science*; *Life of Aristotle*; *On Actors and the Art of Acting*; *Problems of Mind*, etc.

**Lewis, Albert**, American professor, was born at Westbury, N. Y., 1866. Graduated from Alfred University, 1887; Ph. D., Syracuse University, 1890. He was professor of Philosophy at the University of Chicago, 1888-90; professor of Latin, Alfred University, 1890-92; assistant in rhetoric, 1893-94; 1895-96, professor of Latin, University of Chicago; associate professor of English, 1896-99, University of Chicago and Lewis Institute; professor of English and Latin, 1899-1906, Lewis Institute, Chicago. Author: *The History of the English Language*; *A First Book in English*; *A First Book in Latin*; *A First Book in Greek*; *An Introduction to the Study of Literature*; *A Second Manual of Composition*; *Specimens of the Forms of Diversified Applied English Grammar*, etc.

**Lewis, Meriwether**, American explorer, was born near Charlottesville, Va., 1774. In 1803-06 he was engaged with Captain William Clarke in an expedition to the Pacific Ocean, the results of which were important to geographical science; and in 1807 he was made governor of Territory of Louisiana. He was subject to periods of mental depression, in one of which he is said to have taken his life near Nashville. His memoir by Jefferson was published, together with Biddle and Allen's *Narrative of the Lewis and Clark Expedition*, in 1814.

**Lewis, William Draper**, American educator and law writer, dean of the law department, University of Maryland, since 1895. He was born at Philadelphia, Pa., 1867. He was graduated at Harvard, 1888; at the University of Pennsylvania, 1891. Ph. D., 1891. Author: *Foreign Trade, Over Commerce and Its Effect on State Action*; *Our Foreign Trade*; *History of the Development of International Law*. Editor: *Law of Evidence*, 3 vols.; *Wharton's Criminal Law*; *Lewis' Biographical Dictionary*, 2 vols.; *Decisions of the Supreme Court of Appeals*, etc.

**L'Épital (L'Épital), Michel de**, French statesman, was born about 1507. He was president of the court of accounts, 1554-60, and afterward minister of France until 1568. He was the edict of Romorantin, which excluded the Huguenots from France; the ordinance of Orleans, which put an end to the religious wars; and the edict of pacification, for the free exercise of Protestant worship; and the ordinance of Moulins, which reformed the administration of justice. He died in 1573.

**Liddon (Lid's), Henry Parry**, English clergyman, was born at North Walsham, Norfolk, 1827. He was graduated at Christ Church, Oxford, 1850; was ordained in 1852 as senior student of New College, Oxford, 1854; and became principal of Cuddesdon theological college, and in 1864 became a prebendary of Salisbury, in the diocese of St. Paul's, and a lecturer of exegesis at Oxford, until 1882. In 1886 he declined the bishopric of Edinburgh, and in 1887 visited the holy land. Canon Liddon was the most able and eloquent exponent of liberal high church principles. He died suddenly at Weston-super-Mare, 1900.

**Lieber (L'Évê), Franz**, German-American publicist, was born in Berlin, 1800. After suffering imprisonment for his political opinions, he came to America in 1827, and was made professor of history in South Carolina College, 1833-36, of political economy in Columbia College, 1837-40, and of political science in Columbia law school, 1860-72. He edited the *Encyclopedia Americana*, 1843-44; *Encyclopedia Britannica*, 1845-46; *Government*; *Guerilla Warfare*, etc. Died 1872.

**Lebig (L'Évê), Eugen von**, German chemist, was born at Darsdorf, near Leipzig, at Bonn and Erlangen; then went to Paris, and attracted the attention of Humboldt by a paper on the action of St. Paul's, and a lecturer of exegesis at Oxford, until 1882. In 1886 he declined the bishopric of Edinburgh, and in 1887 visited the holy land. Canon Liddon was the most able and eloquent exponent of liberal high church principles. He died suddenly at Weston-super-Mare, 1900.

**Li Hung Chang (L'Évê, 'ch'ang)**, Chinese statesman, was born in 1823, and studied at Hankin in 1843. He was appointed to the post of minister to the imperial army as secretary. In 1864 he was appointed governor-general of the Kiang provinces, and in 1872 he was appointed grand secretary. He founded the Chinese navy and promoted a native mercantile marine. On the outbreak of the war with the English in 1894 he was appointed commander in chief of the navy in supreme command of the military and naval forces in Korea, was thwarted by the incompetence of the army and navy, and in 1895 the Chinese forces were swept out of Korea, and the whole policy was that of peace, was deprived of his position, and succeeded in securing the return of his last command be refused to comply, and the disastrous course of events soon compelled the emperor to restore him to restore him to his post. His efforts for the war was brought to a termination in 1895, China ceding Formosa and paying a war

indemnity of \$175,000,000. Professedly friendly to foreigners, and well aware of the value of western science, he was engaged in the various works of Germany, France, England, and America in 1860. He died in 1901.

**Lincoln, Abraham**, American statesman, and the sixteenth president of the United States of America, was born in Kentucky 1809. He removed with his family in 1816 to Spencer county, Indiana, and for the next ten years was engaged in law visits with various kinds, having only about a year's schooling at intervals.

At the outbreak of the Black Hawk war in 1832 he joined a volunteer company, and as captain he served three months in the campaign. He next opened a country store, was appointed postmaster of New Salem, Illinois, began to study law, and at the same time turned amateur lawyer. In 1834 he was elected a member of the Illinois legislature, to which he was again returned at the three following biennial elections, and in 1836 he was licensed to practice law.

In 1846 he was elected a representative in congress from Illinois, and voted steadily in congress with the anti-slavery party. In 1849 and again in 1850 he was unsuccessful in attempts to enter the United States senate. In the Republican national convention held at Chicago in May, 1860, he was nominated as a candidate for the presidency, and after several weeks of canvassing he was eventually chosen unanimously. The southern states alarmed at the aggressive anti-slavery policy which many of the leading Republicans advocated, their determination to follow, refused to acquiesce in Lincoln's election, and began one after another to announce their secession, and to organize the means of resisting the enforcement of the claims of the central government.

The election of Lincoln took place in November, 1860, and he assumed office on the 4th of March, 1861. It was the intention of Lincoln to use the force of the constitution consistent with the policy he deemed it essential to the national interest to pursue. On one point, however, his resolution was steadfast, to admit no secession, and before his secession office secession was as resolutely determined on the other side. On the 4th of February the southern confederacy had been constituted, and on the 12th of March the Confederate States of America was struck by the capture of Fort Sumter by the Confederates.

The events of the civil war during the next four years in Lincoln's career belong to the history of the United States. Lincoln's persistence in raising and pouring in fresh troops after every disaster finally enabled the Federal government to subdue the secession. The toleration of slavery was always in Lincoln's opinion an unhappy necessity; and when the southern states had by their rebellion forfeited all claim to the protection of their peculiar institutions, it was an easy transition from this view to its withdrawal. The successive stages by which this was effected—the emancipation of the slaves of rebels, and the offer of compensation for voluntary emancipation, followed by the constitutional amendment and unconditional emancipation without compensation—were only the natural steps by which a change involving consequences of such vast extent was reached.

The determination of the northern states to pursue the war to its conclusion on the original basis of the Union, was the decisive event in 1864. The decisive victory of Grant over Lee on April 24, 1865, speedily followed by the surrender of the latter, had just afforded the prospect of an immediate termination of the long struggle, when on the 14th of the same month, President Lincoln was shot in Ford's Theater, Washington, by the assassin John Wilkes Booth, and expired on the morning of the 15th. The actions of America Lincoln holds a place second only to Washington.

**References.**—Nichols and Hay, *Abraham Lincoln*; and many other authors, see *Complete Works of Abraham Lincoln*. See also *Lives* by Morse, Arnold, Hurdson and Weik, Lincoln's *Life* by Todd, *History of the United States from the Compromise of 1850*, Lincoln, Robert Todd, American lawyer, was born

at Springfield, Ill., 1843, eldest son of Abraham Lincoln. He was graduated at Harvard, 1864; entered Harvard Law School, but left to enter the army, serving until 1865, when he was promoted to General Grant. He then finished his law studies, was admitted to the Illinois bar, 1867, and practiced at Chicago until 1870, when he was elected, 1880; secretary of war, 1881-83, and United States minister to Great Britain, 1889-93. He is also vice-president of the Commonwealth Edison company; Central Union telephone company, Commercial National bank, Pullman loan and savings bank, etc.

**Lind, Jenny** (Madame Otto Goldschmidt), the Swedish singer, was born in Stockholm, Sweden, 1820. At three years of age she could sing correctly any piece she had once heard, and at nine was placed under Crolius, a famous teacher of music. She was married in 1850 to Otto Goldschmidt, the pianist, and was enthusiastically received, but disclosed the engagement prematurely in 1851, was married to M. Otto Goldschmidt, a skillful pianist and conductor, and retired from the stage. She reappeared in 1855, in 1861, in 1863, and in 1860 for a limited period. She was professor of singing at the Royal College of Music, Wiesbaden, 1883-86. She died in Wynd's Point, Malvern, England, in 1887.

**Lindsey, Benjamin Barr**, jurist, reformer, was born in Jackson, Tenn., 1869. He was educated in the public schools studied law and was admitted to the bar. Judge of the circuit and juvenile court of Dever, Colo., since 1900. He is the originator of the juvenile court system and has an international reputation as an authority on juvenile delinquency. In 1906 he was a candidate for governor of Colorado. Author: *The Beast and the Jungle*.

**Linerich (lin-erich) Nikolay Petrovich**, Russian general, was born in the government of Tvergouff in 1828. He served in the Russo-Turkish war and in 1900 succeeded to the command of the Siberian troops in Manchuria. In 1904 he commanded the Russian troops in the battle of Mukden in the Russo-Japanese war and succeeded General Kuropatkin in 1905 as commander-in-chief in the Far East. Died in 1907.

**Lingard, John**, noted English historian was born in Winchester 1771. He studied for the Roman Catholic priesthood, but after the death of his father, four years old. His greatest work is the *History of England* in 10 vols. After his *History of England* was published in 1809, he published a manual that which he refused. He died at Hornby near Lancaster 1851.

**Linné (lin-né) Karl Von**, commonly called Linnaeus, the greatest botanist of his age, was born at Rasmult, Sweden, 1707, and died at Upsala in 1778. He was the son of a clergyman, who was a learned and a good grammar-school and the gymnasium of Wexjö. He showed an early interest in botany; entered the University of Lund, where his botanical ideas were encouraged; and removed to Upsala in 1729, where he undertook the supervision of the botanic garden. Here he made the acquaintance of the botanist Rudbeck, whose assistant he became.

Aided by the academy of sciences at Upsala, Linné made a journey through Lapland, the result of which was shown in his *Flora Lapponica*, published 1735. In this year he went to the University of Harderwijk in Holland and took an M. D. degree; afterward visited Leyden, where he published the first sketch of his *Systema Naturæ* and *Fundamenta Botanica*. He then visited England, went to Paris in 1738, and afterward settled in Stockholm as a physician.

He became professor of medicine at Upsala in 1741, and then of botany. His life history was made a knight of the Polar Star with the rank of nobility; and died on his estate near Upsala from apoplexy.

The great merit of Linné as a botanist was that he arranged the plants on a simple system of sexual relationship and prepared the way for the more natural and satisfactory classification which has superseded the Linnaean system. He must it be forgotten that he was eminent not only in botany, but in all the sciences of his time. His chief works besides those already mentioned were: *Genera Plantarum*, Cited plantarum in Suecia, *Flora Suecica*, *Philosophia Botanica*, and the *Species Plantarum*.

**References.**—Nash's *History of Botany*; *Curtis's History of Zoology*; *Smith's History of Sir Charles Linnaeus*; Caddy's *Through the Fields with Linnaeus*.

**Lipton, Sir Thomas Johnstone**, British sportsman and merchant was born in Glasgow, of Irish parentage, 1850. He started life as a retail merchant, acquired a small fortune in coffee and cocoa estates in Ceylon, and accumulated a large

fortune. He is chairman of Lipton, Ltd., and is also largely interested in business enterprises in the United States and Canada. He owned the *Illustrated London News*, and was staff editor and challenged for the American cup 1889, 1901 and 1904. He was knighted in 1898, and created a baronet in 1907.

**Lister, Joseph, Lord**, English surgeon, was born in Upton, England, 1827. He was graduated at Edinburgh, Scotland, 1847, and then studied in Paris. He was successively lecturer on surgery, Edinburgh; regius professor of surgery, Glasgow; professor of surgery, 1862; and surgeon-in-chief of clinical surgery, King's College hospital, London, and surgeon-extraordinary to Queen Victoria. His contributions to the study of the coagulation of the blood, inflammation etc., his great work has been the introduction, since 1865, of the antiseptic system, which has revolutionized modern surgery. He has received many foreign honors, and was made a baronet in 1883 and a peer in 1897.

**List (list) Franz**, noted Hungarian pianist and composer, was born at Raiding, 1811. In 1849 he became conductor of the court theater at Weimar; in 1861 was made commander of the legion of honor, and in 1865 took orders and received the tonsure. In 1871 his native country granted him a pension of 600 pounds a year, and in 1875 he was named director of the Hungarian Academy of Music. He was married to the actress married Richard Wagner, his lifelong friend. Though List's fame as a pianist overshadows his work as a composer, yet his *Madama Butterfly* and the symphonies and his *Hungarian Rhapsodies* for the piano are unrivaled. He died at Raiding, 1886.

**Littman, Simon**, educator, economist, was born in Odessa, Russia, 1873. He was educated at Odessa Commercial College, University of St. Petersburg, Paris, at the University of Zurich, and University of Munich; lecturer at the Russian School of Commerce in Paris, 1902; instructor in Mathematics University of California, 1903-1908; associate in commerce, 1909-1910, and assistant professor in commerce, 1910-1911, at the University of Illinois. Member of the American Economic Association, American Statistical Association, American Association for Economic Research, National Geographic Society, Author of *Trade and Commerce*; *Die Statistik*, *Commercia*, and of many articles on commerce, commerce and trade statistics.

**Littledale, Charles Edgar**, American lawyer, ex-congressman, was born in Lebanon, York county, Me., 1851. He received a liberal education, was admitted to the bar, 1876, and rapidly acquired a high reputation for legal and literary attainments. Attorney-general of Maine, 1880-93; elected to 60th congress, 1889, to fill vacancy caused by the death of Nelson W. Dodge, and re-elected to 61st and 62nd congresses from second Maine district. In 1908 he retired from congress and took up the law in New York City.

**Littlen, Martin W.**, American lawyer, was born in Boone county, Tenn., 1872. He was practically self-educated and began practicing law in 1891. He was assistant prosecuting attorney, Dallas, Texas; delegate from New York to national democratic convention, 1904; and has appeared in many famous legal trials. He was elected to Congress 1910.

**Littlen, Sir Thomas**, English jurist, was born in Wrexham, Cheshire, England, 1402. He was recorder of Coventry in 1450, king's serjeant in 1455, in 1460 judge of common pleas, and in 1473 a knight of the bath. His reputation rests on his treatise on *Treason*, written in law French, and turned into English about 1600. He was called "the Coke commented on in his *Coke upon Littlen*. Died, 1581.

**Littlen, Maximilien Paul Emile**, French philosopher and philologist, was born in Paris, 1801. He studied at the Lycée Louis-le-Grand, then at the University of Bonn, where he turned to philology. He fought on the barricades in 1830, and was one of the principal editors of the *Nation* down to 1831, and became an enthusiastic follower of Comte. His *La Poésie Homérique* of 1836, and *La Poésie Française* of 1840, are the first book of the *Hand in the art of the Trouvère*. His splendid *Dictionnaire de Littérature* was projected in 1840, and he died in 1863 from rejecting its author, whom Bishop Dupanloup denounced as holding impious doctrines, and the academy refused to publish him. He was one of the first linguists and aesthetes of this century. Died, 1881.

**Livingston, Edward**, American jurist and statesman, was born at Livingston, N. Y., 1724. He was elected a member of congress in 1794, and became federal attorney and mayor of New York in 1795. He was elected to congress in 1803, he became aide-de-camp and secretary to General Jackson. In 1824 he was appointed to draw up the treaty of peace between the United States for Louisiana, 1820-31; secretary of state, 1831-33; minister to France, 1833-35, and supported the annexation of Texas in 1845, and the government for indemnity on account of French

spoliations, and succeeded in securing its payment.

Died at his own estate on the Hudson, 1836. **Livingstone, David**, African explorer and missionary, was born at Blairgowrie, Scotland, 1813. Was sent to southern Africa by the London missionary society in 1840; resented for several years, and died at the Cape, 1853, discovering Lake Ngami in 1849, and penetrating to the Malakole country in 1851; in 1853-54 and 1855, he discovered Lakes Shiraz and Nyama, and in 1865 published a narrative of his journey. He undertook his third expedition in 1866, and spent the remainder of his life endeavoring to ascertain whether the Nile flowed from the water-system west of Lake Tanganyika. In 1871 he was found by Stanley at Ujiji. He died in central Africa, 1873.

**Livy, or Titus Livius**, Roman historian, was born at Patavium (Padua), in the north of Italy, 59 B. C. He was the most eminent of the Roman historians. His history of Rome was written partly at Rome and partly at Naples, under the patronage of the emperor Augustus. It consisted of 142 books, but only some of the early thirty-five have come down to us. It is one of the very imperfect state. Of all but two, however, only the archaic and the last few books have come from another hand. The history, or at least, was called by its author, *The Annals of the Roman People*, and it is a work of great value, and ends with the death of Drusus, the youngest brother of the emperor Tiberius, 9 B. C. Died, 17 B. C.

**Loeare (lo-ear-ah)**, Juan Antonio, Spanish historian, was born at Xicoen del Noto near Calaspar, 1756. He was educated at the University of Toledo. King Joseph gave him sundry posts, and in 1807, when the invasion was suppressed, became his archivist. He died in 1823, having written his history. He died at Madrid, 1823.

**Locke, George Herbert**, Canadian educator, professor of education, and dean of training school for teachers, Macdonald College, McGill University, Montreal, Canada, since 1907, was born at Etobicoke, Canada, 1869. He was educated at Victoria College, University of Toronto, and University of Chicago; instructor in history and political science, 1890-91; at Queen's College, Cambridge, Mass., 1897-99; associate professor of education, University of Chicago, 1900-01; and of education, University of Chicago, 1901-02. He is the author of *The Quarterly Journal of Pedagogy*, 1907. He is the author of many contributions to educational periodicals.

**Locke, John**, eminent English philosopher, was born at Wrington, in Somersetshire, 1632, and died at Oates, Essex, 1704. He was sent to Christ church, Oxford, where he took the degrees of B. A. and M. A., and applied himself to the study of medicine. In 1666 Locke made the acquaintance of Lord Ashley, afterward earl of Shaftesbury, and held various offices in the patronage of that nobleman. When in 1682 his patron was obliged to retire, for political reasons, to Holland, Locke accompanied him to his exile. Owing to the troubled condition of his country, and the continued triumph of the party which he had opposed, Locke continued in exile until 1689.

He returned to England at the revolution, and was appointed commissioner of appeals under the new government. As early as 1670 he had formed the plan of his famous *Essay on Human Understanding*, in which he had carefully elaborated in his exile, and which he published in its completed form in 1690. It was received with much opposition, notably by the University of Oxford, which resolved to discourage it; but despite this it acquired a great reputation throughout Europe, and was translated into French and German. Locke was made a commissioner of trade and plantations in 1695, but retired when unable to perform its duties, and lived with his friend Sir F. Masham until his death.

His *Essay* must be stated that the chief purpose of Locke's celebrated *Essay* was to find the original sources and the scope of human knowledge. The conclusions he arrived at were that the human mind is a "white paper," that the human mind is a sheet of white paper prepared to be written upon; that the knowledge thereon written is supplied by experience; and that the mind is a reflection of the sources of all our ideas.

Among other works of Locke are his *Letters on Education*; *Thoughts concerning Education*;

expression of the ruling principles of his life, and a description of his policy. On the death of Philip IV, the king of Spain, Louis claimed to Holland, which he invaded; but this led to the alliance against him of England, Sweden, and Holland, usually called the League of Augsburg, and Louis was speedily compelled to make peace. Several others were followed, notably the war of the Spanish succession, in which Louis sought to secure the Spanish monarchy for his grandson, the duke of Anjou. Two years afterward, 1715, Louis died at Versailles, after a reign of 43 years. He left several children. Many of the most famous names in French literature belong to this reign.

**Louis XV.**, surnamed "the well-beloved," king of France, 1715-74, was born at Fontainebleau, 1710. He was the son of the duke of Burgundy and the successor of his great-grandfather, Louis XIV. On the death of Augustus, king of Poland, 1733, Louis supported the pretensions of his father-in-law to the vacant throne, and was opposed by the emperor of Germany, who upheld the claims of the elector of Saxony. Afterward, in 1755, a new war was kindled between England and France, about their possessions in Canada; and this war was not terminated until 1763, when, by the treaty signed in Paris in that year, France formally ceded to England Canada, Nova Scotia, and its other North American possessions, Florida, Granada, Dominica, and Tobago, in the West Indies. During the latter part of his reign, Louis was to be governed wholly by favorites, among them were the Marchioness de Pompadour and Madame de Barry.

**Louis XVI.**, king of France, 1774-93, was born at Versailles, 1754. He was the grandson of Louis XV., whom he succeeded on the throne in 1774. In 1770, married Marie Antoinette of Austria, daughter of Maria Theresa, and sister of the emperor Joseph II. The first years of Louis's accession, endeared him to his people, for he gave them immunities to which they had been hitherto unaccustomed, and he was popular in the administration; but he soon became embarrassed by financial difficulties, and was not fortunate in his choice of ministers. A mob of armed women from Paris made an attack on the palace of Versailles, after which the king and queen were forcibly taken to Paris. In 1789 the states-general of the kingdom was convoked at Versailles. Within a few days it was transformed by the representatives of the people, and assumed the whole legislative authority; and then began the revolution, which culminated, as far as the king was concerned, in his execution in 1793, and in his execution on the scaffold in 1793.

**Louis XVIII.**, king of France, a younger brother of Louis XVI., was born at Versailles, 1755. He fled from Paris on the same night as the king. Louis XVI. reached the frontier, and Louis XVIII. assumed the dashing king, under the title of Louis XVII., and in 1795 he was crowned king himself. The fall of Napoleon opened the way for him to the French throne and in 1814 he landed at Calais after twenty-four years of exile. He ruled by "the divine right of kings." The revolution had taught him nothing, and the followers of Napoleon, opened the way for Napoleon's return from Elba, when he fled into exile until after the battle of Waterloo. He was restored to the throne by the allied powers in 1815, and ruled until his death at Paris, 1824.

**Louis Philippe (10<sup>th</sup> of his name)**, king of France, was born at Paris, 1773, eldest son of Louis Philippe Joseph, duke of Orléans. He sought, during the revolution, in Switzerland a place of security for his sister Adelaide, wandered about for four months, and accepted a place of refuge in geography and mathematics in a school at Reichenau, near Chur, assuming the name of Chabaud-Latour. On the fall of Napoleon he fled to Paris, where he was received with distrust by Louis XVIII. After the second restoration, when he came to the throne, he was treated with great esteem. He was very popular in Paris. He kept aloof, however, from political intrigues; and the bloody days of the revolution passed, and he nearly over before he was brought forward, the banker Lafitte proposing, in the provisional committee, his appointment as king, and the approval of the kingdom, from which he proceeded to the acceptance of a constitutional throne, August 2, 1830. Insurrectionary movements were made, a demand for a more liberal suffrage, ensued in the streets of Paris in February, 1848; and the "citizen king" fled with a few adherents, and the guard could not be expected to support him. On February 24th Louis Philippe, deserted by his courtiers, fled to the coast, and was taken by a queen, concealed himself for some days, and at length found opportunity of escaping in a British steamboat, to Netherlands, where he died at Mr. Smith. He died at Claremont, 1850.

**Lothar**, duke of Prussia, was born in 1776, at Stolp, where his father, Duke of Mecklenburg-Strelitz, was commandant. He was married to the crown prince of Prussia, afterward Frederick William IV., and was the mother of Frederick William IV. and William III. after emperor. Died, 1810.

**Lounsbury (Lounsbury's), Thomas Baynesford**, American educator and scholar, professor of the history of 1871, and of the study of scientific school. Yale, was born at Old Saybrook, Conn., was graduated at Yale, 1859; LL.D., Yale, 1867; Harvard, 1868; LL.D., L.H.D., Lafayette, 1895, Princeton, 1896. He was engaged on the *American Cyclopædia*, 1860-61; was first lieutenant 120th Mass. Infantry, 1862-63; instructor at Yale, 1870-71. He edited *Chaucer's Parliament of Fowls*, and is the author of *Chaucer's Works*, *The Middle Ages in Chaucer*; *Shakespeare as a Dramatic Artist* and many other scholarly works.

**Low, Robert**, inventor of the Union Pacific railroad, was born in San Jacinto, Texas, 1860. He was educated in the public schools; Graduated at Louisiana State University, 1880; attorney for Houston East and West Texas railroad, 1884-89; assistant general attorney, 1889-91; general attorney, 1891-92, Texas and Pacific railroad; general counsel for Harman railroads, 1904-09; succeeded Edward H. Harman as president and chairman of board of directors, Union Pacific railroad, 1909.

**Low, A. Maurice**, journalist, author, was born in London, England, 1860. He was educated at King's College, London, and in Austria. Since 1886 he has been Washington correspondent of the *London Standard*, and is the author of *The London Morning Post*; *The Supreme Surrender*; *American Life in Town and Country*.

**Low, Seth**, American educator and publicist, mayor of New York, 1902-03, was born in Brooklyn, 1840. He was graduated at the University of 1870; LL.D., University of New York, 1900; Amherst, 1889; University of Pennsylvania, Harvard, 1891; Trinity, 1890. Mayor 1899-1900. In 1881-83, elected on independent ticket; unsuccessful candidate for mayor of Greater New York, 1897, and president of Columbia university, 1900-1901. In 1895 he erected for that institution a university library at a cost of \$1,175,000. In 1899 he was appointed by President McKinley a member of the delegation to represent the United States at the international peace conference at The Hague. He is a trustee of the Carnegie Institution, Washington.

**Lowell, Abbott Lawrence**, American educator and statesman, son of Harvard, was born at Boston, 1809, was born in Boston, Mass., 1856. He was graduated at Harvard 1877; Harvard Law School, 1880; graduated at New York University, 1881. He was lecturer at Harvard, 1879-99; professor of the sciences of government, Harvard, 1900; and president of Columbia university, 1900-1901. In 1895 he erected for that institution a university library at a cost of \$1,175,000. In 1899 he was appointed by President McKinley a member of the delegation to represent the United States at the international peace conference at The Hague. He is a trustee of the Carnegie Institution, Washington.

**Lowell, James Russell**, American poet and diplomat, was born in Boston, Mass., 1819. He was graduated at Harvard University, spent several years abroad studying languages, and, in 1855, succeeded Longfellow as professor at Harvard. LL.D., Harvard, and Cambridge, England; D.C.L., Oxford. Was United States minister to Spain, 1877-80, and ambassador to Great Britain, 1880-85. In 1860 he published *Under the Willows, and Other Poems*, and *The Cathedral*, an epic; in 1870; a collection of essays; in 1871, *My Study Window*; in 1887, *Democracy*; in 1888, *Political Economy*; *Historical and Rur*, etc. Among his poems the best known are *The Vision of Sir Launfal*, *The First Snowfall*, and *The Commencement*. He died in Cambridge, 1891.

**Lowell, Fernald**, author, astronomer, was born in New York, 1851. He was graduated at Harvard, 1876; LL.D., Amherst, 1907. He went to Japan in 1883, and lived there from time to time until 1894, when he returned to the United States, and undertook an eclipse expedition to Tripoli, 1900. He received the Janssen medal of the French Academy of Sciences, 1900. His searches on Mars, and his made discoveries on the planets, especially Mars; appointed non-resident astronomer at the Lick Observatory, Institute of Technology, Author: *Annals of the Lowell Observatory*; *The Solar System*; *Mars and Its Atmosphere*.

**Lowther (Lowthorpe), James William**, British statesman, speaker of the house of commons from 1860 to 1865, was born in 1790. He was elected to parliament for Rutland; contested Mid-Cambridgeshire, 1835; was under-secretary for the colonies, 1836; represented Rutland at international conference at Venice, 1852; chairman of committee on ways and means and deputy speaker, 1855.

**Loyola, Ignatius (Iñigo López)**, original name Inigo Lopez de Recalde, the founder of the order of the Jesuits, was descended from a noble Biscayan family, born at the castle of Loyola, in 1491, and died 1556. He was attached in his youth as a page to the court of Ferdinand and Isabella, and trained up in all the vices and frivolities peculiar to his position.

When still a young man he entered the army, and during the defence of Pamplona in 1521, against the French, he was severely wounded, and lay for some time in bed. This was the result. The only books he found to relieve its tedium were books of devotion and the lives of saints. This course of reading induced in him a religious devotion, in which he renounced the world, made a formal visit to the shrine of the Virgin at Montserrat, and vowed himself her knight.

At his own house he made pilgrimage to Rome and Jerusalem, and from 1524 to 1527 attended the schools and universities of Barcelona, Alcala, and Salamanca. In 1528 he went to Paris, where he went through seven years' course of liberal and theological training. Here in 1534 he formed the first nucleus of the society which afterwards became so famous. Francis Xavier, professor of philosophy, sciences, and letters joined with Loyola and bound themselves together to devote themselves to the care of the church and the conversions of infidels.

Rome ultimately became their headquarters, where Loyola submitted the plan of his new order to Paul III., who, under certain limitations, confirmed it in 1540. Loyola continued to reside in Rome and govern the order until 1558, when he died of his death. He was beatified in 1607 by Paul V., and canonized in 1622 by Gregory XV.

**References.**—Of the complete *Life*, the best is in the *Life of Loyola*, by the Rev. J. B. de la Motte, in French, the *Life by B. de la Motte*. See also *Duffin's Ignatius a Loyola*; *Catholic Encyclopedia*; *Loyola and the Jesuits*; *Ignatius a Loyola*; *Ignatius a Loyola*.

**Labbok (Labak), Sir John, Lord Abernethy**, English naturalist and politician, was born in London, 1831. He was educated at Eton college, then entered his father's banking house, and in 1858 became a member of parliament, where he served at intervals until elevated to the peerage in 1900, as Lord Abernethy. He is the author of *Prehistoric Times*; *The Origin of Civilization*; and *The Progress of the Human Mind*; *Fifty Years of Science*; *Placards of Life*, etc.

**Laerulus (Larulus), or Titus Laerulus**, Latin author, was born in Rome, 100 B.C., about 99 B.C. His principal work, *De Rebus Naturæ*, in six books, appeared 56 B.C., and in 100 B.C. It was a philosophical dictionary. Died about 55 B.C.

**Laetinius (Lælius), Lucius Laetinius**, celebrated Roman statesman, was born in 165 B.C. He twice defeated Tigranes of Armenia; but his legions became mutinous, and he was superseded by Pompey. He was a friend of Pompey's power, and was one of the first triumvirs, but soon withdrew from politics.

**Leini (Léni), or Luvino, Bernardino**, painter of the Lombard school, was born at Luino, about 1473. His skill was developed in the school of Leonardo da Vinci; indeed, many of his works were at one time attributed to that great artist. He is one of the five great painters whose "imprudence" Rukin affirmed died about 1533.

**Leumais (Lewm), Charles Fletcher**, American author, explorer, was born at 1828, New York. He was graduated at Harvard, 1851; Litt.D., Santa Clara College. Edited newspaper in Ohio, 1852-54. He was city editor *Los Angeles Daily Times*, 1855-57; lived five years in India; publisher of India, New Mexico, learning Indian languages and customs; traveled in the south of the United States; also in Mexico and South America; has explored entire coastland from Canada to the Gulf of Mexico; author of *The Awakening of a Nation*; *Mexico For Dummies*, etc.

**Lewis, William**, American jurist, was born at Newport, Ky., 1844. He was graduated at Cumberland University, Tennessee, 1867; at the University of Virginia, 1868. He was of the United States circuit court, 6th judicial circuit, 1863-1869, and became associate justice of the United States Supreme Court, 1900. He has been for a number of years professor of constitutional law and dean of the law department, Cumberland University.

**Luther, Martin**, great German religious reformer, was born at Eisleben, 1483, and died there 1546. At school he made rapid progress in Latin and other studies, and, in 1507, entered the University of Erfurt. Here in 1505, he received a master's degree.

About this time he discovered in the library of the university a Latin Bible, and found, to his amazement, that the translation was more than the excerpts in common use. He was destined by his father to the law, but his more intimate acquaintance with the Bible induced him to turn his attention to the study of divinity, with the view of enter-

the theory that the electric current is capable of passing through any substance, and, if started in any given direction, of following an undeviating course without need for a wire or other conductor. Soon afterward he succeeded in sending messages from Spain to a steamer fifteen kilometers distant; also in sending a message from Queen Victoria to the prince of Wales on royal yacht, 1897; came to the United States, 1899; used his method in reporting election, 1900; succeeded in establishing wireless telegraphic communication across the Atlantic ocean, 1901; daily cables were serviced by British wireless telegraph inaugurated by him on trans-Atlantic liners, 1904.

Verus, Aurelius Arminius, son of Annius Verus and Domitia Cavilla, was born at Rome, 121 A. D. His qualities attracted the notice of the emperor, and he was adopted by him in 161 A. D. Verus, but *Verissimus*, and who conferred his honors on him even while a child. When only twelve years of age he was adopted by the emperor Lucius C. Commodus, but Antoninus Pius, the successor of Hadrian; and Faustina, daughter of Pius, was selected for his wife. He was made emperor in 168 A. D. and reigned until the death of Pius, 161 A. D., he continued to discharge the duties of his various offices with the same moderation and wisdom as he had shown in the office of proconsul, and as a member of the senate and as an orator under Herodes Atticus and Cornelius Fronto, and his love of learning unreasonable. Even after he had attained to the highest dignity of the empire he continued to study the works of Sextus of Chironia. Many of letters were his most intimate friends, and he received the highest honors which could be conferred on a man. In 180 A. D. was felt to be a national calamity; he was deified, and for more than a hundred years his image was found among the household gods in the homes.

Margaret of Angoulême (d'orléans), queen of Navarre, and daughter of Charles of Orleans, was born in 1492. In 1527 she was married to Henri d'Albret, king of Navarre, to whom she bore a son, who died in infancy, and a daughter, Jeanne d'Albret, mother of the great French monarch, Henry IV. She encouraged agriculture, the arts, and learning, and to a certain extent embraced the cause of the reformation. She died at Odoon, 1549.

**Margaret of Anjou** (mā'shō), daughter of René of Anjou, was born in 1430. In 1445 she was married to Henry VI. of England. In the wars of the Roses, Margaret, after a brave struggle of nearly twenty years, was finally defeated at Tewkesbury in 1471, and was kept in the Tower four years, until ransomed by Louis XI. She then retired to France, and died at the castle of Dampierre near Saumur, 1482.

**Margaret of Austria**, daughter of the emperor Maximilian and Mary of Burgundy, was born at Ghent, Belgium, 1480. She married first John of Castile, and second Philibert of Savoy; was made governor of the Netherlands in 1507, and negotiated both the league of Cambria, in 1508, and the "pair des dames," in 1529. She died at Mechlin, Belgium, 1530.

**Margaret of Denmark**, daughter of Waldemar IV. of Denmark, was born in 1353. She succeeded

her father, became queen also of Norway on the death of her husband, Hakon VIII., but was soon expelled. She recovered Norway in 1387 and, having defeated Albert of Mecklenburg in 1389, united the three Scandinavian kingdoms by the union of Kalmar in 1397. Died 1412.

**Maria Christina**, ex-queen-dowager of Spain, was born at Naples, 1806, daughter of Francis I., king of the Two Sicilies. In 1829 she became the fourth wife of Ferdinand VII. of Spain. In 1834 a revolution expelled her from the country, and she took refuge in France, but returned to Spain in 1864, only to retire again in 1868. Died 1878.

In 1804, only to retire again in 1806. In 1802, 1808, 1809, 1810, 1811, 1812, 1813, 1814, 1815, 1816, 1817, 1818, 1819, 1820, 1821, 1822, 1823, 1824, 1825, 1826, 1827, 1828, 1829, 1830, 1831, 1832, 1833, 1834, 1835, 1836, 1837, 1838, 1839, 1840, 1841, 1842, 1843, 1844, 1845, 1846, 1847, 1848, 1849, 1850, 1851, 1852, 1853, 1854, 1855, 1856, 1857, 1858, 1859, 1860, 1861, 1862, 1863, 1864, 1865, 1866, 1867, 1868, 1869, 1870, 1871, 1872, 1873, 1874, 1875, 1876, 1877, 1878, 1879, 1880, 1881, 1882, 1883, 1884, 1885, 1886, 1887, 1888, 1889, 1890, 1891, 1892, 1893, 1894, 1895, 1896, 1897, 1898, 1899, 1900, 1901, 1902, 1903, 1904, 1905, 1906, 1907, 1908, 1909, 1910, 1911, 1912, 1913, 1914, 1915, 1916, 1917, 1918, 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2

**Mariana** (má'ré-d'na), **Juan**, Spanish historian was born in 1536. He was a Jesuit, taught theology in Rome, Seily, and Paris, and finally lived in retirement in Toledo. In 1609 he published at Cologne *Seven Theological and Historic Treatises*, two of which were censured by the (41)

inquisition, and the author was subjected to imprisonment and penance. His chief work is his *History of Spain*, which extends to the accession of Charles V. with a summary of later events down to 1621. He died in 1623.

[illegible]

**Marie de' Medici** (mā'rē' də mād'dē-sī), queen of France, daughter of Francis of Tuscany, was born in 1573. She married Henry IV. of France in 1600, and became the mother of Louis XIII., during whose minority she was regent. She was overthrown by Richelieu after a long contest, and left France in 1631. Died, 1642.

**Mario** (*né-tro-é*). **Giuseppe**, famous Italian opera-singer, was born at Cagliari, Italy, 1810, son of General di Candia. In 1835 he made his first appearance in opera as Robert in *Robert le Diable*. In this he achieved the first of many successes in Paris, London, St. Petersburg, and America. Mario married the famous singer, Giulia Grisi, and retired from the stage in 1867. Died, 1883.

**Marion, Francis**, American general and patriot, was born near Georgetown, S. C. 1732. He

received a scanty education, and, after a trial of seafaring life, in which he was wrecked and with difficulty rescued, engaged in farming. His first active service was in Charleston harbor, and later in the defense of Fort Moultrie, 1776. He was present at the battle of the Clouds, 1780, and was a member of several companies of volunteers among the country lads, or "cowboys" as the British called them, and with this force marched to the relief of General Gates, at that time in North Carolina. Among the most noted engagements in which he took part were the battles of the Clouds, 1780, and of Parker's Ferry, and Eutaw. At the close of the war Marion resumed his former occupation, and

remained a his plantation until his death, 1795.  
**Marion Harland.** See Terhune, Mary V.  
**Marius** (mă'ri-us), Calus, Roman general, was  
 born near Arpinum, 157 B. C. He served with  
 distinction at Numantia under the younger Scipio  
 Africanus, and in 119 was tribune of the plebs.  
 Meanwhile an immense horde of Cimhri and Teu-

tons had burst into Gaul, and repeatedly defeated the Roman forces. Marius, consul for the second, third, fourth, and fifth times, 104-101, annihilated them after two years' fighting in a terrible two days' battle near Aix, in Provence, where 100,000 Teutons were slain. Marius was declared the saviour of the state, the third founder of Rome, and was made consul for the sixth time in 100. Marius and Cinna were elected consuls for the year 86, but Marius died a fortnight afterward.

**Mark, Edward Laurens**, American naturalist and educator, professor of anatomy, Harvard, was born at Hamlet, Chautauque county, N. Y., 1847. He was graduated at the University of Michigan, 1871; Ph.D., University of Leipzig, Germany, 1876; LL.D., University of Michigan, 1897. University of Wisconsin, 1904. Hersey professor of anatomy since 1885, director of zoological laboratory since 1890. *See* *Biographical Dictionary of the History of Science*.

laboratory since 1900, Harvard University.  
**Markham, Edwin**, American poet, writer, lecturer, was born in Oregon city, Ore., 1852. He went to California, 1857, worked at farming, blacksmithing, herded cattle and sheep during his boyhood, and earned his way through the common school. He has written poems, since early boyhood, for California papers and received recognition of best Eastern magazines; was principal and superintendent of schools in California until 1899. Author: *The Men with the Hoe, and Other Poems*; *Lincoln, and Other Poems*;

**Marlborough, John Churchill**, first Duke of Marlborough and diplomat, was born in 1650. He obtained a commission, through the influence of his sister, with the duke of York, and first served under Turenne; defeated James II. He received the title of Marlborough created a commander-in-chief by William III., intrusted with his former master; was appointed captain-general and duke under Queen Anne, and won the victories of Blenheim, 1704, Ramillies, 1706, Oudenarde, 1708, and Malplaquet, 1709. He died in 1722. He was dismissed on a charge of peculation. Died, 1722.

**Marlowe, Christopher**, British dramatic writer, was born about 1564. He belonged to the genera-

tion immediately preceding that of Shakespeare and is considered by many to be second only to

Shakespeare among the dramatists of the time. His chief plays are: *Tomerlane the Great*; *The Tragical History of Dr. Faustus*, to which Goethe acknowledged his obligations; *The Jew of Malta*; and *Edward the Second*. He died in a tavern brawl at the age of twenty-nine, in 1593.

**Marlowe, Julia**. American actress. 1885. b. England, in the village of Caldbreck, Cumberlandshire, 1870. She came to the United States with her mother and sister in 1885, and after two years; moved to Ohio, locating finally in Cincinnati; attended public schools until her twelfth year, then joined juvenile opera company, where she sang, danced, and acted, and in other light opera. She then retired from the stage and studied three years in New York; made her metropolitan debut as *Yarbenia* in *Ingomar*, with the Grand Opera Company, in 1895. She played other tragic and romantic roles throughout the United States and Europe. She married Robert Taylor, a headliner of the same company, but afterward secured legal separation.

**Marmontel** (*mār'môn'tel'*), Jean François, French writer, was born at Bort, 1723. He wrote *Les Incas*; *Bélésaire*, and *Contes Moraux*, and made his way into Parisian society by gentleness, wit, and a dainty and candid literary power. He was elected to the French Academy in 1763, and was a literary disciple of Voltaire. Died, 1799.

**Mateo de Vilanova**, Clément noted French poet, was born at Cahors about 1405. He entered the service of Princess Margaret, afterward queen of Navarre. He made many enemies by his witty satires, and in 1534 fled first to the court of the queen of Navarre, and later to that of the duchess of Ferrara. He returned to Lyons in 1460, and in 1538 began to translate the poems which the French dress and sing to secular airs, helped to make the new views fashionable. His poems consist of elegies, epistles, rondeaux, ballads, sonnets, madrigals, epigrams, nonance verses, and longer pieces. His special gift lay in badinage and gracefully naïve.

**Marquette** (*mar'ket*). Jacques, French Jesuit missionary and American explorer, was born at Laon, France, 1637. He founded Sault Ste. Marie and Keweenaw missions; accompanied Joliet in his exploration of the Mississippi, and died while attempting to establish a mission among the Illinois Indians. 1675.

**Marryat** (mar'-at), Frederick, English author, was born in Westminster, 1792. He served in the navy for many years, becoming a post captain, and wrote many novels, including: *Frank Mildmay*; *Middlemarch*; *East*; *Peter Simple*; *Snarles*; *...*

may; *Businessman Easy*; *Enter Simple*; *Charlie, you*; *The Little Savage*; and *Valerie*. He also published a *Code of Signals for Vessels Employed in the Merchant Service*, adopted in England and other countries, and *Diary in America*, in 6 volumes.

**Marsh, George Perkins**, American diplomat and philologist, was born at Woodstock, Vt., 1801. He studied law, was elected to congress in 1842, was United States minister to Turkey, 1849-53, and to Italy, 1861-82. He was made LL. D. by Harvard in 1859. He died at Vallombrosa in Italy, 1882.

**Marshall, Alfred**, English economist, was born in London, 1842. He was educated at Merchant Taylors and St. John's, Cambridge; D.Sc., Oxford and Cambridge; honorary LL.D., Edinburgh; hon. Dr. juris., Cracow University; professor of political economy, Cambridge University, 1885-1908; member of royal commission on labor, 1891; vice-president of the royal economic society; fellow of the British Academy, 1902, and member correspondent de l'Institut de France, 1908. Author: *Economics of Industry*; *Curriculum in Economics*, etc.

**Marshall, Henry Rutgers**, American architect and author, was born in New York, 1852. He was graduated at Columbia in 1873; L. H. D., Rutgers, 1904; in practice as architect since 1878. Fain, *Pleasure, and Aesthetics; Aesthetic Principles; Instinct and Reason*, etc. He is a contributor to art, psychological and philosophical journals and literary magazines and reviews, and was the principal speaker on aesthetics at the congress of arts and sciences, St. Louis exposition.

**Marshall, John**, American jurist, chief-justice of the United States, was born in Fauquier county, Va., in 1733. He was educated at the College of William and Mary, where his legal studies were interrupted by the revolution, in which he served under his father, Colonel John Marshall. He was admitted to the bar in 1778. In 1781 he began to practice law in Fauquier county, Va. He was sent to France with Pinckney as an envoy in 1793. In 1795 he was ordered to leave the country when he had declined Talleyrand's request for a loan. In 1799 he was elected to the U. S. House of Representatives as secretary of state. He was made chief-justice of the Supreme Court in 1801 by John Adams, and held this position until his death, which occurred at Philadelphia, Pa., 1835. His name is associated with the landmark case of the supreme court for thirty-four years, during which his decisions on constitutional questions were generally accepted as authoritative. The constitution that have been accepted ever

**Martel, Charles.** See Charles Martel.

**Maximilian I.**, German emperor, was born in 1459, son of Frederick III. In his nineteenth year he married Maria, only child and heiress of Charles the Bold, duke of Burgundy, and was soon involved in a war with Louis XI. of France, who attempted to seize some of her possessions. Subsequently he married the daughter of the duke of Milan, and although inclined to peace, he became involved in wars with the Swiss, the Venetians, and the French. Died 1519.

**Maximilian, Emperor of Austria and Mexico.** Maximilian Joseph, Archduke of Austria, and emperor of Mexico, was born in Vienna, 1832. He was the brother of the present emperor of Austria-Hungary. In 1853 Napoleon III. had it in mind to conquer Mexico and set up an empire, and he offered the crown to Maximilian, who went to Mexico in 1864. But he pleased no one, and in 1866, when the French troops left the country, the empire fell to the Mexicans. Maximilian then made a desperate effort for his own defense, but he was captured by the republicans, and, after a trial, shot near Queretaro, in his thirty-fifth year, 1867.

**Max O'Rell.** See Blouet, Paul.

**Maxwell, James Clerk**, British physicist, was born at Edinburgh, 1831. He was educated at the University of Edinburgh. In the great work of his life, *Electricity and Magnetism*, 2 volumes, he constructed a theory of electricity in which "action at a distance" should have no place. He was the first to make correlation the subject of actual measurement. But he was best known to the public by his investigations on the kinetic theory of gases. In 1879 he edited Cavendish's *Electrical Researches*, and died in the same year.

**Maxwell, William Henry**, American educator, superintendent of schools of Greater New York since 1898, was born at Stewartstown, Ireland, 1852. He was educated at royal academical institution, Belfast, and Queen's College, Galway and Belfast. He was teacher in the public schools, Brooklyn, N. Y., 1880-82; assistant superintendent of schools, Brooklyn, N. Y., 1882-87, and superintendent, 1887-98. He is author of a series of text-books on English grammar and composition.

**May, Sir Thomas Erskine**, English jurist and writer, was born in London, 1815. He was educated at Bedford school. He was created successively C. B. and K. C. B., and was on his retirement, in 1886, created Baron Farnborough. His *Treatises on the Law, Privileges, Proceedings, and Usage of Parliament* has been translated into various languages; his *Constitutional History of England 1760-1860* is a continuation of Hallam; and his *Democracy in Europe* shows great learning and impartiality. He died in 1886.

**Mayer, Henry** ("Hy Mayer"), caricaturist, was born at Worms-on-Rhine, 1808. He was educated in England and Germany, and came to the United States, 1886. He began his career as an artist in Cincinnati, 1887, and has resided in New York since 1893. He has been illustrator for *Florescent Blazette*; *Figaro Illustré*; *Le Rire*; *Pall-Mall Magazine*; *Punch*; *Life*; *New York Times*, *Herald*, etc. Author: *Autobiography of a Monkey*; *A Trip to Twend*; *Alphabet of Little People*, etc.

**Mazarin** (*ma-zo-ran'*), Jules, cardinal and chief minister of France during the minority of Louis XIV., was born at Rome, 1602. Having accompanied a papal legate to the court of France, he became acquainted with Richelieu, and his later career perceived his great political talents, and engaged him to maintain the French interests in Italy, which he did while still employed by the pope as vice-legate at Avignon. In 1642, as nuncio to the French court, he was appointed ambassador of France among the nations as increased, and in the internal government of the country those principles of despotism were established on which Louis XIV. afterward acted. The administration of justice, however, became very corrupt, and the commerce and manufactures of the country sunk into deep depression. Died, 1661.

**Maximil** (*max'ul-né*), **Guisepp**, Italian patriot and revolutionist, was born at Genoa, 1805. The organization of a new liberal league, the Young Men of Italy, was his first step toward action. His first work was a newspaper, entitled "New Europe," and based on principles of European rights and enfranchisement, was inaugurated by the exertions of Massimo in Switzerland. In 1837 he quitted Switzerland, and took refuge in London. From London, he sent his labors in the Italian revolutionary cause were unceasing. After an ineffective scheme for a republican league, he ventured to enter Italy, and was arrested and confined in the fortress of San Leo. A prisoner until Rome was taken by the Italian army. On his death, 1872, the government honored him.

with a public funeral.

**Mead, Larkin Goldsmith.** American sculptor, was born at Chatham, N. H., 1835. His early education was spent in Vermont. He studied art at Brooklyn, N. Y., and in Italy. The colossal statue of "Vermont" on the dome of the state-house, and of "Ethan Allen" in the portico of the same building in Vermont, and one of the same name by the city of Vermont, are the handiwork of representatives at Washington are all his work; also, a colossal statue, "The Mississippi River"; colossal marble group representing Columbus appealing to Isabella, Sacramento, Cal., and such redemptive traits in the Henry James, William D. Howells, and John Hay.

**Mead, George Gordon**, American general, was born in Cadix, Spain, where his father was an agent of the United States navy, 1815. He was educated at the United States Military Academy at West Point, New York, and served one year in the army, resigned to begin practice as a lawyer in 1839. He was called to the bar in 1841, and in 1842 he was placed in command of a brigade of volunteers, soon rose to the command of a division, and in 1846 was appointed to command the army of the Potomac. At Chancellorsville he commanded the first corps, and when Hooker's army was defeated at Gettysburg, the army itself was in hasty movement northward to check Lee's invasion of the North in 1863. Meade's army was defeated at Gettysburg, and he, with the greatest reluctance, and altogether from a sense of duty. He had inclined to fight on the defensive, but he was overruled by the army. He then followed Lee's army, and on September 30, 1863, he was defeated at the battle of Red Bank. He was then called to the aid of the army, and he was made major-general in the regular army, and commanded the military division of the Atlantic at the time of his death at Philadelphia, 1872.

**Lorenzo de' Medici** (né *di*), **Lorenzo de'**, nicknamed "the Magnificent" (1469-1492), was the second son of the ruler of an illustrious Florentine family, which for centuries exerted great influence in Italy and in Europe. He was born on April 8, 1469, in the Palazzo Medici, and his brother Giuliano, by the Passi, another distinguished family of Florence, who were Italian monarchs, was elected pope in 1523, as Clement VII, archbishop of Pisa. He resulted that Giuliano was named and Lorenzo wounded; whereas Giuliano was killed, Lorenzo was spared. He wore an archiepiscopal robe, and Giacomio de Passi, with one of his nephews, shared the same fate. He was a member of the Medici family, which was the ruling family of Florence, had an interdict upon the city territory, and forming a league with the king of France, the king of Spain, and the king of the dominions. Hostilities followed, and were carried on with great vigor, and the city was besieged. The remainder of Lorenzo's administration was unmarked by any great public events; but his private life was distinguished by his extraordinary attention he paid to the augmentation of the Laurentian library, which had been

**Meissonier** (*mei'son'ay*). **Jean Louis Ernest**, French painter, was born in Lyons, 1815. He was a pupil of Cogniet, and became a member of the Beaux Arts in 1861. His best pictures distinguished for minute detail are probably the "Napoleon Cycle," among which the picture called "1814" was sold, in 1887, for the highest price ever obtained during an artist's lifetime, \$170,000. He served in the Italian campaign and the early part of the Franco-Prussian war, and was colonel

Meibach, (mairch'-bach), Philip, Luther's fellow-laborer in the reformation, was born at Eisleben in the principality of the Rhine, in 1493. In 1521 he published his famous treatise, *Theologia Germanica*, the first great Protestant work. He was a zealous and devoted worker, and an important contribution to the cause of Protestantism in the Augsburg confession. After Luther's death he continued his work, and was one of the some of the Protestants, by whose concessions to the Roman Catholics which his anxiety for the peace of the empire induced him to make, the Reformation was preserved. He died at Meibach, Madame, nee Helen Porter Mitchell, operatic vocalist, was born in Methuen, August 18, 1862. She studied singing in Boston, and in Paris, and made her stage debut in 1887 in *Figaro*, at the theatre de la Monnaie, Brussels. Her first American tour was in 1890, when she sang in 1889 played *Ugolino* at Paris grand opera. For her Boston specially wrote *Elaine*, produced in 1891. She has since made several tours, and in recent opera seasons in London and New York, and, in 1906, proved herself equally successful in song.

**McLellan, Charles Sanger**, American railway official, was born in Lowell, Mass., 1851. He has been in the railway service since 1869, beginning as a freight conductor on the New York and New England Hampshire railroad; auditor, 1881-83, superintendent, 1883-84, general superintendent, 1884-88, Boston and Lowell and Concord railroads; assistant general manager, 1888-89, general traffic manager, 1889-90, New York Central; general manager of New York and New England railroad at Boston, 1892; second vice-president New York, New Haven and Hartford railroad, 1892-96; president of the New York, New Haven and Hartford railroad company, since 1903.

**Meng-tzu** (*Men-tsi*), **Meng-tz**, Chinese sage, was born in Shantung, about 371 B. C. He founded a school of thought known as the *Wang Yang-ming* or *Ching-tzu* Confucius. After his death his disciples collected his conversations and exhortations, and published them as the *Book of Meng-tzu*. The philosophy root of his system is belief in the ethical goodness of man's nature. He is liberal and tolerant, and he is a firm political economist. He advocated freedom of trade, the deposition of unworthy rulers, division of labor, inspection of work by government, maintenance of good roads and bridges, poor-laws, education, and the abolition of war. His teachings and sayings are based on his writings. Died about 287 B. C.

**Mendelssohn-Bartholdy** (men'dei-sön bar'töl'dē'), Felix, German composer, was born at Hamburg, 1809. In 1835 he accepted the directorship of the Leipzig concerts. Here he was in the center of the musical world of Germany, and was stimulated to his highest and most brilliant efforts. His oratorios, *Paul and Peter*, are his two greatest works, the latter second only to the greatest works of Handel. He died at Leipzig, 1847.

**Wengels (Wengels).** Anton Raphael, modern German artist, was born in Augsburg, Bohemia, 1728. From his sixth year he was compelled to exercise himself in drawing daily and hourly, and a few years later was instructed by his father in oil, miniature, and enamel painting. In 1761 Charles III. invited him to Spain, where his principal works at this time were an *Assembly of the Gods*, and *Descent from the Cross*. In 1776 he returned once more to Rome where he died in 1779.

**Menzies, Alan Wilfrid Granbrook**, 1877; professor, was born in Edinburgh, Scotland, 1877; M. A., Edinburgh, 1907; B. Sc., 1898; studied at Leipzig and Aberdeen; Ph.D., 1886; Chicago, 1910; D.Sc., 1912; Glasgow, 1913; F.R.S.E., 1914; University College, Edinburgh, 1898-1901; professor of chemistry, Bt. Muogo's College, Glasgow, 1902-08; secretary Medical Faculty, 1907-08; research assistant, instructor, Chicago University, since 1908. Fellow of the Society of Chemical Industry.

**Brevitiveness of a Thermoregulator; Phosphoric Acid Hydrates; Molecular Weight Determination of Dissolved Substances; New Methods for Measuring Critical Temperatures; The Influence of Temperature on Solubility; Vaporization Apparatus; Composition of Calomel Vapor; Calomel and Alkali's Anomaly; Critical Temperature of Mercury; Calculation of Critical Temperatures; Physical Constants Formulas; The Influence of the Coefficient of Expansion on High Temperature Ovens, etc.**

**Mercator** (mër-ka'tör), Gerardus, Flemish geographer of the sixteenth century, was born at Rupelmonde, Flanders, 1512, his real name being "merchante," "merchant," of which Mercator is the Latinized form. He took his degree as bachelor of philosophy at Louvain, but devoted his later years to the study of geography. He published several important works, including maps and a description of France, Germany, and Great Britain. Some of his later works were of a religious character and were supposed to favor the Catholic cause. Died Dec. 21, 1594.

**Heredia, George**, English poet and novelist, a leader of the Symbolist movement in England. He was studying for some time in Germany he commenced his literary career with the publication of a volume of poems. This was followed by the *Shaving of Shagpat*, an Arabian entertainment; *Parina*, a legend of the East; *Reveries*, a collection of poems; *The English of England*; *Enitha in England*; *Rhoda Fleming*; *Vittoria*; *Benusomph's Career*; *Daughters of the Crossways*; *A Reading of Earth*; *One of Our Conquerors*; *Empty Purses*; *Jump to Glory Jane*; *The Conqueror's Marriage*; *The House on the Beach*; *Comes and Goes*; *One of the Comets*; *Spirits*; *Selected Poems*, etc. Died, 1909.

**Wredth, Owen**, See **Lytton, Edward Robert**, **Earl of**.

**Sergenthaler** (*ser'gen-dal'er*). **Ottmar**, inventor of the typesetting machine bearing his name, was born in Wurtemberg, Germany, in 1812. He came to the United States in 1872, and received a government position in Washington, D. C., to care for the mechanism of bells, clocks, and signal service apparatus. He died in Baltimore, Md., 1899.

**Ariste** (a'ri'stè'), **Prosper**. French novelist, historian and archaeologist. Born at Paris, 1803. After a failed anonymous effort, wrote *Clara Garsul*, and *La Garza*, Spanish comedy, and *Illyrian songs*; *La Chénante*, a *Requiem*; *Chénante IX*, his most famous work; *Le Capitaine*; *Calabaz*; *Caenen*; *Tamara*. He became a member of the French academy in 1844, was made a senator in 1853, president of the commission for reorganizing the bibliothèque impériale in 1858, and commander of the legion of honor, 1860. Died at Cannes 1870.

**derivate** (muri-nul), **Charles**, English historian, dean of Ely, was born in Exeter, 1808. He was graduated at Cambridge. He wrote a history of Rome from its foundation in 753 to the fall of Augustus in 476, but his chief work is the *History of the Romans under the Empire*, indispensable as an introduction to Gibbon. Died, 1893.

**Verre d'Aubigne** (*verre d'Artois*). **Jean Henri**, ecclesiastical historian, was born near Geneva, Switzerland, 1794. In 1823 he was appointed court preacher at Brussels, but after the revolution of 1830 he declined the post of tutor to the prince of Orange; returning to Geneva, he took part in the institution of the new Evangelical College, and filled its chair of church history until his sudden death in 1872. His *History of the Reformation in the 16th Century* has enjoyed immense popularity.

educator, was born at Auburn, Me., 1854. He was graduated at the Maine State University, B. S., 1879; Ph. D.; professor of geology and mineralogy, George Washington University, since 1893. Author: *Stones for Building and Decoration*.

Quaker school at Philadelphia. At first in a New York counting-house, he studied law, and was admitted to the bar; but during the revolutionary war he was arrested by the British. From 1785 he was crippled by a fever. In 1787 he published his *Power of Religion on the Mind*. His *English Grammar* (1789) was widely read and loved by English scholars, an English reader, etc. Died, 1826.

**Musset (mü'set'), Louis Charles Alfred de**, French poet, was born in 1810. In 1828 he received a prize for a Latin dissertation. His *Reveries* (1829) and *Novels* (1830) were popular, and his *Nuits*, which are regarded as his finest lyrics. He was librarian in the ministry of the Interior for several years before 1848, and was restored to his office in 1852, with the title of reader to the emperor. His complete works appeared in ten volumes in 1866. Died, 1907.

**Mutsuhito (mut'wō-hi'tō)**, emperor of Japan, was born in 1853, ascended the throne in 1867, and married Princess Haruko in 1869. His reign has been marked by great reforms. Under the title of the present emperor, Japan has entered upon an unprecedented era of prosperity. Civilization has made rapid progress, and the introduction of western arts and ideas has secured for Japan the foremost place among Asiatic nations.

**Myers, Philip Van Ness**, author, historian, was born at Tribes Hill, N. Y., 1840. He was graduated at Williams College, 1862. He was president of the Farmer's College, Ohio, 1879-90; professor of history at the University of Cincinnati, 1890-1900; dean academic faculty, University of Cincinnati, 1890-97. Author: *Life and Times of George Washington*; *Remains of Lost Empires*; *Ancient History*; *Medieval and Modern History*; *General History*, etc.

**Nesbit, Herbert**, English novelist, was born at Arlington, Mass., 1860. He was graduated at the Massachusetts Agricultural College, Amherst, Mass., 1882. He is now president and editor of Phelps publishing company; director of *Good Housekeeping* since 1901; was vice-president of the Orange Judd company and editor of *American Agriculturist* at New York, and *Orange Judd Farmer* at Chicago, 1888-1894; president, editor, and manager of *Orange Judd* company, New York, since 1891.

**Nadir Shah (nā'dir shāh)**, Persian ruler, belonging to the Afshars, a Turkish tribe, was born near Herat, in Khorasan, Persia, in 1748. He was degraded and punished for some real or supposed offense, he betook himself to a lawless life, and in a few years was the head of a band of 8,000 robbers, who levied contributions from almost the whole of Khorasan. He invaded India, took Delhi in 1739, and seized the throne of diamond and the peacock throne. His last years were marked by rapacity and oppression, and he died at last under the hands of his subjects in 1747. He is still reckoned by the Persians, however, as one of their great national heroes.

**Nesbit, Charles**, lawyer, editor of commerce and labor since 1909, was born in Colorado county, Texas, 1849. He was graduated from the St. Louis Law School in 1872, and was admitted to the bar in 1873. President of the St. Louis city council from 1892 to 1895, and was a member of the St. Louis Law School faculty since 1896. He has taken an active part in politics for the last twenty years, and has delivered addresses before bar associations and similar organizations at various times of public interest.

**Nansen (nā'sen), Fridtjof**, Arctic explorer, was born in Norway, 1861, and was graduated from the University of Christiania, Ph.D., 1888. He started on his first Arctic expedition in 1882, and in May of the same year he and his companions celebrated journey across Greenland, which he accomplished in forty-six days. In 1893 Nansen sailed in the *Fram* to the Arctic Ocean, and explored entire polar regions, and penetrated farther north than any of his predecessors. He then became professor of zoology at Christiania University; took an active part in the separation of Norway and Sweden in 1905, was minister for Norway at the court of St. James in 1906-07, and at the court of oceanography, Christiania University, since 1908. Author: *Polarized North*; *Scientific Results*; *Arctic and the Arctic*; etc.

**Napier (nā'pīr; nā-pēr'), Sir Charles**, British admiral, was born at Merchiston ball near Falkirk, 1760, cousin to the hero of Sin. Commanding the *Flammar* in 1811, he defeated the *Flammar* upon the enemy in the Mediterranean. In 1814 he led the way in the ascent of the Potomac and took part in the battle of Blenheim. He also commanded the Baltic fleet in the Russian war; but the capture of Bomarsund failed to realize expectations, and he was dismissed from the sea in the British parliament, and until his death at his Hampshire seat, Merchiston ball, in 1860, he labored to reform the naval administration.

**Napier, Sir Charles James**, British general, the conqueror of Sind, was born at London, 1782. He served during the Indian war, and at the battle of Corunna was five times wounded and taken prisoner. He also took part in the Anglo-American war of 1812. He died in 1827, and was governor of Cephalonia, in 1838, and K. C. B., and

in 1841 was sent to India to command the army of Bombay against the Amers of Sind. Here he destroyed the fortifications of Eman Ghar, 1842, India, by the battle of Meeanee (Meeanee), where, with 2,800 English and Sepoys, he defeated 22,000 Baluchis. After the annexation he was appointed governor of Sind. He died near Portsmouth, 1853.

**Napier (nā'pīr), John**, Scottish mathematician, was born at Merchiston ball near Edinburgh, in 1550. He made a contract with Logan of Restarick for the discovery of iron mines in the East of Scotland, and he was employed for defense against Philip of Spain, and recommended him as a fertilizer of land. He applied his famous logarithmic tables in *Horologium Logarithmicum Canonis Descriptio*, in 1614, and the calculating apparatus called "Napier's bones" in *Arithmetice Universalis per Virgulas libri duo*, 1617. Died at Merchiston, 1617.

**Napier of Magdala, Robert Corneil Napier, Lord**, British general, was born at Colombo, Ceylon, 1810. During the Indian mutiny he was chief engineer to Sir Colin Campbell's army, distinguished himself at the siege of Lucknow, and was made K. C. B. He received the thanks of parliament for his services in the Chinese war of 1858. In 1870 he became commander-in-chief in India and a member of the Indian council, and was afterwards commander-in-chief of the field-marshal, and countess of the Tower. He died in 1890, and was buried in St. Paul's.

**Napoleon Bonaparte**, French emperor, the brother of Sir Charles, was born near Dublin, 1768. He served in the peninsular campaign and retired to St. Helena in 1815. He wrote *History of the War in the Peninsula*, *The Campaign of Austerlitz*, and *The Life of Sir Charles Napier*, London, 1860.

**Napoleon I., (Napoleon Bonaparte)**, emperor of the French, was born at Ajaccio, 1769. He was, at the age of eleven sent to the military school of Brienne, in Champagne, and in 1784, to the military school of Paris.

In 1785 he was appointed junior lieutenant in the army. He was in Paris on June 20, 1792, and saw the mob invade the Tuilleries. He also witnessed the overthrow of the monarchy on August 10. In 1793 he took a leading part in ousting the English from Toulon, and in 1794 was appointed general of the army of the army of Italy, and drove back the Sardinians.

He was married to Josephine Beauharnais in 1796, and two days later left to assume command of the army of Italy. He first overthrew the Austrians and Sardinians at Millesimo and Dego, and forced the Sardinians to make the armistice of Cherasco. He then turned against the Austrians, and after a severe struggle at the bridge of Lodi, he drove across the Adda. Then ensued the celebrated fights for Mantua—Castiglione, Arcola, and Rivoli. Mantua fell on January 16, 1797, and the Emperor Francis II. agreed to preliminaries of peace at Leoben. Bonaparte had already organized Lombardy as a republic, and had forced the pope to make the peace of Tolentino.

On his return to Paris Bonaparte obtained leave of the directory to attempt the conquest of Egypt, which was meant to be the prelude to the restoration of the French supremacy in India. Sailing from Toulon, 1798, he captured Malta, and landed in Egypt. On July 2 he captured Alexandria, on July 21, the French won the battle of the Pyramids, and the conquest of Egypt was effected. But Nelson's victory on August 1 in the battle of the Nile (Aboukir) was a bitter reverse, destroying his fleet.

In 1799 he invaded Syria, but failed to take Acre, which was defended by Sir Sidney Smith's squadron. Here he massacred 2,500 prisoners at Jaffa, and returned to Egypt, where he defeated the Turks in the battle of Heliopolis. He was elected consul of the second coalition in Europe, of the French loss of Italy, and of the state of France, he left Kober in command in Egypt, and returned to his native land on the evening of November 9, 1799, arranged by Sicily followed, and the consulate was established.

Austria and England were now the chief foes of France. Early in 1800, Bonaparte crossed the Great St. Bernard, and on June 14 won the great battle of Marengo. On December 3, Moreau won the battle of Hohenlinden, and on February 9, 1801, the treaty of Lunéville was signed. The terms were in the main the same as those of Campo-Formio. On

March 27, 1802, the peace of Amiens was signed with Britain; on August 1 Bonaparte was proclaimed consul for life. The concordat with the pope had already been signed, and Napoleon, as he was henceforth called, had to the end of 1803, however, Napoleon made preparations for a fresh development in foreign policy. He proposed to found one colonial empire in the New World, and another in India. But his schemes with regard to America were frustrated when fever destroyed his army in Haiti in 1803. In the same year he sold the territory of Louisiana to the United States for \$15,000,000.

He then determined to rearrange the map of Germany and to destroy British commerce. Early in June, 1802, he became President of the Italian republics, and in September and October he annexed Piedmont, Parma, and Piacenza. In February, 1803, he reconstituted Switzerland, and sent secret agents to stir up rebellion in Ireland. Further, he refused to desist from his British evacuation of Malta. On May 18, 1803, war between France and England broke out, and Napoleon was occupied by French troops.

The victory of Austerlitz, by Georges Cadoudal strengthened Napoleon's position, and on May 18, 1804, he became emperor of the French. Then he made elaborate preparations at Boulogne for conveying troops across the channel and capturing London. In 1805 he incorporated the Ligurian Republic with France, and forced Naples to make a treaty. But the defeat of Vienna, and the capture of the British in July destroyed all chance of a successful invasion of England, and in September he invaded Germany.

The call of Ulm opened the way to Vienna; and though Napoleon's victory at Trafalgar, on October 21, destroyed the Spanish and French fleets, Napoleon defeated the Austrians and Russians on December 2 at Austerlitz, and in 1805 he defeated the British at the battle of the Nile. He then forced Francis II. to make the treaty of Pressburg, Austria being humbled and deprived of much territory, an opportunity was given Napoleon of forming a new confederation of the Rhine. Austria, Prussia, Bavaria, Hesse-Darmstadt, and other states placed themselves under Napoleon's protection. The Holy Roman Empire ceased to exist, and on August 5, 1806, the Emperor Francis II. formally renounced his title of German Emperor.

Prussia, however, declared war on October 1, 1806; on the 14th of the same month her army was totally defeated at Jena. On the 25th the French occupied Berlin. England and Russia were alone left unruined. Against the former Napoleon issued the famous Berlin decree on November 21, 1806, and at the same time prepared to attack the Russians. In February, 1807, he fought the battle of Eylau, and on June 15 he won a decisive victory at Friedland. In July the Czar Alexander and Napoleon signed the treaties of Tilsit, which enabled them to dominate Europe. In October, 1807, France and Spain agreed to conquer Portugal, and in November Napoleon entered Lisbon. No sooner had Napoleon made Joseph Bonaparte king of Spain (June, 1808) than the Spanish people rose, and an English expedition landed in Portugal (August), and Wellington won the battle of Vitoria. The Czar Alexander proved one of the principal causes of the fall of Napoleon. War with Austria again broke out in April, 1809; but after the battles of Aspern and Wagram, the Emperor Francis was forced to sign the humiliating treaty of Vienna (Schönbrunn) October, 1809.

In seeking to strengthen his position, Napoleon was led to divorce Josephine, and in 1810 to marry Marie Louise of Austria. At the same time he made almost superhuman efforts to ruin England by means of his continental system. But on December 31, 1810, the crisis came; for he intended to modify his adherence to the continental system, and Napoleon resolved to invade Russia. His

army was defeated at Borodino, and he was forced to retreat.

dinastous campaign to Moscow in 1812, undertaken while he had the Spanish War on his hands, emperor of France during the spring of 1814, Napoleon was forced to abdicate in April, and Louis XVIII. entered Paris. After a short sojourn in Elba, Napoleon escaped to the island of St. Helena in March 2, 1815, and his reign of a hundred days began. The battle of Waterloo (June 18) completed the downfall of his hopes and he ended his days on the Island of St. Helena.

That Napoleon often showed himself in his earlier days kind, generous, and affectionate is undoubted; that he was patient during his last captivity is equally true. His temperament was Italian, his passionate feelings Corsican, but he was by nature neither blood-thirsty nor cruel. The code Napoleon withdrew to the battlefield, and he was a statesman; while, as Marbot tells us, the soldier who understands Napoleon's strategy has nothing more to learn. He waged war on a scale never before witnessed, and neither France nor any other country has produced a greater military genius. His body was conveyed to France in 1840, and laid in the Hotel des Invalides in Paris.

**Napoleon III., or Charles Louis Napoleon Bonaparte**, emperor of the French, was born in the palace of the Tuilleries, Paris, 1808. In 1830, he took part in a revolution which overthrew Louis XVIII. and in 1836 entered France, but, seeking to arouse the soldiery at Strasbourg in his favor, he was taken prisoner and sent to the United States. In 1840 he landed at Boulogne, again hoping to arouse the French soldiery in his favor; for his second attempt he was taken prisoner and taken to the chamber of peers, and received a sentence of perpetual imprisonment in the castle of Ham. In 1846 he was released, and the disguise of a workman. In 1848, on the abdication of Louis Philippe, the provisional government permitted him to return to France. In June of that year he was elected to the national assembly for the department of Seine and for three other departments, and in the following December he was elected by an immense majority president of the newly-constituted republic. In December, 1852, the famous coup d'état took place, and Louis Napoleon secured his election as president for ten years; but a year later he again appealed to the people, and obtained an almost unanimous vote for the restoration of the empire. In 1870 the Franco-Prussian war broke out, which led to the surrender of the emperor and his army at Sedan, and to the ultimate reestablishment of the republic. He died at Chislehurst, England, 1871.

**Narces (nár'sis)**, Hyandian statesman and general, was born toward the last quarter of the fifth century. From a manual office in the imperial household at Constantinople he rose by successive steps to the post of private chamberlain to the emperor Justinian, and ultimately to that of keeper of the privy purse. In 521 he was sent to Italy in command of a body of troops. Narces took possession of Rome, and after a series of successes, fought in southern and northern Italy, and extinguished the Gothic power in that peninsula. Justinian appointed Narces earl of Italy in 533, and he resided at Ravenna until his death in 541.

**Navarro (ná-vá-ró)** Mary Anderson de, American actress, was born in Sacramento, Cal., 1859. She began her debut as Juliet in 1876, and in 1877 at Louisville, 1878. She had great success in leading legitimate roles in the United States and England until 1880, when she married and retired from the stage. She has since lived in England. Author of *A Few Memories*.

**Niederer (né-dér'er)**, Johann August Wilhelm, noted German ecclesiastical historian, was born at Göttingen, 1789, of Jewish parents, named Mendel. He received his early education at the Johanneum in Hamburg, and then took up his residence at Heidelberg University as a private student; in 1812 he was appointed professor of theology; and the following year he was called to the newly established University of Berlin as professor of church history. Here he remained until his death in 1850. The most important

work of his life was his *Universal History of the Christian Religion and Church*, in 5 volumes. **Nedžad (né-dzad')**, Mirza Asad, a commander, was a native of Crete, who settled in Anapoli during the reign of Philip, and became the ruler of the young Alexander. He died in 329 he joined Alexander in Bactria with a body of Greek mercenaries, and took part in the Indian campaign. Having been killed, his nephew, Alexander gave Nedžad the command. He left the India in November, 325, and, skirting the coast, reached Babylon in 323. His narrative is preserved in the *Indica* of Arrian.

**Nedžad-zar (né-dzad'-zar)**, king of an ancient Persia, was born about 645 B. C. In 604 B. C. he became king, took Jerusalem about 605, and made Zedekiah king as his vassal. Zedekiah refused to surrender, and Nebuchadnezzar took Jerusalem, after a terrible siege, destroyed the temple, threw down the walls of the city, and carried the people captives to Babylon. Among the captives was the Hebrew prophet Daniel, who took much about him in the book of Daniel. He died about 561 B. C.

**Necker (ná-ker)**, Jacques, French financier and statesman, was born at Geneva, 1732, and was for many years a banker at Paris. His *Adieu au Colibri*, his *Traité sur les Ceres* and *Les Indes*, and some *Essays on the Resources of France* inspired such an interest in his talent for finance that in 1776, he was appointed director of the treasury, and after a short time, comptroller-general of France. He died at Copet, Switzerland, 1804.

**Necker, Pierre**, was a French statesman, of his work his form fifteen volumes. **Necker, Pierre**, was a French statesman, of his work his form fifteen volumes.

**Necker, Pierre**, was a French statesman, of his work his form fifteen volumes.

**Necker, Pierre**, was a French statesman, of his work his form fifteen volumes.

**Nelson, Horatio, Viscount**, famous English admiral, was born at Burnham Thorpe, Norfolk, in 1758. He served the navy from 1771 to 1779, and after voyages to the West Indies, the Arctic regions, and the East Indies, was promoted to a lieutenant in 1777. While in command of the *Boreas* on the Leeward Islands station, he involved himself in trouble through his severe and arbitrary enforcement of the navigation act against American traders. His conspicuous bravery at the engagement with the Spaniards off Cape St. Vincent in 1797 brought him to the rank of rear-admiral. In the same year he lost his right arm at Santa Cruz, and in the following year, with an inferior force, annihilated the French fleet in the bay of Aboukir, for which he was raised to the peerage as Baron Nelson, and created duke of Bronté. The king of Naples, in token of his fear of a Napoleonic invasion he kept a vigilant watch in the channel, and, on the recognition of Napoleon's power, he was crowned king. His memorable victory off Trafalgar over the French fleet commanded by Villeneuve, but was himself severely wounded at the very height of the battle, dying in 1805.

**Nelson, Knute**, lawyer, United States senator, was born in Norway, 1802. He resided in the United States in 1849, and resided in Chicago, Ill., until the fall of 1850; returned to the state of Wisconsin, and there to Minnesota, 1857. He was admitted to the bar in the spring of 1867; was a member of the assembly in the Wisconsin legislature, 1868 and 1869; member of the legislature of 1870; elected United States senator for Minnesota, 1870, and re-elected in 1901 and 1907.

**Nepertus**, Roman historian, was born probably at Verona, Italy, and flourished during the time of Julius Caesar and the first six centuries of the Christian era. He was the friend of Cicero, and his only extant work, *Vite et Illustres Imperatores*, is held in high esteem as an educational work.

**Nerast (né-rast)**, Walther, German chemist and physicist, was born at Brücken, Prussia, 1864. He studied at the University of Zürich, and at Göttingen; appointed professor of physics at Göttingen in 1901, where in 1905 he organized the institute for physical and electro-chemistry, of which he

became director in 1905. He is the inventor of the Nerast electric lamp.

**Nero, Claudius**, or **Clodius Drusus Germanicus**, Roman emperor, was born at Antium, in Latium, A.D. 37. He was adopted by the emperor Claudius, who died in 54, and he succeeded him, four years later he succeeded Claudius on the throne, which he occupied for fourteen years. His whole reign was characterized by his love of a loose, dissolute, and cruel life. The great fire in Rome happened in Nero's reign, and it is ascribed by some writers that the city was burned by Nero, and that he, who attributed the fire to the Christians, and persecuted them with the most unrelenting cruelty.

The philosopher Seneca, who had been a tutor, four miles from Rome, where he put an end to his own life on hearing the tramping of the horses on which his pursuers were pursued, 68 A. D.

**Nesselrode (né-sel'-rode)**, Karl Robert, Count, Russian diplomat, was born at Lieben, Spain, 1780, son of the Russian ambassador. He gained the confidence of Emperor Alexander, took a principal part in the negotiations which ended in the peace of Paris, and in the congress of Vienna, and was one of the most able diplomats of the holy alliance. Died, 1862.

**Nestorius** (né-s-tó-ris), celebrated heresiarch, was born in Syria. He was made patriarch of Constantinople in 428, deposed for heresy by the council of Ephesus in 431, and banished to the island of Naxos. He died there in 451.

**Netherland**, or **Netherlands**, English actress, was born in London, 1870. Daughter of Henry Netherland. She joined the Garrick theatre in 1891, and was manager of the Garrick theatre in 1891; visited Australia on a starring tour, and in the congress of Vienna, and was one of the most able diplomats of the holy alliance. Died, 1862.

**Nevada** (né-vá-da), Emma, née Emma Wixon, prima donna, was born at Austin, Tex., 1861. She studied under Mme. Marchesi, Paris; and made her debut in 1880, at the Grand Opera, London, 1880, as Amina in *La Sonnambula*. She subsequently sang here and in Europe. In 1885 she married Dr. Raymond Palmer, and now lives in Paris.

**Nevin, Ethelbert**, American composer, was born at Edgemoor, N. Y., 1859. He was educated at the University of Michigan, and taught in Boston, then went to southern Europe to study until 1900 when he returned and associated with the highest musical circles. He produced a group entitled *Water Scenes*, and a song, *The Swan*, which are perhaps his most popular compositions.

**Newcomb (né-komb)**, Simon, American astronomer and mathematician, was born in Wallace, N. S., 1835. He was educated at the University of Michigan, and graduated at Lawrence Scientific School, Harvard, 1858; L. D., Columbia, Yale, Harvard, Columbia. He was assigned to duty at United States naval observatory; professor of mathematics and astronomy, Johns Hopkins, 1884-94, and editor of *American Journal of Mathematics*. In 1874 he was made correspondent, and after 1893 was one of the eight foreign associates of the Institute of France; made officer of legion of honor of France, 1893. Author: *Solar Variations and Mutual Relations of the Orbits of the Asteroids*; *Investigations of the Orbit of Neptune*; *Researches on the Motion of the Moon*. Died, 1909.

**Newlands, Francis Griffith**, lawyer, United States senator, was born in Natchez, Miss., 1848. He was admitted to the bar in 1870, and was elected to the District of Columbia and went to San Francisco, where he entered upon the practice of law and continued the active practice until his death, until 1888. He was elected to the fifty-third, fifty-fourth, fifty-fifth, fifty-sixth, and fifty-seventh Congresses, and died in the United States Senate, Nevada, in 1903 and 1908.

**Newton, Sir Isaac**, English natural philosopher was born at Woolsthorpe, Lincolnshire, 1642. In 1665 he invented the calculus, the binomial theorem, the method of tangents, and the fluxional calculus.

The story seems to be authentic that the fall of an apple from the bough of a Woolsthorpe tree late in 1655, started the train of thought which led him to the discovery of universal gravitation. He certainly then deduced the rule of inverse squares from Kepler's third law, and he attempted to verify it by the motion of the moon. It was not, however, until 1685, when Picard's improved value for the terrestrial radius was at his disposal, and he had completed the differential calculus, that he was able to ascertain the agreement to be exact.

The great work embodying his conclusions was published in 1687, with the title *Philoso-*

PHILOSOPHY OF NATURAL PHILOSOPHY

PHILOSOPHY OF NATURAL PHILOSOPHY

*philosophiae Naturalis Principia Mathematica*. The first book expounded generally the dynamical results of the law. The second treated of motion in a resisting medium, hydrostatics, hydrodynamics, and the theory of the tides. Finally, Book III, showed the working of the attractive principle in the solar system, and demonstrated the subjection to it of comets.

Newton's optical researches began in 1666, when he resolved white light into its constituent colors. Two years later he constructed the first reflecting telescope, and in papers communicated to the Royal Society, in 1672 and 1673, described his prismatic experiments and the phenomena of thin plates. His results were collected in a volume on *Optics*, in which the emission theory of light was advocated. Newton was made Lucasian professor of mathematics at Cambridge in 1669.

He represented the university in the convention of 1689; but though again elected to parliament in the Whig interest in 1701, he was rejected at the polls in 1705. He was knighted by Queen Anne in 1705, and acted as president of the Royal society from 1703 until his death. The controversy between Newton and Leibniz regarding their respective claims to priority in the discovery of the differential calculus dragged on for a score of years from 1705. The facts elicited left no room for doubt of Newton's originality.

He was engaged in 1694-5 on the laborious task of perfecting his lunar theory, for which purpose Flamsteed's observations were indispensable. They were communicated partially and reluctantly, and the annoyances involved caused Newton to abandon his pursuit of the moon's inequalities. This contest embittered seven years of his life. He died at Kensington, 1727, and was buried in Westminster abbey.

**References.**—See *Life*, by Sir David Brewster, and A. de Morgan; also Lodge's *Pioneers of Science*; and Hawthorne's *True Stories*.

**Swman, John Henry**, English prelate and author, was born at London, 1801, son of a London banker. He was graduated from Trinity College, Oxford, 1820, and took orders in 1824. He took a leading part in the tractarian movement, and in 1841 wrote *Tract XC.*, which was severely condemned. After living at Littlemore for some years in seclusion, he was received to the Roman Catholic church, 1845. He was created a cardinal in 1879, and during his short life as apostolic vicar of the United States. He was a great writer. Died, 1890.

**Key (nd), Michel**, French marshal, was born in Saarbrücken, now in Prussia, 1769, the son of a French officer. He was a general in 1796, was killed in 1798; became a general of brigade in 1806, and distinguished himself by his bravery. When Napoleon abdicated in 1814 he attached himself to Louis XVIII., but on the former's return from Elbe he joined his old master, and stood by him during the hundred days. He was defeated by the allies at Waterloo, and was afterwards named the Old Guard at Waterloo on June 18th. On the second restoration he was arrested, tried by his peers, and shot, December 7, 1815.

**Nicholas I.**, emperor of Russia, third son of Paul I., was born at St. Petersburg, 1796. In 1828 the war with Persia began, and on its close occurred the war with Turkey. This was followed by the rising of Poland, which he subdued, and reduced the kingdom to a mere province. His rule now became despotic and fierce. Died 1855.

**Nikolai II.**, son of Russia, was born in St. Petersburg, 1868, son of Alexander III, whom he succeeded in 1894. During the famine of 1891, he organized the relief of the starving, and was a member of committees of rescue, and worked hard in the organization of relief. He married Princess Alix of Hesse-Darmstadt in 1894. The coronation took place in 1896. He visited the United States at Moscow in May, 1896, and in August of the same year he commenced a tour which included visits to the United States, Canada, and Mexico. He was crowned king of Denmark, to Queen Victoria, and to the president of France. His reign has been marked by the construction of the trans-Siberian railroad, the Russo-Japanese war, and the revolution of 1905, by adroit diplomacy with China, by a strong and conservative attitude toward Turkey, as well as toward the Balkan powers, and by the granting of a constitution in 1905.

**Nicholas V., pope, Tommaso Parenteucci,** was born near Pisa, Italy, 1397. He was educated at Bologna and Florence, went to Rome in 1426, and entered the ecclesiastical service. He was chosen pope in 1447. A liberal patron of scholars, he despatched agents east and west to purchase or to copy important Greek and Latin manuscripts, and may almost be said to have founded the Vatican library. Died, 1455.

**Nicholas, Edward Leamington**, American physicist, professor of physics, Cornell, since 1887, was the son of American parents, a Leamington, England, 1834. He was graduated at Cornell in 1875. He is editor-in-chief of the *Physics Review*, and author of *The Galvanometer*; *A Laboratory Manual of Physics and Applied Electricity* (2 vols.); *The Elements of Physics* (3 volumes).

**Nicias** (nikh'-as), Athenian statesman and general of the Peloponnesian war, was the son of the

wealthy Nereetus. In 427 B. C. he defeated the Spartans and Corinthians, and ravaged Minor Meios, and Loeira. In 415 he was appointed one of the commanders against Sicily, and in the autumn laid siege to Syracuse. At first successful, later his fleet was destroyed, his army began a retreat, and he was captured and put to death in 413 B. C.

**Nicoll** (ask'ul), **De Lancey**, American lawyer, was born at Bayside, L. I., N. Y., 1854. He graduated from Columbia University, 1876; Columbia Law School, 1876; was admitted to the bar, and has since practiced law in New York city. He was nominated by the Tammany organization for district attorney, 1887; was elected and served three years. Is now a member of the law firm of Nicoll, Anable and Lindsay, and has appeared in numerous corporation cases.

**Niebuhr** (*nee'boor*), **Barthold George**, German historian and eritic, was born in Copenhagen, 1776, where his parents then resided. He was educated at Kiel and Edinburgh, held several appointments under the Danish government, and entered the Prussian civil service in 1806. At the opening of the University of Berlin, in 1810, he became connected with the University. His greatest work is his *History of Rome*, upon which he was engaged for many years. His *Lectures on Roman History*, and several other works, were published after his death by Dr. Schmitt and others, from notes of Niebuhr's own lectures. He died

**Niehaus** (as/hous), **Charles Henry**, American sculptor, was born at Cincinnati, Ohio, 1855. He was educated in the Cincinnati schools, and at the Royal Academy, Munich, Germany. Among his works are: equestrian statue of General Forrest, Memphis, Tenn.; statue of McKinley and lunette for tomb at Canton, Ohio; Benjamin Harrison monument, Indianapolis; pedimental statue capital, Frankfort, Ky., etc.

**Nelice** (*Altura*). **Alice** (born Kentucky, U.S.A.). American opera singer. She was born at Nashville, Tenn., daughter of Erasmus Iverius. She received her musical education in San Francisco, under Mlle. Ida Valera, and made her first stage appearance with an operatic company at Oakland, Cal., 1893, as Yum Yum in *M. de la Huchette*. She made her New York debut, and made her first appearance in grand opera at the Bellini theater, Naples, Italy, as Marguerite in *Faust*; appeared at San Carlo opera house, Naples, in *La Traviata*, and at Covent Garden, London, in *Don Giovanni*, *The Marriage of Figaro*, *La Huchette*, *Il Trovatore*. She toured the United States in grand opera, 1901-02.

**Nightingale, Florence**, a famous philanthropist nurse, was born at Florence, Italy, 1820, of wealthy English parentage. At the age of twenty-two entered the Institution of Protestant deaconesses at Kaiserswerth to be trained as a nurse, and afterward studied the methods of nursing and hospital management with the sisters of St. Vincent de Paul, Paris. In 1854 she volunteered to organise a staff of nurses during the Crimean war, and, during the winter of 1854-5, she ministered with unwearied devotion to the suffering soldiers. She wrote *Notes on Nursing*. *Notes on Hospitals*, etc. Died 1910.

**Nikisch** (N'ish), **Arthur**, noted Hungarian orchestral conductor, was born in Lőbény Saint Miklos, 1855, and at an early age disclosed extraordinary musical talent. He remained at the Vienna conservatory for eight years; was appointed first violinist at the royal opera; and, in 1878 went with Neumann to Leipzig, where he was made assistant conductor and conductor in the Old opera house. In 1881 he succeeded Herz as conductor of the Boston symphony orchestra, and in 1895 accepted the post of director of the royal opera at Budapest. He is one of the greatest conductors of our time.

**Nilsson** (nî'ssŭn), **Christine** (Comtesse de Mirande), Swedish operatic singer, was born at Wexö, Sweden, 1843, daughter of a peasant. She made her début at Paris in 1864, in London, 1867. She repeatedly visited the United States. In 1871 she married M. Rousand, who died in 1882; and in 1887, at Paris, she became the wife of the Comte de Mirande, and retired.

de Muland, and Putney.  
 was born in Leeburg, La. 1861. He was graduated at the United States Naval College, 1882. He went next to the Royal Naval College, Greenwich, England, by navy department, and transferred to construction corps of the navy, 1889. He served on the battleships *Oregon*, *Indiana*, and *Massachusetts*, and then resigned from navy to become superintending constructor of the Cramp shipyard, Philadelphia, Pa., and in 1893 founded the Crescent shipyard, Elizabeth, N. J. He spent 10 years as a work part on the East River bridge commission, 1898; appointed, 1900, New York commissioner to Louisiana Purchase

exposition, St. Louis. He succeeded Richard Croker as leader of Tammany Hall, 1901-02. Nobel (c. 6-4), Alfred Bernhard, Swedish chemist and engineer, was born at Stockholm, 1833. He studied at the universities of Uppsala, Berlin, Göttingen, Petersburg, and in 1862 began to manufacture nitroglycerine. In 1867 Alfred, who assisted his brother, Robert, in the manufacture of some of the explosives, was the first to suggest the use of sand of the packing, how to make a safe and manageable explosive—dynamite. He also introduced the use of blasting caps, and the use of less powder. At his death at St. Remo, Italy, in 1896, he left a fortune of over 2,000,000 pounds, some of which he destined to go for annual prizes for the making of the most important discovery in physics, chemistry, physiology, writing the best literature, and accomplishing the most for

**Noda** (a'da), **Mitsutaru**, Count, Japanese general, was born in Setsumi, 1840. He fought on the side of the Meiji government in the war of restoration, and with imperialists in the Satsuma rebellion. During the war with China he captured Pinyang; was placed in command of the 8th division; later on appointed commander-in-chief of the first army, and, during the Japanese and Russian war, commander-in-chief of the fourth army. He was created a baron, 1895.

**Nogi** (nô'gë), **Kiten**, Baron, Japanese general, was born in Choshi, Japan, 1849. He served in the Russo-Japanese war, and was severely wounded. He commanded the third army in the Russo-Japanese war, and captured Port Arthur, 1905. He was created baron in 1905.

**Nogin** (nô'gin), **Isidor**, French novelist, critic and writer, of Jewish descent, was born at Budapest, 1849, but is a Prussian subject. He received the citizenship of France in 1881, and of Italy in 1882. He was co-founder and for many years vice-president of the association *Littérature et Art*. He was a member of the Académie Française. His book on Paris appeared in 1878; others, more especially two in English translation, *Constitutional Law of the Republic of France*, and *Constitutional Law of the Republic of Austria*, and a considerable number of others, and led to considerable discussion.

**Nordenskjöld** (nó'renshó'ld), **Nils Adolf Eric, Baron**, Swedish explorer, geologist, was born at Helsinki, Finland, 1832. In 1854 he was appointed state mineralogist at Stockholm, obtained letters of naturalisation as a Swedish subject, and was a member of the chamber of commerce during his residence in the Swedish capital. After several successive voyages and explorations in the Arctic sea, he in 1878-79 discovered the northeast passage. He was created baron in 1880. Died, 1901.

**Northoff** (nord'of), Charles, American author, was born at Erwitte, Prussia, 1830. He came to the United States with his parents when a child of five years. From 1861 to 1871 he was editorial writer for the *New York Evening Post*. The next two years he spent in travel through California and the Hawaiian islands. He then became Washington correspondent for the *New York Herald*. His principal works are: *A Manual of War Life: The Merchant Vessel*. Died, 1901.

**Nordica** (nôr'dî-ka), **Lillian**, née Lillian Norton, stage name of Mrs. Zoltan F. Dome, American prima donna, was born at Farmington, Me., in 1859. Her early education was pursued at the New England conservatory, Boston, and her later studies at Milan, Italy. She made her debut as an opera singer at Brescia, Italy, in *La Traviata*. She has sung leading soprano parts in forty operas and in all the standard oratorios, but she is best known in Wagnerian parts. She has appeared in grand opera in the United States

**Norman, Sir Henry**, English journalist, author, and traveler, was born at Leicester, England, 1858. He was graduated from Harvard College in 1881. He was several times sent abroad upon important missions on account of his proficiency in modern languages. In 1895 he was sent to Constantinople to report upon the Armenian massacres; and from there proceeded to Washington, D. C., to write for the London *Daily Chronicle* the status of the Monroe doctrine. He was elected to parliament in 1900; founded *The World's Work* in 1902. He was knighted in 1906.

**North, Frederick**, eighth Lord North and second earl of Guilford, English statesman, was born in 1732, and educated at Oxford. He entered the house of commons at the age of twenty-two, and was made junior lord of the treasury in 1759. In 1770 he became prime minister, and his course to a large extent, caused England to lose America. He resigned in 1782, and became blind five years before his death, which occurred in 1792.

Norton, Charles Eliot, American educator, critic, and scholar, professor of art at Harvard, 1874-98, was born at Cambridge, Mass., 1827. He graduated at Harvard, 1848; M.A., 1850; LL.D., 1883. L.H.D., Columbia, 1885; LL.D., Harvard, 1887, Yale 1901; honorary D.C.L., Oxford 1900. In 1864-68 he was joint editor with Lowell of the *North American Review*. In 1874 he was appointed professor of the history of art at Harvard, and in 1879 became president of the Archaeological Institute of America, holding that office for eleven

**years.** Editor: *Letters of James Russell Lowell: Correspondence of Carlyle and Emerson; Correspondence of Goethe and Carlyle; Reminiscences and Letters of Thomas Carlyle*, 1918. Editor, translator and translator of Dante's *Vita Nuova* and *Divina Commedia*, 1922, 1928.

**Norvalle** (ed-er), German lyric poet and philosopher, was born in Saxony, 1772. His real name was Friedrich Ludwig von Hardenberg. His principal works and *Lesser Lyrical Poems*, *Biblical as die Nacht*, and an unfinished art romance entitled *Heinrich von Ofterdingen*. He died of consumption, 1842.

**Noyes, George Bassett**, American biblical scholar, was born in Massachusetts, 1798. He was graduated at Harvard College, 1818, and studied theology at Cambridge Divinity School. In 1840 he was made professor of Hebrew and oriental languages and *Lesser Lyrical Poems*, *Biblical literature* at Harvard University. Died, 1868.

**Nye, Edgar Wilson**, American writer and humorist, who wrote largely under the pseudonym of "Bill Nye," was born at Shirley, Me., 1850. He studied law and later went to Wyoming where he was admitted to the bar and elected to the legislature. On account of ill health he returned to the East and settled in New York, having already achieved considerable popularity through his humorous contributions to the press. In connection with James M. Smith, he wrote the frequent satirical *Cartoon*, giving entertainments consisting of lectures and readings. He died near Asheville, N. C., in Feb., 1902.

**Oberlin (oh-ben), Jean Frederic**, German clergyman and philanthropist, was born in Strassburg, 1740. He was educated at the University of Halle, studied theology, became a German Lutheran clergyman, and was celebrated for his philanthropy, and for active benevolence. He was founder of Ban-de-la-Roches, among whom he labored for fifty-nine years. His name was celebrated throughout Europe, and he was elected to the Academy with the decoration of the legion of honor. Oberlin College, Ohio, is named after him. Died, 1825.

**O'Brien, Morgan Joseph**, American lawyer and jurist, judge of the New York supreme court, 1857-90, and of the New York circuit court, 1890-97, was born in New York, 1832. He was graduated at St. John's College, New York. He is a trustee of the New York public library, and of the New York public library, and trustee of Equitable life assurance society of the United States since 1905.

**O'Brien, Thomas J.**, American lawyer and jurist, was born at Jackson, Mich., 1842. He was graduated from the law department, University of Michigan, 1865, and practiced law in Detroit, 1864. Candidate for judge of the supreme court of Michigan, 1883; E. E. and M. P. to Denmark, 1887, and American ambassador to Japan since 1907.

**Ockam (oh-om), or Okham, William of**, English philosopher, was born at Ockham in Surrey, between 1270 and 1280. He was a Franciscan monk, studied at Oxford and Paris, and headed the Franciscan revolt against Pope John XXII's denunciation of evangelical poverty. His views on civil government are expounded in his *Dialogues*; his philosophical views in *Summa Logice*, in his commentaries on Porphyry and Aristotle, and the commentary on the *Sententiae* of Peter the Lombard; and his theological views in this last and the *Tractatus de Sacramento Altaris*.

**Ochs (oh), Adolph B.**, newspaper publisher, was born in Cincinnati, Ohio, 1838. He received a common school education at Knoxville, Tenn., established *The Tradesman*, 1879, of which he is still principal owner. He became publisher and principal owner of the *New York Times*, 1896; publisher and principal owner *Philadelphia Public Ledger*.

**Ochs, George Washington**, journalist, was born at Cincinnati, Ohio, 1861. He was educated at the University of Tennessee, and was elected mayor of Chattanooga, Tenn., was decorated chivalier of legion of honor by French government. He became general manager of *Philadelphia Times*, 1901; in 1902 the *Public Ledger* and the *Philadelphia Times* consolidated under the name of *Public Ledger*, and he became its publisher and general manager.

**O'Connell, Daniel**, Irish orator and "liberator," was born in County Kerry, Ireland, 1775. He was admitted to the Irish bar in 1798. His large practice, worth, he said, \$35,000 a year, was confined for his time, which he took with him to part in Irish politics. He was head of the Catholic party and contended for the admission of Catholics to parliament, and himself entered parliament, in 1829. In 1844 he, with his son and five others, was tried for sedition and sentenced to imprisonment for one year, which he served in England, though the house of lords soon set aside the verdict, the fourteen weeks he was in prison brought him the ailment of which he died in 1847.

**O'Connell, Daniel**, Irish orator and "liberator," was born at Charleston, S. C. He was educated at St. Charles' Seminary and St. Mary's College, Charleston, S. C., 1827. He was elected to the U. S. House of Representatives, 1827. He was for some time secretary to Cardinal Gibbons, was head of the American College in Rome

several years, and rector of the Catholic University of America, 1903-09.

**O'Connor, Thomas Power**, journalist and parliamentarian, was born in County Wick, Ireland, 1848. He was born at Athlone, Ireland, 1848. He took up journalism in Dublin and went to London later. He was a member of the staff of the *Daily Telegraph*. He was afterward employed in the London office of the *New York Herald*, and in the London office of the *Standard*, 1880. He was returned for both Galway and Liverpool, 1885; chose the latter, and was again returned, 1892, 1898, 1902, 1906.

**Lord Beaconsfield, a Biography; Gladstone's House of Commons**.

**O'Connell, James**, American lawyer, was born in New York city, 1804. At the age of twenty he was admitted to the bar of New York, and soon gained high rank in the profession. He was counsel in many important cases; was prosecuting lawyer in the "Cotton" case; and in 1871 was nominated in the face of his absolute refusal for the presidency by the labor reform party, and by a convention of democrats dissatisfied with the nomination of Horace Greeley. Died at Nantucket, Mass., 1884.

**Odoacer** (oh-doh-aser), the Roman emperor Augustus, and wife of Mark Antony, was born about 60 B. C. Her first husband was C. Marcellus, and she was married to him in 43 B. C. After the fall of Julius Caesar, she was married to Mark Antony, who was killed in 41 B. C., shortly after which she consented to marry Antony, to make secure the reconciliation between him and Octavian, and to secure the war, long inevitable, broke out between Antony and Octavian, and the former covered his insults by the murder of his wife's favorite, P. Clodius. No injury was too great to be forgiven, and after her husband's death she brought up with maternal pride her son, who was called Octavianus, or Augustus, also. Her death took place 11 B. C.

**Odoacer** (oh-doh-aser), king of the Germanic tribe of the Herali, ruler of Italy from 476 to 493, was born in the East. He was a Hun, and one of his ambassadors to the court of Constantinople. He entered the military service of the Western Roman empire, rapidly rose to ambler, and took part in the revolution by which Orestes, in 476, drove the emperor Julius Nepos from the throne, and overthrew himself to be a wise and polite ruler, quite unlike our general notion of a barbarian. But on March 28, 493, Odoacer was assassinated by Theodoric, king of the Goths, and his command.

**Olenschlager** (oh-len-shlag-er), Adam Gottlieb, German poet and dramatist, was born at Copenhagen, 1779. In 1803 appeared his first collection of poems, including one longer dramatic poem, *Die Helden von St. Jago*. He received a favorable notice for the lively fancy with which national habits and local characteristics were personified in his poetical works, and in his thirty volumes. His rank among the Danes as Goethe among the Germans, and his death in 1850 at the age of 71.

**Oersted** (oh-sterd), Hans Christian, Danish physicist, was born at Roeskilde, in the island of Langeland, 1777. He studied at the University of Copenhagen and received the degree of Ph. D. there in 1799. In 1819 he published his famous essay entitled *Experimentum in Effect of Opposite Electricity Upon the Magnetic Needle*, in which he discovered the identity of the force of magnetism, electricity, and galvanism, and thus opened the way for the wonderful development of knowledge in these three forces, which was one of the chief scientific glories of the nineteenth century. Died at Copenhagen, 1851.

**Olfenbach** (oh-fen-bach), Jacques, French composer of comic opera, was born in Cologne, 1819, of German-Jewish parents. In 1837-37 he studied music in the conservatory. He was employed as manager of the *Opéra* theatre in 1873, and sank some millions of francs in the experiment. He was elected to the United States. Died at Paris, 1880.

**Oden, Robert Curtis**, retail merchant and philanthropist, was born in Philadelphia, 1857. He was educated in select schools at Philadelphia; M. A., Yale, 1902. He was president of the board of directors of the Hampton Institute, 1902. He was director of Union Theological Seminary, New York; trustee of Tuskegee Institute, Alabama, since 1908.

**Oglethorpe** (oh-gle-thor-pe), James Edward, English general and founder of Georgia, was born at London, 1696. He was a member of the House of Commons, and was thirty years in parliament. He planned a colony in America, as a refuge for debtors, who were sent to the colony in 1733. He was elected to the House of Commons, and was thirty years in parliament. He planned a colony in America, as a refuge for debtors, who were sent to the colony in 1733. He was elected to the House of Commons, and was thirty years in parliament. He planned a colony in America, as a refuge for debtors, who were sent to the colony in 1733. He was elected to the House of Commons, and was thirty years in parliament.

**Olm (oh), Georg Simon**, German physicist, was born at Bamberg, Bavaria, 1803. He was educated at the University of Erlangen, held the chair of physics at Cologne from 1817 to 1826. He was a member of the Academy of Sciences, and the measure of resistance, called the ohm, was named in honor of his achievements.

by the Paris congress of physicists in 1881. He died at Munich, 1894.

**Ohnet (oh-net)**, Georges, French novelist of great popularity, was born in Paris, 1848. He was educated at Sainte Harbe, and at the Lycée Bonaparte. Under the general title of *Les Bastards* he published a series of novels, the most popular of which have reached a hundredth edition. Chief of these are: *Serge Panine*; *Le Maître des Forges*; *Le Comte de Montfort*.

**Olsen** (oh-len), Lorenz, German naturalist, was born at Berlin, Sweden, 1779. He became professor of medicine at Lund in 1807, and in 1816 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

**Oksu (oh-oh)**, General Hekko, Count, Japanese soldier, a Samurai of Ke-Kun was born in 1845. He entered the army in 1867, and in 1868 issued a journal called *Isis*, which led to government interference and his resignation. Died 1854.

is author of the following works: *A History of Greece*; *Warwick the King-maker*; *Short History of the Byzantine Empire*, etc.

On the 24th of September, 637, A.D., 'Abu-Bakr al-Kharrab. second caliph of the Moslems, was born about 581. After Mohammed's death he caused Abu-Bakr to be proclaimed caliph, and was himself appointed prime minister. On the death of Abu-Bakr, Omar succeeded as caliph, and pushed on the wars of conquest with increased vigor. He was summoned to Jerusalem, in 637, to receive the keys of that city, and before leaving gave orders to build a mosque, so called by his name, on the site of the temple of Solomon. He instituted the practice of dattin from the beggars. He died in 644.

**Omar Khayyām** (*ʿOmār al-Khayyām*), astronomer-poet of Persia, was born at Nishapur about 1017, and he said to have died there in 1123, or 1124. Omar was the poet of agnosticism, though some see nothing in his poetry save the wine cup and roses, and others read into it that Sufi mysticism with which it was largely adulterated long after Omar's death. He was a true poet; yet Fitz-Gerald's translation is far finer than the original.

**Omer Pasha** (*d'émér-pa-shâs*), Turkish general, was born at Plank, in Croatia, a province of Austria, 1806. When he died because of suicide, he was Omer Pasha, governor of Lebanon. When the Russians invaded the European dominions of Turkey, he was sent with an army of 60,000 men against them, and successfully withstood them at Kalafat, and, after their withdrawal from the country, entered Bucharest in triumph, August, 1854. He was governor-general of Bagdad, and also minister of war at different periods. He died at Constantinople, 1871.

**Ontario, Bishop, of.** See **Mills, William Lenox.**  
**Oppenheim, Nathan,** American physician, medical author, was born at Albany, N. Y., 1865. He was graduated at Harvard, 1888, and from the College of Physicians and Surgeons, New York, 1891. He is attending physician, children's department, Lebanon hospital. Author: *The Development of the Child; The Mental Diseases of Childhood; The Care of the Child in Health, Sickness, Growth and Control*; and various scientific papers.

**Opper, Frederick Burr**, American artist, was born at Madison, Ohio, 1857. He left school at fourteen. He was on the art staff of *Frank Leslie's* three years; an artist on *Puck* for eighteen years, and severed his connection with *Puck*, to accept

**Optic, Oliver**, American writer of books for young folks, was born in Medway, Mass., 1822. His real name was William T. Adams, and he was for several years a public school teacher in Boston. He wrote a large number of books which are published in several series. *Oliver Optic's Magazine* for Boys and Girls was edited by him for many years, but it was discontinued in 1875. He died at Boston, 1887.

**Orange, Prince of.** See William I., the Silent;  
William III., king of England.

**Orsagna** (ôr-săg'ya), **Andrea di Cione**, Italian painter, sculptor, architect, and poet, was born at Florence, about 1368. He was chief architect of the cathedral at Orvieto. The frescoes of the *Last Judgment* and *Christ and the Doctors*, in the church of Santa Maria at Florence, still survive as examples of his painting. His work was studied by succeeding painters, especially by Michelangelo and Raphael. He died about 1376.

**O'Reilly, John Boyle**, Irish-American poet, was born at Dowth, Ireland, 1844. He passed through the various stages of journalism from type-setting to the writing of editorials. He was tried for treason, convicted, and banished to Australia in 1866. Escaping from that country, he reached the United States in 1868 and became the editor of the *Boston Pilot*. Died, 1890.

**Origen** (*or'-jen*), Greek church father, was born at Alexandria, about 185. Most of his life was spent in the study of the Bible and the

spent in Alexandria, in which city he obtained great reputation as a teacher, but, which he was compelled, by persecution, to leave finally in 321. His writings are said to have amounted to six thousand, but by far the greater number are lost. As to the learning of Origen and his ability as a teacher, we possess the most ample testimony. He died at Tyre, 254.

**Oster** (os'ter), William, Canadian physician, educator, and author, was born at Bond Head, Ontario, 1849. He was graduated at McGill University, Montreal, 1872; LL.D., McGill, Toronto, University of Edinburgh. He was professor of the Institutes of medicine, McGill University, 1874-84; professor of clinical medicine, University of Pennsylvania, 1884-89, and at Johns Hopkins University, 1889-1905. He was a regular practitioner since 1872. Oxford University, since 1905. Author, *The Cerebral Passions of Children; Chorea and Choreaiform Affections; Lectures on Abdominal Tumors; Angina Pectoris and Allied Stages*; etc.

**Osman I.** (os'-mde) or **Othman** (oth'mdn), surnamed "the conqueror," was born in Bithynia 1259. When the Moegols overthrew the sultanate of Iconium, 1299, he seized a portion of Bithynia. From his name the terms Ottoman and Osmanli are derived. He died in 1326.

**Ossian** (oh'shan), Celtic bard, supposed to have lived in Scotland or Ireland about fifteen hundred years ago. He was the son of Fingal, king of Morven, a famous hero, and was blind. His poems are remarkable for their grandeur and wild beauty, and are very different from all other poetry. They have been published in nearly all European languages.

Ossoli (ds' o-lé), Marchioness. See Fuller, Sarah Margaret.

Otto I., the Great, emperor of the West, son of the emperor Henry I., of Germany, was born in 912, and in 936 formally crowned king of the Germans. He consolidated the disjointed power of the German emperors, and established Christianity at many different points in the Scandinavian and Slavonic lands which lay beyond the circuit of his own jurisdiction. Died 973.

Otis, James, son of Samuel and Sarah, was born at West Barnstable, Mass. 1725, and became a leader of the Boston Rev. He was advocate-general in 1760. In 1761, elected to the Massachusetts assembly, he was prominent in resistance to the revenue acts. In 1769 he was savagely beaten by revenue officers and others, and lost his reason. In 1783 he was killed by lightning. His home chiefly rests on *The Rights of the Colonies Asserted*, published by him in 1764.

**Ottawa, Bishop of.** See Hamilton, Charles.  
**Otter, William Dillon.** Canadian general, chief of the general staff, Canada, was born in 1843. He was educated at Upper Canada College, Toronto; served for twenty-two years in active militia; since 1883 in the permanent militia, and saw active service during Fenian raids of 1866 and 1870, Northwest rebellion of 1885, and during the Boer war of 1899-1900. He is the author of *The Guide, or Manual of Interior Economy*, etc.

**Oudinot** (*oud'noht*). Charles Nicolas, duke of Reggio, French general and noble, b. 1733-1801. He served in the revolutionary wars, and in 1805 obtained the grand cross of the legion of honor and the command of two reserve battalions, the "grenadiers Oudinot." In 1810 he was charged with the occupation of Holland, and took part in the Russian campaign and in the battles of 1813 with Russians and Austrians. In 1823 he commanded in Spain; became grand chancellor of the Legion of Honor in 1824, and succeeded Marshal Momey as governor of the Invalides, 1842. He died at Paris, 1847.

**Ouida** (wī'da). See De la Ramée, Louise.  
**Overbeck, Johann Friedrich**. German painter.

Overbeck, Johann Friedrich, German painter, was born at Lübeck, 1789. He studied art at Vienna, 1809-10, and settled in Rome, where he allied himself with the like-minded Cornelius, Schadow, Schnorr, and Veit, who, from the stress they laid on religion and moral significance, were scoffed at as church-romanticists, pre-Raphaelites, etc. His oil-pictures are inferior to his frescoes. He died in 1869.

**Overman, Lee Slater**, lawyer, United States senator, was born in Salisbury, N. C., 1854. He was graduated at Trinity College, N. C., 1874; member of North Carolina legislature, 1883, 1885, 1887, 1893, 1900; and speaker, 1893. He was elected United States senator, 1903, and reelected for the term 1909-15.

**Ovid** (n's'd), or **Publius Ovidius Naso**, Roman poet and writer, was born at Sulmo, Italy, 43 B.C. He belonged to a noble family, and was brought up to the law; but his love for poetry and his natural indolence led him to desert the practice of the law, though he occupied once or two judicial positions. He died in banishment at Tomi, 18 A. D. Beside the *Metamorphoses*, consisting of all the transformations recorded in legend from the creation of the world to the time of Julius Caesar, he was the author of a poem called *Amatoria*, or the "Art of Love."

**Owen, Sir Richard**, British naturalist, was born at Lancaster, England, 1804. He studied medicine at Edinburgh and London, but soon began by work in zoology and comparative anatomy, by preparing catalogues of the collections in the museum of the Royal College of Surgeons, and lecturing on comparative anatomy. Owen's researches in zoology number nearly 400; they are largely devoted to structure, and embrace every class of animals from a sponge to man. Among his voluminous writings are: *Comparative Anatomy of Invertebrates*; *Comparative Anatomy*

**Owen, Robert,** English social reformer, was born in Wales, 1771. In 1799 he married the daughter of David Dale, from whom, with others, he bought the mill at New Lanark, near Glasgow, in Scotland. Here he introduced a system of reform which proved for a time highly successful. He went to the United States in 1824, and tried to found a communist society at New Harmony, Indiana. He was so disappointed that he returned to Great Britain, where experiments of a similar nature, attended by a similar result, were made at Orbiston in Lanarkshire, and at Tythierley in Hampshire. He finally became a spiritualist. D. 1858.

**Owen, Robert Latham**, lawyer, United States senator, was born at Lynchburg, Va., 1856. Began practice of law, 1880; United States Indian agent for the five civilized tribes, 1885-89. He

He is the owner of extensive banking, real estate, farming, and cattle interests. As attorney for Choctaws and Chickasaws he recovered from the United States government, in money, nearly \$1,000,000. He directed the removal of the giving United States citizenship to every Indian in Indian territory. He was elected United States senator from the Choctaw and Chickasaw counties in 1890. He died in 1904.

Oyama (ô'yô-mô), Iwao, Prince, Japanese field-marshal, was born in Kanagawa, 1844. He

entered the Japanese army, was appointed a colonel in 1871, promoted major-general in the same year, lieutenant-general in 1877, general in 1881, and in 1898 was raised to the rank of field-marshal. He was sent to France in 1894, and on his return, Franco-Prussian war, upon his return to Japan, he entered the ministry of war, and assisted in the work of reorganizing the army. In 1904 he was chief of the general staff, and when war broke out between Russia and Japan he was appointed in-chief in Manchuria defeating the Russians at the three great battles of Liau-Yang, the Sheho, and Mukden. He received the order of merit, 1905, and the order of the Rising Sun, 1906, and in April, 1910, he was created prince in 1910.

**Frackard, Alpheus Spring**, American naturalist, was born at Brunswick, Maine, in 1839, was graduated from Bowdoin in 1861, and became assistant to Agassiz at Cambridge. After taking part in several scientific expeditions, he became state entomologist of Massachusetts, and professor of zoology and geology at Brown University. Besides many technical papers, his publications include, *Guide to the Study of Insects*; *Our Common Insects*; *Zoology*; *Entomology for Beginners*;

**Paderewski** (pa'de-ref'ski), **Ignace Jan**, Polish pianist and composer, was born in Podolia, Russian Poland, 1860. In 1872 he went to Warsaw, studied under Roguski, and subsequently pursued his studies under the late Frederick Kiel of Berlin. In 1884 he resolved to adopt the career of a virtuoso, removed to Vienna, placed himself under his fellow-countryman, Theodor Leschetzki.

and at the expiration of three years' hard study made his debut. Afterward he visited Germany, and in the autumn of 1889 made his first appearance before a Parisian audience. His first appearance in the Metropolitan Opera House was in London, 1890, and he has paid four visits to America. He has written *Manru*, an opera, *Suite for Orchestra in G*, etc.

**Paganini** ('pag'-ni-ni). **Niccolò**, Italian violinist, son of a commission broker at Genoa, was born in 1781. His musical talent showed itself in his childhood. At the ninth year he had instructions from Costa at Genoa, and afterward from Rolle at Parma, and from Ghirelli. In 1831 his violin playing earned an equal furor in Paris and London. His mastery over the violin has never been equalled. He died in 1840.

**Page, Thomas Nelson.** American author, was born on Oakland plantation, Hanover county, Virginia, 1853. He was educated at Washington and Lee University; LL.B., University of Virginia, 1874; LL.D. Washington and Lee, 1887, Yale, 1901; LL.D. Tulane University, 1899. He practiced law at Richmond, Va., 1875-83, but subsequently turned to literature and lecturing. Author: *In Old Virginia*; *Two Little Confederates*; *On Newfound River*; *The Old South*; *Among the Camps*; *Elkshot and Other Stories*.

**Page, Walter Hines.** American journalist and

writer, editor of *The World's Work* since 1900, was born at Cary, N. C., 1855. He was educated at Randolph-Macon College, Virginia, and Johns Hopkins University; LL.D., Randolph-Macon, and Tulane. He was literary adviser to Houghton, Mifflin and Company, 1895-99; editor of *The Atlantic Monthly*, 1896-99. Author: *The Rebuilding of Old Commonwealths*, etc.

**Raget** (pa'ri), Sir James, English surgeon, was born at Yarmouth, England, in 1814. He entered the Royal College of Surgeons in 1836, became member of the council in 1865, president in 1875, and Bradshawe lecturer in 1882. He was made a baronet in 1871, and also an LL.D. by the University of Edinburgh. His works are *Lectures on Surgical Pathology*, *Clinical Lectures*, etc. Died at London 1899.

**Raine, John Knowles**, American composer and organist, professor of music, Harvard, since 1875, was born in Portland, Maine, 1839. He studied music under Herman Kretschmar there; made his first appearance as soloist at the age of 17; went to Germany under Haupt and others, 1858-61; and made an artistic tour there, 1866-67. He was instructor in music, Harvard, 1867-73, and became professor there in 1876; A.M., Mus.D., he received from the same institution in 1877. His compositions performed in Greek at Cambridge, 1861; *Hymns of the West*, words by Steedman, sung at the opening of the St. Louis exposition, 1904; *The Fenimore, St. Francis, Requiem of Peace*, *Eucharistic cantata*. Died 1896.

**Paine, Thomas**, Anglo-American writer, was born, 1737, at Thetford, England. In 1774 he came to America, was favorably received by a bookseller in Philadelphia, and in 1776 published a pamphlet entitled *Common Sense*, in which he set forth the cause of the colonies against the mother country. The success and influence of this publication were such that it was called the "friendship of Washington, Franklin, and other distinguished American leaders. In 1791, he published *The Rights of Man*, in which he set forth all the replies to Burke's *Reflections upon the French Revolution*. In 1792 the department of the United States sent him a deputation to the national convention, where he usually voted with the Girondins. At the trial of Louis XVI, he proposed that the king should be executed, and was offered an opportunity of seeking an asylum in America. In 1802 returned to the United States, and died, 1809.

**Palestrina** (pál'-strá'-nd), Giovanni Pierluigi, distinguished Italian composer, was born near Rome about 1514. In 1543 he was made master of the Julian chapel, Rome, and in 1554 published a collection of masses, so highly approved by Pope Julius III., to whom they were dedicated, that he appointed their author one of the singers of the pontifical chapel. During the remaining years of his life the number and the quality of the works of Palestrina were remarkable. He died in 1594.

**Paley** (pál'-y), William, English divine and writer, was born at Peterborough in 1743. He was educated at Christ Church, Oxford, and for ten subsequent years he resided at the University. In 1783 he was elected to the chair of divinity at the University of Cambridge. He was successively made vicar of Haverhill, a prebendary of St. Paul's, successively a doctor of divinity, and rector of Bishop's Wearmouth. Died, 1805.

**Palliss** (pál'-s), Bernard, French artist and philosopher, was born about 1514. He was apprenticed in a glass work at Agen, where he learned the art of painting on glass. Having completed his apprenticeship he set out on a tour of France and Germany. In 1528, maintaining himself by practicing the craft of glass painter and by land surveying. During his travels he studied attentively all the books within his reach, and acquired an extensive knowledge of the sciences of his time.

In 1535 he returned to France, married, and settled at Saintes. Shortly after his return his attention was attracted by a fine crucifixion of enamel, which he saw there upon resolved to discover for himself the secret of the enamel. Being ignorant of the potter's art he had to grope his way, and labored after year after year without success, almost starving, and reducing his family to the depths of poverty. At length, after sixteen years of unremunerated labor (1538-54), he obtained a pure white enamel, affording a perfect ground for the application of decorative art.

He was now able to produce works in which he represented natural objects grouped and portrayed with consummate skill, and his enamelled pottery and sculptures in clay became recognized as works of art.

In 1562 he went to establish himself at Paris, where he continued to work in his art, and also delivered scientific lectures, which were attended by the most distinguished men in Paris, and continued views far ahead of his time. He suffered persecution as a Huguenot, and was arrested in 1589 and thrown into the Bastille, where he is said to have died in 1600. He left several philosophical works.

**References**—Morley's *Palliss the Potter*, and *Lives of the Burys and Dupays*; Lamar's *Celebrated Characters*; Wood's *Peopling of Europe*.

**Palladio** (pál'-a'dyó), Andrea, famous Italian architect, was born at Vicenza, 1518. After having studied with the greatest care the writings of Vitruvius and the monuments and ruins at Rome, he settled in his native city, and first acquired a reputation by his restoration of the basilica of Vicenza.

**Palma** (pál'-ma), Tomas Estrada, Cuban patriot, was born about 1836 in Bayamo, Cuba; studied law at University of Havana, and was active in the Cuban revolution of 1895-78, and took part in the Cuban revolution of 1895-78, and became president of the Cuban republic, but was captured, 1877, and the imprisonment and sufferings ceased, 1878. During the last Cuban revolution he was delegate-at-large and minister plenipotentiary for Cuba republic, and subsequently president of Cuba, 1902-06. He died, 1908.

**Palmieri**, Alfred Freeman, American educator, was born at Coleville, N. Y., 1855. She graduated

at the University of Michigan, 1876; was professor of English at Wellesley College, 1877-87, 1882-87; and non-resident dean of the women's department, University of Chicago, 1887-91. She was also professor of German and professor of philosophy in Harvard University, in 1887. Died, 1902.

**Palmieri**, Edward Henry, English explorer and orientalist, was born, 1840, at Cambridge. He graduated from Cambridge in 1867. In 1881 he was elected to the chair of Oriental History in the Standard. In 1882, on the eve of Arabi's Egyptian rebellion, sent by government to war over the Nile. He was captured, and Edward Henry and Lieutenant Charrington were on August 11th murdered in the ravine of Wady Badr. Among *Palmieri's* works are the *Desert of the Exodus*; *Palmieri's Dictionary*.

**Palmieri**, Erasmus Dow, American sculptor, was born at Pompey, N. Y., 1817. He was a joiner, and made carvings first of animals and leaves in wood. Seeing a cameo head, he cut on a shell portrait of his wife, and his success induced him to try working in marble. He executed busts of Alexander Hamilton, Washington, and George Washington. He was the *Landlord of the Palmaria*, in the capital at Washington, one of his largest works. He died, 1904.

**Palmieri**, George Herbert, American educator and scholar. Afforded professor of natural religion, moral philosophy, and civil polity, Harvard, 1864. He was elected to the chair of Natural Religion at Harvard, 1864; L.L.D., University of Michigan, 1894; Union, 1895; Harvard, 1906; and was successively fellow of the University in Greek at Harvard, 1870; assistant professor, 1873-83, and professor of philosophy, 1883-90.

**Palmieri**, G. O. G. A. English tractarian in rhythmical prose; *The Lifed Works of George Herbert*; *Life of Alice Freeman Palmer*, etc.

**Palmieri** (pál'-mí-ry), Henry John Temple, Viscount, Irish statesman, was born at Londonderry, in Hampshire, 1784. He entered parliament as member for Newport in 1807, and in 1811 became member for the University of Cambridge, which constituency he represented until 1831. Lord Palmieri was engaged in official life during nearly the whole of his career. In 1809 he became home secretary under the earl of Aberdeen, when he succeeded as first lord of the treasury in 1835. In 1838 he was defeated and compelled to resign office owing to a conspiracy bill arising out of Orsini's attempt to assassinate Napoleon III. He was the following year returned to power, and remained prime minister until his death. He was a statesman of unerring tact and sound judgment in relation to foreign policy, of which he was an acknowledged master.

**Pao** (pál'-a), Pasquale, famous Corsican patriot, was born in 1725 at Morosaglia, in Corsica. In 1769 he was elected captain-general of Corsica. In 1794 he joined the British in driving out the French. He then surrendered the island to the British, and was banished to France by the government. He quarreled with the British victory. He therefore retired from the island in 1796, and spent the remainder of his life in the neighborhood of London. He died, 1807.

**Pape**, Eric, American artist, illustrator, was born in Philadelphia, 1870. He received his art education in Paris. He exhibited at Paris salon, 1890-1900, World's Columbian exposition, 1893, Munich Kunst, Amstellung, 1897, Omaha exposition, 1898, Paris exposition, 1900, Pan-American exposition 1901, St. Louis exposition, 1904, and at various art museums and exhibitions in the United States and abroad, and has illustrated many important works.

**Papin** (pál'-pín), Denis, French physicist, was born at Blois, 1647. He studied medicine in Paris, where, after receiving his degree, he practiced as a physician. He was undoubtedly belongs the high honor of having first applied steam to produce motion by raising a piston, a discovery which was the principle of action of the explosion. Died at Marburg, Germany, 1712.

**Papinianus** (pá'-pín-a'-dus), Æmilius, Roman jurist, was born at Amulium. He held a high position under Septimius Severus, but was put to death by Caracalla in 212. He was remarkable for his sagacity and his sense of right and morality. Nearly 600 excerpts from his legal works were incorporated in the Justinian's Digest.

**Pappenheim** (páp'-pén'-im), Gottfried Heinrich, Count von, a great imperial general in the Thirty Years' War, was born at Pappenheim, in the Palatinate, of an old and distinguished Silesian family. He served under the king of Poland and the emperor, and was distinguished for his valor. He joined the Catholic faith, defeating the Bohemians at Prague in 1620. At Lützen, in 1632, he was killed in battle. He was mortally wounded by the Swedes, but was mortally wounded in the second charge and died at Leipzig, 1632.

**Papastasi** (pá'-pas-tá-si), George, was born at Constantinople, 1835. He entered the church at sixteen, studied alchemy and chemistry with

Withemina, bishop of Würzburg, and next at the mines in Tyrol, learned the properties of metals and minerals. He acquired fame as a medical practitioner, was made town physician at Basel, and held the post of chief physician at the hospital at Gales and Avignon, and justified the famous estimates that pursued him by his own vastness of knowledge. He was a member of the Parisian Academies. Of some 250 works attributed to him, the critics admit only from ten to twenty-four to be his. The others being by his followers in the "Pascuistia." In spite of his attraction to alchemy and mysticism, he made new chemical compounds, and discovered a phlogisticated phosphorus. Died, 1841.

**Paris** (pá'-ris), Comte de, Louis Philippe Albert d'Orléans, King Louis Philippe, was born in Paris, 1838. He was educated in England. In 1862 he returned to France, entered the national guard, and the Comte de Paris was followed to England where he occupied himself in writing a History of the Orleans family. He was the head of the Orleans family, and a claimant to the French throne. Died, 1894.

**Paris**, Rowell, American physician, was born at Pomfret, Conn., 1852. He was graduated from Racine College; A.M., Harvard; M.D., medical department of Northwestern University, 1876; honorary M.D., Lake Forest University; L.L.D., Yale, 1902. Since 1883 professor of surgery, medicine, and obstetrics, and surgeon to Buffalo general hospital. He is a member of all national and several foreign surgical societies, and is a member of the New York state pathological laboratory in Buffalo.

**Parker**, Alton Brooks, American lawyer, judge, was born in Cortland, N. Y., 1852. He was educated at the Cortland Seminary, Cortland Normal School, and graduated at the Albany Law School; L.L.D., Union University. Appointed justice of the peace, Cortland, 1880. He was elected, 1882, justice court of appeals, second district, 1882. His nomination for the court of appeals, 1896-1902. His nomination for the presidency made on the ballot, 1900. He was elected to the American Bar association, 1906-07, and is now practicing law as a member of the firm of Parker and Wheeler.

**Parker**, Edward Wheeler, statistician, was born at Point Deposit, Md., 1860; was educated at Baltimore, Md., and graduated at the United States Geological Survey since 1891, in charge Division of Mineral Resources and Geology, 1902. He was elected to the United States Census, member Antarctic Coal Strike commission, 1902; expert in charge of historical and geological survey of the United States, 1903; member of the Carnegie Institute. Author: *Annual Reports on Production of Coal in United States*, 1903; *Annual Reports on Production of Coal in United States*; also reports on coal mining, coke manufacture and petroleum refining for United States Census.

**Parker**, Sir Horatio Gilbert, Anglo-Canadian novelist, was born in Canada, 1862. He was educated at Trinity College, Toronto; B.C.L., Toronto. He was trained to journalism in Australia, and there first began his literary and dramatic works: *When Voltaire Came to Fenton*; *The Seats of the Mighty*; *The Battle of the Stars*; *The Lone That Had No Turning*; *The Right of Way*; *History of Old Quebec*; *The Weaver*, etc. He was returned to parliament for Gravesend as a Unionist in 1900, and was knighted in 1902.

**Parker**, Horatio William, American composer and organist, professor of the theory of music, Yale, since 1894, was born at Auburndale, Mass., 1843. He was educated at Auburndale and in Europe; graduated at Royal Conservatory, Munich, 1885; M.A., Yale, 1892; Mus. D., Cambridge University, 1902. He was organist at the Church of the Holy Trinity, Boston since 1893. His *Hora Novissima* was performed at the Chester (England) festival, 1894. He was organist of the church of the three choirs, Worcester, England. He is author of the cantata, *King Trumps and The Kolossal*, and of the oratorio, *How Newman and St. Christopher*.

**Parker**, Joseph, English preacher and author, was born at Huddersfield, 1814. He was educated at University College, London, and became pastor of Congregational chapel at Bathurst, Hampshire, in 1869, of which church he was represented by the City Temple in London. *Ecce Deus* his most noted work. Died, 1902.

**Parker**, John, English archbishop of Canterbury, was born at Norwich, England, 1504. He studied at Corpus Christi College, Cambridge, and at the University of Paris. On the accession of Queen Mary he refused to conform to the reestablished order of things, and was declared a heretic, and was ordered to leave to conceal himself. The death of Mary, and the accession of Elizabeth, called him from his compulsory exile. He was appointed by the queen archbishop of Canterbury. The subsequent history of Archbishop Parker, it has been said, was the history of that church of England. It was under his presidency, that the thirty-nine articles were finally revised and subscribed to by the clergy, 1562. He died, 1575.

Sydenham, near London, 1863.  
**Fayne, John Heward**, American dramatist, was born at New York, 1792. His first appearance as an actor was in that city in 1809. He was a successful actor for thirty years, and also wrote several plays, of which the best known are *Brutus*.

Persia. During the six years he spent in that country he began to study the cuneiform or wedge-shaped inscriptions, and made a translation of the famous Behistun inscription of Darius, which he published in the *Journal of the Asiatic Society*. He died at London, 1895. He wrote a number of books, among which are: *England and Russia in the East; The Cuneiform Inscriptions of Western Asia; Outline History of Assyria*, etc.

**Bayleigh** (rd'li). **John William Strutt, Lord**, distinguished English physicist, was born in 1812, graduated at Trinity college, Cambridge, in 1865, and became a fellow in the following year. He succeeded to the title of baron in 1873, was professor of experimental physics at Cambridge, 1879-84, and of natural philosophy at the royal institution, London, 1887-1905.

**Raymond, George Launing**, American educator and author, was born at Chicago, 1839. He was graduated at Williams college, 1862; received a degree; A. M., Princeton; L. H. D., Rutgers; graduated at Princeton theological seminary, 1865, and was a student in Europe, 1865-68. professor of aesthetics, 1893-1905, Princeton; professor of aesthetics, George Washington, since 1905. Author: *Colony Ballads; Ideals Made Real; Orator's Manual; Ballads of the Revolution; Sketches in Song; Art in Theory; Pictures in Verses; Rhythm and Harmony in Poetry and in Music; Proportion*.

**Raymond, Henry J.** American journalist, was born at Lima, N. Y., 1820. He was graduated at the University of Vermont in 1840, and after serving for a number of years on the staff of the *New York Tribune* and other papers, he in 1851 founded the *New York Times*, which speedily took rank among the leading journals of the country. Died, 1869.

**Bayner, Isidor**, lawyer, United States senator, was born in Baltimore, Md., 1850. He was educated at the University of Maryland and at the University of Virginia, where he completed the academic and law courses. He was admitted to the Baltimore bar in 1871; member of congress 1886-92, and attorney-general of Maryland in 1899. He was counsel for Rear-Admiral Schley before investigation commission in 1901, and United States senator from Maryland, since 1904. He is recognised as one of the leading lawyers of the senate, is a finished orator, and an authority on

**Read, Thomas Buchanan**, American poet and painter, was born in Chester county, Pa., 1822. He entered a sculptor's studio in Cincinnati, afterward studied painting, and in 1841 settled in Boston, where he began to paint portraits. In 1846 he returned to Philadelphia, and in 1850 went to Florence, where he spent most of the rest of his life. He died at New York, 1872.

**Meade, Charles** was a distinguished English novelist, was born in Oxfordshire, England, 1814. W. graduated at Oxford, secured a fellowship there, and in 1847 was admitted to the bar as a member of Lincoln's Inn. He began his literary career by play-writing; studied the art of fiction for fifteen years and first made his mark as novelist in 1852, when he was nearly forty, by the publication of *Peg Woffington*. This was followed in 1856 by *It is Never too Late to Mend*, and in 1861 by *The Cloister and the Hearth*, the last his best and the most popular. He died in London 1884.

**Réaumur** (ré-ô-mür'), **René Antoine Ferchault** de, French naturalist and physicist, was born at La Rochelle, France, 1683. He was educated at Poitiers, Bourges, and Paris, and was elected a member of the academy of sciences in 1708. He discovered the method of tinning iron; and invented the Réaumur thermometer. He died in 1757, leaving behind him a voluminous array of works, the most important of which is the *Mémoires pour*

**Récamier** (ré'ka'mpé'). **Mme.** (née Jeanne Françoise Julie Adélaïde Bernard), French woman of society, was born at Lyons, France, 1777. At fifteen she was married to the painter Louis Récamier, but she was never united to him, and was attracted to her salon at Paris a brilliant circle during the consulate and empire. A record of the splendid social triumphs of Mme. Récamier would involve notice of nearly all that was distinguished in Paris during a space of about fifty years. She became a power in the whole of French society, and her influence was the chief fortune which ordinarily would have involved the extinction of even more solid celebrity. Died, 1849.

**Reclus** (*Reklus*). **Jean Jacques Ellise**, French geographer, was born at St-Foix-la-Grande, France, 1830. He was educated at Montauban and Berlin. An extreme democrat, he left France after the coup d'état of 1851. In Switzerland he began his masterpiece, *Nouvelle Géographie Universelle*, wrote also a physical geography, *La Terre; son aspect, son histoire, son avenir*. He died in 1905. In 1893 he became a professor at Brunsia. Died, 1905.

**Red Jacket, or Sa-go-yew-at-hs.** "He keeps them awake," a noted chief of the Seneca tribe of Indians, was born at Old Castle, on Seneca lake, New York, about 1751. He was a friend of the whites, though he wished to have the Indians keep their own lands; and, when the six nations made a treaty to sell theirs, he opposed the treaty in an eloquent speech, 1784. Some years after this he visited General Washington, who gave

him a silver medal. In later life he visited New York and Washington, and the speeches that he made there are among the finest specimens of Indian eloquence. He died at Seneca village, near Buffalo, N. Y., 1830.

Reed, Thomas Brackett, American lawyer and legislator, was born at Portland, Me., 1839, and was graduated from Bowdoin College in 1860. He was a member of the Maine legislature; attorney-general of the state; and was elected to congress in 1876. His ability was so clearly recognized that he soon became the acknowledged leader of the republican party on the floor; and, when his party secured a majority of the house of representatives in the fifty-first congress, Reed was chosen speaker. He served in congress until 1899, and was elected speaker of the fifty-fourth

and fifty-fifth congresses. Died, 1902.

**Reed, Walter**, American surgeon and bacteriologist, was born in Virginia, 1851. Received his medical education at University of Virginia and at Bellevue hospital in New York. Reed demonstrated that typhoid fever is spread in camps through flies and personal contact, rather than by infected water, and that yellow fever is caused only by the bite of a certain kind of mosquito. By means of the precautions he urged after the Spanish war, yellow fever was practically exterminated in Cuba. He died, 1902.

**Leaves, John Sims**, English tenor, was born at Shooter's Hill, Kent, 1822. He went to Paris, 1843, in order to perfect his voice and style, and on his return to England in 1847, was recognised as the first tenor in that country; his position was maintained for a number of years. In 1852 he became professor in the Guildhall school of Music, London, and retired from the stage, returning to concert work, however, in 1896. He died at Worthing, Sussex, 1900.

**epiglotomatus** (*ep-i-j-e-mot-ah's*), the name given to him from his birthplace at Königsberg (*Mons Regius*) to the mathematician and astronomer Johann Müller. He was born in 1436, studied at Vienna, and in 1461 accompanied Cardinal Bessarion to Italy to learn Greek. In 1471 he settled in Nuremberg, where, with Bernhard Walther, he labored at the "Alphonsine tables," and published *Ephemerides 1475-1600* in 1473. Died, 1476.

**Regnard** (re'ngär'), **Jean François**, French dramatist, was born at Paris, France, 1655. After a roving and adventurous life in various countries, he returned to France about 1683, and became prominently connected with the ministry of finance. Regnard was one of the best followers of Molière, and is regarded as second only to that great master as an exponent of French comedy. Died, 1709.

**Regnault** (rə'nyəʔ). **Henri**, French figure and genre painter, was born in Paris, 1843. He studied there and at Rome, later making a study of Velasquez in Madrid. His equestrian portrait of Marshal Prim was one of the finest of the century. Regnault enlisted in the army during the Franco-Prussian war and was killed at Buzenval, 1871.

**Légnant, Henri Victor**, French chemist and physicist, was born at Aix-la-Chapelle, 1810. In 1841 he succeeded Dulong as professor of physics in the Collège de France; in 1847 he became chief engineer of mines, and in 1854 director of the porcelain factory of Sevres. He rendered distinguished service to science by his exact determination of physico-chemical constants, and his criticism of the law of Boyle and Mariotte. Died, 1878.

**Régner** (rā'gā), **Mathurin**, French poet, was born at Chartres, 1573. After a life of dissipation he became in 1609 canon of the cathedral of Chartres, and was called "the good Régner," on account of his amiability. Boileau called him the best satirical poet before Molière. He died

at Rome, 1613). **Marcus** **Atilius**, Roman general, was consul in 207 B. C., when he took the **Agri** into Gaul, received a triumph, and in 205 B. C. he was a second time consul, and in conjunction with his colleague, **Manlius**, defeated the Carthaginian fleet of 250 sail under **Hanno** and **Hamilcar**, landed at **Clypea**, and ravaged the coast of **Spain**. **Scipio** the Carthaginian, in 206, defeated him and took him prisoner. After five years' captivity he was sent in 200 B. C. to Rome, along with an embassy, on condition that he would remain a negotiator between Rome and Carthage. He persuaded the Senate to refuse to make peace, and returned to Carthage, where he was put to death.

about 250 B. C.

**Ada** (dā'dā; dā'dā). **Ada**, actress, was born in Limerick, Ireland, 1850. She came to the United States in childhood, made her first appearance on the stage at fourteen, in Newark, N. J., and played in Philadelphia, Baltimore, Albany, and Louisville stock companies. In 1870 she was engaged by Augustin Daly to fill leading positions in Daly's theater, and continued with him until his death, in 1899.

lich (rik), D. Emil, Austrian author and lecturer, was born in Eperjes, Hungary, 1854. He was educated at Prague, Budapest, and Vienna University; J. U. D., Vienna. Author: *History of Civilization; Græco-Roman Institutions*, Oxford lectures; *Hungarian Literature; Foundations of Modern Europe*, etc.

**Nield, Sir James**, British physician, physician-in-ordinary to King Edward and to the prince of Wales, was born in Scotland, 1849. He was graduated at Aberdeen University, M. A., 1869; M. D., 1875; LL. D., 1895; honorary LL. D., Glasgow, 1901. He studied at Vienna, 1876-77; practiced in Scotland, 1877-81; resident physician to Queen Victoria, 1881-1901; physician extraordinary, 1887-89; physician-in-ordinary, 1889-1901.

**Weld, Robert Gillespie**, Canadian railway builder and capitalist, was born in Scotland, 1840. In 1871 he came to America and had charge of the construction of the international railway bridge at Niagara Falls, the international bridge over the Rio Grande, and the Lachine bridge over the St. Lawrence.

son, Thomas, Scottish philosopher, was born at Strathairn, Scotland, 1710. He took his degree at the University of Aberdeen in 1726, and continued to act as librarian there for a number of years. In 1763 he was chosen to succeed Adam Smith as professor of moral philosophy in the University of Glasgow, and henceforth devoted himself to mental and metaphysical speculation, resigning his chair in 1781. In 1764 he published his *Inquiry into the Human Mind*; and in 1788, his *Active Powers of the Human Mind*. Died, 1796.

**Mildred Whitelaw**, American diplomat and journalist, was born at Xenia, Ohio, 1837. He was graduated from Yale University, 1860; married, 1869; moved to New York City, 1870; Princeton, 1879; Yale, 1901; Cambridge, 1902; D. C., Oxford, 1907; aide-de-camp on the staff of General Thomas A. Morris and W. S. Kitchener in India, 1908-1910. He was attached to the editorial staff of *New York Tribune*; managing editor, 1869; editor-in-chief, and chief writer, 1870-1871; assistant manager, 1871-1872; returned to America, 1872; went to France, 1889-92; special ambassador of the United States to Queen Victoria's jubilee, 1897; returned to America, 1898; special ambassador to the coronation of Edward VII, 1902, and United States ambassador to England during the Boer War, 1900-1902. His books are: *Tour; Ohio in the West; Schools of Journalism; Newspaper Tendencies; Town Hall Suggestions; Two Speeches at the Queen's Jubilee; Some Consequences*

**Pinch (rins).** **Paul Samuel**, American educator and author. Professor of political science, University of Wisconsin, since 1899, was born at Milwaukee, Wis., 1862. He graduated from the University of Wisconsin, 1892; Ph. D., 1898. Author: *The Common Law in the Early American Republic*, 1905; *The American Republic in the Nineteenth Century as Influenced by the Oriental Situation*; *Colonial Government*; *Colonial Administration*; *Colonial Development*. Lectured in Europe.

**Rajne (ra'dshān).** **Madame** (Gustavie Rájo), French actress, was born in Paris, 1857. She married **Paul**, director of the Théâtre de la Renaissance, Paris, and was educated at the Paris Conservatoire, under Regnier, and made her debut at the Vaudeville theater in *Revue des Deux* in 1879. She has since played in many theaters and obtained an enormous success. She now manages her own theater in Paris, the Théâtre

**Rembrandt** (rem'brānt), **Van Ryn, Paul Harmens**, a Dutch painter, was born in Leyden 1607, and died 1669. He studied in Leyden and Amsterdam, and about 1623 fitted up a studio in his father's windmill on the bank of the Rhine. In 1628 he executed his first great work, a portrait of his mother, and in 1630 settled in Amsterdam, where he gained great celebrity, and founded a school of art based on the natural style.

His paintings and etchings, exhibiting the most powerful effects of light and shade, brought great prices, and he taught a large number of pupils. He preferred the imitation of vulgar nature to the cultivation of ideal beauty; and his manner depends upon the elaboration of a single element in art, that of *chiaroscuro*.

Among his historical pictures are *The Sacrifice of Abraham*, *The Woman taken in Adultery*, and *The Descent from the Cross*; his portraits include *The Jew Merchant* and *The Night Watch*. His peculiar style is perhaps most strikingly displayed in his etchings, especially in his *Christ Healing the Sick*. He was twice married; his second marriage involved him in difficulties, and he became bankrupt in 1856. He executed over 600 paintings, now variously valued at from \$500 to \$20,000.

**Remington, Frederic**, American artist, illustrator, sculptor, and author, was born in St. Lawrence county, N. Y., 1861. He early studied at Yale art school, and at the art students' league of New York, after which he led the life of a cowboy and

**Knecht, William Henry**, American sculptor, was born in Carroll county, Md., 1825. He received a common school education, and at the age of twenty-one began his career as a marble worker in Baltimore. In 1855 he went to Italy. He completed Crawford's bronze doors for the capitol at Washington; executed a bronze statue of the Chief Justice, Taney, under a commission from the state of Maryland, unveiled in Annapolis in 1872. He died at Rome in 1874, leaving his property as a fund for the aid of indigent

**Ripley, George**, American scholar and critic, was born at Greenfield, Mass., 1802. He graduated at Harvard College, 1823, and was ordained to the pastorate of a Unitarian church at Boston. This he held until 1841. In the meantime he had become one of the leading spirits in the transcendental movement, the first meeting of the club being held at his house in 1836; and on leaving the pulpit he started the Brook Farm experiment. He was co-editor of the *New American Cyclopedia*. Died, 1880.

**Elipon, Bishop of.** See Carpenter, Rt. Rev. William Boyd.

**Ristori** (*ris-to-ri*), Adelaide, Italian actress, was born in 1821, the child of strolling players. In America she played with Edwin Booth. Her leading parts were: Francesca da Rimini, Marie Stuart, Phedra, Lady Macbeth, Judith, etc.

**Ritter, Karl**, German geographer, was born at Quedlinburg, Prussia, 1779. He studied at Halle, became professor of geography at Berlin in 1820, and afterward member of the academy and director of studies in the military school. With Ritter as the founder of comparative geography, began a new epoch in the history of geographical science. He died at Berlin, 1859.

**Rive (rév), Amelia**, Princess Amélie Troubetzkoy, American novelist, was born at Richmond, Va., 1863. Her earliest production was a series of stories entitled *A Brother to Dragons*. This was followed by a sensational work called *The Quick or*

**the Dead** which met with considerable popularity. **Elvire** (1819-72), **Erison**, English painter, was born in London, 1840, of Huguenot ancestry. He was graduated at Oxford in 1867, M. A., D. C. L. He had exhibited at the royal academy in 1858, and from the appearance of *The Poacher's Widow*, 1866, he has been regularly represented there and at various international exhibitions. He became A. R. A. in 1878, R. A. in 1881.

**Robbia** (rób'byä) Lucca della, Italian sculptor, was born at Florence, about 1400. He decorated the campanile of the cathedral at Florence; made a bronze door for the sacristy of the same; and was famous for his work in enameled terra cotta, since known as "della Robbia's" ware. Died 1482.

*The Prisoner of Mademoiselle*; *The Heart that*  
*Knows*; *In the Deep of the Snow*; *The Young*

**Robert, Frederick Sleight**, baron of Kandahar and Waterford, distinguished British general, was born at Cawnpore, India, 1832. He was educated at Eton College, at Addiscombe, and at Sandhurst; D. C. L., Oxford, LL. D., Cambridge. At the age of nineteen he joined the Bengal artillery

and served through the Indian mutiny. For his gallant services during the storming of Lucknow he took part in the Abyssinian war, and was made a C.B. In the Afghan war of 1878 he commanded the British field force which defeated the Afghans at Kandahar, and won the Victoria Cross for his famous march from Kabul to Kandahar, effecting the relief of the latter place. For his gallantry in the battle of Shivanai he was promoted Major-General, and earned from his soldiers the familiar sobriquet of "Little Bobs" or Bobs Bahadur. In 1890 he raised the 1st Buffs as a new regiment, which was made field-marshal and commander of the forces in Ireland. In 1899 he proceeded to South Africa to command the troops sent to assist the Boers, where he invaded the Orange Free State and the Transvaal and turned the fortunes of that country over to the British. After the close of the war he returned to England to succeed Lord Wolseley as commander-in-chief of the army, a post which he held until 1904.

**1904-1906**.—*The Boer War; The Rise of Mafeking; The Relief of Ladysmith; The Siege of Mafeking; and Forty-one Years in India.*

**Roberts, Morley**, English novelist and journalist, was born in London, 1857. He was educated at Owens College, served before the mast, on Australian sheep-runs, on Texan ranches, on California railways, and British Columbian saw-mills, and multiplied his experiences in the South seas, the Transvaal, Rhodesia, and Corsica. Between 1887 and 1904 he published some forty works, mostly novels.

**Robertson, Frederick William**, English pulpit orator and writer, was born in London, 1816. He was educated for the army at Tours and Edinburgh, but subsequently studied at Oxford, 1837-40, and devoted himself to the church. In 1842 he was settled at Cheltenham; in 1847 became incumbent of Trinity chapel, Brighton.

where his earnestness, originality, and wide sympathy arrested attention, but provoked suspicion. He resigned in 1853 because his vicar had refused to confirm his nomination of a curate, and died the same year. His *Sermons* were published complete

Robertson, William, British historian, was born in Northwick, Nidlothian, 1721. He distinguished himself in the general assembly of the church, and became leader of the moderate party. He was one of the ministers of Greyfriars church, Edinburgh, and principal of the university from 1762. He wrote *History of Scotland During the Reigns of Mary and James VI.*; *History of the Reign of the Emperor Charles V.*; and *History of America*. He died in Edinburgh when nearly seventy-one years old, 1793.

**Roberts, William Henry**, clergyman, was born at Holyhead, Wales, 1844; graduated from the College of the City of New York, 1863; and Princeton Theological Seminary, 1873; D. D., Western University of Pennsylvania, 1884, Lafayette, 1907;

L.L. D., Miami University, 1888. Assistant Librarian of Congress, 1866-71; ordained Presbyterian minister, 1873; Librarian Princeton Theological Seminary, 1876; professor of Church History, Lane Theological Seminary, Cincinnati, 1896-98; president Glasgow, Scotland, Pan-Presbyterian Council, 1890; president Inter-church Conference on Federation, New York, 1905; moderator Presbyterian General Assembly, 1907. Author: *History of the Presbyterian Church; The Presbyterian System; Laws Relating to Religious Corporations*, etc.

**Despièrre** (*Des-pyair'*). **Maximilien Marie Isidore**, noted French revolutionist, was born at Arras, France, 1758. He was elected to the National Assembly in 1791, and in 1792 was and recognized chief of the extreme party he was one of the main agents in procuring the execution of Louis XVI. In 1793 he was elected to the 1792. A period of terror followed; Marie Antoinette and the infamous duka of Orleans were the first victims. Despièrre was one of the men whose moulds were next immolated, on a suspicion of having favored a reactionary policy; and for months he was the victim of the most cruel persecutions. Finally, in 1794, he was executed for safety. Marie became the victim of an indiscriminate quasi-judicial slaughter, in which some thousands of lives were sacrificed. A conspiracy was organized against Despièrre in Arras, and he was arrested. At the convention his arrest was accomplished. A rescue by the populace followed, but he refused to take advantage of the opportunity, and, while he hesitated his enemies acted, and in July, 1794, he closed his

**Robinson, James Harvey**, American historian and educator, professor of history, Columbia University, since 1896, was born at Bloomington, Ill., 1863. He was graduated at Harvard, 1887; Ph. D., Freiburg, 1890. Author: *The German Bunderrail; Petrarch, the First Modern Scholar and Man of Letters*, with H. W. Rolfe.

**Johnson, William Calthian**, American educator and legal writer, dean of law school, Catholic University of America, since 1895, was born at New York City, 1845; graduated at Dartmouth College, 1864; graduated in divinity, General Theological Seminary, Protestant Episcopal church, 1867; studied law, and was admitted to the bar in 1864; LL. B., Dartmouth, 1870. He practiced law in New Haven, Conn., 1870-76; judge of city court, New Haven, Conn., 1869-71; judge of court of common pleas, New Haven county, Conn., 1874-76; member of the legislature of Connecticut, 1876-77; author of *Constitutional Law; Elementary Law; Civil Remedy; Law of Patents; Forensic Oratory; Elements of American*

**able, Virginia Huntington**, author and editor, was born at Salmon Falls, N. H., of an old colonial family, and educated in Boston, Mass.; has specialized as a writer on furniture, ceramics and interior decoration; associate editor of *The House Beautiful*. Author of *Interior Decorations*; *Shamrock and Thistle*; *Historic Styles in Furniture*; etc.

at Wigan, Lancashire, England, daughter of Charles Robson. She was graduated at St. Peter's Academy, Satan Island, New York, 1897, and made her professional debut at California theater, 1897. She played Juliet to the Romeo of Kyrie Bellaw, 1903; starred in *Merely Mary Ann*, 1903-05, and headed an "all-star" cast in a special production of *Six Weeks to Conquer*, at the New Amsterdam theater, New York, under Liebler and company, 1905.

**Donatien de Vimeur, Comte de**, marshal of France, was born in 1725. He served in the war of the Austrian succession; distinguished himself in the Seven Years' war, cooperated with Washington at the siege and capture of Yorktown, during which he was taken prisoner. In 1791 he became commander of the French army in the north, but resigned in 1792, and narrowly escaped execution during the reign of terror. Died, 1807. See **La Rocheffoucauld**. **France**.

**Rockefeller, John Davison**, American capitalist and philanthropist, was born at Richford, N. Y., 1839, and moved to Cleveland, Ohio, 1853. He received a public school education; was clerk in

forwarding and commission house, and as nineteenth a partner in the firm of Clark and Rockefeller, commission merchants. Subsequently the firm became Andrews, Clark and company, and engaged in the oil business. In 1865 the firm, with the Standard Oil Co., was organized as the Standard Oil works at Cleveland, and this was consolidated with others in the Standard Oil company, 1870. Other interests were later acquired, and in 1882 the Standard Oil Co. was dissolved, 1892. The various Standard oil companies are now operated separately, with Rockefeller at the head of the entire business. He has given a total of more than \$55,000,000 to

**orchestrator, John Davison, Jr.,** capitalist, son of preceding, was born in 1877. He was graduated at Brown University, and married, in 1901, Abby Green Aldrich, daughter of Nelson W. Aldrich, United States senator from Rhode Island. He is associated with his father in his various business enterprises, and is a trustee of the University of Chicago.

**Bookefeller, William**, capitalist, brother of John Davison, was born at Richford, N. Y., 1841. He was educated at Oswego, N. Y., and Cleveland, Ohio; was bookkeeper and late partner in produce commission trade; soon after joined his brother, John Davison, in oil business, and since 1865 has been at the head of the business in New York.

born at the end of the twenties in New York.  
**Odin** (rô'dan'), **Auguste**, French sculptor, was  
 born at Paris, 1940. He studied under Barye,  
 and began to exhibit in the salon in 1878. He  
 has produced a number of great scriptural and  
 symbolical groups, but is best known by his  
 portrait busts and statues, notably the bust and  
 the monument of Victor Hugo. He is generally  
 acknowledged to be the greatest of living sculptors.

**odner, George Brydges, Lord**, English admiral, was born in 1719. In 1759, after twenty-eight years of active service, he was made rear admiral. In 1762 he became vice admiral, and in 1764 was made a baronet. During the Seven Years' war he accomplished the relief of Gibraltar and Minorca and defeated, near Martinique, the French fleet, under Count de Guichen; took Eustatia from the Dutch, with 250 ships and other booty. He was elevated to the peerage as Baron Rodney, and received a pension of 2,000 pounds per annum for himself and his successors. Died, 1792.

**cebling** (1844-1919), **John Augustus**, American civil engineer, was born in Muhlhausen, Prussia 1845. He emigrated to the United States in 1831, and in course of years became the designer and constructor of many great public works, among them the canal aqueduct across the Allegheny river, and the Monongahela suspension bridge, both at Pittsburgh; the suspension bridge at Niagara; the Ohio bridge at Cincinnati, etc. He died in 1899, having just before projected the bridge over the East river.

**Leobling, Washington Augustus**, American engineer, was born at Saxtonburg, Pa., 1837. He was graduated at Rensselaer Polytechnic Institute, 1857; joined his father in construction of Pittsburgh suspension bridge across Allegheny river. The Brooklyn bridge was undertaken by his father, but the latter's death in 1869 left the entire construction in his hands, and he directed it to completion. He is president and director of the John

tion. He is president and director of the John A. Roebling's Sons company, manufacturers of iron and steel wire and wire rope, Trenton, N. J.

**Röntgen (rân'gen), Wilhelm Konrad**, eminent German scientist, distinguished investigator of physical problems, and discoverer of the "X" or Röntgen rays, was born in the province of Düsseldorf, Prussia, 1845. In December, 1895,

He was communicated to the Würzburg physicist and medical society his remarkable discovery of the new and powerful "X-rays," since known by his name, and in the following month he described his discovery at the celebration of the semi-centennial of the founding of the Berlin physical society. Later he demonstrated the rays in the presence of the emperor of Germany, who decorated him, and Prince Ludwig of Bavaria created him a baron. In 1901 he received the Nobel prize for physics.

**Wade, Henry** Wade, American educator, dean of the law department of Yale University since 1904, was born at Holland Patent, N. Y., 1833. He was graduated at the University of Michigan, 1854; LL. D., Wesleyan University, Conn. He was admitted to the bar, 1877; was professor of law, University of Michigan, 1883-85; dean of same, 1885-90; president of Northwestern University, 1890-1901, and professor of law at Yale, 1901-03. Author: *Illinois Citations*; *Export Treaties*.

**Waters, Randolph**, American sculptor, was born at Waterloo, N. Y., 1825. After following mercantile pursuits for a number of years in early life, he went to Rome to study the sculptor's art. Among the works for which he is distinguished are many memorial statues in different parts of the country. Died at Rome, 1892.

**roland** (*ro'lan'*), **Marie Jeanne**, wife of Jean Marie Roland de la Platière, daughter of Pierre Gratiot Philpon, was born at Paris, France, 1754. Her husband was obliged to flee from Paris, May 31, 1793, and the same night she was arrested and imprisoned in the Abbaye. Summoned before

Recommended to Vincenzo Gonzaga, Duke of Mantua, he was sent on a mission by the duke to Philip III. of Spain, and on that occasion painted several portraits of Spanish noblemen. He also spent considerable time at Venice and Rome making copies for the duke, and executing independent works, which added largely to his reputation. In 1608, after an absence of eight years, Rubens returned to Antwerp on account of the illness of his mother, but about a year later he had accomplished his journey. He intended to return to Mantua, but was induced to remain by the Archduke Albert, governor of the Netherlands.

In 1621 he visited Paris by invitation of Maria d' Medici; and in 1625 completed the series of sketches for the pictures destined to adorn the palace of the Luxembourg. Rubens was sent by the Infanta Isabella widow of the Archduke Albert, on a diplomatic mission to Philip IV. of Spain in 1628; and in the following year on a similar mission to Charles I. of England, by which he was known to the English court in 1630. He returned to Antwerp in 1640.

**References.**—*Stevenson's Peter Paul Rubens*; article in *North American Review* (November, 1900) by Benjamin Constant; *Early Flemish Painters*, by Sir J. A. Crowe; and *Original Unpublished Letters of Philippe Rubens*, by Sir Peter Paul Rubens, by W. Norton, 1891.

musicians, by the name of the composer, **Antony Gregor**, Russian composer and pianist, was born at Wechotyets, near Jassy, in Russian Bessarabia, 1829. At Berlin he studied composition under Dehn. In 1872-73 he visited America, and after 1867 he spent his time in traveling and composing. As a pianist he was the only rival, technically, that he had ever had, and as a composer he worked in the style of Chopin, with a wonderful fertility of imagination, and many of them by a gorgeous original coloring. Died, 1894.

**Rudolf**, or **Rudolph I.**, founder of the Hapsburg Imperial dynasty, was born at Schloss Limburg in the Breisgau 1218, and, becoming a warm partisan of Frederick II., increased his possessions by inheritance and marriage, until he was the most powerful prince in Swabia. In 1273 the electors chose him German king. Rudolf did much to suppress the robber knights. He died at Spire in 1291.

**Rudolf, or Rudolph II.**, born at Vienna, 1552, eldest son of the emperor, Maximilian II., became king of Hungary in 1572; king of Bohemia, with the title "king of the Romans," in 1575; and emperor on his father's death in 1576. He died in 1612 after an inefficient reign.

**Lundberg** (roo-ne-ber'y), **Johan Ludwig**, national poet of Finland, was born at Jacobstad, 1804. He was educated at the University of Åbo, where he afterward lectured. His epic *Idylls*, *The Elk Hunters*, *Christmas Eve*, his epic *King Fjalar*, *Fänrik Ståls Sägner*, etc., are the finest poems in the Swedish language, and are characterized by repose, simplicity, artistic finish, and the warmth of national life. He died in 1877.

**Boff, Henry Waldmar**, editor, author, was born in Germantown, Pa. 1867, and was graduated from Indiana University 1900; post-graduate work at University of Chicago, 1901; anthropology and comparative religions, and at Columbian (now George Washington) University, two years, 1902-03; Ph.D., 1904. Editor, *Journal of American Geography*, D. C. L. E. Columbian, 1901, George Washington, 1907; *Litt.* L. 1910. Assistant in anthropology, University of Chicago, 1901; instructor in psychology, logic, ethics and philosophy of history, Pennsylvania State College, Audubon, 1903-04. *Journal of American Geography*, 1904-05. *Ecology and Sciences Politiques*, Paris, in comparative politics and jurisprudence, 1901-2. Associate editor, *Journal of American Geography*, 1905-06. *Journal of American Geography*, 1907-78. Member American academy of political and social sciences, national geographical society. Has traveled extensively in Europe, Asia, Africa, and Australia. Editor: *Home and State; Woman in the Middle Ages; Century Book of Facts; Constitution of the United States; The American People; The American Leaders of Men; Universal Cyclopaedia Handbook; The Standard Dictionary of Facts; Masters of Action*.

**Maxwell, The Volume Library, etc.**  
**Musart, James**, English, a third son of the first Viscount of Salm, was born at the point of Frederic's death, and Elizabeth's daughter of James I. of England, was born at Prague, 1619. In 1642 he returned to England and for the next three years was in the service of the king, and now, as the royalist cause, winning many a battle by his resistless charges, to lose it as often by a too headlong pursuit. In 1645 his surrender of Bristol to Cromwell, and his flight to France, created him duke of Cumberland and a generalissimo, that he dismissed him. A court-martial, however, cleared him, and he returned to his duties. In 1650 he was again in France, but in 1652 he was recalled to England. He now took service with France, but in 1648 accepted the command of that portion of the English fleet which had espoused the king's cause. He was killed at the battle of Beachy Head, a few days later. He died in 1682.

**Rush, Benjamin**, American physician, was born near Philadelphia, Pa., 1745. He was graduate at Princeton in 1760, studied medicine at Edinburgh and at Paris, and became professor of chemistry in the Philadelphia College of Medicine. He was a founder of the Philadelphia dispensary, the first in America, and of the college of physicians, and was given several medical professorships besides the one he already held at Philadelphia. Among his medical writings are: *Medical Inquiries and Observations; Essays; and Discourses of the Mind*. He died at Philadelphia, 1813.

**Foster, John.** An architect and writer on art; was born in London, 1819. He studied at Christ Church, Oxford, where he graduated Bachelor of Arts in 1839, and took his degree in 1842. The year following appeared as first prize in the Royal Academy's annual competition for the Paine Prize. His primary mode of landscape painting was by water-colours. In 1846 he published *The Seven Lamps of Architecture*, and from 1851 to 1863 *The Stones of Venice*, both being important contributions to the study of the significance of domestic architecture. About 1860 he became deeply interested in the social problems of the day, and wrote *Socialism and Manners* (London). Among his later works are: *Seas and Lakes; The Ethics of the Dust; The House of the Future*. He died in 1875. His autobiography, completed in 1888. He was also selected Slade professor of fine arts at University College, London, in 1873, and held the post in 1884 on account of failing health. For several years prior to his death he lived in retirement.

**Russell, Annie**, actress, was born in Liverpool, England, 1869, and made her first stage appearance at Montreal, Quebec. She afterward appeared in New York in *Pinefort*, was in South America and West Indies in varied repertory; She has since appeared as a star in *Miss Hobbs*, *A Royal Family*; *The Girl and the Judge*; *Mice on Men*; *Jimmy the Carrier*; *Brother Jacques*; *Majesty Barbara*; *Midsummer Night's Dream*, etc. She married Oswald Yorke, an English actor, 1904.

**Russell, James Earl**, American educator, dean of Teachers College, Columbia University, since 1898, was born at Hamden, N. Y., 1864. He was graduated at Cornell in 1887; Ph. D., Leipsic, 1894; professor of education, Teachers' College, since 1897; and Barnard professor of education, Columbia, since 1904. Author: *The Extension of University Teaching in England and America*; *German Higher Schools*.

**Russell, John Earl**, British statesman, third son of the sixth duke of Bedford, was born in 1792. He was educated at Westminster and Edinburgh, entered parliament as a Whig in 1813; became secretary of the treasury, 1823; and was instrumental in the repeal of the test and corporation acts in 1828, and the passing of the Catholic relief act in 1829; led the opposition, 1841-44; was prime minister, 1846-52; went as British plenipotentiary to the Vienna conference, 1855; was foreign secretary under Lord Palmerston, 1855; again became prime minister in 1859, but resigned on the defeat of his reform bill, 1860. **Died**, 1878.

**Kuyter** (ro'i'tér; rú'tér), **Michael Adriaanszoon** de, Dutch admiral, was born at Vlissingen in 1607, of poor parents, who sent him to sea as a cabin-boy when only eleven years old. He became a warrant officer, and in 1637 rose to be captain in the Dutch navy. After serving several years in the Indian seas he was, in 1641, made rear admiral. He had his legs shattered in an engagement off the coast of Sicily, and died of his wounds in 1676.

of Builly, and died for his wounds in 1678.  
 1680. **St. John's.** **John** (John) **Rome**  
 Catholic archbishop, was born at Thurles, County  
 Tipperary, Ireland, 1831. He was graduated  
 Coler College, 1852; LL. D., University of New  
 York and University of Pennsylvania. He was  
 chaplain of the Gratiot state military prison and  
 of the U. S. Army, 1861-62. He was rector and  
 rector of Annunciation church, delivered lectures  
 in English at Rome, 1868, on invitation of  
 Pope Pius IX. He was consecrated, 1872, titular  
 bishop of Tricomia in Palestine and made co-  
 adjutor bishop of the same province, and was  
 consecrated, 1883, and in June, 1885, was transferred  
 to the see of Philadelphia, Died 1911.

**Ryan, Thomas Fortune**, American financier, was born in Nelson county, Va., 1851. He began business life, 1868, in a Baltimore dry goods house; entered Wall street, 1870, and became a member of the New York stock exchange, 1874. He was vice-president of the Mortuam trust company; director of the Seaboard air line railway, American Tobacco company, Fifth Avenue trust company, Industrial trust company of Providence, and many other corporations; and purchased a controlling interest of the stock of the Equitable life insurance society of the United States in 1900.

**Sachs** (saks), Hans, noted German poet, was born at Nürnberg, 1494. He was the son of a tailor and by trade a shoemaker. He learned "the mystery of song" from a weaver. In 1568, examining his stock for publication, he found that he had written over 6,000 pieces, among them 208 tragedies and comedies. He sank in oblivion during the seventeenth century, but his memory was revived by Goethe in the eighteenth. He died in 1576.

**Sachs, Julius von**, botanist, was born at Breslau 1832. In 1867 he became professor of botany at Freiburg, and in 1868 at Würzburg. There he carried on important experiments, especially as to the influence of light and heat upon plants, and the organic activities of vegetable growth. He wrote extensively on botany, and is considered the founder of experimental vegetable physiology. Died at Würzburg, 1897.

**Sacy (sá'sé), Antoine Isaac, Baron Silvestre de**, was born in Paris, France, 1758. He was appointed in 1793 professor of Arabic in the school of oriental languages, and in 1806 of Persian in the Collège de France, besides which he held various other appointments. He founded the Asiatic society in 1822; was created a baron by Napoleon I., and entered the chamber of peers in 1832. His writings gave a stimulus to oriental research throughout Europe. He died in 1838.

**Sadi-Carnet.** See **Carnet.**  
**Sadi (ad-ad')** Persian poet, was born at Shiraz, about 1184. He studied science and theology at Bagdad, and from there made the first of fourteen pilgrimages to Mecca. He is called the "nightingale of a thousand songs," and the catalogue of his works contains twenty-two different kinds of writing in prose and poetry, in Arabic and Persian. Died, 1291.

**Sagasta** (*sá-gás-tá*). **Praxedes Mateo**, Spanish statesman, was born in 1827. He was obliged to leave the country for his share in the rising of 1856, and again, ten years later, to seek refuge in France. After the accession of Alfonso XII., he became president of the cortes, formed a liberal constitutionalist party, and having, in 1880, joined a new liberal combination, formed a coalition with Campos, which lasted until 1883.

**Sage, Russell**, American capitalist, was born in Oneida county, New York, 1816. Educated in the public schools, he became a grocer's clerk, and established himself as a wholesale grocer in Troy, 1839. He was a member of congress, 1852-56, removed to New York in 1863, purchased a seat on the stock exchange and associated himself with Jay Gould in extensive rail-

way operations, gaining a wide reputation by his close bargaining and successful speculation. His fortune was variously estimated at from \$50,000,000 to \$100,000,000. Died, 1908.

**Sage, Margaret Olivia Slocum**, philanthropist, was born at Syracuse, N. Y., 1828, daughter of Joseph Slocum; in 1859 married Russell Sage, at Watervliet, N. Y. She has given many millions of dollars to charitable and educational institutions.

**Saint Ambrose.** See *Ambrose*.

**Saint Ambrose.** See **Ambrose.**  
**Saint Augustine.** See **Augustine St.**  
**Saint Basil.** See **Basil.**  
**Saint Benedict.** See **Benedict.**  
**Saint Bernard.** See **Bernard.**  
**Saint Clair, Arthur.** American general, was born in Scotland, 1735. In 1777 he became major-general, and entered congress in 1785, of which body he was elected president two years later. In 1789 he was made governor of the Northwest territory.

He was Indian governor of the Northwest territory, and two years afterward suffered a defeat with heavy loss, at the hands of the Miami Indians. Died, 1818.

**Saint Columba.** See **Columba.**  
**Sainte-Beuve** (sant'êv'), **Charles Augustin**,  
 French literary critic, was born at Boulogne-sur-  
 Mer, 1804. In 1827 he became acquainted with  
 Victor Hugo, whose commanding influence drew  
 him into the romantic movement, and determined  
 for him a literary career. In 1837 he lectured at  
 Lausanne on Port-Royal, and these lectures con-  
 tain some of his finest writings; was elected in 1845

to the academy; and three years later lectured for a season at Lige University. During 1849-50 he contributed to the *Constitutionnel*. These contributions form his famous *Coursiers de Louvi* and his *Essai sur l'histoire de la philosophie*. His interest, critical insight, and breadth of sympathy, remain unsurpassed. He was elected a senator in 1865, and his popularity revived by his eloquent advocacy of freedom of thought. In precision, in subtlety, and in delicacy, his works, fifty-three volumes in all, stand alone in the literature of

**Saint Francis of Assisi.** See Francis St.  
**Saint Gaudens** (*saint gô'drân*), Augustus, American sculptor, was born in Ireland in 1848, and was brought to the United States in infancy. During 1861-66 he was a student at Cooper Institute, and at the academy of design, New York; went to Paris and studied at the Ecole des Beaux Arts under Jouffroy. He executed a number of notable

works, of which the most important are: *The Puritan*; *Paraguay*; *Lincoln*; *Peter Cooper*, New York; Colonel R. G. Shaw, Boston. He was awarded medals at the Paris, Buffalo and St. Louis expositions, and made an officer of the French legion of honor. Died, 1907.

**Saint Jerome.** See **Jerome**.

**Saint Louis IX.** See **Louis IX.**

**Saint Paul.** See **Paul**.

**Saint Peter.** See **Peter**.

**Saint Bernard.** See **Bernard**.

**Saint-Pierre** (sən'pîyər'), **Jacques Henri Bernardin** de, French writer, was born in Havre, France, 1737. He is best known for his beautiful story, *Paul and Virginia*, which has been translated into many languages. He died at Eragny-sur-Oise, 1814.

**Saint-Saëns** (sən'sāns'), **Charles Camille**, French composer and pianist, was born at Paris, 1835.

thence after a few months he went to Dresden, where he began the practice of composing during the night, which so fatally assisted in shortening his life. *Der Geister-seher* was written here, and the drama of *Don Carlos* was completed.

In 1787 he was invited to Weimar, where Goethe and he became the closest friends. Henceforth Schiller owed more to Goethe than to all other men. His *History of the Thirty Years' War* originally appeared in the *Sachsenkalendar* or *Year-Dameter*. On the occasion of the poet's marriage in 1790 with Charlotte von Lengefeld, the Duke of Meiningen made him a privy-councillor; the French republic also conferred on him the right of citizenship; and in 1802 the emperor raised him to the rank of nobility.

While staying for a year with his relatives in Württemberg, he wrote his exquisite letters on aesthetic culture. After 1795 the finest of his lyrics and dramas were produced—as *Der Spaziergang* and *die Lied von der Glocke* (Song of the Bell), Wallenstein, *Maria Stuart*, *Die Jungfrau von Orléans*, *Braut von Messina* and finally his *Wilhelm Tell*. He died 1805.

**References.**—In English we have the famous biography by F. Colburn (1810), and the excellent one by James Sime, H. Nevins, and T. Calvin. For evidence the following are of importance: E. Dowden's *Schiller's Friendship with Goethe*; F. Werner's *The Characteristics of Schiller's Drama*; and G. Schlegel's *Works illustrated by the German Artists*.

**Schlegel** (shô'pû), **August Wilhelm** von, German critic, poet, and scholar, was born at Hanover, 1767. In 1800 he published his first volume, a poem; and, in company with his brother, Friedrich Schlegel, he edited the *Wendekunst*, a valuable and most widely popular work was his *Lectures on Dramatic Art and Literature*, originally published in 1804, and which has since been translated into most European languages. In 1818 Schlegel, now ennobled, was appointed professor of history in the University of Bonn, and continued to devote his time to literary, historical, and philological research. He was one of the first students of Sanskrit in Germany, established the first printing press at Bonn, and an *Indische Bibliothek*, Diehl, 1845.

**Schlegel, Karl Wilhelm Friedrich**, German critic and author, brother of the preceding, was born at Hanover in 1772. He studied at Göttingen and Leipzig, and in 1797 published his first work, *The Greeks and Romans*, followed in the course of a year by his *History of Greek and Roman Poetry*. In 1808 he went to Vienna, where, in 1811, appeared his *Lectures on Modern History*, and in 1815 his *History of Ancient and Modern Literature*.

<b>Schleiermacher</b> (shl'f-er-mä'k'ir). <b>Friedrich</b> <b>Ernst</b> Daniel, German philosopher and theologian. Born 1768 in Breslau. In 1794 he became assistant clergyman at Landsberg-on-the-Warthe, where he remained for two years. The first work that won for him general recognition was <i>On Religion</i> , published in 1804. He returned from its spiritual torpor. He was professor at Halle, 1804-06, and in 1810 was called to a theological chair at Berlin. He was the author of <i>On Religion</i> (1811) appeared his <i>Brief Outline of the Study of Theology</i> . In 1817 his <i>Critical Essay on the Writings of Luther</i> ; and in 1821-22 his greatest work, <i>On Religion</i> , of which he published a second edition in 1830. He died in 1834.	<b>Principles of the Evangelical Church</b> . Died, 1834.

**Scley** (sArl), **Winfield Scott**, American admiral, was born near Frederick, Md., 1839. He was graduated from the United States Naval Academy, 1860; served in West Gulf blockading squadron, 1861-62; in 1863, he was promoted to be lieutenant. In 1864 he was promoted to be lieutenant commander of the department of modern languages at Annapolis. In 1884 took command of Greeley relief expedition and rescued Lieutenant Greeley and his survivors from the wreck of the ship. He was in command of the "flying squadron" on duty in Cuban waters in war with Spain; was in immediate command at the destruction of Cervera's fleet on Santiago, July 3, 1898. Promoted to admiral, April, 1900. He received the Medal of Honor for his gallant and heroic services in the war with Spain; a gold sword by the people of Pennsylvania; a silver sword by the Royal Arcanum; a gold and jeweled medal, with the thanks of the Maryland Legislature.

**Schliemann** (sh'lan), **Heinrich**, German traveler and archaeologist, was born at Mecklenburg-Schwerin, 1822. He excavated the ancient city of Troy in 1870, and in 1876 he began excavations on the site of the ancient city of Mycenae, in Greece, and the treasures found there are now preserved at Athens. He wrote an account of his work in *Mycenae, Tiryns, Ilios, Troja*, and other volumes. He died at Naples, 1890, and was

**Schmidt** (schmī), Nathaniel, professor of Semitic languages and literature at Cornell since 1898, was born at Hudiksvall, Sweden, 1862, and educated in the University of Stockholm, and at

Berlin. He was professor of Semitic literature at Colgate, 1888-96, and has gained an international reputation as a student and critic of Semitic and biblical literature.

**Chesfield (aké/fild), Jerry McAllister**, American general, was born in Gerry, N. Y. 1831. He was graduated at West Point in 1853, and served in the war in 1855; L. D., China, 1858-60; and in the war in 1861-62. When the civil war broke out, he entered the army as major of the 1st Missouri Cavalry, and was promoted to lieutenant colonel, and was in most of the battles which ended with the taking of Atlanta, when he returned to Tennessee, defeating Hood at Franklin, and was promoted to major general. He was killed in 1865. In 1868 he became secretary of war, and major-general in the regular army. Upon the death of General Sheridan, 1868, he succeeded to the command of the Sixth Army Corps. In 1870, on his retirement, he was by act of congress, made lieutenant-general, 1875. He published a biographical and narrative entitled *Forty-six Years in the Army*, New York, 1906.

**ethnologist.** **Henry Rowe,** American ethnologist and explorer, was born at Watervliet, N. Y., 1793. After studying at Watervliet Academy, he went to the University of the Mississippi, and also acted as geologist in an exploring expedition to Lake Superior and the upper Mississippi under the command of General Cass. He secured the first treaties that gave the United States 16,000,000 acres. As a member of the legislature of Michigan he was instrumental in securing the organization of the American Ethnological Society. An expedition which he commanded in 1832 discovered the sources of the Mississippi. His works include narratives of his journeys: *Travels in the Westward of the Rocky Mountains, Thirty Years with the Indian Tribes; and The Indian in His Wigwam*. He died at Washington.

**Schopenhauer** (shô'pen-hau'er), Arthur, German philosopher, was born at Dantzig, Germany, 1788. He studied first at Göttingen and afterward at Berlin and Jena. He then proceeded to Dresden, where he published a treatise, *Sight and Color*, which was followed three years later by his great work, *The World as Will and Idea*. Died, 1860.

**Chouler (akó-lér), James**, American lawyer and historian, was born at Arlington, Mass., 1839. He was graduated at Harvard, 1859; LL.D., National University, 1891, Johns Hopkins, 1902. He was admitted to the Massachusetts bar, 1862, and to the supreme court of the United States, 1867; and lecturer, Johns Hopkins, Baltimore, *Austrian The Law of Domestic Relations The Law*

Author: *The Law of Domestic Relations; The Law of Bailments; The Law of Personal Property.*  
 Schubert (*schü'bért*). Franz Peter, Austrian composer (1797-1828). His music, especially his compositions soon revealed itself, and by 1813 his supreme gift of lyric melody showed itself in the song *Th. Erlking*, the *Mass in F*, etc. His output of work was remarkable for its variety and quantity, embracing some 600 songs, ten symphonies, six masses, operas, sonatas, etc.; but his fame rests on his songs, which are infused by an intense feeling of the life of the people.

**Schumann** (*shū'mdn*). **Robert**, German composer, was born in Zwickau, 1810. He studied at Heidelberg, 1828-30, and then at Leipzig under Wieck. Up to 1840 nearly all his compositions had been for the piano, but he subsequently produced 138 songs, many of which have become classic. In 1850-53 he was director of music at

**Dehmann-Heink** (*shō'mén hīngk'*), **Ernestine**, née **Roeseler**, German dramatic contralto, was born at Lieben, 1851. She studied at Gratz, and made her debut at Dresden, 1878. In 1883 she went to Hamburg, in 1896 sang at Bayreuth. She married Heink in 1883, and sang with him in 1896. She sang the American debut in 1898; since then she has devoted herself largely to concert work. In 1905 she bought a large estate at Montclair, N. J.

**Schurman (Schürman), Jacob Gould**, American educator, president of Cornell University since 1892, was born at Freetown, Prince Edward Island, 1837. He was educated at the University of London, 1877, studied at Paris and the University of Edinburgh, 1877-78; D.Sc., Yale University; LL.D., Columbia University, 1892, Yale University, 1901; University of Edinburgh, 1902. He was the last of a line of distinguished scholars, latter part of time dean of Sage school of philosophy, Cornell. Author: *Kantian Ethics* and the *Ethics of Evolution*; *The Ethical Import of Darwinism*; *Belief in God*; *Agnosticism and Religion*; *A History of Philosophy*; *Report of the Philosophy Committee*.

**Lehrer, (Albert).** Carl, American publicist; was born in Liblar, near Cologne, Germany, 1829. He was educated at the gymnasium, took part in the revolutions of 1848, and was expelled from the University of Bonn; L.D., Harvard; college part of the revolutionary army, but finally had to flee to Switzerland. Came to the United States, 1852; settled in Watertown, Wis.; United States minister to Spain, 1857; resigned, 1860; secretary of the Wisconsin Central, 1862; major-general, 1863; and commanded a division at the second battle of Bull Run and at Chancellorsville, and a corps at Gettysburg. After the war he was secretary of the Wisconsin Central, 1865-66; Tribune, 1865-66; and United States senator from Wisconsin, 1869-71.

Missouri, 1859-75. He was one of the organizers of the liberal party, 1872; supported Hayes, 1876; was secretary of the interior, 1877-81. Author: *Speeches; Life of Henry Clay; Abraham Lincoln, an Essay*, and an autobiography published in *McClure's Magazine*, interrupted by his death in 1906.

**Schwab (Auld), Charles M.**, American capitalist, ex-president of the United States steel corporation, was born in Williamsburg, Pa., 1862. He was educated in the village school and at St. Francis College; entered service of Carnegie company as stake-driver in engineering corps of Edgar Thompson steel works; became superintendent of Homestead works and finally president of Carnegie steel company, limited. He built the new Catholic church, costing \$150,000, at Loritto, Pa.; established an industrial school at Homestead, Pa., etc.

**Schwanthaler** (shwa'n'ts-lar), **Ludwig von**, German sculptor, was born at Munich, 1802. He studied under his father, and after a visit to Rome was charged by King Louis of Bavaria to execute bas-reliefs and figures for the public buildings of Munich. Among his works are the colossal statue of *Basaria*; statues of Goethe, Jean Paul

Richier, Mozart, etc. He died in 1848.  
**Selipo** (sip'-lō). **Emillanus Fabilius**, surnamed  
 Africenus Minor, was born about 185 B. C. After  
 distinguishing himself in Spain, he proceeded to  
 Africa to take part in the third Punic war. Here  
 he laid siege to Carthage, took it by storm, and  
 leveled it with the ground in 146 B. C. He was  
 afterward sent to Spain, where he captured Numan-  
 tia after a stubborn resistance, to the extension of  
 the sway of Rome. Died 129 B. C.  
**Selipo**. **Fabilius Cornelius**, surnamed Africenus  
 Major, celebrated Roman general, was born about  
 247 B. C. He was slain at the battle of Zama in

237 B.C. In 212 B.C. he was elected aedile, and in 209 B.C. he was elected consul, with command of the Roman forces in Spain. His defeat of Hannibal at Baecula, with heavy loss. In 205 B.C. he returned to Rome, where he was elected consul, and in the following year sailed for Lilybaeum, in Sicily, at the head of a large army, for the invasion of Africa. His success was followed by a Carthaginian embassy to negotiate peace with Hannibal from Italy. Peace was concluded the following year, when Scipio returned to Rome, and enjoyed a triumph. His laurels, however, did not protect him from the intrigues of his enemies in Rome. Various charges were brought against him, but he was acquitted, and he returned to his country seat at Liternum, where he died, 183 or 185 B.C.

Scott, Sir George Gilbert, British architect, was born at Gawcott, near Buckingham, England, 1811. He was indentured to a London architect, 1827-30, and eventually became the leading architect of the Gothic restoration in England. He was elected A.R.A. in 1855, R.A. in 1861; held the professorship of architecture at the London Academy; and was knighted in 1872. He died in 1878, and was buried in Westminster.

Scott, **James Brown**, American lawyer and educator, was born at Kincardine, Ontario, 1860. He was graduated at Harvard, and studied international law, 1891-94; J.U.D., Heidelberg, 1894. He practiced law at Los Angeles, Cal., 1894-99; professor of law, Columbia Law School, 1903-06; professor of law, 1905-06, and of international law, since 1906, in George Washington University. He has been solicitor for the department of state since 1906. Author: *Cases on International Law*; *Cases on Quasi-Contracts*; *Cases on Equity Juris-*

**Scott, Richard William**, Canadian senator and Dominion secretary of state since 1898, was born in Ontario, Canada, 1823. He was educated at Prescott, became member of parliament for Ottawa, 1857-63; speaker of the house of commons, 1871; appointed to senate, 1873; secretary of state, 1873-78; and leader of the opposition in the senate, 1879-96. He carried through parliament the school bill giving the Roman Catholics right to establish separate schools, 1863, and the *Canadian Education Act*, 1876.

**Scott, Sir Walter**, Scotch novelist and poet. He was born in Edinburgh, 1771. He came of an old border family. Though he matured early, he was feeble and sickly, and was smitten with a lameness which remained with him throughout his life. In 1783 he entered Edinburgh University, and remained there three years. In 1786 he was articled apprentice to his father, by whose office he worked as a clerk until 1792. In that year he was called to the bar, and

In his profession he had fair success, and in 1797 he was married to Charlotte Margaret Carpenter, a lady of French birth and parentage. Toward the end of 1799, through the interest of his friends Lord Melville and the Duke of Buccleuch, he was made sheriff-depute of Selkirkshire, an appointment which brought him 300 pounds a year, with not very much to do for it. Meantime, in a tentative and intermittent way, his leisure had been occupied with literature, which more

**Shakespeare, William**, the chief literary glory of England, was born at Stratford-on-Avon, in Warwickshire, 1564. His father, John Shakespeare, seems to have belonged to the cloth of gold. His mother, Mary Arden, was of more distinguished origin, and came of a good old Warwickshire family. Of a family of four sons and four daughters, he was the second and the youngest child. At the free grammar school of Stratford there can be little doubt the young Shakespeare received his entire education. He was married to Anne Hathaway of Shottery, a girl about eight years older than himself. The children born of the marriage were three boys and two girls. The boy Hamnet died in his twelfth year.

At the age of twenty-two, Shakespeare went to London. No certain details have come down to us as to his earlier relations with the London theater. According to one tradition, he was content at first to turn a penny by holding horses at the door. According to another—which seems a natural sequence with the foregoing—we find him admitted inside on his promotion, though as yet only a member of the humble category of prompter. At any rate, his time was thus occupied. At what time, and for how long, it could have been only for a brief period, as very speedily we have note of him as a man of some importance, at once dramatist, actor, and shareholder in the Blackfriars theater.

In the year 1592 we find a contemporary and brother dramatist, Henry Chettle, apologizing to Shakespeare for an offense given, in terms most respectfully appreciative of his earlier work, at one of the meetings of the company, and in 1698 Francis Meres, in his *Wife's Treasury*, writes of him as the "most excellent among the English for both kinds of tragedy and comedy." We have ample evidence of the unrivaled position which he has attained from all classes; they brought him special marks of favor and approval from Queen Elizabeth and her successor James, and the nobles of the court, and the friendship of some of the most accomplished men of rank of the time, more notably, Henry Wriothesley, earl of Southampton, to whom he dedicated *Lucrece* and *Antony and Cleopatra*, and Kap. Sir Thomas Wroth and William Herbert, earl of Pembroke, to whom his *Sonnets* are addressed.

His visits to Stratford now became more and more frequent; and prior to the year 1613 he had ceased to reside in London, and finally established himself at Stratford. Of his last years there spent, further than that he was a peace-loving man, and the exercise of a liberal and kindly hospitality, nearly nothing is known. There is a good reason to believe that, though withdrawn from other active concernment with the stage, he still continued to write for it. His death took place on his fifty-third birthday, 1616, and he was buried in Stratford churchyard.

He was essentially a man of noble and estimable character, and was obviously of most kindly and lovable disposition; his pleasurable wit and good nature made him delightful as a companion; and it was as a man of full and liberal views that he was familiarly known to his contemporaries. The lofty eulogy of Dryden, "was the man who, of all modern and perhaps ancient poets, has the largest and most comprehensive soul," has been generally acquiesced in. As a poet, he is usually held to be unequalled without a peer; as poet, there are but one or two names in literature even to be named beside his; and dismissing his claims in either kind, we have in his works such a treasury of good wisdom on all matters of human government as no other writer has ever left to the world.

**Schaler** (shā'tēr). **Nathaniel Southgate**, American scientist, author, was born in Newport, Ky., 1841. He was graduated at Lawrence Scientific School, Harvard, 1862; Sc.D., 1865; served two years in the artillery, and then joined the civil war. Professor of paleontology, 1868-77, and afterward professor of geology, Harvard; 1877-1882. He was in charge of the geological survey of the Atlantic division of the United States Geological survey. Author: *A First Book in Geology: Kentucky*, a Pioneer Commonwealth; *Sea and Land in Kentucky*; *Geology of the Mountains of the American Commonwealth*; *American Highways*; *Features of Coasts and Oceans*; *Domesticated Animals of the World*; *Man, The Individual*; *Study of Life and Death*; etc. D. 1909.

**Sharpless, Isaac**, American educator, president of Haverford College since 1887, was born in Chester county, Pa., 1848. He was graduated at the Lawrence Scientific School, Harvard, 1873; Sc.D., University of Pennsylvania; LL.D., Swarthmore College; professor of mathematics and astronomy, 1879-84, and dean, 1884-87, of Haverford College. Author: *Astronomy*; *Geometry*.

**Shaughnessy, Sir Thomas George**, Canadian railway president, was born at Milwaukee, Wis., 1853. He received a common school education; entered the railway service in 1869, in the purchasing department of the Chicago, Milwaukee and St. Paul railroad. Vice-president and director, 1891-98, and president since 1898 of the Canadian Pacific railway. He was knighted by Queen Victoria in 1900.

Shaw, Albert, editor of the *American Review of Reviews*, was born in Shandon, Ohio, 1857. He was graduated at Iowa College, Grinnell, Ia., 1879; Ph.D., Johns Hopkins, 1884; LL.D., University of Wisconsin, 1904. He is a member of numerous learned societies, and has lectured in many Universities and colleges. Author: *Isaria—A Chapter in the History of Communism*; *Manic*

**Shaw, George Bernard**, British dramatist, critic, and novelist, was born in Dublin, Ireland, 1856 and came to America in 1892 to work on a newspaper. He published a few novels, wrote musicalcritiques in the *London Star*, 1888-90, and in the *World*, 1890-94; and, in 1895, began his work as a dramatic critic, writing in the *Saturday Review*. In 1898 he published *Plays, Pleasant and Unpleasant*. Since then his chief literary work has been criticism for the *Times*. His plays include *Man and Superman*; *John Bull's Other Island*; *Major Barbara*; *The Doctor's Dilemma*; *Cæsar and Cleopatra*; *Getting Married*, etc.

**Shaw, Henry Wheeler**, American humorist. was born in Lancaster, Mass., 1818. In 1859 he began to write, and, in 1860, sent *An Essay on the Mue*, to *Josh Billings* to a New York paper. It was reprinted in several comic journals, and extensively copied. His most successful literary work was his humorous story, *Uncle Abner*, a travesty on the *Old Farmer's Almanac*. He began to lecture in 1863, and, for twenty years previous to his death, contributed regularly to the *New York World*. Died in Monterey, Cal., 1885.

**Shaw, Leslie Mortimer**, American financier and lecturer, was born at Morristown, Vt., 1848. He was graduated at Cornell College, Mt. Vernon, Ia., M.B., 1874; LL.D. He was admitted to the Iowa bar in 1876, and began practice at Denison, Ia.; subsequently engaged in banking at Denison.

Manilla, and Charter Oak, Ia. He was twice elected governor of Iowa, 1898-1900, 1900-02; secretary of the treasury, 1902-07, and president of the Chicago Board of Trade, 1907-12. He was born in Shays, Daniel, American insurgent, was born in Hopkinton, Mass., 1747. He served as ensign at the battle of Bunker Hill; attained the rank of captain in the continental army, and took a leading part in it. He was a member of the Massachusetts for the redress of alleged grievances due to misgovernment. In 1786 he appeared before Springfield, Mass., at the head of 1,000 men, to prevent the session of the supreme court at that place. He died in Sparta, N. Y., 1825.

[illegible]

Sheley, Mary Wallstonecraft Godwin, wife of the poet, was born in London in 1798, and married Shelley in 1816. In 1818 she produced a remarkable novel entitled *Frankenstein*. She likewise

wrote *Rambles in Germany and Italy*, etc., and carefully edited her husband's poems. Died in London, 1851.

**Shepard, Edward Morse**, American lawyer and publicist, was born in New York, 1850. He graduated at Columbia college of the city of New York, 1869, studied law and was admitted to the bar. He was civil service commissioner of Brooklyn, 1883-85; New York state forestry commissioner, 1884-85, and democratic candidate for mayor of Greater New York, 1901. Author: *Martin Van Buren in American statesmen series; Memoirs of Dugdale*; and many review, magazine and other articles and addresses on political, industrial and educational topics.

**Shepherd, F. J.**, Canadian physician, professor of anatomy and dean of the medical faculty, McGill University, Montreal, was born at Cavagnol, province of Quebec, 1851. LL.D., Edinburgh and Harvard. He was demonstrator of anatomy in McGill University, 1875; president of the Montreal medico-surgical society, and vice-president of the international dermatological congress, 1894 and 1907. Author: *American Text-Book*

**Sheridan, Philip Henry**, American general, was born at Albany, N. Y., 1831. He was graduated at West Point in 1853. At the beginning of the civil war he was a captain in the 13th infantry, was made quartermaster of the federal army in Missouri, and rapidly passed up through the various grades to major-general in 1863 for brilliant service.

Grant served in the battles of Perryville and Stone river. For his decisive victory over Early at Cedar Creek—the occasion of his famous ride—he was promoted to major-general in the regular army, and received the thanks of congress. In returning to the north, he was in command of the army of 25,000 men, the most conspicuous under Grant in the operations before Petersburg, and in the final battles preceding Lee's surrender. When Sherman was made general, Sheridan was made lieutenant-general, and when Sherman was retired, a special act of congress conferred the further rank of general upon Sheridan. He died in 1893, and was buried in the army cemetery at West Point.

Sheridan, Richard Brinsley, at Rosherville, Mass., 1888. Sheridan, a brilliant dramatist and politician, was born in Dublin, 1751. He was educated at Harrow, and became a student of the Temple, London, though he was never called to the bar. In 1776 he wrote *The Rivals* successfully at Covent Garden. In 1777 he became part proprietor of Drury Lane theater, for the production of which he wrote *The School for Scandal* and also *The Critic*, one of the wittiest farces in the language. During the whole time of Pitt's administration the talents of Sheridan were displayed in combating the French. He was a brilliant speaker, however, his eloquence was acknowledged, and especially his eloquence on the occasion of the Warren Hastings trial, which was held in 1786, and was buried in Westminster Abbey.

**Sherman, James Schoolcraft**, lawyer, banker, vice-president of the United States since 1909, was born in Utica, N. Y. 1855. He was graduated from Hamilton College in 1878, and was admitted to the bar in 1880; LL.D., Hamilton, 1903. Was mayor of Utica, 1884; chairman of New York state republican convention in 1895 and again in 1900; and chairman of the national republican congressional committee, 1906-09. He was a member of congress, 1887-91, 1893-1903, and 1903-09; elected vice-president of the United States, 1908, taking his seat, March 4, 1909.

**Sherman, John,** American statesman, brother of William Tecumseh, was born at Lancaster, Ohio, 1823. He was employed for a time at surveying and was admitted to the bar in 1846. He entered into partnership with his brother. He became an anti-slavery whig, and as such entered congress in 1850. He was elected to the senate and continued in the house until 1861, when he was elected leader of the republicans. He was then United States senator, 1861-77, and 1881-97; secretary of treasury, 1877-81; secretary of war, 1881-85; and secretary of state under President McKinley, 1897-98. He supported the reconstruction measures, defended the protective tariff, and took a leading part in the introduction of the currency of specie payments and the refunding of the national debt, and was author of the famous Sherman anti-trust law. Died at Washington, 1900.

**Sherman, Roger**, American statesman, was born at Newton, Mass., 1721. He was a shoemaker by trade, then a surveyor of lands, and finally a lawyer and judge; served in both the continental and the United States congresses from 1774 to 1791; was one of the committee that drafted the declaration of independence, one of the signers of it. He was United States senator 1791-93.

**Sheridan, William Tecumseh**, American general, was born in Lancaster, Ohio, 1820. He was graduated at West Point in 1840, and received a commission as first lieutenant in the United States army in 1841. During the war with Mexico he was promoted to the rank of captain. In 1861, he was appointed colonel of infantry. Raised to the rank of brigadier-general. He distinguished himself at the battle of Shiloh, and as major-general in the siege of Vicksburg. Raised to an independent command, he marched across the state

of Mississippi, took command of the army of Georgia, forced General Hood to evacuate Atlanta, and captured Savannah and Charleston, from which point he moved north, and, by cutting off the resources of General Lee, compelled the evacuation of Richmond, and the surrender of General Lee to General Grant, April 9, 1865. He was Northern general acquired popularity as then Sherman. He was appointed lieutenant-general in 1866, and in 1869 became general and commander-in-chief of the army. He was a man of design, fertility of resource, brilliant strategy, and untiring energy. General Grant pronounced him "the greatest general the world had produced." He retired from the command of the army of the United States, 1884. Died, 1901.

**Shorey, Paul**, university professor, was born at Davenport, Ia., 1857; graduated from Harvard, 1879; University of Leipzig, 1882; University of Bonn, 1882; American School of Classical Studies, Athens, 1885-3; Th. D., University of Munich, 1884; L. D., Iowa College, 1895; admitted to bar, Chicago, 1880. Professor of Greek, Bryn Mawr College, 1885-92; professor of Greek since 1892; head department since 1890, University of Chicago. Annual associate director of American School Classical Studies, Athens, 1901-2; president American Philological Association, 1902. Author of *De Platonis Idearum Doctrina; The Idea of Good in Plato's Republic; The Odes and Epodes of Horace; The Unity of Plotinus*, etc.

**Siddons, Sarah**, noted English tragic actress, was born at Brecon, 1755, daughter of Roger Kemble, manager of a company of actors. She married her eighteenth year married William Siddons, an actor, and in 1775 made her first appearance in London as Helen, in *Philoctetes*, at the Theatre Lane, 1782, in the character of Isabella in *The Fatal Marriage*. In 1785 she appeared as Lady Macbeth, her greatest success. She married John Catherine. Thereafter her course was a continual triumph. She died in 1831. In 1783 Sir Joshua Reynolds painted her in *The Fatal Marriage*.

**Sidwick, Henry**, English moralist and economist, was born in Yorkshire, 1838, and educated at Trinity College, Hartford, Conn., 1856. He came from 1859 to 1875, becoming professor of moral and political philosophy in the latter year, and professor of moral philosophy in the former. His chief works comprise *The Methods of Ethics; The Principles of Political Economy; History of Ethics; and The Elements of Political Economy*.

**Sidney, Sir Philip**, English writer and soldier, was born in Kent, 1554. He was educated at Oxford, travelled throughout Europe, and returned to become a favorite at Elizabeth's court. He was called "the jewel of her dominions." For her entertainment he wrote his celebrated *Arcadia*. He served several minor posts in the army. He also has *Apology for Poetries and Defense of Poetries*. He was killed at the battle of Zutphen, 1596.

**Siegel, Henry**, German engineer and electrician, was born at Lüneburg, Germany, 1852. He was educated in Germany, and in 1874 school, Washington. He came to the United States in 1877, and in 1878, at Chicago in 1876, established the clock manufacturing firm of Siegel, Hartfield and Company; later Siegel Brothers, and finally established Siegel, Cooper and Company, department store, Chicago.

**Siemens, Ernst Werner von**, German engineer and electrician, was born at Lenthe in Hanover, 1816. In 1838 he entered the Prussian artillery, and in 1844 took charge of the artillery workshop at Berlin. He developed the telegraphic system in Prussia, and discovered the insulating property of gutta-serena, and was the first to explode a submarine mine by electricity. Besides devising numerous forms of galvanometers and other electrical instruments, he was the inventor of the discoverers of the self-acting dynamo. He determined the electrical resistance of different substances, the Siemens system being called after him. He died at Berlin in 1892.

**Siemens, Sir William (Karl Wilhelm)**, German electrician, was born at Berlin, 1823. He was brother of the preceding. He studied at Göttingen, giving special attention to science. As manager of the house of Siemens Brothers, he was engaged in constructing telegraph lines, the steamship *Parady* being designed by him for cable laying. He invented a water level, a bathometer for measuring ocean depths, an electrical thermometer, and a process of hastening the growth of plants by electric light. He was president of the three principal telegraphic societies of Great Britain, and of the British association, and in 1882 was knighted. He died at London, 1883.

**Siemkiewicz (Siemkiewicz), Henryk**, Polish novelist, was born at Warsaw, 1846, and was educated at the University of Warsaw. In 1876 he came to the United States, and for a time, in company with his wife, he was a countryman, he resided in California, where he designed to establish a Polish colony. He returned to Poland, and in 1881 he wrote *The Tartar Soloway*, following this, a few years later, by his masterly novel, *With Fire and Sword*. To this succeeded *The Two Brothers*, *The White Dove*, and *Children of the Soil*. In 1895 appeared his masterpiece, *Quo Vadis*—a tale of the time of Nero. His later works include *The Knights of*

the Cross, *Maria Curie*, etc. In 1903 he received the Nobel prize for literature.

**Silliman, Benjamin**, American physicist, was born at Trumbull, Conn., 1779. He was educated at Yale College, and admitted to the bar in 1803, but soon after received from the college the appointment of professor of chemistry, and held this position until his death in 1851. He edited the *American Journal of Science*, better known as *Silliman's Journal*, of which he was for twenty years the editor. Died, 1851.

Author: *History of the French Revolution*; *Albuquerque*; *Revolutionary Europe*; *Colonial City Service*, etc.

**Stephenson, George**, the founder of the railway system of Great Britain, and perfecter of the locomotive engine, was born in Northumbria, 1781. At the age of 14, he joined his father as a journeyman, and in 1802, where, by a close attention to all he saw, and a constant study of every piece of mechanism that came in his way, he acquired a large amount of sound practical knowledge; while by meeting best workmen, and seeing the best clocks, he was enabled to add a trifle to his weekly earnings.

In 1812 he was appointed engineer to the colliery, at a salary of \$500 a year. Soon after this he built his first traveling engine to draw the wagons along the tramway, which, though clumsy and weak in power, was immensely superior to any engine in use at the time. The following year he constructed one superior to his first as that had been to all others before it.

From this time improvement followed on improvement, and rapid success followed. Not only in the form of the locomotive, but in the rails and in every department to which steam was applicable, till, from mere tramways, the whole beneficent system of railway locomotion, with all its complications of stations, signals, tenders, and carriages, was at last completed by the opening of the Liverpool and Manchester railway.

In 1830 this great undertaking was opened, and from that time the name of Stephenson became one of the most popular among men of science in Europe. In 1845 he retired from all railway work, and devoted his time to his collieries and other sources of business, and, after having been instrumental in establishing all the foreign and home lines, he died in 1848, leaving his fortune and his fame as a statesman, and his reputation as a statesman.

**Stephenson, Isaac**, United States senator, was born near Fredericton, New Brunswick, 1829. In 1858 he moved to Marinette, where he had an active career in business. He was elected to the United States senate, 1907, to fill the unexpired term of Hon. J. C. Spooner, and was re-elected in 1909.

**Stepniak (stepniak)**, pseudonym of Sergius Michailowitsch Kravtchinski, Russian revolutionary leader and writer, born, 1841. Among his works were: *Underground Russia*; *Russia under the Tsar*; *Wladimir as it is*; *King Street and King Log*. He was run over by a train in a London suburb, and killed, 1895.

**Sternberg, George Miller**, American physician, surgeon-general of the United States, 1893-1902, was born at Hartford seminary, Utica county, N. Y., 1838. He graduated at the College of Physicians and Surgeons, New York, 1861; L. D., Michigan, 1864; and is a member of many medical societies and president, 1898, of the American Medical Association. Author: *Micrographia*, and *How to Make Them*; *Bacteria*; and many government reports, etc.

**Steuart, John**, English statesman, was born at Clonmel, Ireland, 1715. He studied at Cambridge and became a clergyman. In 1759 he wrote the first two volumes of *Life and Opinions of Tristram Shandy*. The rest of the work, which reached nine volumes, as written at the request of the author, was published in France and Italy, published in 1768, was the result of a tour through those countries in 1765. He died at London, 1768.

**Steuart, William Mott**, statistician, was born at Corpus Christi, Texas, 1861; graduated, L. L. B., Columbia, 1884; and was admitted to the bar, 1884, L. L. M., 1888. Admitted to bar, 1884; practiced in D. C., Md., and Detroit; became connected with the Bureau of Census, 1890; chief of division, 1890 and 1900, chief statistician for manufactures, since 1903, Bureau of Census. In the debate on the repeal of the Missouri compromise, Sumner took the position in Kansas he took a prominent part. His speech upon this issue, delivered in 1856, under the title "The American Question," was one of the ablest of members of congress from South Carolina, one of whom, Preston S. Brooks, on May 22d assaulted Sumner, and he had to be removed from the chamber. In 1871 he opposed the annexation of San Domingo to the United States. He published *White Slavery in the United States, Origins and Speeches*, etc., 1875. He died at Washington, D. C., 1876.

**Sumner, William Graham**, American educator and economist, professor of political and social science at Yale 1872-1910, was born at Paterson, N. J., Jan. 1840. He graduated at Yale, 1863; LL. D. 1880. Author: *A History of American Currency*; *Robert Morris; The Financier and Finances of the Revolution*; *Folkways*, etc. Died, 1910.

**Sutherland, George**, lawyer, United States senator, was born in Buckinghamshire, England, 1862. He attended the law department of the University of

**Suturoff** (sû-rô'ôf), **Prince Alexei**, celebrated Russian field marshal, was born in 1729, at Suskoi, in Finland. In the war against the Turks from

In 1787 to 1790, he gained the battle of Rymnik, took Isevil by storm, and obtained other important advantages. When Russia joined the continental coalition, in 1799, he was placed at the head of the combined army in Italy, and, after several sanguinary battles, succeeded in wresting that country from the French. He died, 1800.

**Swain, Joseph**, American educator, president of Swarthmore College since 1902, was born at Pendleton, Ind., 1857. He graduated at Indiana University, 1883; A. M., M. L. D.; professor of mathematics in Leland Stanford Jr. University, 1891-93; and president of Indiana University, 1893-1902. He is a member of the national council of education, national council of religious education, etc.

**Sweetman, Arthur**, archbishop of Toronto, and primate of Canada since 1907; was born in 1834. He was graduated at Christ's College, Cambridge; rector of Grace church, Brantford, Ontario, 1872-76; secretary of the diocesan synod, 1872-79; secretary to Canadian house of bishops, 1873-79; archdeacon of Brant and rector of Woodstock, Ontario, 1876-79; and bishop of Toronto, 1897-1907.

**Swedenborg** (swi'den-borg), Emanuel, Swedish philosopher and mystic, the founder of the New church, was born in 1688, at Stockholm. In 1743 he claimed a divine commission to disclose the internal or spiritual sense of scripture by the

correspondence existing between natural and spiritual things, and thereby to make known its true doctrines. He also stated that for the purpose of his mission he was intermitted as to his soul into heaven, hell, and the intermediate state between them. Of these he treats in *Heaven and Its Wonders*, *The Last Judgment*, and *The Earth is the Universe*. In his philosophy, which is really one with his theology, he treats of creation in his *Divine Love and Wisdom*. He died in London 1772.

**Sweet, Henry**, English philologist, was born in London, 1845. He studied at King's College, London; at Heidelberg, and at Balliol College, Oxford; M. A., Ph. D., LL. D. Author and editor of editions of Old and Middle English texts; Old and Middle English readers and primers; *Student's Dictionary of Anglo-Saxon*; *Primer of Spoken English*; *History of English Sounds*; *Primer of Phonetics*; *The Practical Study of Languages*.

Swift, Jonathan, British satirist, was born in Dublin, of English parents, 1667. He was educated at Trinity College, Dublin, and then moved to London. He became a member of the household of Sir William Temple. Before 1700 he had written the most powerful satirical work of the eighteenth century, the *Tale of a Tub*, in 1704 he wrote the *Discourse of the Dissolution of the Convent of the Abbess*, and innumerable pamphlets and quackeries against the whigs, and became a formidable force in the Tory party. His political views were so strong that he compelled the government to abandon a scheme for supplying Ireland with copper coinage. The triumphant author made his last visit to England in 1745, and died in 1745. He was one of the most popular of all his works. Died, 1745.

**Swinburne, Algernon Charles**, English poet and prose writer, was born in London, 1837. He was educated at Balliol College, Oxford. His first productions were the plays, *Queen Mother* and *Rosalind*, and these were followed by two tragedies, *Attila* and *Endymion*, and the poem *Italy*; by the dramas *William Blake*; and *Songs before Sunrise*. His subsequent works include: *Bathurst*, a Tragedy; *Songs of Two Nations*; *Century of Roundels*; *A Study of Victor Hugo*; *Studies in Prose and Poetry*; *The Duke of Gardia*, etc. He died in 1909.

**Hybel** (at/bel) **Heinrich von**, German historian born at Dönnelsdorf, 1817. He studied at Berlin under Raake; became professor of history at Bonn, 1844; and in 1875 was made director of the state archives at Berlin. Then came his great work, *Geschichte der Revolutionszeit, 1789-95*, a history of the French revolution based upon official documentary evidence. He died at Marburg, 1895.

**Sydenham** (sid'en-am). **Thomas**, English physician was born at Wioford Eagle in Dorsetshire, 1624. His last work, *Processus Integri*, in 1692, is an outline of pathology and therapeutics. Seemingly behind his age in science, he was really ahead of it in practice. He died at London, 1689.

**Symonds (si'monds), John Addington**, an Englishman of letters, was born at Bristol, England, 1840. He was graduated at Oxford. His chief writings are an *Introduction to the Study of Daniel*; *Studies of the Greek Poets*; *Sketches in Italy and Greece*; *The Renaissance in Italy*; *Italian Byways*; *Shakespeare's Predecessors in the English Drama*. *The Renaissance in Italy* is his chief work. He died at Rome, 1893.

**Tacitus** (*luc' -tus*), **Gaius Cornelius**, Roman historian and orator, was born about 55 A. D. In 97 he was appointed consul, succeeding T. Virginii Rufus. Tacitus became one of the most intimate friends of the younger Pliny, of whose letters eleven are addressed to him. The time of his death is unknown, but he probably survived Trajan, who died in 117. His chief works are the *Life of Agricola*, and the *Germania*, both written about 98.

**Tadema, Alma.** See **Alma-Tadema.**

**Wm. William Howard**, twenty-seventh president of the United States, was born in Cincinnati, Ohio, 1823; he graduated from the University of Ohio and from the law school, Cincinnati College, 1850; L. L. D.; admitted to the Ohio bar, 1850; assistant prosecuting attorney, Hamilton county, Ohio, 1851-52; collector of internal revenue, first district, Ohio, 1852-53; was assistant county solicitor, Hamilton county, Ohio, 1853-57; judge of the superior court of Ohio, 1857-60; United States circuit judge, sixth circuit, 1862-1900; president of the United States Philippine commission, 1901; first civil governor of the Philippine islands, 1901-02; secretary of war, United States, 1904-08. He died at Washington, D. C., 1909. He was married to Miss Mary Ann, daughter of John C. Calhoun, United States senator, and succeeded March 4, 1893.

**Taine, Hippolyte Adolphe**, French historian and critic, was born at Vouziers, France, 1828. One of his first essays was crowned by the French Academy. Among his most important works is his *History of English Literature*, a clear and valuable criticism written in brilliant style; in 1878 he was elected to membership in the French Academy. He died at Paris, 1893.

**Tait, Peter Guthrie**, British mathematician and physicist, was born in 1831. He was educated at Edinburgh University, and St. Peter's College, Cambridge; was elected professor of natural philosophy at Edinburgh, 1860. He resigned his chair early in 1901, and died the same year.

**Takahara** (*ta'-da-ah'-ra*). **Kogoro**, Japanese diplomat; born 1874; acting consul, 1894. He was educated in Tokyo and entered the foreign office as student attaché, 1896; acting consul-general, 1898-99; consul-general at New York, 1892; envoy extraordinary and minister plenipotentiary to Italy, 1894-95 and 1906-07, to Austria and Switzerland, 1896-99; and envoy extraordinary and minister plenipotentiary to the United States, 1900-06.

**Takheyran-Firak** (*ta'-he'-ran'-fir'-ak*). **Chah**

les Maurice, Prince de, was born in Paris, 1754. As bishop of Autun he was a member of the states-general which was convoked in 1789. The progress of the revolution led to his retirement to England and afterward to America; but on the fall of Robespierre he returned to Paris, and, thus, to the influence of the Girondins. With Barras, he was appointed foreign minister. In return for his services he was made grand chamberlain, and prince of Bénéveto. After the fall of Napoleon, he became for a time prime minister under Louis XVIII., but ceased to hold this position subsequent to the battle of Waterloo.

**1. Thomas De Witt**, American Presbyterian minister and orator, was born in New Jersey, 1832. He was educated at New York University. He edited for several years *The Christian at Work*, and later the *Christian Herald*, and wrote extensively. In 1889-90 he visited the holy land, and in 1894 made a tour of the world. He was pastor of the First Presbyterian church, Washington, D. C., 1895-99. Author: *Crumbs Swept Up; Marriage Ring*, etc. Died, 1902.

**Tamerlane, or Timur** (*14-m60r*), oriental conqueror, was born at Sebs, near Samarkand, about 1336. His whole career was one of conquest, though he was frequently interrupted by revolts in his own dominions, and in the provinces he had brought under his rule. He was preparing for the conquest of China, but died on his march to that country, 1405.

Taney (16'51), Roger Brooke, American jurist, was born in Calvert county, Md. 1777. He was graduated at Dickinson College; he succeeded John Marshall as chief-justice of the United States supreme court in 1836. His most famous decision was that in the Dred Scott case, in 1857. He died at Washington, D. C., 1864.

**Tarbell, Ida Minerva**, American author and editor, was born in Erie county, Pa., 1857. She was graduated from Allegheny College; editor on staff, and associate editor of *McClure's Magazine*, 1894-1906, and associate editor of the *American Magazine* since 1906. Author: *Early Life of Abraham Lincoln*, with J. McCan Davis; *History*

**Tarkington, Newton Booth**, American novelist, was born in Indianapolis, Ind., 1869. He was graduated at Princeton, 1893; A. M., 1899. Author: *The Gentleman From Indiana*; *Monsieur Beaucaire*; *The Two Vandrrels*; *The Conquest of Canada*; *His Own People*, etc.

**Tarr, Ralph Stockman**, American educator, was born at Gloucester, Mass., 1864. He was graduated at Lawrence scientific school, Harvard, 1891; assistant professor of geology at Harvard, 1892-97; professor of physical geography, since 1906, Cornell University. Author: *Economic Geology of United States; Elementary Physical*

**Taschereau** (*tash'té'*), **Sir Henri Eliezer**, Canadian jurist, chief-justice of the supreme court of Canada, 1902-06, was born in 1838. He was admitted to the Quebec bar, 1857; was appointed a judge of the Quebec superior court, 1871; judge of the supreme court of Canada, 1878.

**Tasso (dà'ssò), Torquato**, Italian poet, was born in Sorrento, 1544. In 1565 he entered the service of cardinal Luigi d'Este, and was invited to the court of his brother, Alfonso, duke of Ferrara. While there he wrote his pastoral

drama, *Aminta*, and in 1575 finished his great epic, *Jerusalem Delivered*, describing the first crusade. In 1594 Pope Clement VIII. summoned him to Rome to receive a laurel crown, but he died soon after his arrival, in 1596.

**Tauler** (*tou'ler*), **Johann**, German mystic, was born at Strassburg, about 1300. He entered the Dominican order about 1318. He died at Strassburg in 1361.

**Taylor, Charles H.**, American journalist, editor and manager of the *Boston Daily Globe* since 1873, was born in Boston, Mass., 1846; member of the Massachusetts legislature, 1872. He served during the civil war to the 38th Massachusetts regiment; was wounded at Fort Hudson, La., 1863; and brigadier-general on Governor Russell's staff, 1891-93. He has long held a prominent

**Taylor, Hannis**, American lawyer, diplomat, was born in New Bern, N. C., 1851. He was educated at the University of North Carolina; LL. D.; professor of constitutional and international law, George Washington University, 1892-98, and was special counsel for the government of the United States before the Spanish treaty claims commission, and before the Alaskan boundary

**Taylor, James Bayard**, American author and traveler, was born at Kennett Square, Pa., 1825. In 1862-63 he was connected with the embassy at St. Petersburg, and in 1874 he was in Iceland.

*Literature* was published in 1840, and at once took high rank, and was translated into Spanish, German, and French. He was one of the founders of the Boston public library.

**Tiffany, Charles Louis**, American merchant, was born at Killingly, Conn., 1812. In 1832 he established a station and fancy goods store next door to A. T. Stewart's establishment. In 1847 Tiffany began the manufacture of gold jewelry. In 1850 Tiffany and James Watson, the diamonds in London, selling them in the United States at tremendous profit. The firm became wealthy and conspicuous. In 1851, Tiffany established branches in several European centers. Died, 1902.

**Tiffany, Louis Comfort**, American artist, was born in New York, 1848. He studied art under George Inness and Samuel Coleman, New York, and John Bailey, Paris, and became distinguished chiefly to oriental scenes in oil and water colors. He discovered the formulas for staining decorative glass known as "Tiffany Favrile glass."

**Tilden, Samuel Jones**, American statesman, was born at New Lebanon, N. Y., 1814. He was educated at Yale and at New York University, and admitted to the bar in 1841. By 1868 he had become leader of the democrats in the state and attacked and destroyed the "Tweed Ring." He died in 1886, leaving a great part of his large fortune to found the Tilden Foundation.

**Tilman, Benjamin Ryan**, United States senator, farmer, was born in Edgemoor county, S. C., 1847. He was elected governor of South Carolina in 1890 and 1892, and has been United States senator since 1898. He is also author of the dispensary act of 1906, selling liquor under state license. One of the leaders in securing the insertion of advanced positions in democratic platform of 1896.

**Till, Johann Torkelin**, Count of, Belgian general, one of the great leaders of the Thirty Years' war, was born near Gembloux, Belgium, 1559. He distinguished the Bavarian army, and was devoted to the Catholic cause, was given command of the Catholic army at the outbreak of the Thirty Years' war. Till was mortally wounded, in the battle of Lech, 1632.

**Tintoretto (tin'-to-ri-oh)**, Venetian historical painter, was born in 1518. His real name was Jacopo Robusti. He rose to the reputation which was employed by the Venetian government to paint a picture of the victory gained over the Turks in 1571. Most of his pictures are in the church at Venice. He died at Venice, 1594.

**Tischendorf, August Friedrich**, Friedrich Konstantin von, German biblical scholar, was born at Lengenfeld in Saxony, 1815. His labors in the use of the best and most accurate methods of the new testament, especially those in 1844, 1853, and 1859, resulted in the discovery of the fourth Greek Sinaitic codex at the altar of the church of Sinai; count of the Russian empire, L. L. D., C. C., etc. He died in Leipzig, 1874.

**Tissot, J. H. (J. H. Tissot)**, French genre painter, was born at Nantou, France, 1836. He was educated at the Ecole des Beaux Arts in Paris, and under Lamotte in Rome. He made his first appearance in the Paris salon in 1859, with a number of fine water colors. He then turned his attention to his series of religious subjects illustrating the *Life of Christ*. Died, 1902.

**Titchener (tik'-en-er)**, Edward Bradford, American educator, professor of psychology at Cornell since 1896, was born at Chester, England, 1867. He was graduated at Branscomb College, Oxford, 1890; Ph. D., D. D., etc.; assistant professor of psychology, Cornell, 1892-95; American editor of *Mind*; associate editor of *American Journal of Psychology*, etc. He is author of *Principles of Psychology*; *A Primer of Psychology*.

**Titian (ti-tan'-oh)**, or **Tiziano Vecellio (ti-sa-no-vec'-el-lyo)**, Venetian painter, was born at Pieve de Cadore, in the Carnic Alps, in 1477. He studied under Giovanni Bellini of Venice, and in 1507 was associated with the master Giorgione in executing certain frescoes.

In 1511 he was invited to Padua, where he executed three remarkable frescoes still to be seen. In 1513 he was commissioned to the unfinished picture of Giovanni Bellini in the Sala del Gran Consiglio at Venice, and the senate were so pleased that they gave him an important office. To this period are attributed his pictures of *The Tribute Money* and *Sacred and Profane Love*.

In 1514 he painted a portrait of Ariosto at Ferrara, and after his return to Venice, in 1518, he painted an *Assumption of the Virgin*, considered one of the finest pictures in the world. About 1528 he produced his magnificent picture, *The Death of St. Peter Martyr*. His picture, says Ariosto, "is so perfect that the great masters admitted they could not find a fault," unfortunately destroyed by fire in 1667.

In 1530 the Emperor Charles V. invited

him to Bologna to paint his portrait and execute various other commissions. In 1532 he again painted the emperor's portrait, and he is said to have accompanied Charles to Mexico, where he received several honors. He remained, it is said, three years in Spain, in which country many of his masterpieces, such as *The Sleeping Venus*, *Christ in the Garden*, *St. Margaret*, and *The Dragon*, are still to be found. In 1537 he painted an altar picture, and in 1541 he produced *The Descent of the Holy Ghost on the Apostles*, *The Sacrifice of Abraham*, and *David and Goliath*. In 1543 he painted his picture of *The Virgin and St. Titian*; and in 1545 he visited Rome, where he painted the famous group of *Pope Paul III., the Cardinal Farnese*, and *Duke Ottavio Farnese*. He was patronized as warmly by Philip II. as by his father Charles V.

Of Titian's private life but little is known. He died of the plague in 1576, aged ninety-nine, having painted to the last with almost undiminished powers.

Titian excelled as much in landscape as in figure-painting, was equally great in sacred and profane subjects, in ideal heads and in nature. His pictures of religious subjects and others may have surpassed him in single points, none equaled him in general mastery. As a colorist he is almost unrivalled, and his pictures of man reach the perfection of sensuous beauty.

**References**.—Crows and Cavallazzi's *Life and Times of Titian*; Claude Phillips' *The Early Italian Masters*; and *The Italian Masters*; Morrell's *Italian Painters*; Runkin's *Modern Painters*.

**Titman, Otto Hilgard**, American scientist, was born at Belleville, Ill., 1850. He entered the United States Coast and geodetic survey in 1867. He was appointed to the international geodetic conference, Berlin, 1895; and superintended since 1900 United States Coast and geodetic survey. He was appointed to represent the United States at the demarcation of the boundary between Alaska and Canada in 1899, and was United States-Alaska boundary commissioner, 1904.

**Toqueville (to-ke-vil)**, Alexis Charles Henri Clerf, French statesman and writer, was born at Verneuil, 1788. He studied at the law, and was admitted to the bar in 1825. He became actively engaged in the study of the moral sciences, and of the French aristocracy. After 1838 he was the most formidable opponent of the first rule in opposition to the republic, as strenuously opposed Louis Napoleon. He became vice-president of the assembly in 1849, and from 1850-51 was minister of foreign affairs. Died, 1859.

**Todd, David P.**, astronomer, was born at Lake Umbagog, Me., 1825. He was graduated at Ph. D., Washington and Jefferson College, 1888; chief assistant on United States nautical almanac, 1878-81; professor astronomy and navigation and director of observations, Amherst College, since 1881. Astronomer in charge Lick observatory observations, transit of Venus 1882; professor astronomy and higher mathematics, Smith College, 1882-7; astronomer in charge American eclipse expedition to Japan, 1887; chief United States scientific expedition to West Africa, 1889-90; chief Amherst eclipse expedition to Japan, 1890, to Tripoli, Barbary, 1900, to the Dutch E. Indies, 1901, and to Tripoli, 1905; chief Mars expedition to the Andes, 1907. Author: *A New Astronomy*; *Solar System*; *Elements of Astronomy*. Designed and erected new observatories at Smith College, Northampton, 1889-7, and at Amherst College, 1890-1.

**Togo (to'-go)**, Admiral Count Metchiro, Japanese admiral, was born at Kogoshima, 1847. He first came into prominence as commander of the *Naniwa*, which sank the transport *Koushou*, and forced on the war with China. He was then a second time third in command of the fleet. At the close of January, 1904, he was selected to command the entire Japanese fleet in the hostilities against the *Caifu* fleet. The fleet of Japan was fought May 27-28, 1905, when of the fleet fifty-two ships were sunk, six captured, and the remainder dispersed and interned. Togo was made count in 1907.

**Tolstoy (tol'-stoy)**, Count Lyoff Nikolayevitch, Russian novelist, was born at Yasnaya Polyana in 1828. Studied at the University of Kasan; entered the army when twenty-three, was wounded at the Caucasus. He was promoted. Leaving the army soon after the close of the Crimean war, he devoted himself to literature. His first novel, *War and Peace*, is devoted to Napoleon in 1812, is regarded as his masterpiece; but his *Anna Karenina*, which appeared in 1877, is better appreciated. He declared "the evil" the keynotes of the Christian faith, and insists that the literal interpretation of the sermon on the mount is the only rule of life. He died in 1910. He deposited his *Memoirs and Diaries* with the curator of the Rumyantsev museum on the

condition that they should not be published until ten years after his death. He was excommunicated by the holy synod in 1901, and the same authority ordered all his works to be burned, celebrating his eightieth birthday in 1908. Died, 1910.

**Tombes, Robert**, American politician, was born in Wilkes county, Ga., 1810. From 1833 to 1861 he was a member of the United States senate. In 1861 he became secretary of the Georgia state federate government, but resigned to accept the commission of brigadier-general in the confederate army. He joined the army of General Johnston, and on his return to the South refused to take the oath of allegiance to the United States government. He died in 1886.

**Toothaker, Charles Robinson**, curator, was born at Philadelphia, 1873; graduate Central Pennsylvania Normal School, Philadelphia, 1890; received a degree in zoology under D. E. Cope; other special courses. Mineralogist in employ of A. E. Foss, Philadelphia, 1890-7; assistant curator, 1898-1904, curator since 1904, Philadelphia museum; lecturer on commercial geography; special instructor in commercial geography, Temple University, 1907-8; Consul for Republic of Colombia in Philadelphia. Author: *Commercial Raw Materials*, etc.

**Toranzo, Archbishop of, See Sweetman, Arthur**. Torricelli, Evangelista, Italian physicist and mathematician, was born probably at Fiesole, in the Romagna, 1608. He is celebrated for his discovery in 1643, and in 1644 for his improvements in lenses for telescopes. He died at Florence, 1647.

**Torshusen, Leonard**, count of Orjala, Swedish general, was born at the castle of Torshusen, Sweden, 1693. He accompanied Adolphus Frederick in 1694, and in 1695 was appointed to the command of the Swedish army in Germany. He died in 1691.

**Touchebent, Alexandre, Franz Eduard Ivanovitch**, Russian general and military engineer, was born 1818. Until he was severely wounded in the Crimean war he was in command and energy the defense of Sebastopol. During the Turkish war of 1877-78 he was called to defend Plevna, and was severely wounded in 1878, and was buried at Sebastopol. He wrote an admirable account of the defense of Sebastopol.

**Tourgey (toor-gee)**, Abner Wintner, American author, was born at Williamsfield, Ohio, 1838. Moved to North Carolina, where he was prominent in the reconstruction of the state, and up the constitution, and aiding in the revision of the laws. For some years prior to his death in 1905 he was United States consul at Bordeaux, France, and Halifax, Canada.

**Toussaint (to'-saint)**, (Jean-Pierre) L'Ouverture, Francois Dominique, Haitian general, was born in 1743, son of African slaves, in San Domingo. In 1796 he was elected generalissimo of the army of the army of San Domingo. When Bonaparte sought to restore slavery in San Domingo, Toussaint refused to surrender, and was sent to France, where he died in prison in 1803.

**Tower, Charles James**, American capitalist and diplomat, was born in Philadelphia, Pa., 1848. He was graduated at Harvard in 1872; LL. D. He lived in Duluth, Minn., 1883-87; was president of Duluth and Iron Range railroad and managing director of Minneapolis iron company. He was United States minister to Austria-Hungary, 1897; ambassador to Russia, 1899-1902; and ambassador to Germany, 1902-08. Author: *The Marquis de Fagundes in the American Revolution*.

**Troy, Crawford Howell**, university professor, was born at Norfolk, Va., 1836; graduated at the University of Virginia, 1858; studied at the University of Berlin, 1866-8; LL. D., University of North Carolina and Harvard. Professor of Hebrew, University of Virginia, 1860-1900; Greenville, South Carolina and Louisville, Ky., 1860-79; Hancock professor of Hebrew and other Oriental languages, University of Virginia, 1880-1900. Distinguished lecturer on biblical literature until 1903. Author: *The Religion of Israel*; *Quotations in the New Testament*; *Hebrew and Aramaic*; *Hebrew Text and English Translation of Esau's Commentary on Genesis*, etc.

**Trajan (tra'-jan)**, Marcus Ulpius Crinitus, Roman emperor, surnamed Optimus, was born at Italica, near Seville, A. D. 58. He was adopted by Nervus, 98 A. D. Trajan was invested with the imperial purple. In his civil capacity, he ruled for the welfare of the empire. He was a great actor, he sustained the glory of Rome. The column which bears his name was raised in the Roman forum to commemorate his victories. He died 117 A. D.

**Tree, Herbert Beerhohn**, English actor and manager, was born at London, 1824. He was known as was as the timid curate in *The Private Secretary*. He managed the Comedy theater in 1887, and produced *The Rose Tree*. In 1890, one of the same year assumed charge of the Haymarket theater. In 1897 he opened his new theater, His Majesty's. He was the first to introduce the great mystery of his success: *Herod*; *Ten Nights*; *The Merry Wives of Windsor*; *King Richard III.*; *Macbeth*; *Hamlet*; *Shakespeare*. He produced several of Shakespeare's plays in Berlin, and was greatly appreciated by the emperor.

system, was born in Tuscaloosa, Ala., in 1832. Fr. D. Ohio Wesleyan and Harvard; LL. D. He was one of the founders, in 1874, of the Chautauque assembly; founder, 1878, of the Chautauque literary and scientific circles. He was a member of the American Academy of Arts and Letters, and was chancellor ever since; in 1900 was made rector bishop in charge of European work of Methodist Episcopal church. Author of *Chautauque School; Studies in Young Life; Little Footprints in Bible Lands; Our Own Church; Outline History of the World; Outline History of the Family; Worship for Every Day in the Year*, etc.

**Vinci, (da vin' che), Leonardo da**, Italian painter, was born at the village of Vinci, near Florence, 1452. He was the third of the Leonardo da Vinci School of painting. Was educated in Florence, where he studied painting under Verrocchio. His unfinished *Adoration of the Kings* and his *Mona's Head* belong to his Florentine period. In 1482 he settled in Milan and to his Milanese period are ascribed his most celebrated productions—the two versions of *Our Lady of the Rocks*, and *The Last Supper*. He also founded an academy of arts, for which he wrote *Notes for a Treatise on Painting*.

Owing to the French occupation of Milan, in 1499, Leonardo returned to Florence, and was commissioned to write a treatise to decorate the council hall of the Signoria—paintings subsequently destroyed. The famous *Mona Lisa*, was painted in 1504. For ten years (1506-16) he resided alternately between Florence, Rome, and Milan, and painted his *St. Anne and St. John the Baptist*. Thereafter he accompanied Francis I. to France, and died 1519 in the Château de Cloux, Amboise, 1519.

A man of extraordinary physical beauty and of physical strength, his endless invention, his curiosity in science, and his careless quest after the ideal, made him a model for the small number of pictures finished by him. Of these, the *Last Supper* is practically destroyed through his experimentation with oil methods. But he created a systematic type of ideal female figure, sublimely beautiful, with the mysterious smile that has haunted and perplexed his students of succeeding generations.

**References.**—Browne's *The Life of Leonardo da Vinci*; Rio's *Leonard da Vinci et son École*; Henton and Black's *Leonardo da Vinci and his Age*; Houma's *Leonard da Vinci*; Richter's *Literary Works of Leonardo da Vinci*.

**Vinogradoff, (or vin'grad'off), Paul**, Russian educationist and writer, was born at Moscow, Oxford University, since 1903, was born at Kostroma, Russia, 1854. He resigned his chair in the University of Cambridge, England, in 1903, and resided his interrupted studies in English social and legal history. He was elected Corpus professor of jurisprudence in 1903. Author: *Villains in England; Inquiries in the Social History of England*; *English Society in the Eleventh Century*, etc.

**Virehow (vir'oh), Rudolf**, German pathologist, was born in Prussia, 1821. He was a member of the Prussian diet, 1862-1902; of the German Reichstag, 1880-93; became leader of the liberal opposition in the Prussian diet. In 1878 he retired from public life. His master work was *Cellular Pathology*, which laid the foundation of that branch of science. Died 1902.

**Virgil, See Vergil.**

**Victoria Colonna, See Colonna.**

**Vladimir (vlad'vay'ler), Alexander**, Russian emperor, who reigned from 980 to 1015. He added largely to the kingdom by conquest, but is best known for the introduction of Christianity into the empire. He died in 1015.

**Vost (voh), Karl**, German naturalist, was born at Göttingen, 1817. In 1849 he was made professor of geology at Geneva, and held that position to the time of his death, May 6, 1896. He wrote *Studies in Geology and Fossils; Essays on the Darwinian Theory*.

**Volta (voh'ta), Alessandro**, Italian physicist, was born at Como, 1745. He invented the voltaic pile, electrophorus, electrocopper, and condenser; discovered several new properties in electricity; was for thirty years professor of natural philosophy at Pavia.

**Voltaire, (voh'tair), the assumed name of François Marie Arouet**, French poet, dramatist, and philosopher, was the most celebrated writer of the eighteenth century, was born at Châtigny, near Paris, 1694, died there 1778. His father was François Arouet, a lawyer, and he was educated for the legal profession, but abandoned the law for letters. In 1718 a tragedy named *Oedipe* was brought out by him, and was a great success. It is said that this play was finished, and that

two cantos of his epic the *Henriade* were written in the Bastille, where he was confined from May 1717 to April 1718, for writing certain satirical verses on the regent. It was about this time that he adopted the name of Voltaire. In 1726 he was again imprisoned in the Bastille for sending a challenge to the Chevalier Rohan, by whom he had been grossly insulted. He was liberated within a month, and went to England on the invitation of Lord Bolingbroke. He resided till 1729 and acquired some knowledge of English literature. His *Henriade* was completed and published by subscription in England.

On his return to France he lived chiefly at Paris till 1734. During this period he raised himself from very moderate circumstances to a condition of affluence by successful monetary speculations. From 1734 to 1749 he resided with the Marchioness de Châtelet at Cirey, in Lorraine. She died in 1749, and Voltaire then accepted the oft repeated invitations of Frederick the Great to come and live at his court at Potsdam. Here he was received with great honor, but a series of disagreements with the king ended in Voltaire's retirement from the Prussian court in 1753. He then resided for a short time at Strasbourg, Colmar, and Lyons, removing at the end of 1754 to Geneva. For almost the whole of the remainder of his life he lived in Switzerland, or close to its borders. In 1760 or 1761 he fixed his residence with his niece, Madame Denis, at Ferney, where he received a constant succession of distinguished visitors, and maintained a correspondence with the intellectual and literary circles of the crowned heads of Europe. In 1778 he went to Paris, where he was received with enthusiasm by all classes. But the excitement of the occasion hastened his death.

His works embrace almost every branch of literature; poetry, the drama, romance, history, philosophy, and even science. Hatred of fanaticism and superstition was his dominant motive, and his near-sightedness are strongly animated by a spirit of hostility to the religion of his age. He upheld them, however, with as much zeal as he denounced them.

Voltaire's literary fame chiefly rests on his philosophical novels: *Zadig*, *Candide*, *L'Ingénu*, etc.; his histories: *Siècle de Louis XIV.*, *Histoire de Charles XII.*; his correspondence, and more than 10,000 letters, his poetical epistles, satires, and occasional light poems, which all exhibit wit, gaiety, vivacity, and grace. Several of his tragedies, such as *Zaire*, *Aïné*, *Méropé*, and *Mahomet*, had great success in their day, but are not assigned a high place in French literature. His comedies, the best of which is *L'Enfant Prodiges*, were less successful. His *Henriade*, an epic poem, had great success, and exercised a powerful influence when it first appeared, but is not highly esteemed now.

**References.**—The best lives are those by Diderot, Lessing, and James Paulding. See also Morley's *Voltaire*; biographies by Hamley, Epinasse, and Lounsbury's *Shakespeare and Voltaire*.

**Wade, Benjamin Franklin**, American statesman, was born at Springfield, Mass., 1800. He studied law, and became United States senator, 1851, 1857 and 1863. He opposed all the measures proposed as compromises between the North and South, and was expelled from getting the homestead bill through congress. After the death of President Lincoln, Wade was vice-president of the United States. Died at Jefferson, Ohio, 1878.

**Wadlin, Horace Greeley**, librarian of Boston, was born at Boston, 1805, was a bookbinder, 1805, was an architect in Boston, 1878. He was a member of the legislative house of representatives, and was supervisor of United States census, 1892-1900. Author: *Annual Statistics of Manufactures of 1890-1901*; *Decennial Census of Massachusetts for 1895*, etc.

**Wagner (voh'ner), Charles**, French Protestant clergyman and essayist, was born in 1822; he settled in Paris in 1882, and aroused great interest by his effective protest against the degenerating tendencies of Parisian literature and life in *Les Contes de la femme*, and in *Le roman expérimental*.

**Wagner, Wilhelm Richard**, the most celebrated of modern composers, was born at Leipzig 1813, died at Venice 1883. He received his education at Leipzig and Dresden.

From 1834 he filled various musical engagements at Magdeburg, Riga, and Königsberg. In 1839 he went to Dresden, and composed his operas *Rienzi* and the *Flying Dutchman*. The brilliant success of these operas secured him the conductorship of the Wagner royal court of Dresden in 1843.

He joined the insurrectionary movement of 1848-49, and was compelled to exile himself. Until his return to Germany in 1864 he spent most of his time in Switzerland. In 1868 he went to Bayreuth, and *Tristan and Isolde* appeared in 1865 and 1869 respectively. The king of Bavaria, Louis II., became an enthusiastic and liberal patron of Wagner, and the theatre at Bayreuth, especially built for Wagner, was chiefly supported from the king's purse. Here his famous tetralogy *Der Ring des Nibelungen*, consisting of *Das Rheingold*, *Die Walküre*, *Siegfried*, and *Götterdämmerung*, was first performed in 1876 before an unusually brilliant and appreciative audience.

About a year before his death he produced his last opera, *Parsifal*. In 1870 he had married, as second wife, Cosima von Bülow, a daughter of the Abbé Liszt. Wagner labored to reform dramatic music according to his theories of the drama, and gave his creations a national character by selecting his subjects from old German heroic legends. His theory was that in a perfect musical drama the three arts, poetry, music, and dramatic representation should be welded together into one well balanced whole. This theory he demonstrated with consummate ability and unsurpassed magnificence. His artistic views on music are embodied in a well-known work entitled *Oper und Drama*.

**References.**—Perhaps the best *Life* is Julien's. See also *Life* in Germany, by Hans Pohl, Tapert, and Wolzogen; Krebbs's *Studies in Wagnerian Drama*; Newman's *A Study of Wagner*; Froese's *Wagner as a Poet*; and Hoefer's *Richard Wagner and the Music of the Future*.

**Wainwright, Richard**, American naval officer, was born at Washington, D. C., 1849. He was graduated from the Naval academy in 1868; was assigned to the *Albatross*, 1869, and was destroyed in Havana harbor, February 15, 1868. After this he did good service at the battle of Santiago. Promoted to *Wagner* at 1891, and was superintendent of the naval academy, 1900-02; became a captain in 1903.

**Walbridge, (or wal'bridge), American** jurist, chief-justice of the supreme court of the United States, 1874-88, was born at Lyme, Conn., 1816. He was graduated from Yale in 1837, and practiced in Ohio. He was nominated by President Grant chief-justice of the United States supreme court, 1874, and served until his death in 1888.

**Walcott, Charles Doolittle**, American geologist, secretary of the Smithsonian institution since 1907, was born at New York Mills, N. Y., 1850. Assistant geologist to the United States geological survey in 1879 and director of United States geological survey, 1894-1907. He is a member of many scientific societies, and author of the following *Life in the Triassic*; *The Cambrian Fauna of North America*; *Pre-Cambrian Fossiliferous Formations*; *Correlation Papers*.

**Walden, (or val'den), Alfred von**, German general, was born in Potsdam, Prussia, 1832, and entered the German army in 1850, and was promoted to general in 1878. He was in the war; succeeded Moltke as chief of staff in 1888. In 1900 he was created field-marshal, and was appointed commander-in-chief of the German allied army engaged in suppressing the Boxer disturbances. Died, 1904.

**Waldstein (voh'den), Charles**, American archaeologist, was born in New York, 1856. He was educated at Columbia College and at Heidelberg. Made professor of Greek in 1878. Held the University, 1895-1901 and professor, 1895-97, American school of classical studies, Athens, Greece. Author: *The Second Punic War*; *The Age of the Surface of Things*; *The Jewish Question*; *The Archaic Heram*, etc.

**Walker, Francis Amasa**, American political economist, was born at Andover, Mass., 1807, was graduated from Amherst in 1826, took part in the civil war, and in 1865 rose to the brevet rank of major. He was a member of the institute, and was professor of political economy in the Sheffield scientific school at Yale, and in 1881 became president of the American Society of Political Economy at Boston. Author: *The Indian Question*; *The Wages Question*; *Money, Bimetallism*, and *History of the Second Punic War*, 1897.

**Wallace, Alfred Russel**, English naturalist and traveler, was born in Monmouthshire, England, 1822. He visited South America and the Malay

Archipelago, and was a member of the Royal Society.

**Wallace, Alfred Russel**, English naturalist and traveler, was born in Monmouthshire, England, 1822. He visited South America and the Malay

Archipelago, and was a member of the Royal Society.

**Wallace, Alfred Russel**, English naturalist and traveler, was born in Monmouthshire, England, 1822. He visited South America and the Malay

Archipelago, and was a member of the Royal Society.

**Wallace, Alfred Russel**, English naturalist and traveler, was born in Monmouthshire, England, 1822. He visited South America and the Malay

Archipelago, and was a member of the Royal Society.

**Wallace, Alfred Russel**, English naturalist and traveler, was born in Monmouthshire, England, 1822. He visited South America and the Malay

Archipelago, and was a member of the Royal Society.

**Watson, John**, Canadian educator and writer, was born at Glasgow, Scotland, 1847. He was graduated at Glasgow University, 1872; 1873, D. 1880; has been professor of logic, metaphysics, and ethics in Queen's University, Kingston, since 1872. Author: *Logic and Metaphysics*; *Practical Cosmology*; *Mind and Space*; *Idiosyncratic Theories*; *The Philosophical Basis of Religion*, etc.

**Watson, John**, American lawyer and politician, was born in Georgia, 1856. He was a member of the Georgia House of Representatives; member of congress, 1891-93; began the publication of *Tom Watson's Magazine*, in New York, 1905. Author: *The Slave's Life in England*, etc.

**Watson, William**, English poet, was born at Burley-in-Warstead, 1855; honorary LL. D., Aberdeen, 1904. His early poem, published in 1883, is the *Liverpool Argus* in 1875, and his first book, *The Prince's Quest*, appeared in 1880. Since then have appeared: *Epigrams of Art, and Nature*; *Odes*; and other forms: *The Purple East*; *Ode on the Coronation of King Edward VII.*; *For England*, etc.

**Watt, James**, Scotch engineer and, generally accredited inventor of the steam engine, was born at Greenock, 1736; and died at his seat of Houthill, Staffordshire, 1819. His father was a merchant and magistrate of Greenock, and James received a good education there. Having determined to adopt the trade of mechanical engineer, he went to be taught in London in 1754, for instruction, but ill-health compelled him to return after a year's apprenticeship. Shortly after he endeavored to establish himself in Glasgow, was appointed in 1767 mechanical-instrument maker to the university, and resided within its walls till 1763.

From this time till 1774 he acted as a civil engineer—made surveys, built bridges, canals, and harbors, and some of his plans were carried out. It was during this period that he gave shape to his chief improvements on the steam-engine. In order to produce the improved machine he associated himself with James Boulton, 1775) in business with Matthew Boulton—the firm of Boulton and Watt having their engine works at Soho, Birmingham. He retired from business in 1795.

Watt was a fellow of the Royal societies of London and Edinburgh, and member of the national institute of France. He was twice married, and was survived by one son, who carried on the establishment at Soho in partnership with a son of Mr. Boulton's. Besides improving the steam engine, Watt invented or improved a variety of mechanical appliances, including the centrifugal governor. Was an ardent student of chemistry, and it was long maintained on his behalf that he discovered the composition of water. He was a man of high mental powers generally, and possessed a wide and varied knowledge of literature and science.

**References.**—*Smiles' Lives of Boulton and Watt*; *Muirhead's Mechanical Inventions of James Watt*; *Thurston's The Growth of the Steam Engine*; and *Flemington's James Watt*.

**Watterson, Hector**, American journalist and orator, was born at Washington, D. C., 1840. He served with distinction in the Confederate army as chief scout under Lee in 1862. He was subsequently settled at Louisville, Ky., where he has made and has since edited the *Courier-Journal*, which he founded and was the greatest of the newspapers. At Chicago, in 1893, he delivered the dedicatory oration at the opening of the World's Columbian Exposition. He published a *History of the Spanish-American War*; *Oddities of Southern Life and Character*; *Abraham Lincoln*, etc.

**Watts, George Frederick**, English artist, sculptor, portrait painter, and delineator of historical subjects, was born at London, 1820. He was elected at the Royal Academy in 1837, and gained a reputation for the size, artistic excellence, and beauty of coloring of his pictures. His chief exhibits included: *Caractacus*; *Cymbeline*; *Faia Morgana*; *Life's Allusions*; *Sir Galahad*. Died, 1904.

**Watts, Isaac**, English hymn writer and theologian, was born at Southampton, England, 1674. His theological works were numerous. His version on *Logic* had a considerable reputation. His reputation has been chiefly perpetuated by his well known hymns. Died, 1748.

**Wayne, Anthony**, famous general in the war of the revolution, was born in Pennsylvania, 1733. Led the attack at Germantown, 1777, and was captured and detained at Valley Forge; achieved a brilliant victory in the storming of Stony Point, 1779. His courage and able leadership were recognized in 1780. By his dash and audacity he acquired the sobriquet of "Mad Anthony." He became major-general and commander-in-chief in 1792. Died, 1796.

**Weber (de'ber), Karl Maria von**, German composer, was born at Eutin near Lubeck, 1786, of a famed musical family. His first great production was *Der Freischütz*, which established his fame, and was followed by *Oberon*, his masterpiece. Died, 1826.

**Weber, Arthur Gordon**, American physicist, professor of physics, Clark University, was born 1863. He was graduated at Clark University, 1885. A member of many scientific associations, and author of: *A Mathematical Treatise on the Theory of Electricity and Magnetism*; and many papers on physics.

**Webster, Daniel**, great American statesman and orator, was born at Salisbury, New Hampshire, 1782. Daniel was the second son of Nathaniel Webster, a small farmer and justice of the county court. He entered Dartmouth College in 1797, and taught school in winter to pay his expenses. He graduated in 1801, and in 1804, went to Boston, and entered the law office of Mr. Gore. In 1805 he was admitted to the Boston bar, passed one year in the practice of his profession at Boscowan, and, on the death of his father, established himself at Portsmouth, N. H., and married in 1808.

Having engaged in politics as a member of the federalist party, he was elected to congress, where he immediately took rank with the foremost men of the country. He resigned his seat in the special session of May 1813, and on June 10, delivered his maiden speech on the repeal of the Berlin and Milan decrees. This, and his mastery of the question of currency and finance, secured him a high position. At the close of the session, however, Webster removed to Boston, where, during a period of seven years, he devoted himself exclusively to the practice of his profession, and occupied a prominent position as a counselor and advocate.

In 1822, he was a member of the Massachusetts constitutional convention; and on December 22, 1822, he pronounced at Plymouth the eulogy of the anniversary of the Pilgrims, the first of that remarkable series of discourses, or orations, which put him in the first rank among American orators. In 1825, he delivered an oration at the laying of the cornerstone of the Bunker Hill monument; in 1843, one on its completion. In 1826, he pronounced the eulogy of John Adams and Thomas Jefferson, two fathers and founders of the Union. In 1846, he who died on the same semi-centennial anniversary of the declaration of independence; and in 1851, a patriotic discourse on the laying of the corner stone for the extension of the Capitol at Washington.

In 1822, he was elected to Congress from Boston, and distinguished himself by his speeches on the holy alliance, and the Greek revolution, and his labors in the revision of the criminal laws of the United States. In 1826, he was chosen United States senator; and in 1830, rose to the height of his forensic renown, in a speech of two days, in the debate over Mr. Hayne, of South Carolina, on the right of "nullification." Webster and Hayne were the leaders of the opposition during the administration of Jackson and Van Buren.

In 1841, he became secretary of state under President Tyler, and remained in the administration of President Tyler until 1843; and was a third time secretary of state in 1850, in the cabinet of Mr. Fillmore. On various occasions Webster had been an unsuccessful candidate for the presidency. He acquired again to that position in 1852, but his advocacy of compromises on the slavery question had given offense to the abolitionists, and the choice of the convention assembled at Baltimore fell upon General Scott. The great orator died a few months after, October 24, 1852.

Webster's figure was commanding; his countenance was remarkable even in repose, but when animated by the excitement of debate, it "spoke no less audibly than his words." His gestures were vehement, without being undignified; and his delivery, unrivaled in power, in clearness, and in modulated variety of tone.

**References.**—*The Writings and Speeches of Daniel Webster* have been published in 18 volumes, of which 13 vols. are complete. See also *Life of Daniel Webster*; *Harvey's Reminiscences of*

*Daniel Webster*; *Lodge's Daniel Webster*; *McMaster's Daniel Webster*; *Wheeler's Daniel Webster*; *The Encyclopedia Americana*.

**Webster, John**, English dramatist, was born about 1650. He collaborated with a number of writers of the day, and then produced the tragedy of *The White Devil*, one of his two great masterpieces, about 1635, and about 1616 his famous *Tragedy of the Dutch Merchant*.

**Webster, Noah**, author and philologist, was born at Hartford, Conn., 1758, and was educated at Yale College, 1776, and then studied in Yale. While employed in teaching at Goshen, N. Y., he prepared his *Grammatical Institute of the English Language*, 1807, he published then *Philosophical and Practical Grammar of the English Language*, which commenced his *American Dictionary of the English Language*, 1828. He was a student of the Greek, he devoted ten years to its study, and prepared a *Synopsis of Words in Twenty Languages*; then began his dictionary, and in seven years completed it. Died in New Haven, Conn., 1842.

**Weed, Thurlow**, American journalist, was born at Cairo, N. Y., 1797. He served as a volunteer in the war of 1812. In 1805 he moved to New York city and became editor of the *New York Times*, and afterward of the *Commercial Advertiser*. In 1810-12 he went to Europe on a special mission by President Lincoln. Died at New York in 1862.

**Weir (weir), Robert Walter**, American painter, was born at New Rochelle, N. Y., 1803. After studying in Italy several years he was made professor of painting in the University of California, 1837, and remained for twenty-two years. His best known works are *Portrait of Henry Hudson*, *Columbus before the Council*, etc. Died, 1889.

**Westwood (we'st-wood), Augustus**, German biologist, was born at Frankfurt, 1834. He contends that natural selection is the dominant factor in evolution. He has written, besides the *Romance* lectures of 1894, *The Evolution of Theory* and works on kindred problems.

**Wells, William Henry**, American physician and pathologist, professor of pathology at Johns Hopkins, was born at Norfolk, Conn., 1830. He graduated at Yale in 1850; M. D., 1855; professor of pathology, Johns Hopkins, 1884; and pathologist to the Johns Hopkins Hospital, 1889. He is the author of *General Pathology of Fever*.

**Wellington, Arthur Wellesley, Duke of**, celebrated British general, was born at Dangan Castle, Ireland, 1769; entered the army as ensign, 1787, and became lieutenant-colonel in 1793. It was in the battle of Assaye, in 1803, that he first gained fame. In 1814 he was created marquis of Douro and duke of Wellington. He was then appointed commander-in-chief of the British army in Europe, and from Vienna joined the army at Brussels. The battles of Ligny and Quatre Bras were fought on June 16 and 18, 1815, and the great battle of Waterloo. Here the grand duke was blown from his horse, and the power of Napoleon was annihilated. At the battle of Waterloo, in 1815, he was struck at Lord high commander of England. In 1827 he succeeded the duke of York as commander-in-chief of the British army, and from 1828 to 1830 was prime minister. Died at Walmer Castle, in 1852.

**Wells, Carolyn**, author, was born at Rahway, N. J., daughter of William E. Wells, and has been engaged in literary work since 1895. Author of: *The Sign of the Sphinx*; *The Garden of Marjorie's Vocation*; *Rainy Day Disasters*, etc.

**Wells, David Ames**, American economist, was born at Springfield, Mass., 1828. He was graduated from Williams College. Among his published works are text-books on *Science of Common Things*; *Recess Economy*; *Manual of the Principles of Political Economy*; *Principles of the Science of Production*; *Our Merchant Marine*. Died at Norwich, Conn., 1898.

**Welsh, Martine George**, English novelist, was born at Bromley, Kent, 1856. He was graduated at the Royal college of science, 1888. Author: *The Sign of the Sphinx*; *The Garden of Marjorie's Vocation*; *Rainy Day Disasters*, etc.

**Wendell, Barrett**, American editor, critic and critic, professor of English at Harvard since 1896, was born at Boston, 1855. He was graduated at Harvard, 1877; Ph. D., 1880. He was a lecturer at the Sorbonne and other French Universities, 1904-05. Author: *English Composition*; *Life of Col. Matthew Smith*; *Life of Col. Smith*; *Concerning America*; *The Temper of the Seventeenth Century in English Literature*; *History of Literature*.

**Wenley, Robert Mark**, American educator, head of philosophical department, University of Michigan, was born at New York, 1861. He was graduated at the University of Glasgow, M. A., 1884; Ph. D., Sc. D., L. L. D., University of Michigan, 1890. He was co-editor of *Dictionary of Philosophy*, etc. Joint author: *The Psychological Review*.

**Wernicke, Wilhelm**, German geologist, was born at Wernicke, Germany, 1800. He was a geologist, and extended his reputation throughout Europe. In his mineralogical system minerals were distinguished by their chemical composition and their external characters. He died at Dresden in 1817.

**Wesley, Charles**, English hymn writer, was born at Epworth, England, 1708, and was associated with his brother John in the Methodist movement. He is the author of a great number of hymns, many of which are among the best and most admired in the English language. He died 1791.

**Wesley, John**, English divine, who, with Whitefield, founded Methodism, was born at Epworth, 1703, and at Oxford and at the University, he and his brother, with a few other students, formed themselves into a society for the purpose of mutual edification in religious exercises. So singular an association excited considerable notice, and among other names bestowed upon the members, that of *Methodists* was applied to them. Wesley with some others, chiefly Moravians, came to Georgia in 1735, but at strictness of discipline which he attempted to introduce proved very distasteful to the colonists. After a residence of less than two years in America, he returned to England, preaching to open air meetings, and gathered many followers. He built spacious meeting houses in London, Bristol, and other places.

For some time he was associated with George Whitefield, but differences arising on account of the doctrine of election, which was zealously espoused and preached by the latter, they separated, and the Methodists were denominated according to their respective leaders.

Wesley was indefatigable in his labors, and was almost continually engaged in traveling over England, Wales, Scotland, and Ireland. No man ever labored more zealously or continuously in the cause which he had undertaken. Every moment of his life was devoted to the organization of the great sect of Methodists, and his influence over his followers was to the last. His preaching was extemporaneous, but not vehement. He dwelt much upon practical religion, though he taught his followers to seek inspiration of the Holy Spirit, and to a state of sinless perfection. Died in London 1791.

**References.**—Perhaps Wesley's best single treatise were his *Notes on the Old and New Testaments*, and his *Doctrine of Original Sin*. His complete *Works*, with a *Life* by T. Boehman, and a *Portrait* by J. Jackson, have been printed in 15 volumes. *Lives of John Wesley* have been written by Southey, Tyerman, Wedgwood, Telford, and Southey, and Wesley's *Life* by Southey and his *Centenary*, by Dr. Fitchett.

**West, Benjamin**, American painter, was born at New York, 1738. He was a portrait painter for seven years of age, worked in Philadelphia and New York, studied in Italy, 1760-63, and settled in England in the latter year. Among his best paintings are: *The Death of Wolfe*; *Christ Healing the Sick*; *Death on the Pale Horse*, etc. Died in London in 1820.

**Westcott, Brooke Foss**, English prelate, writer, and biblical scholar, was born near Birmingham in 1825; regius professor of divinity at Cambridge and in 1890 was appointed bishop of Durham. His writings embrace: *History of the Canon of the New Testament*; *The Gospel of Life*; *Social Aspects of Christianity*; *Characteristics of the Gospel Miracles*; *New Testament in the Original Greek*. Died, 1901.

**Westinghouse, George**, American inventor and manufacturer, was born in New York in 1816. In 1860 he invented and successfully introduced the Westinghouse air brake, which he has since greatly improved. He was the pioneer in introducing alternating current electricity in America, built the great generators at Niagara Falls and those for the Atlantic railway and rapid transit system in New York.

**Wilmore, George Feabody**, United States senator, was born during a visit of his parents abroad, at London, England, 1847. He was graduated at Yale College, 1867. He is a trustee of the Wesleyan education fund, was governor of Rhode Island, 1888-90; 1897-7; clerk of the United States senate, 1894, 1891 and 1890.

**Wynne, Stephen**, English novelist, was born at Ludlow, 1805. In 1800 he published *The House of the Wolf*, followed by *Francis and his Friends*. He was himself famous by *A Gentleman of France*.

**Wheatstone, Sir Charles**, English physicist and mathematician, was born at Gloucester, England, 1802. Invented the telegraph, the barometer and barometer; secured first patent for an electric telegraph; and an apparatus for conveying intelligence to engineers and steamboat boards large steam-vessels. He is well known for the Wheatstone bridge. Died, 1875.

**Wheeler, Benjamin Eli**, American educator and philologist, president of the University of California since 1899, was born at Randolph, Mass., 1854. He was graduated from Harvard University

1875; Ph. D., LL. D., Harvard, 1900; professor of Greek, 1888, at Cornell. Author: *The Greek Vowel-Accent*; *Analogy in Language*; *Organization of Language* in the University of Chicago.

**Wheeler, Joseph**, American general was born in Augusta, Ga., 1836. He was graduated at the United States Military Academy, serving in the cavalry until the outbreak of the civil war, when he entered the confederate army, in which he was later commissioned major-general and senior commander of cavalry; was made major-general of volunteers during the Spanish-American war, 1898. He was appointed major-general in 1903, and was retired the following September.

**Whipple, Edwin Percer**, American author, was born at Gloucester, Mass., 1819. In 1872 he became literary editor of the *Boston Globe*. In 1877 wrote for the *North American Review*, his publications include: *Essays and Reviews*; *Literature of the Age of Elizabeth*, etc.

**Whistler, James Abbott McNeill**, noted American painter, was born in Lowell, Mass., 1834. He entered the United States military academy but was dismissed; studied drawing and painting in Paris, France, and in 1863 settled in London, England. He gained celebrity as an artist. His best known works are: *Portrait of My Mother*; *Nocturne in Blue and Gold*. Died in London, 1903.

**White, Edward Douglass**, American jurist, was born in the parish of Lafourche, La., 1845. He was educated at Mount St. Mary's College, Maryland, and at the Jesuit College in New Orleans. During the civil war he served in the confederate army, 1862-63. He was appointed associate justice of the United States supreme court in 1894 and chief justice, 1910.

**White, William**, American journalist, was born at Colebrook, N. H., 1834. He was graduated at Beloit College, Wis., 1853; from 1883 to 1903 was editor of the *New York Herald*, and was president of the company, editorial writer, and editor-in-chief. Author: *Money and Banking*; *History of the United States*; *The Roman History of Appian*, etc.

**White, Horatio Stevens**, professor of German at the University of Wisconsin, was born at New York, 1829. He was graduated at Harvard, 1873; LL. D.; head of German department, 1891-1902; dean University library, 1896-1902; Cornell University, 1902 he became professor of German at Harvard. Edited: *Selections from Lessing's Prose*; *Selections from Heine's Poems*; *Selections from German Prose Composition*; and *Deutsche Volklieder*.

**White, James William**, American physician and surgeon, was born in Philadelphia, Pa., 1851. He was graduated at the University of Pennsylvania, M. D., Ph. D., LL. D. He was resident physician of Philadelphia hospital, 1873; is now John Rhea Barton professor of surgery, University of Pennsylvania. Joint author: *American Surgery*; *Principles of Surgery*.

**White, Richard Grant**, American author and critic, was born in New York city, 1821. He was a member of the editorial staff of the *New York Times*. The result of his studies and writings on music and art was a volume on *Christian Art*. He was a contributor to the *Century*. Author: *Poetry of the Civil War*; *Life of Shakespeare*; *Studies in Shakespeare*, etc. He died, 1885.

**White, Newell Adams**, American geologist, was born in Grand Rapids, Mich., 1873; Ph. B., University of Michigan, 1895. He is a frequent contributor to the *Geological Survey of the United States*. Author: *The Blasted Trail*; *The Forest*; *Blasted Trail Stories*; *The Forest*; *Camp and Trail*.

**White, William Allen**, American journalist and author, owner and editor of the *Emporia Daily and Weekly Gazette*, was born 1868. Author: *White's Weekly*; *White's Almanac*, *Strangers and Spots*; *A Certain Rich Man*, etc.

**Whitfield, George**, one of the founders of Methodism, was born in Northampton, Mass., 1714. He was educated at Oxford. One of his most famous missionary journeys was that which he made to America, several of which lasted for two or three years. He died at Newburyport, near Boston.

**Whitman, Walt**, American poet, was born in 1819 at Westhill, L. I. He learned the printing trade, and was employed by the *Brooklyn Daily Eagle* and papers and magazines. Later he became a newspaper publisher for a year; in 1846, he became for one year publisher of the *Brooklyn Daily Eagle*, which he traveled widely in the United States and

Canada. In 1855 appeared his first collection of *Leaves of Grass*. Later he produced his *Democratic Vistas*, *Drum*, *Rivulets*, and *Specter*, *Days and Nights*. He died at Camden, N. J., 1895.

**Whitney, Eli**, American inventor, was born in Westborough, Mass., 1793. In 1792 he was graduated at Yale University, and spent some time owing to litigation growing out of the claims of fraudulent inventors, and despatching of obtaining his rights. He finally went to New Haven, Conn., 1798, near which city he became engaged in the manufacture of firearms. He died 1859.

**Whitney, Josiah Dwight**, American biologist, was born at Northampton, Mass., 1819. He was graduated at Yale University, and was a professor at Harvard. He wrote extensively on geological topics, and died in 1906.

**Whitney, William**, American philologist, was born at Northampton, Mass., 1827. In 1854 he became professor of Sanskrit at Yale, and in 1870 also of comparative philology. He waged war with Max-Müller on fundamental questions of the science of language. Among his works were: *Material Form in Language*, *Life and Growth of Language*; *Mixtures in Language*, etc. He was editor-in-chief of the *Century Dictionary*. Died at New Haven, 1894.

**Whittier, John Greenleaf**, American poet, was born of Quaker parents at Havorthall, Mass., 1807. In his youth he was a farmer, and learned the shoemaking trade. He carried on the farm himself for five years, and in 1830-36 he was a shoemaker. He was a Quaker and always remained an ardent abolitionist. Among the numerous volumes of poetry which he has written are: *Drum*, *Drum*, *Fishes*; *The Voice of Freedom*; *The Chapel of the Hermits*; *Snow-Bound*; *In War-Time*; *Hazel Blossoms*; *Myself*; *Myself*, etc. He is best known for his poems, *Barbara Fuchs*, *The Barefoot Boy*, *Myself*, *Myself*, etc.

**Wickersham, George Woodward**, American lawyer, attorney-general of the United States since 1890, was born at New York, 1828. He was a graduate of the University of Pennsylvania 1850; he removed to New York city, and in 1853 entered the law office of John Jay. He was admitted, four years later, to partnership in the firm, which connection he terminated upon becoming attorney-general.

**Wieland (volland), Christoph Martin**, noted German poet, was born at Oberholzhorn, near Biberach, 1733. He was a member of the *Sturm und Drang* movement, and was especially noted in the didactic poem *Maximus*, a work of singular grace and harmonic treatment. He wrote the *Choice of Hercules*. Died, 1812.

**Wiggin, Kate Douglas**, American author, was born in Philadelphia, 1861. She was graduated at Abbott Academy, Andover, Mass., 1878, and married Samuel Wiggin in 1880 and George C. Rice in 1881. She has written: *Myself*; *The Story of Pagan*; *Pagan Oliver's Problem*; *The Village Black Tavern*; *The Diary of a Goose Girl*; *Rebecca*; *The Fair at the Inn*.

**Wilberforce, William**, English statesman and philanthropist, was born at Hull, England, 1759. He was educated at St. John's College, Cambridge. He entered parliament as the representative of his native town. In 1789 he first proposed in the house of commons the abolition of the slave trade, and with the aid of Charles James Fox, this measure was carried in 1806. Died 1833 and was buried in Westminster abbey.

**Wilcox, Ella Wheeler**, American poet and writer, was born near Madison, Wis., 1855, and was educated at the State University of Wisconsin. For many years she has been on the staff of the *New York American*.

**Wiley, Henry**, American chemist, was born at Kent, Ind., 1814; graduated at Hanover College, 1837; M. D., Indiana Medical College; B. S., Harvard University, 1840; Ph.D., 1842; was 1850; professor of chemistry, Purdue University, and state chemist of Indiana, 1874-83; chief chemist, United States Department of Agriculture, 1883-1910; professor agricultural chemistry, George Washington University, since 1899; consulting professor in Indiana Polytechnic Institute, 1902. Author: *Principles and Practice of Agricultural Chemistry* (3 volumes); *Foods and Their Adulterations*; *Nutrition*; *Government Laboratories*; *Handbook and twenty-five scientific papers*, etc.

**Wilhelmine (Wilhelmina)**, *Helene Pauline Marie*, German empress, was born at Schleswig, Holstein, 1840. She succeeded to the throne of the Netherlands on the death of her father in 1890. She was crowned as empress in 1890, when she was inaugurated as queen. In 1901 she married Prince Henry, youngest son of the late king of Denmark. She was born in England, 1869, in the *Lady of Lyons*. She has toured the United States in *Diana Gurney*, *Tom Funck*, *From London to London*, etc.

**Willard, Emma C.**, American educator, born at Berlin, Conn., 1857. In 1908 she married Dr. John Willard, president of the Brooklyn College, and by her efforts a school for the training of

adorn the triumph of her conqueror. She was a woman of great courage, high spirit, and remarkable beauty.

**Zimmerman, Helen**, British author, translator, and critic, was born in Hamburg, Germany, in 1846, and was taken to England in 1850. She resided in England until 1887, when she removed to Italy, where she has since lived. Author: *Previous Sinners*; *Gold in the Desert*; *Half-Hours With Famous Novelists*; *Tales From the Bible*; *The Italy of the Italians*, etc.

**Zinzendorf (von-bor-dorf), Nicolaus Ludwig, Count von**, founder of the Moravian brethren, was born at Dresden, 1700. He accidentally met a wandering coppersmith named Christian David, a member of the old sect of Moravian brethren, who described the persecutions to which the sect was exposed, and Zinzendorf invited him and his friends to settle on his estate. They accepted the proposal, and the colony received the name of "Herrnhut." In 1727, at the request of King Frederick William I. of Prussia, he was ordained bishop of the Moravians. In 1741 he went to America and founded the celebrated Moravian colony at Bethlehem, Pa. Died, 1760.

**Ziska (z'ska), or Ziska (zisk'ska), Jan**, leader of the Hussites, was born at Trencov, Bohemia, about 1360. He was an adherent of the Hussite doctrine. Died, 1424.

**Zola (z'ola), Fr. st'di**, Emile, French novelist, was born at Paris, 1852. He was educated at the Lycée St. Louis. His first important venture in fiction was *Les Mystères de Marseille*. Soon after this he formed with Flaubert, Daudet, and the Goncourts the naturalistic school of fiction. The fruit in part of this was the series known as

*Les Rougem-Macquet Family*. His latest work, written in exile, created by his courageous advocacy of the famous Dreyfus case, is entitled *Le Capitaine Corcoran*. He was a knight of the French legion of honor. He died in 1902.

**Zoroaster** (Old Persian *Zarathustra*, later *Per. Zerdusht*), was one of the great religious teachers of the east, the founder of the Persian religion, now known as Zoroastrianism. He has been represented by eminent authors as purely mythical, but it seems more reasonable to believe that he was a real, historical personage. If this view be accepted he was probably a native of the east of Persia, but there is great uncertainty as to the time in which he appeared as a religious teacher. He is supposed by some to have been a contemporary of Moses, by others his data is assigned to the tenth century before Christ.

His doctrines are to be found in the Parsee scriptures called the *Zend-Avesta*, and the *Gōdās*, which is the oldest part of that work, are declared to contain his authentic utterances. The fundamental idea of his doctrine was the existence, since the beginning, of a spirit of good, Ahurā Mazdaō (Ormuzd), and a spirit of evil, Angrō Mainyush (Ahriman). These two are in perpetual conflict, and the soul of man is the great object of the war. Ormuzd created man free, so that if he allows himself to fall under the sway of Ahriman he is held to be justly punishable.

When he dies his good and evil deeds will be weighed against each other, and accordingly as the balance is struck he will be sent to heaven or to hell. If they are exactly equal, the soul passes into an intermediate state, and remains there until the day of judgment. Ormuzd is to triumph ultimately, and then there will be one undivided kingdom of God in heaven and on earth.

The religion of Zoroaster, when it became that of Iran, was expounded by a widely spread priesthood, and these provided for it a ritual and ceremonial. Minutely elaborated laws for the purification of soul and body were laid down. They included a prohibition of the burning or the burying of the dead bodies of believers, which, by the Parsees in Bombay and elsewhere, are still left to be devoured by vultures.

**References.**—Jackson's *Zoroaster, the Prophet of Ancient Iran*; Windichmann's *Zoroastriace Gedenken*; and *Die Iranische Religion*; Max Müller's series of translations of books of the orient, especially the *Zend-Avesta*.

**Zwingli (zwing'li), Ulrich**, Swiss reformer, was born at Wildhaus, 1484. In 1519 he was appointed to the cathedral at Zürich, having previously opposed the sale of indulgences by 'Lutherism.' Attempts were made to prohibit his preaching, but the reformation grew at Zürich. In 1529 Zwingli met Luther at Lichfield at Marburg, but two years later he fell in the battle of Kappel in the war with Bern. Died, 1531.

### HALL OF FAME FOR GREAT AMERICANS

The building known by the above title stands on University Heights, New York, and is affiliated with New York University. It was erected from a fund of \$350,000 given for that purpose by an unknown donor. The structure is a semicircular colonnade connecting the Hall of Philosophy with the Hall of Languages, containing 150 panels for inscriptions and six compartments for mention of those persons whose names are inscribed upon the panels.

The terms of the gift prescribed that fifty panels were to be filled in 1900, and five at the close of each half decade thereafter. Only names of native Americans who have been deceased at least ten years may be chosen. Later provisions included suitable commemoration of great Americans of foreign birth, as well as a hall of fame for women.

In 1900 nominations were invited from the public, and submitted to a committee of 100 distinguished citizens for designation. The action of that committee, and subsequent committees, resulted in the choice of the following persons:

NAME	WHERE BORN	DATE OF BIRTH AND DEATH	EDUCATED	VOCATION
John Adams	Quincy, Mass.	1735-1826	Harvard	Statesman.
John Quincy Adams	Quincy, Mass.	1767-1848	Harvard	Statesman.
Lois J. B. Agassiz	Switzerland	1807-1873	University of Munich	Naturalist.
Sam James Aikin	St. Louis, Mo.	1793-1851	France	Orator.
George Bancroft	Worcester, Mass.	1800-1891	Harvard	Historian.
Henry Ward Beecher	Litchfield, Conn.	1813-1887	Amherst	Preacher, Orator.
Phillips Brooks	Boston, Mass.	1835-1893	Harvard	Preacher.
William Cullen Bryant	Cumington, Mass.	1794-1878	Williams College	Poet.
Henry Clay	Newport, R. I.	1790-1842	Harvard	Preacher, Essayist.
James Fenimore Cooper	Hanover Co., Va.	1777-1852	Elementary	Statesman.
Peter Cooper	Burlington, N. J.	1789-1851	Yale	Novelist.
Jonathan Edwards	New York City	1791-1863	Elementary	Philanthropist.
Ralph Waldo Emerson	Windsor, Conn.	1803-1882	Yale	Theologian, Preacher.
David Glasgow Farragut	Boston, Mass.	1803-1882	Harvard	Essayist, Philosopher.
Benjamin Franklin	Mr. Knowlton, Tenn.	1680-1790	United States Navy	Admiral.
Robert Fulton	Little Britain, Pa.	1765-1815	Politechnic	Statesman, Writer.
Ulysses Simpson Grant	Point Pleasant, Ohio	1822-1885	West Point	Inventor.
Ann Gray	Paris, N. Y.	1810-1888	Fairfield College	Soldier, Statesman.
Alexander Hamilton	Nevia Island, W. I.	1757-1804	Columbia	Statesman.
Nathaniel Hawthorne	Salem, Mass.	1804-1864	Hawdon College	Novelist.
Oliver Wendell Holmes	Cambridge, Mass.	1809-1894	Harvard	Poet, Physician.
Washington Irving	New York City	1783-1859	Academic and Legal	Novelist, Diplomat.
Andrew Jackson	North Carolina	1767-1845	Elementary	Soldier, Statesman.
Thomas Jefferson	Shadwell, Va.	1743-1826	William and Mary	Statesman.
John Paul Jones	Arbigland, Scotland	1747-1792	Elementary and Naval	Naval Officer.
James Kent	Westmoreland Co., Va.	1807-1870	West Point	Lawyer, Jurist.
Robert Edward Lee	Hardin Co., Ky.	1807-1865	Self-educated	Soldier.
Abraham Lincoln	Boston, Mass.	1809-1861	South College	Poet, Diplomat.
Henry Wadsworth Longfellow	Boston, Mass.	1819-1891	Harvard	Poet, Diplomat.
James Russell Lowell	Buckland, Mass.	1817-1849	Academic, Private	Educator.
Mary Lyon	Stratford, Conn.	1793-1826	Yale	Statesman.
Horace Mann	Franklin, Mass.	1796-1859	Brown University	Educator.
John Marshall	Fauquier Co., Va.	1753-1835	Privately	Jurist.
Maria Mitchell	Charleston, Mass.	1818-1889	Privately	Astronomer.
Samuel Finley Breese Morse	Charleston, Mass.	1791-1872	Yale	Inventor, Artist.
John Lothrop Motley	Dorchester, Mass.	1814-1877	Harvard	Historian, Diplomat.
George Peabody	Southey, Mass.	1795-1869	Harvard	Merchant, Philanthropist.
Edgar Allan Poe	Boston, Mass.	1809-1849	West Point	Poet, Romanist.
William Tecumseh Sherman	Lancaster, Ohio	1820-1891	West Point	Soldier.
Joseph Story	Litchfield, Conn.	1783-1845	Harvard	Jurist, Law Writer.
Harriet Beecher Stowe	Litchfield, Conn.	1811-1896	Litchfield Academy	Novelist.
Gilbert Stuart	Narragansett, R. I.	1755-1828	London, with West	Portrait Painter.
George Washington	Westmoreland Co., Va.	1732-1799	Academic	Soldier, Statesman.
Daniel Webster	Salisbury, N. H.	1782-1852	Dartmouth College	Orator, Statesman.
El Whitney	Westboro, Mass.	1765-1825	Yale	Inventor.
John Greenleaf Whittier	Massachusetts	1807-1893	Amherst College	Poet.
Kenneth Willard	Berlin, Conn.	1787-1870	Harvard Academy	Educator.
Frances Elizabeth Willard	Churchville, N. Y.	1820-1898	Northwestern Female College	Temperance Reformer.
Roger Williams	London, Eng.	1604-17-1683	Cambridge, Eng.	Religious Reformer.

accounts for the same being given to eight places in the country.

**brash** (brash), *adj.* brittle, as wood. [*Collage, U.S.*]

**brash** (brash), *n.* broken, loose, and shaggy fragments of rock underlying alluvial deposits.

**brass** (brass), *n.* [*pl. brasses* (brasses)], an alloy of copper and zinc.

**brassy** (brassy), *adj.* pertaining to, or resembling, brass; impudent; brazen.

**brat** (brat), *n.* a child used contemptuously.

**brat-fishing** (brat-fish-ing), *n.* an ornamental open-work; creating.

**bravado** (brav-ə-dō), *n.* [*pl. bravados* (dōs)], arrogant manner; defiance.

**brave** (brave), *adj.* bold; courageous; intrepid; making a fine show; an Italian warrior.

**Syn.** BRAVEY, valiant. *Gallantry* is extraordinary bravery or bravery on extraordinary occasions; the brave man goes bravely where he is commanded; the gallant man leads on with vigor to the attack. *Bravery* is common to vast numbers and whole nations; *gallantry* is peculiar to individuals or particular bodies.

**Ant.** Fear, cringe, shrink, tremble.

**brav-er** (brav-er), *n.* the quality of being brave.

**Syn.** BRAVEY, courage, valor. *Bravery* lies in the blood; *courage* lies in the mind; the latter depends on the reason, the former on the physical temperament; the first is a species of instinct, the second a virtue; *valor* lies in proportion to the force of the mind; *bravery* is without thought; *valor* is a higher quality than either *bravery* or *courage*, and seems to partake of the characteristics of both.

**Ant.** Fear, pusillanimity, cowardice.

**brav-er-y** (brav-er-y), *adv.* well done; good; a cheer.

**brav-er-y** (brav-er-y), *n.* a cheer of great brilliant style, adapted to display the skill of the performer, or the range and flexibility of a singer's voice.

**bravi** (bravi), *n.* *cf.* to quarrel noisily and outrageously. [*FEUD*]

**brawl** (brawl), *n.* full, strong motion; boxer's fight, especially when collared and otherwise prepared.

**brawn-y** (brawn-y), *adj.* muscular; tough.

**bray** (bray), *n.* *cf.* to beat, to bray, *p.* braying, to pound or beat fine or small.

**brase** (brase), *s.* *cf.* to solder with brass; cover or ornament with brass.

**brass** (brass), *adj.* made of brass; pertaining to brass.

**brash** (brash), *n.* an open pan for burning charcoal.

**brasil** (brasil), *Port.* *brasil* (brasil). Named, on account of the color of its tree-wood, from a tree, "live coal." A republic of South America.

**brasil nut** (brasil-nut), *n.* the seed of a tree of Brazil (tree).

**Brasas** (brás-sa) *river*, *Tex.* As named by the Spaniards *Brasas de Dios*, "arm of God." The river established a mission on its bank some thirty miles from the mouth of the San Sabá, and the guard having been called away, the Indians descended on the mission, and commenced its destruction. When the soldiery returned, their loss was quickly discovered, and, searching for a solution, they found in the river many of the dead bodies of the depredators, still floating in its eddies; as they could discern no marks of violence, they pronounced it a restorative miracle done by the "arm of God."

**breach** (breach), *n.* the act of breaking; the violation of a law, contract, or any other engagement.

**Syn.** BREACH, break, gap, chasm. *Breach* and *gap* are the consequence of a violent removal, which destroys the connection; a *break* and *chasm* may arise from the absence of that which would form a connection. A *breach* in a wall is made by means of cannon; *break* in fences are usually the effect of some violent effort to pass through; a *break* is made in a piece of printing by leaving off in the middle of a line; a *chasm* is left by cutting away any words in the sentence are omitted. [*See break*]

**break** (break), *n.* food made from ground grain; food in general.

**break-fruit** (break-fruit), *n.* the fruit of a tree growing from a broken branch.

**break-stuff** (break-stuff), *n.* a grain, flour, or meal from which bread is made.

**break** (break), *n.* the measure of any surface from side to side.

**break** (break), *s.* [*pl. p. broke, p. p. broken, p. p. broken*], to break; to break up; to interrupt; *p.* break; to rupture; an interruption.

**Syn.** BREAK, burst, crack, split. To *break* does not imply any particular manner or form of action; what is broken may be broken in two or more pieces, broken short or lengthwise, and the word *break* is broken as readily as any other word, frequently also with noise. To *crack* and *split* are modes of breaking lengthwise; the former being used in relation to a hard substance, and the latter in relation to the latter in application to wood. [*See break*]

**break-age** (break-age), *n.* the act of breaking; allowance for accidental fracture.

**break-down** (break-down), *n.* a collapse; failure.

**break-or** (break-or), *n.* one who, or that which, breaks. [WAVE]

**break-fast** (break-fast), *n.* the first meal in the day, break-fast (break-fast), *n.* any structure to break the force of the waves.

**break-water** (break-water), *n.* a broad-shaded fresh-water fish; sunfish; marine fishes of different varieties.

**breast** (breast), *n.* the fore part of the body between the neck and the abdomen.

**breast-plate** (breast-plate), *n.* a portion of armor covering the front of the body.

**breast-plate** (breast-plate), *n.* a hastily constructed work, thrown up breast-high for defense.

**breath** (breath), *n.* the air inhaled and exhaled in breathing.

**breath** (breath), *s.* to inhale air and expel it from the lungs; live; take breath.

**breath** (breath), *n.* respiration; air in gentle motion.

**breach** (breach), *n.* the buttocks; the hinder part of the body.

**breach** (breach), *n.* *pl.* a garment worn by men, covering the legs.

**breach-ing** (breach-ing), *n.* the harness which braces round a horse's breech.

**breed** (breed), *s.* [*pl. p. bred, p. p. bred*], to procreate; hatch; train. [*EDUCATION*]

**breed** (breed), *n.* a gentle gait; a fresh, soft wind.

**Syn.** BREED, gait, blast, gust, storm, tempest, hurricane. A *breve* is gentle; a *gale* is brisk; but steady; we have *breves* in a calm sea, which keep the sails in the favorable gale.

**Ant.** Calm, lull, quiet.

**breese** (breese), *n.* a gentle gait; a fresh, soft wind.

**Breese** (breese), *n.* the lowest pass over the main chain of the Alps.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**Brigade** (brigade), *n.* a body of troops, usually of twenty-five miles south of Innsbruck.

**brig-an-tine** (brig-an-tine), *n.* a small two-masted square-rigged vessel like a brig, except that she has no square mainmast.

**brilliant** (brilliant), *adj.* shining; illustrious; witty; clever; lively. [*CLARE*]

**brilliant** (brilliant), *s.* to grow bright; clear up; to make bright; to make cheerful.

**Brington** (brington), *n.* Formerly Brightelmston, from a personal name. A city and watering-place in Sussex, in the English channel. It is the leading seaside resort in Great Britain.

**Bright's disease** (Bright's disease), *n.* a form of kidney disease characterized by the presence of albumin in the urine.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

**brill** (brill), *n.* a fish resembling the turbot; sprat.

[illegible]

**vac**

**val-er-ous** (val'ē-rus), *adj.* brave.  
**val-u-able** (vā-lū-ā-bul), *adj.* possessing useful qualities; having value or worth: a thing of value.  
**val-ue** (vū), *n.* that which renders something useful or estimable; price: *v.* to estimate the worth of; *vt.* to value.

**VALU**. **VALUE**. *price, esteem.* To value is to set any value, real or supposed, relative or absolute, on a thing; in this sense men value gold above silver, or an appraiser values goods. *Value and esteem* are taken only as mental actions; the former in reference to sensible or moral objects, the latter only to moral objects; we may value and esteem according to their merits, or we may value them according to their contents; we prize books more for their contents, in which sense *price* is a much stronger term than *value*.

**ANTH.** **THINK LIGHTLY OF**.  
**VAL**. *val*, *n.* a lid or cover opening in one direction and shutting in another.  
**VAL-MORE** (vā-mōr'), *s. i.* to decamp.  
**VAMP** (vamp), *n.* the upper leather of a boot or shoe: *v.* to furnish with an upper leather.

**VAN-PIRE** (van'pīr), *n.* a faded dream or ghost that shows the blood of persons alive.

**VAN** (vān), *n.* the front of an army or fleet; a large covered wagon for moving.

**VANCOUVER** (van-kō-vēr'), *n.* a rising city which forms the western terminus of the Canadian Pacific railway, bears the name of Captain George Vancouver, B. N., who, in a military expedition, coasted the coast in 1792, and surveyed it in 1792.

**VANCOUVER ISLAND**, named in memory of Captain Vancouver, a British naval officer, who, while he was on his discovery in 1792, while cruising about in search of a river on the west coast of North America.

**VAN-DAM** (van'dām), *n.* one who ruthlessly destroys.

**VANE** (vān), *n.* a weathercock.  
**VANGUARD** (van'gārd), *n.* the advance guard of an army.

**VAN-IL-LA** (vā-nī-lā), *n.* the dried fruit of an orchid, used for flavoring.

**VAN-ISH** (van'ish), *v. i.* to disappear. [DISAP-PEAR.]

**VAN-ITY** (vā-nī), *n.* [pl. vanities (-itē)], love of indiscriminate admiration; empty pride or conceit; idle show; emptiness. [PRIDE.]

**VAN-QUISH** (van'kwish), *not van'kwish*, *v. t.* to conquer; subdue.

**VAN-TAGE** (vān'tāj), *n.* advantage; in lawn tennis, the point after a break.

**VAPOR** (vā'pōr), *n.* steam; mist; *s. i.* to pass off in vapor; boil.

**VAPOR-IZE** (vā'pōr-īz), *v. t.* to convert into vapor.

**VAPOR-OUS** (vā'pōr-ūs), *adj.* full of, or like, vapor; unreal.

**VAPOR-ABLE** (vā'pōr-ā-bul), *adj.* changeable; inconstant; fickle.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAP-OR-IOUS** (vā'pōr-ūs), *n.* difference; quarrel.

**VAN-T** (vān't), *n.* a boat; *s. i.* to brag of; display boastfully; *n.* a boast. [GLORY.]

**VEAL** (vī), *n.* calf's flesh.

**VEAL** (vī), *n.* a directive quantity, as a straight line [force, of velocity].

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VEGETABLE** (vī-jē-tā-bul), *n.* a plant; food cultivated for the table.

**VALUOUS** (vā-lū-ūs), *adj.* green; inexperienced.

**VER-DICT** (vēr'dīkt), *n.* the finding of a jury on a trial.

**VER-DIG-GRASS** (vēr'dī-grās), *n.* the blue-green substance which grows on copper and brass as a pigment.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**VER-DURE** (vēr'dūr), *n.* greenness of vegetation.

**rule log** (*rûl' log*), a large block of wood formerly put upon the hearth on Christmas eve to form the basis of the Christmas fire.

**rule-tide** (*rûl*), *n.* Christmas-tide.

**Yuste** (*yûs'tê*). A convent in Spain, east of Plasencia. It is noted as the place of retirement of the Emperor Charles V. after his abdication.

## Z

**Zacharias** (*zâk'z'as*). From the Hebrew *Zakhar*, "pure," "innocent." Others render it "pure of the Lord," making the last letter stand for Yah. Fr. *Zacharie*; It. *Zacche*; Lat. *Zacharias*.

**Zachariah** (*zâk'z'ar-ih*). From the Hebrew *Zakhar-Yah*, meaning "remembering the Lord." Danish, *Zacharias*; Dutch, *Zacharias*; Fr. *Zacharie*; Ger. *Zacharias*; It. *Zaccaria*; Lat. *Zacharias*; Sp. *Zacharias*; Sw. *Zacharias*.

**Zachary** (*zâk'z'ar-ih*). Same derivation as *Zachariah*.

**Zadok** (*zâd'ok*). Means "righteous." Fr. *Zodoc*; Lat. *Zadocus*.

**Zambesi** (*zâmb'ê-si*, pop., *zâmb'ê-s'ni*). Is the "great river" of eastern Africa, whose upper waters and chief affluents are called *Zambesi* and *Zuambesi*, dialectic forms of the same name.

**Zanesville** (*zân's'vîl*). City in Ohio, named for Ebenezer Zane, who, with John McIntire, founded the city.

**Zan-by** (*zân'by*), *n.* a buffoon; merry-andrew.

**Zanzibar** (*zân-sî-bâr*). The name of an East African island, was used before the fifteenth century in a more general sense to denote the East African coast south of the river Jubba. *Zanzibar* is a Port. form of the Arab. *Zanzibar*, which is itself a corruption of the Persian *Zangibar*, or *Zenqubar*, which means "the coast or region of the blacks," the name being formed like *Hindubar*, "the land of the Hindus," or *Motebar*, "the land of the mountains."

**zeal** (*zêl*), *n.* ardor for a cause; fervor.

**Syn.** *ZEAL*, ardor, fervor. *Zeal*, in reference to these other synonyms, is specific, while they are characteristic or habitual; *zeal* is passionate ardor in favor of a person or a cause; *ardor* is simply warmth or heat of passion in love, pursuit, or exertion; *fervor* denotes the constitutional state or temperament of individuals. We speak of the fervor of passion, declamation, supplication, desire, as demonstrative of warmth. *Ardor* is more

deeply seated; as *ardent* friendship, love, *zeal*, devotedness.

**Zealand** (*zê'land*). A province in the Netherlands, "land surrounded by the sea."

**zeal-of** (*zêl'of*), *n.* an enthusiast; fanatic.

**Zeal-of** (*zêl'of*), *n.* one of a fanatical sect of Jews which carried on a desperate struggle with the Romans until the fall of Jerusalem (70 A. D.).

**zeal-ous** (*zêl'us*), *adj.* ardent in the pursuit of an object; enthusiastic. [EAGER.]

**ze-bra** (*zê'bra*), *n.* a wild animal of Africa of the genus *Equus*, with black and white stripes.

**Zebulon** (*zêb'û-lon*). From the Hebrew, meaning "dwelling." Fr. *Zebulon*; Lat. *Zebulon*.

**ze-na-na** (*zê-nâ-nâ*), *n.* in India, that part of a house reserved exclusively for women.

**ze-nith** (*zê'nîth*), *n.* the point in the heavens directly over the head of the spectator; greatest height.

**Zeno** (*zê'nô*). From the Greek *Zeno*. Fr. *Zeno*; Gr. *Zeno*; It. *Zenone*.

**Zenobia** (*zê-nô-bi-â*). Feminine name formed from *Zeno*. Fr. *Zenobie*; Ger. *Zenobia*; It. *Zenobia*; Lat. *Zenobia*.

**zephyr** (*zê'fîr*), *n.* the west wind; soft, gentle breeze.

**ze-ro** (*zê'rô*), *n.* a cipher; nothing; neutral point (0) between any ascending or descending scale or series.

**zeal** (*zêl*), *n.* relish; keen enjoyment.

**zig-zag** (*zîg'zag*), *adj.* having short, sharp turns: *n.* something with short, sharp turns.

**zinc** (*zîng*), *n.* a bluish-white metal.

**zinc-graphy** (*zîng'grâf-î*), *n.* the art of drawing upon, or printing from, zinc plates.

**Zion** (*zî'on*) or **Sion** (*sî'on*). Mount. A hill on which was situated the old city of Jerusalem; the "city of David." Now used symbolically of the Christian church and of heaven.

**Zionism** (*zî-izm*), *n.* a project for the reestablishment of the Jews as a nation in Palestine.

**zith-er** (*zîth'îr*), *n.* a stringed musical instrument, consisting of a sounding box and 26 to 31 strings.

**zo-di-ac** (*zô'di-ak*), *n.* an imaginary broad belt in the heavens, containing the 12 constellations or signs of the zodiac, which the sun traverses annually.

**zô-di-a-cal** (*zô-dî-d'kal*, not *zô'di-a-kal*), *adj.* pertaining to, or situated within, the zodiac.

**Zoe** (*zê'ô* or *zê*). From the Greek name, signifying "life."

**Zo-la-ism** (*zô-lî-izm*), *n.* excessive realism in the literary treatment of the worse side of human life.

or nature, from Emile Zola, the French realistic novelist.

**zone** (*zôn*), *n.* one of the 5 great belts into which the surface of the earth is divided with respect to latitude and temperature; a girdle or belt; *n. f.* to encircle with, or as with, a zone.

**zoo**, *a prefix* meaning animal, as *zochemistry*, animal chemistry.

**zoo** (*zô*), *n.* a park or other large enclosure in which live animals are kept for public exhibition.

**zo-og-og-raphy** (*zô-ô-g'ô-g'ô-grâ-fî*), *n.* the study of the geographical distribution of animals.

**zo-og-ra-phy** (*zô-ô-grâ-fî*), *n.* the description of animals, their forms and habits.

**zo-ô-og-y** (*zô-ô-ô-g'î*), *n.* that part of biology that treats of animals, their structure, classification, habits, and distribution.

**zo-mor-phi-um** (*zô-môr'fî-um*), *n.* the representation of a deity in the form, or with the attributes, of an animal.

**zo-ô-ph-i-lit** (*zô-ô-fî-lîst*), *n.* a lover of animals.

**zo-ô-phy** (*zô-ô-fî*), *n.* an animal of low organization, bearing some external resemblance to a plant.

**zo-ô-og-my** (*zô-ô-ô-mî*), *n.* the dissection or anatomy of animals.

**zou-ave** (*zô-ô-ô-v*), *n.* a soldier of a light infantry corps of the French army, wearing an Arab dress.

**Zu-lu** (*zû'lû*), *n.* one of a warlike tribe of Kaffirs, north of Natal.

**Zululand** (*zû'lû-land*). The country of Zulul.

**Zurich** (*zû'rîch*). A canton and city of Switzerland. Named from the ancient *Thuricum*, "the town of the Thuriel," who built it after it had been destroyed by Attila.

**Zuyder Zee** (*zû'dêr zê*, Dutch *zû'der-zê*). The Dutch for the "South Sea," in relation to the North Sea or German Ocean, of which it is an arm.

**Zwinger** (*zîng'îr*). A famous museum in Dresden. Its picture gallery contains about 2,500 paintings, also collections of drawings, casts, etc.

**zyme** (*zim*), *n.* the germ supposed to be the poisonous cause of zymotic diseases.

**zym-ic** (*zim'îk*), *adj.* produced by fermentation.

**zym-ol-og-y** (*zim-ol'ô-g'î*), *n.* the doctrine of fermentation.

**zym-ol-ic** (*zim-ol'îk*), *n.* a fermentation.

**zym-ol-ic** (*zim-ol'îk*), *adj.* producing fermentation, or a disease in which a virus works through the body like a ferment, as cholera.

**zymur-gy** (*zim'ûr-jî*), *n.* that branch of industrial chemistry which deals with the processes of fermentation in brewing, wine-making, etc.

*far, dek, fol, fite, edra, Anal; met, mâ, hbr; pin, line; not, nôl, for, ônl, fôg; cup, ûet, fôr; for 2, 3, and 3, see Key.*

## INDEX

The Dictionary of Biography and the Multiplex Dictionary are self-indexing and the items contained therein do not appear in the general index. Consult them direct. The other self-indexing parts given below further supplement the general index. The reader should consult the general index first and if the item does not appear there, recourse should be had to one of the following tabulations or special dictionaries:
